The most revealing part of the report is Chapter VII which refers to an official trip to Paris by Watzlawek and Schüller from the 14th to the 20th of June, 1941. They were sent there by Henschel's Research Department to visit Joliot's cyclotron. We find the following statements in this report:

> "The Research Department of the HWA has confiscated the cyclotron and it has been put into operation by Dr. Gentner (Heidelberg) and by Dr. Bagge (Leipzig)."
>
> "The cyclotron at present produces a beam of only 5 MeV. It is planned to operate at 9 MeV. Gentner has introduced some essential improvements in connection with the high frequency transmitter."
>
> "It has been determined that no fission experiments are being performed with the cyclotron. The work with the cyclotron has as its only purpose the gathering of experience for the construction of later cyclotrons."
>
> "The conversation with Dr. Bagge yielded the information that Professor Joliot, during the war, had handed in a patent at the Berlin Patent Bureau concerning a uranium machine for the driving of motors by energy produced from fission. Americans, Britishers and Frenchmen have worked hard with the help of great resources so that it is not unlikely that they will surprise us one day with airplanes propelled by uranium machines and with uranium bombs."

The rest of the report shows that Bagge was not very communicative. He tried to withhold technical information from the Henschel visitors. Following are a few quoted passages:

> "When Bagge was asked when the fission experiments would be started, he stated that, under the present circumstances, with a man like Joliot and the inadequacy of the French installation, such experiments could not be made. Joliot

always acts very secretive, and his German colleagues get very little out of him."

"He (Bagge) mentioned further that such fission experiments were being done secretively in Germany and that it was also certain that many places were interested in it, principally industries, because he received many requests for visitors from industrial centers."

"As far as Joliot is concerned, to whom we (Henschel visitors) were not introduced, we must note Bagge's statement that Joliot is not sufficiently reliable so that one can perform uranium fission experiments with him. Furthermore, Professor Joliot is still in contact with Paris physicists such as Adler, Halban, Preiswerk, Savitsch and others who have fled to the unoccupied zone with the most important apparatus where they work with great zeal on nuclear physics."

Further down, it is stated that it is

"Dr. Bagge's opinion that cooperation with other German enterprises and an extremely large supply of resources could make it possible to eliminate the American lead. At present, he considers the situation very dangerous because one doesnot know the present state of the experiments in America, England or the unoccupied zone of France...."

In a luncheon conversation, Bagge proposes cooperation between HWA, the air forces and Henschel. Following is a quoted passage:

"Watzlawek believes that he is merely interested in the participation of the generous firm of Henschel and of the Air Ministry which has access to larger resources because the Army (HWA) has hardly any means."

On page 251, we find that Bagge tried to get rid of his visitors, pretending that he was very busy. However, his visitors happened to go to the same place for lunch where they saw him from a distance, together with Bagge's superior, a Lieutenant Dr. Suhnckel. Apparently, Bagge evaded them, from which they concluded that there could be no real cooperation between the HWA and the other groups.

"Therefore, further development in the construction of a cyclotron has to be carried by the German Air Ministry and the firm of Henschel alone without the Army!!"

Henschel Interest in TA

"It is wise to consider that, in the case of the occupation of Russia and England, the cyclotrons in those countries (15 MeV, 50 MeV in Russia, three of 15 MeV in England) should be confiscated for the Air Ministry and the firm of Henschel and in such a manner that the HWA cannot interfere. Moreoever, the cyclotron of Professor Bohr in Copenhagen should be subjected to a more detailed visit."

Enclosed also is the correspondence found in Gerlach's files, dated December 1944, concerning a book on nuclear physics written by Watzlawek. The book was not good enough to be published. A remark in this correspondence between Riezler and Gerlach is of particular interest. Riezler asks, "Would it be possible to make available to the principal participants all the information in the French press which concerns Joliot and our activities in the College de France? One does not know for sure whether one might get into a situation where it is expedient to be properly informed about this."

Gerlach answers, "I have heard nothing further about Joliot. It is said that he is in America at present. In the Foreign Office, they said that he had talked about the impossible conditions in the Paris Institute. I do not know, however, whether this has been officially verified, especially because one must assume that there are places in France which want to protect Joliot against the reproach of collaboration. When I hear more, I shall let you know."

Thomas Siemon. 24 July 2014. *Hessen-Niedersächsische Allgemeine.* https://www.hna.de/kassel/henschel-wollte-atombombe-kriegseinsatz-bauen-3727289.html

Pläne aus Zeiten des Zweiten Weltkrieges

Schriftsatz aufgetaucht: Henschel wollte Atombombe für den Kriegseinsatz bauen

Kassel. 1945 sorgten die Atombomben auf Hiroshima und Nagasaki für zehntausende von Opfern und furchbare Zerstörungen. Bereits vier Jahre zuvor gab es bei der Kasseler Firma Henschel konkrete Überlegungen für den Bau einer Nuklearwaffe. Das belegt ein Schriftsatz aus dem Jahr 1941, der jetzt aufgetaucht ist.

Er hat 260 Seiten und liegt der HNA vor.

Mit ganzer Kraft müsse an der Erforschung der Kettenreaktionsvorgänge gearbeitet werden, heißt es da. Zwar wird auch die Nutzung der Atomenergie für den Antrieb von Kampfflugzeugen, U-Booten, die Medizin und zur Stromerzeugung erwähnt. Das klare Ziel der Entwicklung ist aber die "Herstellung einer Uran-Bombe für den jetzigen europäischen Krieg als furchtbarste Waffe".

An der Echtheit der handgebundenen Dokumente besteht kein Zweifel. Helmut Weich, der ehrenamtliche Leiter des Kasseler Henschel- Museums, hat die erwähnten Namen und Örtlichkeiten überprüft. Demnach hat der damalige Chefentwickler der Henschel-Flugzeugwerke in Berlin-Schönfeld, Professor Herbert Wagner, das umfangreiche Dossier mit Unterstützung von weiteren Fachleuten erstellt.

Plans from the times of the Second World War

Written brief found: Henschel wanted to build a nuclear bomb for war use

Kassel. In 1945, the atomic bombs on Hiroshima and Nagasaki caused tens of thousands of victims and terrible destruction. Four years earlier, the Kassel-based company Henschel had already given concrete consideration to the construction of a nuclear weapon. This is documented in a document from 1941, which has now appeared.

It has 260 pages and is available to the HNA.

It says that the research of chain reaction processes has to be done with all one's strength. The use of atomic energy for the propulsion of combat aircraft, submarines, medicine and power generation is also mentioned. But the clear goal of the development is the "production of a uranium bomb for the current European war as the most terrible weapon."

There is no doubt about the authenticity of the hand-bound documents. Helmut Weich, the honorary director of the Henschel Museum in Kassel, has checked the names and locations mentioned above. Accordingly, the then chief developer of the Henschel-Flugzeugwerke in Berlin-Schönfeld, Professor Herbert Wagner, prepared the extensive dossier with the support of other experts.

Henschel war damals nicht die einzige Firma, die sich intensiv mit den Möglichkeiten der Atomenergie beschäftigte. Auch Siemens, die IG Farben und Degussa hatten großes Interesse an diesem Thema.

In der gedruckten Ausgabe am Freitag lesen Sie außerdem:

- Es blieb bei Plänen für die Bombe: Nach 1941 keine weiteren Aktivitäten zur militärischen Nutzung der Kernenergie bei Henschel bekannt

Bekannt ist, dass eine Delegation von Henschel in Paris war, um sich dort über die Forschung zur Kernspaltung mit einem sogenannten Zyklotron zu informieren. Nach Einschätzung von Fachleuten waren weder Henschel noch die anderen Firmen in der Lage, die Bombe wirklich zu bauen. Nach dem Krieg sprachen alle Beteiligten davon, lediglich Grundlagenforschung betrieben zu haben.

Henschel was not the only company at the time to be intensively involved with the possibilities of nuclear energy. Siemens, IG Farben and Degussa were also very interested in this topic.

You can also read in the printed edition on Friday:

- It remained with plans for the bomb: After 1941 no further activities for the military use of nuclear energy known at Henschel.

It is known that a delegation of Henschel was in Paris to inform themselves about the research on nuclear fission with a so-called cyclotron. According to experts, neither Henschel nor the other companies were able to really build the bomb. After the war, all those involved said that they had only carried out basic research.

Walter Hantzsche and Hilmar Wendt. 1940. HEC 10722. *On Shock Waves from Cylindrical and Spherical Waves of Compression.* [U.K. Imperial War Museum, Duxford Archive, Halstead Exploitation Centre reports]

We utilize only the equations of motion of an unsteady gas flow, and consider, in the following, a plane, cylindrical and spherical compression wave with a steep velocity front. In the case of the plane wave, a shock wave appears following continuous steepening of the velocity front. For cylindrical and spherical waves, on the other hand, it can happen that a steepening of the velocity front only takes place after a given time. Previously the front becomes flatter, the diminishing of the amplitude through the spreading of the wave, outweighing the steepening caused by the compression. A criterion is established for the onset of a shock wave, which, in the case of the spherical wave, agrees with Burton.

[This report demonstrates that by no later than 1940, German scientists had carried out calculations applicable to both spherical and cylindrical implosion bombs. Gottfried Guderley's more famous 1942 paper with similar calculations is shown on pp. 4170–4171. See also pp. 2127–2129 and 5010.]

wave), that in spite of the reduction of amplitude, a shock wave occurs for the sperical case also. He gives an expression for the time of the progress of the wave up to the occurrence of the shock.

We utilize only the equations of motion of an unsteady gas flow, and consider, in the following, a plane, cylindrical and spherical compression wave with a steep velocity front. In the case of the plane wave, a shock wave appears following continuous steepening of the velocity front. For cylindrical and spherical waves, on the other hand, it can happen that a steepening of the velocity front only takes place after a given time. Previously the front becomes flatter, the diminishing of the amplitude through the spreading of the wave, outweighing the steepening caused by the compression. A criterion is established for the onset of a shock wave, which, in the case of the spherical wave, agrees with Burton.

In a rectangular coordinate system x, y, z, with u, v, w the velocity components, t the time, p and ρ the density and pressure, the Eulerian equations of an unsteady gas motion are:-

$$\frac{\partial u}{\partial t} + u\frac{\partial u}{\partial x} + v\frac{\partial w}{\partial y} + w\frac{\partial u}{\partial z} = -1/\rho \; \partial p/\partial x \; ---- \quad (1)$$

$$\frac{\partial v}{\partial t} + u\frac{\partial v}{\partial x} + v\frac{\partial v}{\partial y} + w\frac{\partial v}{\partial z} = -1/\rho \; \partial p/\partial y \; ---- \quad (2)$$

$$\frac{\partial w}{\partial t} + u\frac{\partial w}{\partial x} + v\frac{\partial w}{\partial y} + w\frac{\partial w}{\partial z} = -1/\rho \, \frac{\partial p}{\partial z} \; --- \quad (3)$$

We add the equation of continiuty

$$\frac{\partial \rho}{\partial t} + u\frac{\partial \rho}{\partial x} + v\frac{\partial \rho}{\partial y} + w\frac{\partial \rho}{\partial z} + \rho\left(\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z}\right) = 0 \; --- (4)$$

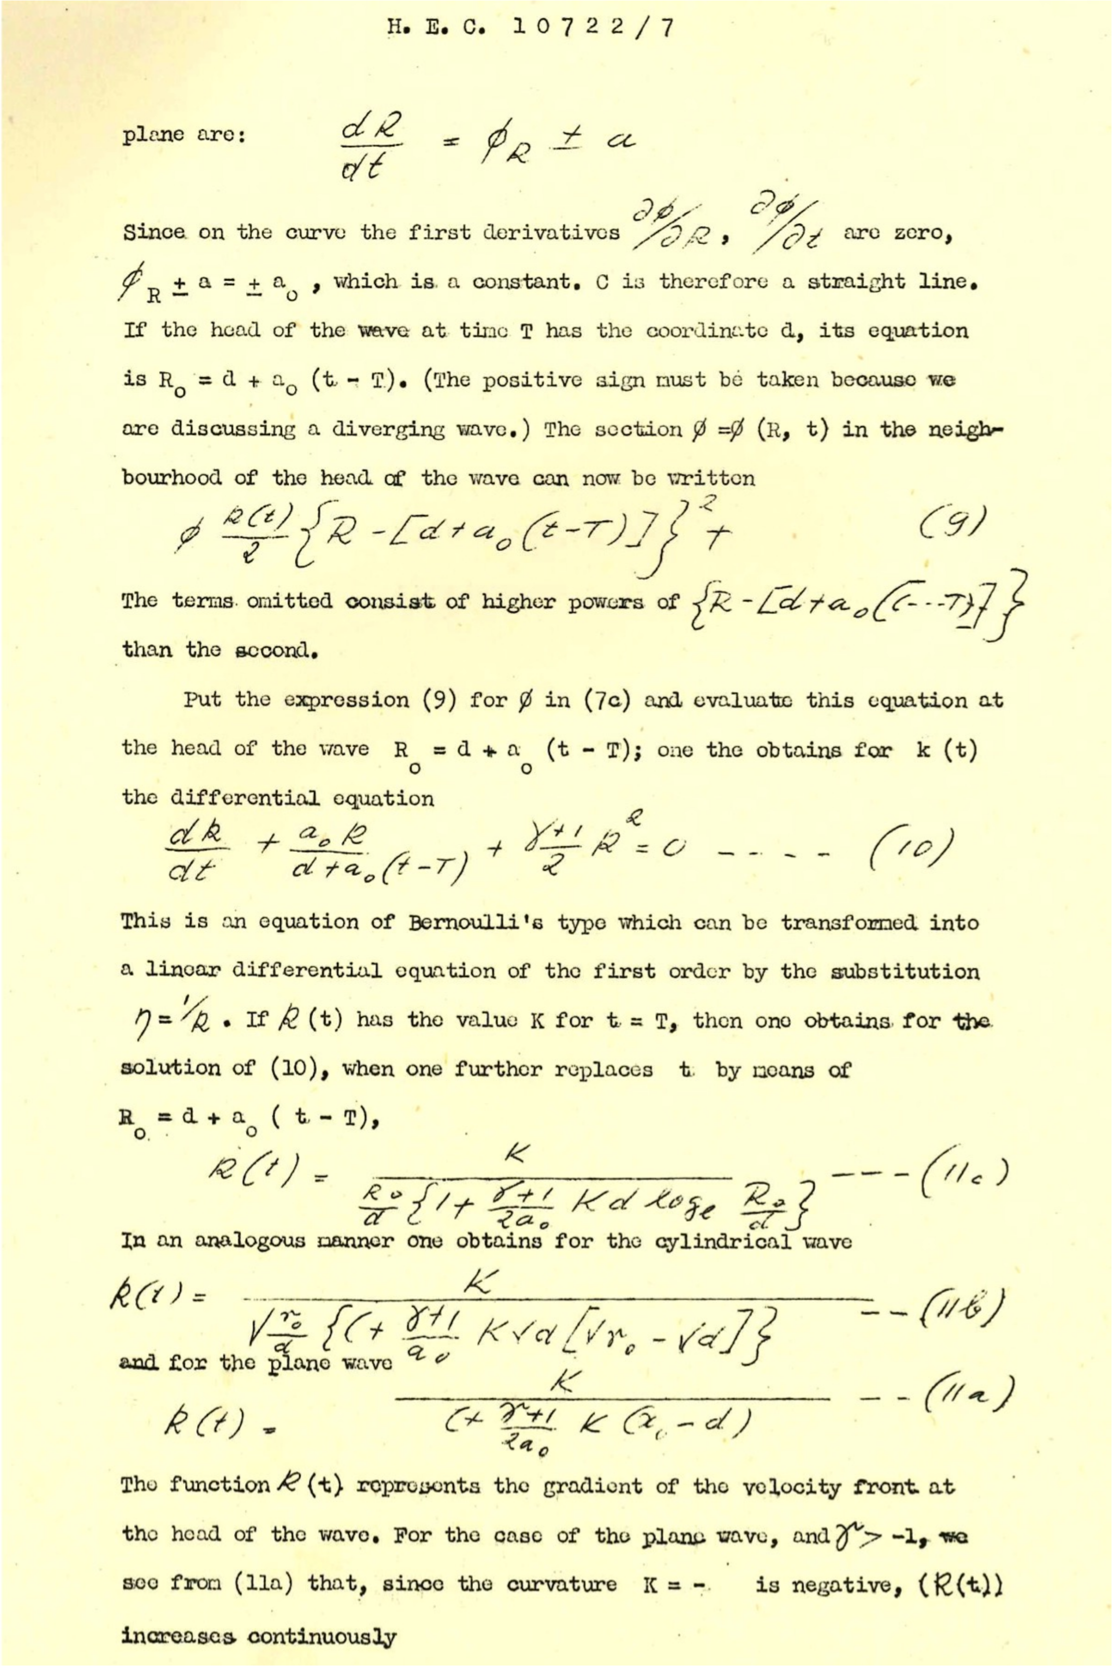
We shall assume a velocity potential ϕ (x,y,z,t) for the flow.

Then:-

$$u = \frac{\partial \phi}{\partial x}, \quad v = \frac{\partial \phi}{\partial y}, \quad w = \frac{\partial \phi}{\partial z}$$

Figure D.552: By no later than 1940, Walter Hantzsche and Hilmar Wendt had carried out calculations applicable to both spherical and cylindrical implosion bombs [Halstead Exploitation Centre (HEC) Report 10722, English translation, U.K. Imperial War Museum, Duxford Archive].

Imperial War Museum, Duxford, HEC 10722



H. E. C. 10722/7

plane are: $\frac{dR}{dt} = \phi_R \pm a$

Since on the curve the first derivatives $\partial\phi/\partial R$, $\partial\phi/\partial t$ are zero, $\phi_R \pm a = \pm a_0$, which is a constant. C is therefore a straight line. If the head of the wave at time T has the coordinate d, its equation is $R_0 = d + a_0 (t - T)$. (The positive sign must be taken because we are discussing a diverging wave.) The section $\phi = \phi (R, t)$ in the neighbourhood of the head of the wave can now be written

$$\phi \frac{k(t)}{2}\left\{R-\left[d+a_0(t-T)\right]\right\}^2 + \qquad (9)$$

The terms omitted consist of higher powers of $\left\{R-\left[d+a_0(t-T)\right]\right\}$ than the second.

Put the expression (9) for ϕ in (7c) and evaluate this equation at the head of the wave $R_0 = d + a_0 (t - T)$; one the obtains for $k (t)$ the differential equation

$$\frac{dk}{dt} + \frac{a_0 k}{d+a_0(t-T)} + \frac{\gamma+1}{2} k^2 = 0 \quad ----\ (10)$$

This is an equation of Bernoulli's type which can be transformed into a linear differential equation of the first order by the substitution $\eta = 1/k$. If k (t) has the value K for t = T, then one obtains for the solution of (10), when one further replaces t by means of $R_0 = d + a_0 (t - T)$,

$$k(t) = \frac{K}{\frac{R_0}{d}\left\{1+\frac{\gamma+1}{2a_0} K d \log_e \frac{R_0}{d}\right\}} \quad ---\ (11c)$$

In an analogous manner one obtains for the cylindrical wave

$$k(t) = \frac{K}{\sqrt{\frac{r_0}{d}}\left\{1+\frac{\gamma+1}{a_0} K\sqrt{d}\left[\sqrt{r_0}-\sqrt{d}\right]\right\}} \quad --\ (11b)$$

and for the plane wave

$$k(t) = \frac{K}{1+\frac{\gamma+1}{2a_0} K (x_0-d)} \quad --\ (11a)$$

The function k (t) represents the gradient of the velocity front at the head of the wave. For the case of the plane wave, and $\gamma > -1$, we see from (11a) that, since the curvature K = - is negative, (k(t)) increases continuously

Figure D.553: By no later than 1940, Walter Hantzsche and Hilmar Wendt had carried out calculations applicable to both spherical and cylindrical implosion bombs [Halstead Exploitation Centre (HEC) Report 10722, English translation, U.K. Imperial War Museum, Duxford Archive].

NEW GERMAN EXPLOSIVE ** SECRET WEAPON

Dr. Berg tells me that his friends know from countless sources that several factories and hundreds of workers have been transported from the Wiesental near Bale to northern Germany. The workers' letters home are mailed from a great variety of towns-- but all these towns are on the peripherie of the Lüneburger Heide.

The story he hears is that they are all all working in vast undrground factories putting out a new explosive in aerial bombs. He has even heard that the container of the explosive is spherical.

A very large number of runways are being built in that region with calculated slowness and care to prevent detection from the air -- and these are to acconodate the planes that will eventually come to load up with the new bombs for an attack on England.

While I am gone he will assemble the details of this story for me -- what kind of factories were removed -- what kind of training the workers had had -- names of any chemicals they may have worked with. He heard some part of the explosive was previously manufactured in the Wiesental before the whole business was concentrated in Lüneburger Heide.

The concentration took place about 9 months ago.

Suggests we take a good look from the air.

493.

From Berg's man in Bâle

19.9.1943

Der neueste Luftangriff auf Strassburg hat nach übereinstimmenden Aussagen unserer Gewährsleute etwa 400 Todesopfer unter der zivilen Bevölkerung gefordert. Unter den Toten befinden sich auch Angehörige der deutschen Wehrmacht. Das Ziel dieses Fliegerangriffes waren zweifellos die Mathyswerke in der Nähe von Strassburg. Diese haben jedoch keinen Schaden erlitten. Auch der Bahnhof von Strassburg blieb unversehrt. Dagegen sollen die Zerstörungen im Gebiete der Colmarerstrasse erheblich sein.

Believe attack was on Kehl to Strasbourg bridge and knocked out one span. FRL.

Man meldet uns weiter, dass die Unterseebootswerften in Karlsruhe fast völlig zerstört seien. Der Luftangriff auf Kehl soll nur unbedeutende Schäden verursacht haben. Die Bomben fielen zur Hauptsache auf freies Gelände in der Umgebung von Kehl.

Unsere Gewährsleute bestätigen einmal mehr, dass man in Deutschland mit wachsender Sorge dem herannahenden Winter entgegenblickt. Die Versorgungslage verschlechtere sich von Tag zu Tag. Den Einschränkungen aller Art fügt man sich mit dumpfer Resignation. Die Entwicklung der Dinge in Italien und die militärischen Rückschläge und Niederlagen im Osten haben die letzten Hoffnungen auf den versprochenen Endsieg zerstört. Da man keinen Ausweg aus dem Elend und Grauen sieht, macht sich unter der Bevölkerung mehr und mehr eine verzweifelte Stimmung bemerkbar. Trotzdem die Gestapo jede Kritik zu unterdrücken sucht, und mit aller Rücksichtslosigkeit gegen die Mekerer vorgeht, ist die Kritik nicht verstumm.- Vor kurzem ist wiederum ein Schiffsmann (Elsässer) in Hüningen verhaftet worden. Man wirft diesem vor, er habe sich in einer Gaststädte in Basel über das nationalsozialistische Regime abfällig geäussert.

Die Frau des Schiffsmannes vom Edelweiss 24 ist neulich beschuldigt worden, sie habe ebenfalls in einem Basler Restaurant an den heutigen Zuständen in Deutschland Kritik geübt.

Figure D.557: Several documents reported that there was a hidden underground nuclear facility somewhere in the Lüneburger Heide area south of Hamburg. Intelligence via Frederick Loofbourow (OSS agent 493) [NARA RG 226, Entry 125, Box 6, Folder 78].

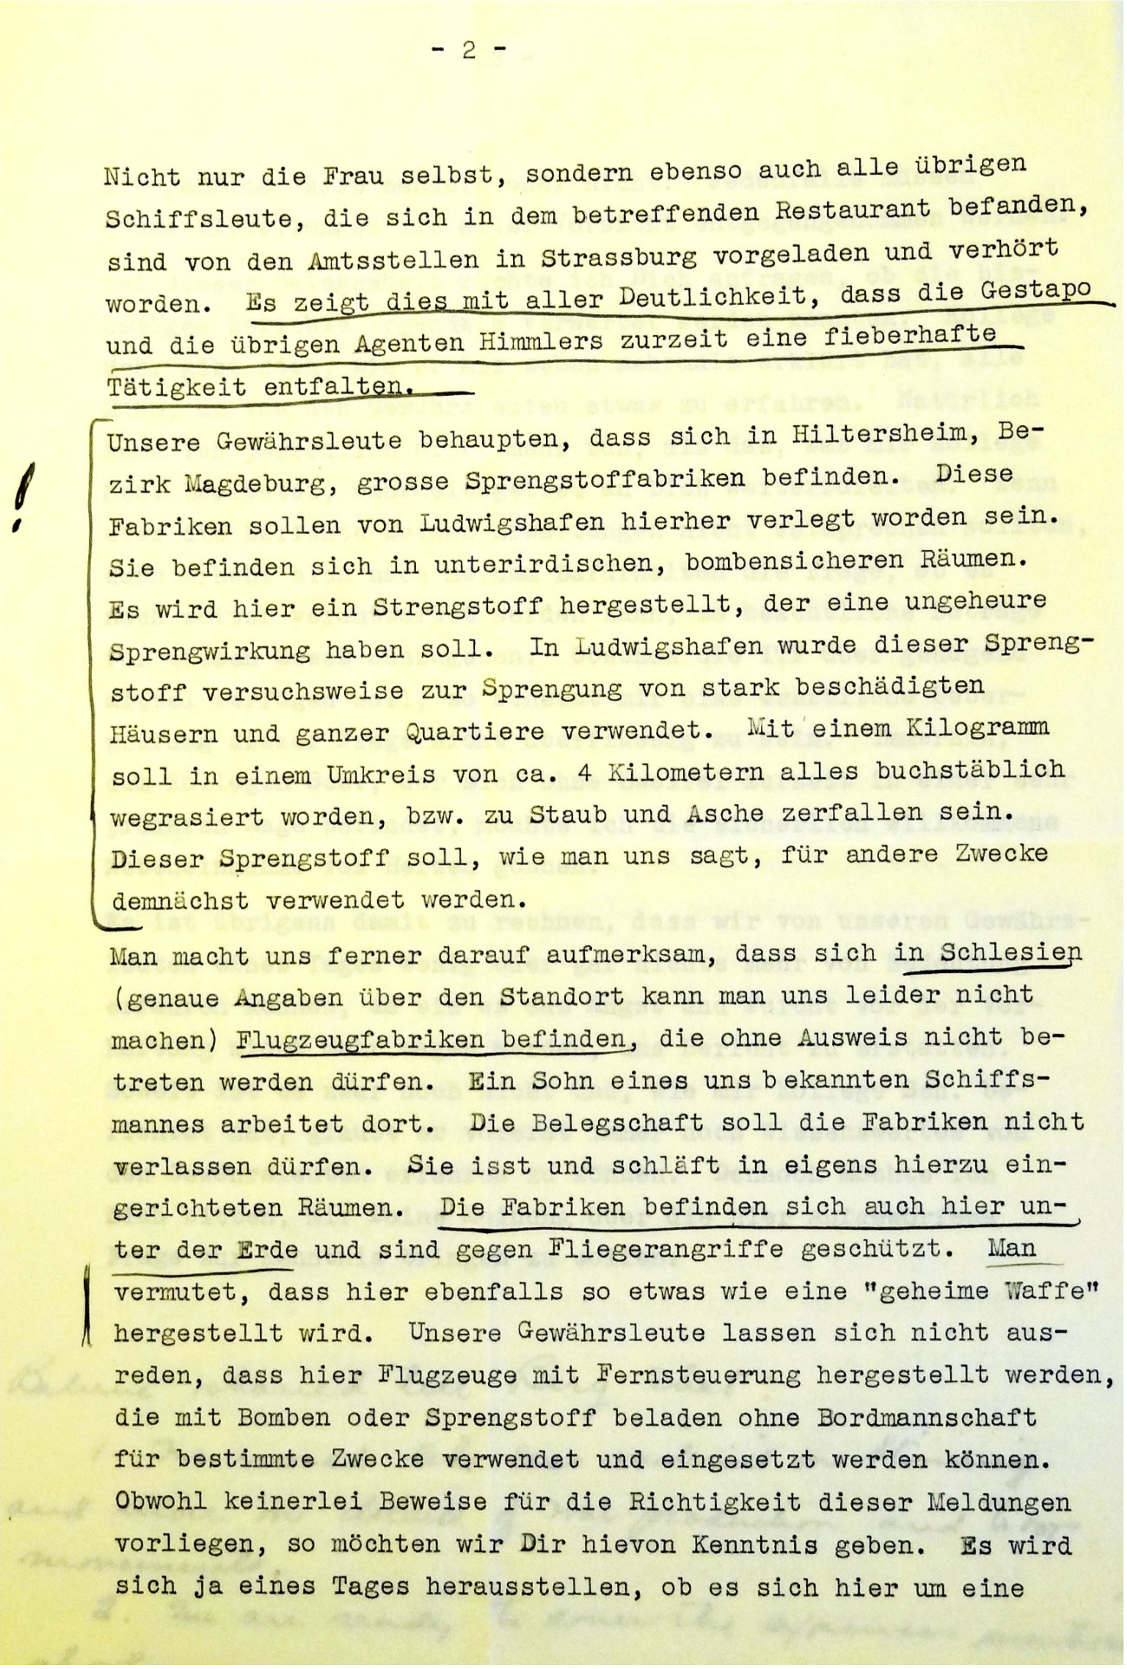
Authority NND 867125



- 2 -

Nicht nur die Frau selbst, sondern ebenso auch alle übrigen Schiffsleute, die sich in dem betreffenden Restaurant befanden, sind von den Amtsstellen in Strassburg vorgeladen und verhört worden. Es zeigt dies mit aller Deutlichkeit, dass die Gestapo und die übrigen Agenten Himmlers zurzeit eine fieberhafte Tätigkeit entfalten.

Unsere Gewährsleute behaupten, dass sich in Hiltersheim, Bezirk Magdeburg, grosse Sprengstoffabriken befinden. Diese Fabriken sollen von Ludwigshafen hierher verlegt worden sein. Sie befinden sich in unterirdischen, bombensicheren Räumen. Es wird hier ein Strengstoff hergestellt, der eine ungeheure Sprengwirkung haben soll. In Ludwigshafen wurde dieser Sprengstoff versuchsweise zur Sprengung von stark beschädigten Häusern und ganzer Quartiere verwendet. Mit einem Kilogramm soll in einem Umkreis von ca. 4 Kilometern alles buchstäblich wegrasiert worden, bzw. zu Staub und Asche zerfallen sein. Dieser Sprengstoff soll, wie man uns sagt, für andere Zwecke demnächst verwendet werden.

Man macht uns ferner darauf aufmerksam, dass sich in Schlesien (genaue Angaben über den Standort kann man uns leider nicht machen) Flugzeugfabriken befinden, die ohne Ausweis nicht betreten werden dürfen. Ein Sohn eines uns bekannten Schiffsmannes arbeitet dort. Die Belegschaft soll die Fabriken nicht verlassen dürfen. Sie isst und schläft in eigens hierzu eingerichteten Räumen. Die Fabriken befinden sich auch hier unter der Erde und sind gegen Fliegerangriffe geschützt. Man vermutet, dass hier ebenfalls so etwas wie eine "geheime Waffe" hergestellt wird. Unsere Gewährsleute lassen sich nicht ausreden, dass hier Flugzeuge mit Fernsteuerung hergestellt werden, die mit Bomben oder Sprengstoff beladen ohne Bordmannschaft für bestimmte Zwecke verwendet und eingesetzt werden können. Obwohl keinerlei Beweise für die Richtigkeit dieser Meldungen vorliegen, so möchten wir Dir hievon Kenntnis geben. Es wird sich ja eines Tages herausstellen, ob es sich hier um eine

Art geheime Waffe handelt oder nicht. Jedenfalls müssen diese Mitteilungen mit aller Vorsicht entgegengenommen werden.

Bei dieser Gelegenheit möchte ich Dich anfragen, ob die bisherigen Berichte irgendwie verwertet werden konnten. Kollege Sch. gibt sich, wie er mir schon mehrmals erklärt hat, alle Mühe, um von den Gewährsleuten etwas zu erfahren. Natürlich kann ich persönlich nicht mehr tun, als das, was mir Kollege Sch. berichtet, wahrheitsgetreu an Dich weiterzuleiten. Wenn aber die Berichte Deinen Erwartungen nicht entsprechen sollten, dann erhebt sich nach meinem Dafürhalten die Frage, ob es noch weiter verantwortet werden kann, so beachtliche Beträge für diesen Zweck auszugeben. Obschon die ITF über genügend Mittel verfügen soll, so scheint mir eine ernstliche Ueberprüfung dieser Frage nicht überflüssig zu sein. Immerhin, dem Kollegen Sch., der sich ohne Zweifel zurzeit in einer sehr prekären Lage befindet, möchte ich die sicherlich willkommene Nebeneinnahme von Herzen gönnen.

Es ist übrigens damit zu rechnen, dass wir von unseren Gewährsleuten eines Tages wenig oder gar nichts mehr von Bedeutung erfahren können, da sie es aus Angst und Furcht vor der Verhaftung nicht mehr wagen werden, uns Bericht zu erstatten. Soweit ist es zwar noch nicht und, wie mir Kollege Sch. berichtet hat, glaubt er vorerst immer noch Wissenswertes von den Gewährsleuten erfahren zu können. Dennoch möchte ich Dich bitten, mir Deine Meinung über die hier aufgeworfene Frage zur Kenntnis bringen zu wollen.

Believe should tell Berg that:

1. We would like less material on Stimmung and more on details of war production and troops movements.

2. We are ready to cover the expenses mentioned above.

493

Figure D.559: Several documents reported that there was a hidden underground nuclear facility somewhere in the Lüneburger Heide area south of Hamburg. Intelligence via Frederick Loofbourow (OSS agent 493) [NARA RG 226, Entry 125, Box 6, Folder 78].

Background on Frederick Loofbourow [Powers 1993, p. 271]

Dulles never lacked for reports of new German explosives. One dated October 28, 1943, came from an OSS officer ostensibly serving as a senior economic analyst in the American consulate in Zurich who signed all his reports "493." This was Frederick Read Loofbourow, an executive of the Standard Oil Company of New Jersey, sent to Switzerland in 1942 by the Board of Economic Warfare to gather intelligence on German petroleum production. After the border was closed, Loofbourow was tapped by Dulles for OSS work and given a wide range of jobs through the end of the war.

Intelligence via Frederick Loofbourow [NARA RG 226, Entry 125, Box 6, Folder 78]

[...] Our sources claim that there are large explosives factories in Hiltersheim, Magdeburg district. These factories are said to have been moved here from Ludwigshafen. They are located in underground, bomb-proof facilities. A special [[explosive?] substance is produced here which is said to have an enormous explosive effect. In Ludwigshafen, this explosive was used on an experimental basis to blow up severely damaged houses and entire neighborhoods. With one kilogram, everything within a radius of approximately four kilometers should be literally razed away, or disintegrated to dust and ashes. We are told that this explosive will soon be used for other purposes.

We are also informed that there are aircraft factories in Silesia (unfortunately we are not given exact details of the location) which cannot be entered without a pass. A son of a shipman we know works there. The employees are not allowed to leave the factories. They eat and sleep in specially equipped rooms. The factories are also located underground and are protected against air raids. It is suspected that something like a "secret weapon" is also being produced here. Our sources will not be talked out of the fact that remote-controlled airplanes are produced here, which can be loaded with bombs or explosives and used for certain purposes without a crew on board. Although there is no proof that these reports are correct, we would like to inform you of them. One day it will become clear whether this is some kind of secret weapon or not. In any case, these reports must be taken with a grain of salt.

[Loofbourow seemed to have great confidence in his source “Dr. Berg” (not to be confused with Moe Berg, an OSS spy). Would it possible now to trace who that person actually was?

The new explosive reported by Dr. Berg was said to have “an enormous explosive effect” and clearly was not a conventional explosive. A fuel-air explosive (such as was being developed by Mario Zippermayr and others) could have an enormous explosive effect, but it would require on the order of a ton, not a kilogram, of fuel, and the fuel would be coal dust or other relatively well known substances. This report of a new explosive that was special substance that was so powerful that one kilogram of the new explosive could have a blast radius of several kilometers, seems to accurately describe the properties of weapons-grade uranium or plutonium. Dr. Berg reported that large factories with hundreds of people were producing the new explosive, which sounds like a large-scale production operation, not just small-scale lab experiments with minute quantities.

According to Dr. Berg, production began no later than early 1943. Based on current evidence about the technologies that were available in Germany at that time and that would have been suitable for producing fission bomb fuel, one of the most likely production methods would have been electromagnetic separation of uranium-235. That approach would have been highly similar to the U.S. calutrons at Oak Ridge, which also required hundreds of minimally trained workers to operate. Other possibilities would have been gas centrifuges or gaseous diffusion for enriching uranium-235, or a reactor or particle accelerators for breeding plutonium-239 or uranium-233.

For aerodynamic, stability, and targeting reasons, bombs are generally not spherical. The only reason to make a spherical bomb is if the bomb physics compels that choice—a spherical implosion bomb. Actually, this report gives many relevant details. It describes a bomb that:

1. Was spherical in overall shape, which strongly suggests an implosion design.
2. Contained on the order of a kilogram of an unusual material that was a new type of explosive.
3. Required large factories, hundreds of people, and over a year to produce enough of that unusual material.
4. Contained other components that are alluded to but not specified.
5. Had a blast radius of several kilometers.

Those details are highly consistent with others descriptions of a German fission implosion bomb.

The Lüneburger Heide or Heath is an area just south of Hamburg. Note the measures taken to avoid aerial surveillance (“to prevent detection from the air”) and aerial bombardment (“vast underground factories,” distribution “in a number of towns”) of this program. If those measures were successful, and if the equipment was evacuated, blown up, or buried before the end of the war, the whole program could have remained unnoticed by Allied countries, apart from a few intelligence reports such as those of Dr. Berg and the following documents, which do not appear to have been seriously pursued.

See also pp. 4987–4988 for a map and list of known underground facilities including Lüneburger Heide.]

Lüneburger Heide south of Hamburg

Figure D.560: Several documents reported that there was a hidden underground nuclear facility somewhere in the Lüneburger Heide area south of Hamburg. See also pp. 4987–4988.

To London and MILID, 12547.

Contact named Handtusch now returned to Germany eval FO states sea pointed last several days is aerial torpedo. Proof fired from Lueneburger Heide in direction Baltic Sea, impact area approximately 100 KM from Kiel. He stated storage depots these torpedos located in Lueneburger Heide near Lueneburg. Manufactured in new underground plants between Rostock and Stralsund.

Sharp.

BIOS 142. *Information Obtained from Targets of Opportunity in the Sonthofen Area.* 1945.

A. The S. S. Hauptamt (information from various sources)

Scientific research on new weapons and the production of armaments in Germany was controlled not only by the established ministries such as the R.L.M. but also by Speer's ministry and by the S. S. Hauptamt. [...]

Obergruppenführer Professor Kammler, one of the directors of the S.S. Hauptamt, was said to have great influence on Himmler and more influence on Hitler than Speer himself; and he was kept informed on all questions concerning armaments. The New Weapons section of the Waffenamt was apparently directed by a man called Bree. Standartenführer Klumm worked in this section and under him Lt. Kreutzfeld, who was interrogated.

One of the functions of the S.S. was to control the work of politically unreliable scientists who were kept in concentration camps. One of these camps was at Oranienburg, and research was done here on new weapons. [...] Another such camp was located at Nordhausen in the Harz, and came under the direct control of Kammler. Here the prisoners worked in an underground factory engaged on production. [...]

B. Information obtained from K. Kreutzfeld [...]

(g) Liquid air bomb

As the research on the atomic bomb under Graf von Ardenne and others was not proceeding as rapidly as had been hoped in 1944, it was decided to proceed with the development of a liquid air bomb. [...]

C. Interrogation of Josef Ernst [...]

(c) Scientific concentration camps

Ernst stated that he had been imprisoned at a concentration camp for politically unreliable scientists called "Camp Mecklenburg" in the Lüneburger Heide. This place was not known to Kreutzfeld, who was however acquainted with the Oranienburg camp. The possibility of bringing Ernst over to Oranienburg was also mentioned in Ernst's personal file, which had been given to him by Kreutzfeld for identification purposes. There was no mention of Camp Mecklenburg in this file. Ernst also stated that there was a similar camp at Maudhausen, near Vienna, but this was also unknown to Kreutzfeld. [...]

(f) Other work at Camp Mecklenburg

Ernst also stated that work was carried out at this camp on a new liquid air bomb, and liquid air gun (?), while trials on some kind of atomic bomb were made at or near the camp.

[The BIOS investigators interrogated Kurt Kreutzfeld, who had apparently been a member of the SS, and Josef Ernst, who had apparently been a "politically unreliable" scientist sentenced to work in concentration camps under the supervision of Kreutzfeld and other SS members. Ernst said he had worked at a concentration camp in the Lüneburger Heide where scientists were developing atomic bombs and other advanced weapons. Kreutzfeld denied that such a place existed and apparently implied to the BIOS investigators that Ernst was crazy. From the report, it seems that the BIOS investigators chose to believe the SS man's denials, and disbelieve the captive scientist's report about atomic bomb development.

The veracity of Ernst's statements is strongly supported by two points he includes that are corroborated by other sources but would have been very far from common knowledge:

- His description of Lüneburger Heide having a very large, very secret facility for the development of an atomic bomb is highly consistent with the statements of Otto Hahn and Frederick Loofbourow's informant, Dr. Berg.
- Ernst said there was another similar concentration camp where scientists were apparently forced to work on atomic bomb development at "Maudhausen, near Vienna." The Mauthausen concentration camp system west of Vienna included Gusen, a large underground complex where nuclear scientists worked on advanced weapons development (see pp. 3882, 4854, 4962ff.).

This report directly links Manfred von Ardenne and the atomic bomb development work, which strongly suggests that one of von Ardenne's specialties, electromagnetic isotope enrichment of uranium-235, was involved in the program. That aligns very well with Dr. Berg's report that many hundreds of workers in the Lüneburger Heide were operating factory equipment to produce small quantities of the special high-density material required by the new type of bomb, very much like the calutron operators at Oak Ridge. For another report linking Lüneburger Heide with atomic bomb development, see p. 4406.

See also: Lüneburger Heide: "Wir wissen nicht genau, was drin ist"—C-Waffen in der Heide aufgetaucht. [Lüneburger Heide: "We don't know exactly what is in there"—chemical weapons appear in the Heide.] *Focus*, 28 March 2017. https://www.focus.de/panorama/welt/lueneburger-heide-wir-wissen-nicht-genau-was-drin-ist-c-waffen-in-der-heide-aufgetaucht_id_6845571.html]

Memo to Lt. Col. P. M. Wilson. Atom-Bomb Specialist. 4 April 1946 [TNA FO 1031/112].

1. The following information has just come to hand and we should be glad if it could be passed on to the appropriate interested agencies.

2. Karl Heinz BOSECK, former Ustuf in the Waffen SS, alleges that he is an Atom-Bomb expert. He is now interned in No. 2 CIC, SANDBOSTEL and his P.O.W. No. is 204526.

[Karl-Heinz Boseck, born in 1915, was a mathematician who studied under Erich Schumann and became a member of the SS [Nagel 2011; Nagel 2012a, pp. 550, 560; Segal 2003, pp. 321–333].

"Atom-Bomb expert" implies much more than just early research. Boseck apparently worked in the SS's nuclear weapons development groups, which remain even more mysterious than other branches of the German nuclear program. Specifically, he helped run the "Mathematical Institute" at the Sachsenhausen concentration camp in Oranienburg [Nagel 2012a, p. 550; Segal 2003, pp. 321–333], an extremely interesting intersection of mathematical calculations, uranium from Auer Gesellschaft in Oranienburg, and slave labor from the concentration camp (perhaps for uranium enrichment?). That also supports Josef Ernst's assertion that the camp at Oranienburg did work related to the nuclear bomb development work at Lüneburger Heide (pp. 4180–4181).

Can other documents from Allied interrogations of Boseck be located, declassified, and released? What other information can be found about Boseck?]

Otto Hahn's autobiography [Otto Hahn 1968, p. 200].

Professor Staudinger schrieb mir, ein Offizier hätte ihm sein Ehrenwort gegeben, daß in der Lüneburger Heide kurz vor Kriegsende drei deutsche Atombomben einsatzbereit gelegen hätten.

Professor Staudinger wrote me that an officer had given him his word of honor that three German nuclear bombs had been ready for deployment in the Lüneburg Heath shortly before the end of the war.

[As Otto Hahn reported in his autobiography, after the war a German military officer in a position to know confirmed that this Lüneburger Heide program did indeed exist and had actually produced three completed fission bombs by the end of the war. With over two years to produce enough material, that could be quite possible. It is also possible that this Lüneburger Heide program produced one or more bombs that were used in the reported late 1944/early 1945 test explosions (Sections D.10–D.12). For a report that appears to link the Lüneburger Heide facility the Baltic atomic bomb test, see p. 4406.

Hermann Staudinger was a Nobel-Prize-winning German chemist just as Otto Hahn was, and of roughly the same age as Hahn. Hahn would have placed great faith in something that Staudinger told him. Since Hahn thought the statement was worthy of inclusion in his autobiography, and since he made no attempt to refute the statement (based on his own knowledge of wartime nuclear work), he seemed to imply that he accepted the statement as credible. Hahn's autobiography was only released after his death.]

Manfred von Ardenne. 1990. *Die Erinnerungen.* 10th ed. Munich: Herbig. p. 159

Bei Besuchen in Dahlem und Lichterfelde hatte ich 1941 Professor Otto Hahn die Frage gestellt, wieviel Gramm des reinen Isotops Uran-235 zur Entfesselung einer momentan ablaufenden Kernkettenreaktion benötigt würden. Er antwortete mir: “Wenige Kilogramm.” In diesem absolut vertraulichen Gespräch vertrat ich die Auffassung, es sei technisch durchaus möglich, mit Hilfe hochgezüchteter magnetischer Massentrenner (die wir damals gedanklich und experimentell vorbereitet hatten), Uran-235-Mengen von einigen Kilogramm zu erhalten, wenn man dafür große Elektrokonzerne einsetzen würde.

During visits to Dahlem and Lichterfelde in 1941, I had asked Professor Otto Hahn how many grams of pure uranium-235 would be needed to unleash a nuclear chain reaction in an instant. He answered me: “A few kilograms.” In this absolutely confidential conversation, I expressed the opinion that it was technically quite possible to obtain uranium-235 in quantities of a few kilograms with the help of highly sophisticated magnetic mass separators (which we had previously designed and experimentally developed), if large electrical corporations were used for this purpose.

Thomas Powers. 1993. *Heisenberg’s War: The Secret History of the German Bomb.* New York: Alfred A. Knopf. p. 513, note 21.

In a letter to Rolf Hochhuth, June 27, 1988, Ardenne cites the conversation with Hahn on December 10, 1941, and quotes the answer of 1 to 2 kilograms. [...] Ardenne confirmed these conversations with me in an interview in Dresden, May 17, 1989, and showed me the signatures of Hahn and Heisenberg in his guest book.

Cable IN 5937 from Bern, Switzerland to Office of Strategic Services Director. 24 March 1944 [NARA RG 226, Entry A1-134, Box 219, Folder IN AZUSA Nov. ’43 Sept. ’45]

#2576-2581. AZUSA. [...]

The following is a report secured from Flute [Paul Scherrer] by 493: [...]

A super-Nazi, Lorens [Manfred von Ardenne] of Berlin-Lichterfelde-Ost is a financial and scientific swindler. He boasts of constructing an uranium bomb but he does not have adequate equipment. Lorens’ associate is Breit [Fritz Houtermans] who was previously a Communist, was apprehended in Russia, but released in 1939 after which he turned into a fervent Nazi. Breit’s work is in nuclear physics.

[Paul Scherrer’s depiction of the personalities of Manfred von Ardenne and Fritz Houtermans is distorted by Scherrer’s scientific jealousy, but Scherrer reported that von Ardenne stated very clearly during the war that he was producing uranium for a fission bomb.]

[According to conventional histories, Otto Hahn was not involved with the German nuclear weapons program. The above sources show that he actually had close ties to the program during the war. This strengthens the credibility of other information from Hahn (pp. 4182, 4460).

The above also shows that a priority of the program was to produce highly enriched uranium-235, especially using von Ardenne's calutron-like electromagnetic isotope separators (Section D.4.3).

The above also demonstrates that the program was focused on producing nuclear devices that would use "1 to 2 kilograms" or "a few kilograms" of uranium-235 to create a chain reaction "in an instant." A reactor would use a much larger quantity of unenriched or low-enriched uranium to produce a continuous, slow reaction, so the devices they were trying to build must have been bombs.

For a sphere of pure uranium-235, the critical mass is ∼46 kg without compression or a surrounding neutron reflector, but only ∼0.36–2.9 kg with compression and a neutron reflector (p. 5162). Thus the information from Hahn and von Ardenne appears to indicate that in 1941 there was an excellent understanding of these numbers and plans to use a bomb design with spherical implosion.

One electromagnetic isotope separator in von Ardenne's personal lab could not produce enough uranium-235 within a reasonable period of time (Section D.15.2), so in 1941 von Ardenne advocated to have many separators built by "large electrical corporations" and then operated in parallel at some other location.

Thus the information above is in excellent agreement with the reports of p. 4176: "vast underground factories" (at a location known to Otto Hahn, p. 4182) with "hundreds of workers" going into operation in 1942, using machines to produce a special material such that "with one kilogram, everything within a radius of approximately four kilometers should be literally razed away, or disintegrated to dust and ashes," when used in uniquely designed "aerial bombs" in which "the container of the explosive is spherical."]

Harry Vosser. Germans Are Still Striving to Perfect New V Weapons. *New York Times*. 22 October 1944, p. E5. [See more on p. 5321.]

V-3 is reported to be the atom bomb. [...] An electric shock from a small instrument set to operate at a given time detonates explosive and atom simultaneously. The expansion caused by a normal explosive substance, such as dynamite when it becomes a gas, is increased by the force of the disintegrating atoms.

V-3? *Time*, 27 November 1944, p. 88.

The terrible novelty of V-2 had by no means worn off yet, but London last week was already abuzz with speculation about V-3—supposedly an atomic bomb. [...]

The speculative London report suggested that the Nazis are using the same pressure principle to crush atoms. The crusher: A "Neuman" demolition charge, which explodes inward instead of outward. Used in a sphere, the Neuman charge might develop pressures of tens of thousands of tons per square inch at the center, perhaps enough to disintegrate an unstable atom such as uranium and release its explosive atomic energy.

[Egon Neumann developed sophisticated shaped charge explosives in 1910 [George Brown 1998, p. 166; Walters and Zukas 1989, pp. 12–13]. His name was presumably attached here to describe the general principle, not to imply that he was directly involved in the reported wartime atomic bomb development.

This article appears to describe the Schumann-Trinks implosion bombs or very similar work, and it supports the view that the work described in the postwar writings of Schumann and Trinks was indeed carried out during the war.]

Leslie R. Groves. 1962. *Now It Can Be Told: The Story of the Manhattan Project*. pp. 147–148.

Another incident that concerned us greatly was the appearance in a national magazine of an article hinting at the theory of implosion. While it did not violate any rules, it was most disturbing. A thorough investigation indicated that it resulted from the work of an alert and inquisitive reporter in another country.

[Clippings in a file at the Franklin Delano Roosevelt Library in Hyde Park, New York [Small Collections, Box 1, Folder 3, ATOMIC BOMB FILE] specifically link this comment from Leslie Groves to the 27 November 1944 article in *Time*. As Groves wrote, it would be quite concerning that any discussion of the implosion bomb design appeared in public at that time. What probably concerned him even more, although he did not mention that in his book, is that the *Time* article said the implosion bomb design details came from the German nuclear program, not the U.S. nuclear program. This evidence strongly supports the conclusion that Germany indeed had an advanced program developing nuclear weapons, and moreover that Leslie Groves knew the German nuclear program was much more advanced than he ever admitted in public.]

General Ivan Ilyichev. Intelligence reports to General Antonov and Joseph Stalin (15 November 1944 and 23 March 1945). Archive of the President of the Russian Federation, 93-81 (45) 37. [For these very important documents on the design and testing of the German fission implosion bomb, see pp. 4481–4485.]

Ordnance Technical Intelligence press release. August 1945. [NARA RG 498, Microfilm MP63-9_0137, Frames 623–624]

Ordnance OTI
For Immediate Release

For over two years, "detectives" of the Army Ordnance Department kept close tabs on German progress in the development of atomic weapons, it was revealed today by Lt. Col. John A. Keck, Chief Enemy Technical Intelligence Branch, Technical Division, Ordnance Service, TSFET.

"This shadowing of German science began in 1942," said Col. Keck, "when several Ordnance Officers, including myself, commenced work with British Intelligence in the United Kingdom. During the period before D-Day, allied agents on the continent were able to obtain from German proving grounds and research laboratories, information which gave definite evidence of steady progress in the atomic field. For some time, the race between German and American science was a close one, and had the Nazis been able to reach their goal, the outcome of the European war might have been entirely different."

Atoms had top priority on Col. Keck's list when he arrived in France with the 1st Army on D-Day. Information at his disposal gave several leads to the location of experimental stations in this line, but in the process of following them up, he hit several discouraging blind alleys. The first road took him to Cherbourg, where the absence of atomic proving grounds was somewhat compensated by the discovery of V-Bomb launching sites. Throughout the Normandy and Northern France campaigns, his searches gave little in the way of results. However, when the breakthrough in Germany got underway, the evidence began to pile up, culminating in the discovery of the great Nazi proving ground at Hillersleben. Here, it was learned that the Germans had gone far in the development of atomic bombs.

"However," said Col. Keck, "they weren't able to go far enough for several reasons, particularly the fact that they didn't have the facilities with which to conduct their experiments, and that our saturation bombing raids would throw their program far behind schedule. Nevertheless their progress was considerable and indicated that they were coming very close to the solution of the problem."

We were fully aware of their plans in this field, for sometimes whatever information we got from our agents went to the proper authorities in the States. This information was undoubtedly put at the disposal of our own scientists. However, it's interesting to note that our knowledge of enemy experiments in the atomic field far exceeded our knowledge of the closely-guarded experiments in the United States.

[The U.S. Army Ordnance Technical Intelligence office publicly stated that evidence proved "the Germans had gone far in the development of atomic bombs." What information were "allied agents on the continent... able to obtain from German proving grounds and research laboratories" during the war? What nuclear-related work was discovered at Hillersleben at the end of the war? Can the relevant U.S. reports be found at NARA or elsewhere?

Keck and the Ordnance Technical Intelligence office described an extended program to monitor German nuclear progress and gave accurate information about Hillersleben, Erich Schumann, and other aspects of German research in this and other press releases. As shown on the next pages, other U.S. government officials later forced them to deny all of that.]

Ordnance Technical Intelligence press release. August 1945. [NARA RG 498, Microfilm MP63-9_0137, Frames 625–626]

Ordnance OTI
For Immediate Release

"If the power of the Army's new atomic bomb is equal to that of 20,000 tons of TNT, its area of destruction would be a circle approximately one mile in diameter," said Colonel Leslie E. Simon, Director of the U.S. Army Ordnance Ballistics Research Center, Aberdeen Proving Ground, Md. Colonel Simon, who was interviewed shortly after release of information on the Army's latest secret weapon, has been in this theater on a special mission which included a 10,000 mile tour of German Ordnance installations and proving grounds. [...]

When asked of the extent to which the Germans had gone in the development of atom bombs, Colonel Simon said that several groups of German scientists had made some progress, but that they had not equalled our developments. He added, however, that they were definitely on the right track and it was a matter of time before they would be able to work something out.

One of the chief experts in this field, he said, was a Dr. Schumann, who was in charge of the research group of the Waffenamt (ordnance) in Berlin. With several other brilliant scientists, Dr. Schumann did much outstanding work, but, according to Colonel Simon, the Germans lagged behind us.

Colonel Simon said he did not believe that any German scientists had gone to Japan to continue their work, chiefly because they would be obliged to leave their laboratory facilities.

[Colonel Leslie Simon conducted extensive on-site visits and wrote detailed reports on German research facilities [Simon 1947a, 1947b, 1971]. He and the U.S. Army Ordnance Technical Intelligence office publicly stated that Erich Schumann (German, 1898–1985) was a "brilliant scientist" who "did much outstanding work," and that "the Germans had gone far in the development of atomic bombs." That view appears to be strongly supported by documentation about Schumann's wartime work (p. 4229). However, the Alsos Mission publicly declared that Schumann was only a "second-rate physicist" whose "main interest was the physics of piano strings" (p. 3297), and threatened the Ordnance Technical Intelligence office "against making further statements on this subject" (see below). This same microfilm MP63-9_0137 contains additional background information on the Hillersleben testing ground and U.S. colonels Keck and Simon—see for example frames 621–622, 638–646.]

Samuel Goudsmit to R. G. Ham. 10 August 1945 [NARA RG GOUDS, Entry UD-7420, Box 3, Folder "Historian's Office Inventory Control Job Goudsmit Box 4 Folder 6"].

The new outbursts of the 'omniscient' Colonel Keck... are deplorable and damaging. Please do something about this situation at once...

The German public opinion about the atomic bomb is as follows: They now believe that Hitler was not lying when he told them that he had a terrible weapon in store...

The following TA scientists have gone to work for the Russians...:

1) Dr. Riehl from Auer...

2) von Ardenne (cyclotron expert, etc.).

3) Gustav Hertz of Siemens, outstanding physicist, Nobel Prize winner, expert on isotope separation and cyclotron construction.

[See document photo on p. 4189.]

Monthly Intelligence Summary. July–August 1945. [NARA RG 77, Entry UD-22A, Box 168, Folder 202.3-1 LONDON OFFICE: Combined Intell Rpts.]

IX CENSORSHIP. [...]

e. The first wave of publicity after the use of the atom bomb brought forth a story from Lt. Col. John A. KECK, Chief of the Enemy Technical Intelligence Branch Ordnance Services, ETO, in which KECK purports to have conducted intelligence operations to determine the scope of enemy work on an atomic bomb. Col. KECK was interviewed by a representative of this office and admitted that he had not performed such a mission but denied having given the story to the Press. KECK stated that the story was released by the Public Relations Section of the Ordnance Services. Both KECK and the PRO were warned against making further statements on this subject.

DECLASSIFIED
E.O. 13526, Sec. 3.3
NW 60992 Tab 105
By [illegible], NARA, Date 11/21/13

MEMORANDUM:

TO : Lt. Colonel R. G. Ham

The following TA information should be brought to the attention of Colonel Pash and Major Calvert:

1. PUBLICATIONS.

a. We cannot stop competent Germans who are available from giving information to reporters about the German development. The information that they are going to give may or may not be correct.

b. The new outbursts of the "omniscient" Colonel Keck (see "Stars and Stripes, 9 August 1945) are deplorable and damaging. Please do something about this situation at once.

c. The German public opinion about the atomic bomb is as follows:

They now believe that Hitler was not lying when he told them that he had a terrible weapon in store but that they had merely had bad luck by being slightly behind the development in the Allied countries. This has resulted in new confidence in the Hitler myth.

d. It is extremely unfortunate that, in the official publications, Lisa Meitner is mentioned as the originator of uranium splitting. She left Germany before that was discovered. Hahn and Strassmann are the real discoverers. As this is mentioned in every popular scientific book and article, it seems inadvisable to omit their names, as people may misconstrue this omission as having had some hidden purpose.

e. With regard to the above statements, it is urgently recommended that some authentic account of the absence of the atomic bomb development in Germany be published at once, especially in Germany.

2. AUER.

a. We have interrogated Dr. Ihwe who originally was our first target. His story merely confirmed what we already knew. We have confiscated some of the correspondence between

NO RESTRICTED DATA OR FORMERLY RESTRICTED DATA.
DOE HAS NO OBJECTION TO ITS DECLASSIFICATION.

SECRET

2.

Auer and Degussa and are studying it now. We have also interrogated a Miss Blobel, secretary to Dr. Riehl, who was in charge of the production of the metal. He himself has gone to work for the Russians. Miss Blobel is rather dumb, and not much information was gotten out of her.

3. RUSSIAN INTEREST.

a. The Russians have shown a definite interest in TA development. I don't know whether they had any real experts here except a general by the name of Klopin. It seems there are two brothers by this name, both either chemists or physicists. This may be the same Klopin who was mentioned as head of the uranium committee in the interrogation of the pseudo-scientist, Shishkov, as reported by B. T. Pash, Assimilated Ph.D.

b. The following TA scientists have gone to work for the Russians, probably somewhere near Moscow, and are presumably working on the TA problem:

1) Dr. Riehl from Auer (see above).

2) von Ardenne (cyclotron expert, etc.).

3) Gustav Hertz of Siemens, outstanding physicist, Nobel Prize winner, expert on isotope separation and cyclotron construction.

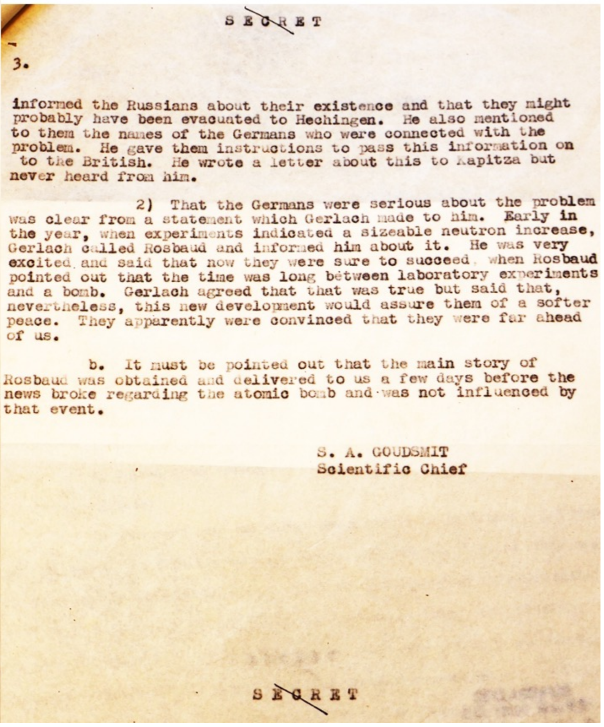
c. A small amount of material which was still in stock at Auer was also removed by the Russians. According to Miss Blobel, this amounted to just a little pile in a corner. That was the only estimate that I could obtain concerning the amount.

4. ROSBAUD.

a. We have found Rosbaud and are getting his complete story which serves as a magnificent confirmation of everything that we have found. He also has a very sound opinion about the personalities involved which coincides exactly with the results which we have obtained by painstakingly studying numerous documents. Rosbaud is giving his story exclusively to us and absolutely to no one else. However, he did have some connections with the Russians shortly after they occupied Berlin. Following are some points from his story:

1) Rosbaud realized the significance of the problem and was afraid that the two tons of heavy water in German hands might be lost to the scientific world. He, therefore,

SECRET



SECRET

3.

informed the Russians about their existence and that they might probably have been evacuated to Hechingen. He also mentioned to them the names of the Germans who were connected with the problem. He gave them instructions to pass this information on to the British. He wrote a letter about this to Kapitza but never heard from him.

2) That the Germans were serious about the problem was clear from a statement which Gerlach made to him. Early in the year, when experiments indicated a sizeable neutron increase, Gerlach called Rosbaud and informed him about it. He was very excited and said that now they were sure to succeed. When Rosbaud pointed out that the time was long between laboratory experiments and a bomb. Gerlach agreed that that was true but said that, nevertheless, this new development would assure them of a softer peace. They apparently were convinced that they were far ahead of us.

b. It must be pointed out that the main story of Rosbaud was obtained and delivered to us a few days before the news broke regarding the atomic bomb and was not influenced by that event.

"The new outbursts of the 'omniscient' Colonel Keck... are deplorable and damaging. Please do something about this situation at once... The German public opinion about the atomic bomb is as follows: They now believe that Hitler was not lying when he told them that he had a terrible weapon in store... The following TA scientists have gone to work for the Russians...: 1) Dr. Riehl from Auer... 2) von Ardenne (cyclotron expert, etc.). 3) Gustav Hertz of Siemens, outstanding physicist, Nobel Prize winner, expert on isotope separation and cyclotron construction."

J. C. Clark. 18 September 1945. Development and Use of Röntgenblitz Technique by the German Scientists during Period 1938–45. Alsos Intelligence Report KO-29365 [AFHRA Folder 170.2279E 18 SEP 1945; AFHRA B1763 frames 0252–0259. Also NARA RG 77, Entry UD-22A, Box 165, Folder ALSOS MATERIAL].

This report is based upon the interrogation of German scientists and scientific reports recovered during the period within a few months after the cessation of hostilities in the E.T.O. Unfortunately the men who apparently did most of the research and development work on the Röntgenblitz equipment, namely Dr. Steenbeck and possibly Dr. Mühlenpfordt working under Dr. Gustav Hertz at Siemens, Berlin, had already gone to Moscow to continue their work, and were not available in Germany for interrogation. However, Dr. Thomer, now working with Prof. H. Schardin at the French Laboratory at Leichtmetall Werke, St. Louis, Alsace, was available for questioning and was well acquainted with the equipment. [...]

Dr. Thomer got his degree at Leipzig in 1936 and worked at Siemens with Dr. Hertz from 1936 until 1938 when he left to go with Prof. Schardin at the Physikalisches Institut der Luftkriegs-Akademie, Berlin-Gatow. Here he used the Röntgenblitz technique for ballistic studies. [...]

By 1941 the Forschungslaboratory acquired high vacuum metal Röntgenblitz tubes from the research laboratory #2 of Siemenswerke for use in multiple flash x-ray studies. This tube and the auxillary circuit is the type which was used for the remainder of the work carried on by Prof. Schardin's workers as well as Dr. Rudi Schall, working under Dr. Erich Schumann at the WaF (research) Division of the Waffenamt, in Berlin. [...]

The uses to which the Germans put the Röntgenblitz equipment were learned by examining captured documents and by interrogation. These applications cover (a) target cavitation produced by projectiles passing through wooden blocks and water targets, (b) the smashing of a lead bullet upon impact with various targets, (c) cavity charge phenomena studies, (d) detonation phenomena studies and (e) an interesting study of the arming of a nose fuze a short distance in front of the muzzle of the gun. With the exception of the studies on detonation of an explosive charge done by Dr. Rudi Schall, all work with the Röntgenblitz equipment was done by Schardin's group, working principally with Dr. Thomer. Only a few German documents covering the above work were available for examination by the author during the investigation of this subject, but it is believed that a complete series of the reports of both Prof. H. Schardin's and Dr. Erich Schumann's groups have been recovered and forwarded through the proper military channels for filing and examination (see Col. L. E. Simon's U.S. Ord. Dept. report).

It was, however, definitively ascertained that the experimental techniques utilized to obtain flash radiographs of cavity charges and high explosive specimens were sensibly the same as those familiar to U.S. research workers. The German scientific groups recognized the value of this technique because it was learned that at least eight more Röntgenblitz units were under construction at the Siemenswerke, Berlin.

[Erich Schumann and Hubert Schardin led groups that conducted detailed research, development, and testing programs for implosion bombs. According to this document, the United States acquired "a complete series of the reports of both Prof. H. Schardin's and Dr. Erich Schumann's groups" and followed up with interrogations of personnel from those groups for several months after the war. Can all of that information be located and declassified now?]

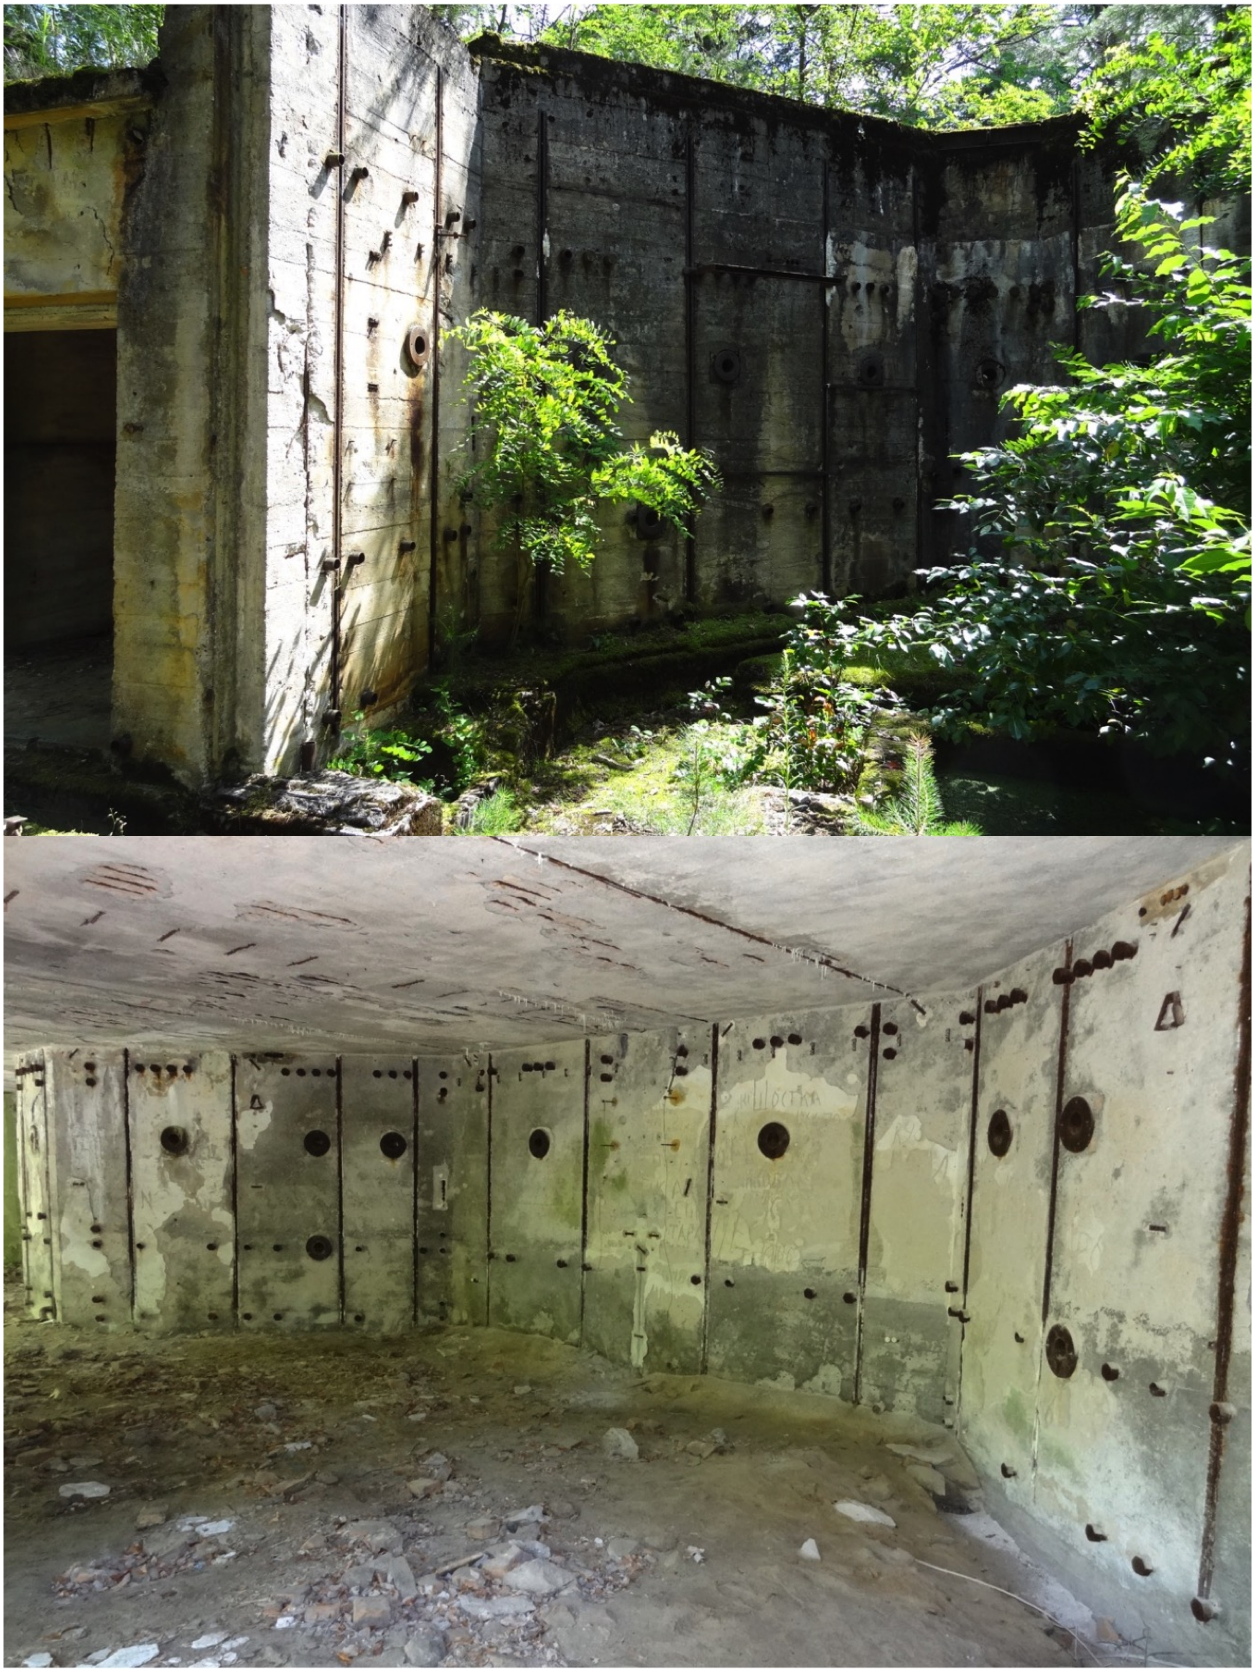

Figure D.562: Historisch-Technisches Museum Versuchsstelle Kummersdorf: Apparent testing area for implosion designs; note numerous ports for mounting diagnostic equipment.

U.S. military intelligence card entry for Erich Schumann. Undated but apparently last updated summer 1945. [NARA RG 319, Entry A1-134B, Box ??, Folder XE170590 Schumann, Erich]

Ministerial Councilor and head of the research office in the Reich War ministry: Professor at the University of Berlin, director of the Second Institute of Physics and of the Second Institute of Theoretical Physics at the University of Berlin. Ph.D. in physics; October 1933, full professor in the faculty of Natural Sciences at the University of Berlin; Special fields are physics connected with armament, especially explosion waves and acoustics. Since the late twenties in the research office of the Reich War Ministry. Chairman of the Union of the Wehrmacht-Functionaries.

Informant considers Prof. SCHUMANN “a very dangerous man who always worked on highly secret missions for the German Army. Even during the Weimar Republic students were not allowed to enter his laboratory.” Informant says that SCHUMANN is perhaps not a Nazi according to the party line, but he is a German nationalist, a pan-Germanist and entirely devoted to the German Army.

[This file is further evidence that U.S. investigators were very well aware of how important and how potentially dangerous Erich Schumann’s wartime work was.

Yet the office of Leslie Groves tried to hide this information from the public (p. 4187), and Samuel Goudsmit knowingly gave false testimony to the U.S. Senate in which he claimed that Schumann was only a “second-rate physicist” whose “main interest was the physics of piano strings” (p. 3297).]

Erwin Respondek. 6 November 1945. [NARA RG 226, Entry A1-210, Box 447, Folder WN 16162–16171]

Übersicht des Standes der wissenschaftlichen Arbeiten in Deutschland zur Atom-Bombe (bis Mai 1945)	Overview of the State of Scientific Work in Germany on the Atomic Bomb (until May 1945).
[...] Prof. Schumann äusserte etwa 1944, dass das Problem der Uran-Bombe gelöst sei. Die Bombe solle an einem Fallschirm abgeworfen werden. Die Zündvorrichtung sei in technisch einfacher Form gelöst worden. Hierzu diene eine Neutronenquelle. Prof. Schumann sagte aber zugleich, dass es bisher nicht gelungen sei, das Uran zum explosiven Spontanzerfall zu bringen. [...]	[...] Prof. Schumann stated around 1944 that the problem of the uranium bomb had been solved. The bomb should be dropped on a parachute. The ignition device was solved in a technically simple form. For this purpose, a neutron source is used. At the same time, however, Prof. Schumann said that so far it had not been possible to bring about the explosive spontaneous disintegration of uranium. [...]

[See document photos on pp. 4195–4198. Erwin Respondek (1894–1971) was a German economist who secretly passed information to the United States throughout the 1940s [Dippel 1992]. Despite the juicy title of Respondek's report, he appears to have been most familiar with the well-known basic nuclear research of the Kaiser Wilhelm Institute, to which he devoted most of the report.

However, he did include one intriguing paragraph about the development of an actual German atomic bomb. According to Respondek, the bomb:

- Involved Erich Schumann in its design, which strongly suggests that the bomb design employed shaped charges and implosion, Schumann's area of technical expertise.
- Used uranium as the fission fuel.
- Used a parachute. (This agrees with other accounts—see for example p. 4436.)
- Was intended to be dropped by an aircraft, at least up until 1944 (based on the parachute).
- Used a neutron source to initiate fission reactions at the right time. (That would be during implosion, and is consistent with the other accounts of the bomb design—see for example p. 4485.)
- Had been completed but not yet successfully tested, as of sometime in 1944. (That is consistent with the first successful test(s) being in late 1944/early 1945—see Sections D.10–D.12.)
- Was separate from and much more secret than the Kaiser Wilhelm Institute program (based on how much less Respondek knew about it).

There is also some evidence that information from Respondek led to the December 1943 Allied bombing of an important site associated with the German nuclear program [Dippel 1992, pp. 111–113]. Can more information on that incident be located in archives? Where was the site? What sort of work was actually being conducted at the site? What intelligence led to the bombing?]

STRATEGIC SERVICES UNIT, WAR DEPARTMENT
MISSION TO GERMANY
U.S. Forces, European Theater

SITS 427

APO 757
27 November 1945

SUBJECT: Azusa

TO : Mr. W. H. Shepardson, Washington
Attention: Col.Howard M. Dix

1. The attached report in two parts (LP/16-19 and 20) was received from our Berlin unit. We have looked over the report but feel that it does not contain material which we can properly handle for distribution in this theater to Gen. Sibert and Lt. Col. Calvert. Accordingly, we are forwarding the original to you.

2. Source of the report is Dr. Erwin Respondek, who was recommended to us by Sam E. Woods, Consul General in Zurich. It appears that Respondek, acting through State Department channels, performed considerable service to the U.S. during the war. He is an expert on matters of finance, taxation and international trade. From 1928-31 he was a member of the Center Party. From 1932-33 he was a Reichstag member of the Center Party and personal assistant to Bruening. He was dismissed from public service after 1933. His sub-sources for this report are Drs. Thiessen and Havemann.

TOP SECRET

Übersicht des Standes
der wissenschaftlichen Arbeiten in Deutschland
zur Atom-Bombe (bis Mai 1945).

I.

1.) Die Atomspaltung ist in einem Vortrag erwähnt worden von Geheimrat Prof. Max Planck "Sinn und Grenzen der exakten Wissenschaft", vorgetragen im Harnack-Haus der Kaiser Wilhelm-Gesellschaft am 4.11.1942, veröffentlicht im Jahrbuch 1942 der Kaiser Wilhelm-Gesellschaft zur Förderung der Wissenschaften, Seiten 93-123. Insbesondere auf S. 119, Abs. 2 bis S.121, Abs.1.

In dem gleichen Jahrbuch 1942 ist ferner der Vortrag von Prof. Otto Hahn "Die Transmutation der chemischen Elemente, ein Kapitel physikalischer und chemischer Zusammenarbeit", der, ebenfalls im Harnack-Haus der Kaiser Wilhelm-Gesellschaft, am 10.3.1942 gehalten wurde, auf den S. 274-295 abgedruckt worden. Über die Uranspaltung berichtete Prof. Hahn auf den S. 290-293.

2.) Aus der Literatur über diese Arbeiten, soweit sie zurzeit hier zugänglich, wird folgendes erwähnt:

Referat über den Vortrag von Hahn und Strassmann, gehalten am 15.11.1939 in der Physikalischen Gesellschaft zu Berlin und Gesellschaft für technische Physik (s. Zeitschrift für angewandte Chemie 1940, S. 19).

Colloquiumsvortrag von Prof. von Weizsäcker im Physikalischen Institut der Universität Berlin am 28.6.1940. Referiert in der Zeitschrift für angewandte Chemie 1940, S. 458. Weizsäcker war Mitarbeiter am Kaiser Wilhelm-Institut für Physik in Berlin-Dahlem.

Die zusammenfassende Übersicht von Dr. S. Flügge behandelt in der Zeitschrift "Naturwissenschaften" 1939, S. 402, die Möglichkeit der Einleitung einer Reaktionskette bei der Uranspaltung, bei der grosse Energiemengen frei würden. Diese Arbeit lag bei Abfassung der folgenden Ausführungen nicht vor. Auf sie bezogen sich jedoch die von Geheimrat Planck auf S. 120 gemachten Angaben. Dr. Flügge war seinerzeit Mitarbeiter am Kaiser-Wilhelm-Institut für Chemie, trat jedoch später zur Forschungsstelle der Reichspost über, die sich ebenfalls mit kernphysikalischen Aufgaben beschäftigte.

-4- ~~TOP~~ SECRET

Heisenberg, seit 1942 Direktor am Kaiser-Wilhelm-Institut für Physik, und Prof. Bothe, Direktor des Instituts für Physik am Kaiser-Wilhelm-Institut für Medizinische Forschung, Heidelberg. Unabhängig von diesem wissenschaftlichen Kreis arbeitete das HWA weiterhin unmittelbar am Uran-Problem, insbesondere unter Mitwirkung von Prof. Schumann.

Die Ziele des wissenschaftlichen Kreises konzentrierten sich von Anfang an auf die Schaffung eines "Uran-Brenners", der z.B. zur Kesselheizung von Schiffen dienen könnte. Die Versuche wurden mit dem handelsüblichen Uran-Metall vorgenommen und nicht mit dem reinen Uran-Isotop 235. Es wurde bei jedem Versuch mit grossen Mengen des gewöhnlichen Uran-Metalls gearbeitet, und zwar sollten grundsätzlich einzelne Vorgänge der Reaktion erforscht werden. Ferner wurde mit besonderer Umsicht das Problem des Strahlenschutzes behandelt, insbesondere für die bei der Uran-Spaltung auftretenden gefährlichen Neutronen-Strahlen. In medizinischer Hinsicht lagen schon frühere Untersuchungen vor von Prof. Rajewsky, Direktor des Kaiser-Wilhelm-Institutes für Biophysik, Frankfurt a.Main. Ohne einen genügenden Strahlenschutz ist die Verwendung des Uran-Brenners zur Kesselfeuerung und dergl. nicht denkbar.

Die Versuche wurden nicht sehr intensiv betrieben, insbesondere wurden sie durch die Herstellung und Formgebung des Uran-Metalls (Auergesellschaft) und die Herstellung von Schwerem Wasser in Deutschland (Prof. Harteck, Hamburg) stark verzögert.

Mit einer Anreicherung des Uran-Isotops 235 wurde erst Ende 1944 begonnen. Versuche an einer grösseren Menge von reinem Uran 235 wurden, soweit bekannt, bis Kriegsende nicht durchgeführt. Für Frühjahr 1945 war ein Großversuch geplant, der nicht mehr zur Ausführung kam. Der Stillstand war durch die gesteigerten Luftangriffe auf Deutschland herbeigeführt worden.

IV.

An Einzelheiten sei noch folgendes bemerkt:

1) Prof. Schumann äusserte etwa 1944, dass das Problem der Uran-Bombe gelöst sei. Die Bombe solle an einem Fallschirm abgeworfen werden. Die Zündvorrichtung sei in technisch einfacher Form gelöst worden. Hierzu diene eine Neutronenquelle. Prof. Schumann sagte aber zugleich, dass es bisher nicht gelungen sei, das Uran zum explosiven Spontanzerfall zu bringen.

2.) Ende Februar 1945 wurde infolge der schweren Luftangriffe auf Berlin das wertvolle Schwere Wasser nach Stadtilm/Thür. verfrachtet. Dr. Diebner übersiedelte etwa im März dorthin. Bei der Bedrohung des Gebietes von Stadtilm durch die amerikanischen Armee wurde Dr. Diebner dem Verlauten nach als Geheimnisträger auf Anordnung von Saukel durch den SD nach Weimar in Schutzhaft genommen. Von da soll er dann mit dem Ziel Innsbruck später weitergereist sein. Prof. Gerlach war ab Februar bereits vorwiegend in München und kam nur zu gelegentlichen Besprechungen nach Berlin.

Attachment II

THE STAGE REACHED BY SCIENTIFIC RESEARCH ON THE ATOM BOMB
IN GERMANY, AS OF MAY 1945.

1. The atomic timor was mentioned by Geheimrat Prof. Max Planck in a lecture entitled "Sinn Und Grenzen der exakten Wissenchaften" (Meaning and Limits of Exact Science). The lecture was delivered on 4 November, 1942, at the Harnack-Haus of the Kaiser Wilhelm Gesellschaft and was published in the society's 1942 yearbook (Jahrbuch 1942 der Kaiser Wilhelm Gesellschaft zur Forderung der Wissenschaften), pages 92 - 123. Particular mention of the subject is made on page 119, para 2 to page 121, para 1.

The same 1942 yearbook of the Kaiser Wilhelm Gesellschaft contains a lecture by Prof. Otto Hahn "Die Transmutation der chemischen Elemente, ein Kapitel physikalischer und chemischer Zusammenarbeit" (The Transmutation of Chemical Elements, a Chapter in the Collaboration of Physics and Chemistry). This lecture was delivered at the Harnack Haus of the Kaiser Wilhelm Gesellschaft on 10 March, 1942, and appears in the yearbook on pages 274 -295. On Pages 290 - 293 Professor Hahn discusses the splitting of uranium.

2. The following refers to literature still currently available which is based on this research:
Review of the lecture by Hahn and Strassmann, delivered on 15 November 1939, in the Physikalische Gesellschaft fur technische Physik (see Zeitschrift fur angewandte Chemie 1940, page 19).

Seminar lecture by Prof. Wezsäcker at the Institute for Physics of the University of Berlin on 28 June, 1940. Reviewed in "the Zeitschrift für angewandte Chemie", 1940, page 458. Weizsacker was collaborator in the Kaiser Wilhelm Institute for Physics in Berlin-Dahlem.

A compendium by Dr. S. Flügge in the journal "Naturwissenschaften" of 1939, page 402, discusses the possibility of chain reaction in the splitting of uranium and the consequent generation of great masses of energy. This research work, however, had not yet been carried out when the following expositions were presented. However, it was to this that Prof. Planck refers on page 120. Dr. Flügge has been a collaborator in the Kaiser Wilhelm Institute for Chemistry, but had later accepted an appointment with the Reichspost which also carried on work in nuclear physics.

Expositions similar to the ones presented before the Physikalische Gesellschaft Berlin were presented by Prof. Hahn some time in the Winter of 1939/40 before the Deutsche Chemische Gesellschaft. He made mention of the work done in collaboration with Prof. LiseMeitner and Dr. Strassmann

IV.

Additional Particulars:

1. About 1944, Professor Schummann declared that the problem of the uranium bomb had been solved and that the problem of the fuze had been solved in a technically simple form. The fuzing, he declared, was connected with a neutron source, but he added that, so far, it had not been possible to explode the uranium by spontaneous disintegration.

2. Because of the concentrated air attacks on Berlin, the valuable heavy water was shipped to Stadtilm/Thuringia late in February, 1945. Dr. Diebner moved to that city somewhat later, probably in March. When the Stadtilm district was threatened by the advance of American forces, Dr. Diebner was taken to Weimar by the SD (Sicherheitsdienst) and placed in protective custody, reportedly on orders of Sauckel and because he possessed vital secret information. He is said to have left Weimar later with the intention of going to Innsbruck. Prof. Gerlach had already spent most of his time in Munich since February and only occasionally came to Berlin for conferences.

Figure D.567: Erwin Respondek. 6 November 1945 [NARA RG 226, Entry A1-210, Box 447, Folder WN 16162–16171].

Erich Schumann. 2 October 1940. Unclassified draft article on explosives research for popular publication [Bundesarchiv Militärarchiv Freiburg N822/17].

[Erich Schumann (German, 1898–1985) was a high-ranking physicist in the wartime German Army Ordnance Office. He was an expert on conventional explosives and on using shaped explosive charges in a wide variety of geometries for different purposes. At the end of the war, almost all of his wartime papers were destroyed by the Germans or captured and classified by the Allies. However, there is strong evidence from multiple postwar sources that Schumann designed and demonstrated large, highly sophisticated, spherical implosion bombs during the war. If furnished with fission fuel in the center, such spherical implosion designs would have been quite suitable for nuclear weapons.

One of the few surviving and relevant wartime documents is this 2 October 1940 draft article on explosives research that Schumann was preparing for publication. Because the article was intended for unclassified publication, it omitted or downplayed many important aspects. Yet it did make clear that no later than September 1940, Schumann and his coworkers:

- Knew that nuclear explosives could potentially be a million times more powerful than chemical explosives (explosive energies up to megatons of TNT equivalent).
- Wanted to use the shock waves produced by chemical explosives to produce the highest possible pressures and temperatures (which immediately suggests a spherical implosion, from basic physical principles).
- Were keenly interested in using (implosive) shock waves from chemical explosives to trigger nuclear reactions.
- Were trying to make the production of suitable shock waves highly precise and "mathematically controlled."
- Could not discuss the details in an unclassified article "because of the significance of special arrangements in terms of weapons technology."

See pp. 4204–4206 for photographs of some pages from this document.]

[...] Der Zustand der Detonation ist dadurch gekennzeichnet, dass die Aktivierungsenergie dem Sprengstoff durch eine Stosswelle zugeführt wird, wobei die beim Zerfall des Stoffes freiwerdende Energie das Fortschreiten der Stosswelle unterstützt. Es ist leicht einzusehen, dass bei der gegenseitigen Kopplung von Wellenausbreitung und Sprengstoffzerfall sich in einem genügend ausgedehnten Sprengkörper ein stationärer Zustand herausbildet, der für die gesamten detonativen Erscheinungen charakteristisch ist.

Die Fortpflanzungsgeschwindigkeit dieser stationären Zersetzung heisst Detonationsgeschwindigkeit. Da diese verhältnismässig einfach messbar ist, liegt für sie ein umfangreiches Messmaterial vor, das zum wertvollsten Besitz der experimentellen Sprengstoffphysik gehört, stellt doch die Detonationsgeschwindigkeit die einzige wirklich physikalische Messgrösse dar, mit der heute ein Sprengstoff charakterisiert werden kann.

[...] The state of detonation is characterized by the fact that the activation energy is supplied to the explosive by a shock wave, whereby the energy released during the decay of the substance supports the progression of the shock wave. It is easy to see that in a sufficiently large explosive device, when the wave propagation and explosive decay are coupled together, a steady state is formed which is characteristic of all detonative phenomena.

The propagation velocity of this stationary decomposition is called the detonation velocity. Since it is relatively easy to measure, there is extensive measured information available for it, which is one of the most valuable possessions of experimental explosives physics, since the detonation velocity is the only really physical major measurement which can be used today to characterize an explosive.

Die geschilderten energetischen Verhältnisse im molekularen Verband der Sprengstoffe sind grundsätzlich die gleichen, wie wir sie vom korpuskularen Verband des Atomkerns kennen. Obgleich beim Kernzerfall eine sehr grosse Energie frei wird, besitzt der Atomkern doch eine grosse Stabilität, weil zur Einleitung des Zerfalls eine erhebliche Aktivierungsarbeit geleistet werden muss. Die heute möglichen Kernzertrümmerungen entsprechen bei diesem Vergleich, der sich nur auf die qualitativen energetischen Verhältnisse erstreckt, vollständig dem stillen Zerfall von Sprengstoffmolekülen. Da die Kernenergien den chemischen Bindungsenergien, aus denen die Sprengstoffe ihre Leistungsfähigkeit schöpfen, um mindestens 6 Grössenordnungen überlegen sind, würde durch die Kernreaktionen die Möglichkeit von Sprengstoffen unvorstellbar grosser Brisanz gegeben sein, wenn es gelingen würde, die Kernreaktion detonativ, d.h. durch Stosswellen, auszulösen. Ganz abgesehen von der geschichtlich einschneidenden Bedeutung einer solchen Möglichkeit, einen Stoff von wirklich gigantischer Zerstörungskraft in menschliche Hände zu geben, würden wir damit die Materie unter thermodynamischen Bedingungen vorzuliegen haben, wie sie sonst nur an ganz wenigen Stellen des Universums vorkommen. Fraglos wäre der kernreaktionäre Sprengstoff physikalische Realität, wenn es gelänge, eine Stosswelle genügender Intensität zu erzeugen, die einen Kernzerfall einleiten könnte. Da jedoch selbst bei den schwereren, am wenigsten stabilen Atomen die Aktivierungsenergie noch nach Millionenvolt gemessen wird, besitzen wir keine Möglichkeit, eine solch intensiv Stosswelle zu erzeugen. Es fehlt bei den Kernreaktionen eben die Abstufung der Aktivierungsarbeiten, wie sie bei den Sprengstoffen von den Initial- bis zu den Sicherheitssprengstoffen gegeben ist; durch diese ist es möglich, durch fast beliebig kleine Impulse über die Initialstoffe äusserst stabile chemische Verbindungen zum detonativen Zerfall zu bringen. [...]

The described energetic conditions in the molecular bond of explosives are basically the same as we know them from the nuclear bond of the atomic nucleus. Although a very large amount of energy is released during nuclear disintegration, the atomic nucleus has great stability, because a considerable amount of activation work must be done to initiate disintegration. In this comparison, which only covers the qualitative energetic conditions, the nuclear disintegration possible today corresponds completely to the simple disintegration of explosive molecules. Since nuclear energies are at least 6 orders of magnitude greater than the chemical binding energies from which explosives derive their power, nuclear reactions would be unimaginably explosive if it were possible to trigger the nuclear reaction via detonations, i.e. by shock waves. Quite apart from the historically far-reaching significance of such a possibility of putting a substance of truly gigantic destructive power into human hands, we would then be able to produce matter under thermodynamic conditions that otherwise occur only in very few places in the universe. There is no doubt that the nuclear-reactive explosive would be a physical reality if it were possible to generate a shock wave of sufficient intensity to initiate nuclear disintegration. However, since the activation energy of even the heaviest, least stable atoms is still measured in millions of volts, we have no way of generating such an intense shock wave. The nuclear reactions lack the gradation of activation energy that is present in explosives, from early explosives to safety explosives; this makes it possible to cause extremely stable chemical compounds to undergo detonative decay by means of almost arbitrarily small impulses via the initial substances. [...]

Für die Sprengwirkung sind nun nicht allein die thermodynamischen Zustandsgrössen an der Unstetigkeitsstelle, die die Detonationsfront kennzeichnet, massgebend, sondern in entscheidendem Masse ihr weiterer räumlicher Verlauf. Für die Berechnung von räumlichen Feldern der in den Schwaden herrschenden Zustandsgrössen liegen jedoch keine genügenden theoretischen Grundlagen vor. Glücklicherweise liefert nun die Röntgenblitztechnik auf experimentellem Wege den Feldverlauf einer der wichtigsten Zustandsgrössen, nämlich der Gasdichte der Schwaden. Dadurch, dass der Dichtesprung an der Detonationsfront durch die Röntgenblitzmethode der Messung zugänglich ist, erhält man nicht nur einen Einblick in der Zerfallsprozess, sondern durch den weiteren räumlichen Dichteverlauf auch in die für die Wirkung entscheidenden Schwadenströmungserscheinungen. Das Arbeitsvermögen der Schwaden ist nämlich nicht allein durch den Drucksprung in der Detonationsfront bestimmt, sondern wesentlich durch den zeitlichen Druckverlauf an der Sprengstoffoberfläche. Dieser ist jedoch durch die Strömungsvorgänge der Schwaden gegeben, die sich auf Grund von Röntgenblitzaufnahmen verfolgen lassen. Fraglos werden sich die thermodynamischen Kenntnisse, die zu einer Berechnung der Strömungsvorgänge bei den in den Schwaden vorliegenden Drucken von über 100 000 atm und Gasdichten in der Grössenordnung derjenigen fester Körper bisher fehlten, aus den nach der Röntgenblitzmethode gewonnenen experimentellen Ergebnissen gewinnen lassen. Damit dürfte die Einführung der Röntgenblitzmethode in die Sprengstoffphysik, die ebenfalls meinem Institute entstammt1), über den engeren Rahmen der Sprengstoffforschung hinaus für die gesamte Physik der Materie bei extremen Bedingungen von fruchttragender Bedeutung sein.

For the blast effect, not only the thermodynamic state variables at the discontinuity point, which characterizes the detonation front, are decisive, but also to a decisive extent its further spatial course. However, there is no sufficient theoretical basis for the calculation of spatial fields of the state variables prevailing in the windrows. Fortunately, the X-ray flash technique now provides the field progression of one of the most important state variables, namely the gas density of the plume, by experimental means. Since the density jump at the detonation front is accessible by the X-ray flash method of measurement, one does not only get an insight in the disintegration process, but also, through the further spatial density course, into the vapor flow phenomena which are decisive for the effect. The working capacity of the vapors is not only determined by the pressure jump in the detonation front, but essentially by the pressure curve over time at the surface of the explosive. However, this is given by the flow processes of the vapors, which can be followed on the basis of X-ray flash photographs. There is no doubt that the experimental results obtained using the X-ray flash method will provide the thermodynamic knowledge needed to calculate the flow processes at pressures of over 100,000 atm and gas densities of the order of magnitude of those of solid bodies in the vapors. Thus, the introduction of the X-ray flash method into explosives physics, which also originates from my institute1), should be of fruitful importance beyond the narrower framework of explosives research for the entire physics of matter under extreme conditions.

---

1) Eine sprengstoffphysikalische Röntgenblitzarbeit wird erstmalig in dem vorliegenden Heft veröffentlicht (Arbeit Schall)

1) An X-ray flash study on the physics of explosives is published for the first time in this issue (work of Schall)

[...] Die soeben bei der Erläuterung des Brisanzbegriffes geäusserten Gedanken deuten bereits eine Theorie der gesamten Sprengstoffwirkung an. Eine solche allgemeine Theorie hat jedoch nicht nur die Vorgänge an der Sprengstoffoberfläche selbst, sondern auch Einwirkungen auf weiter entfernt liegende Punkte zu erfassen. Als Ursache solcher mittelbarer Sprengstoffwirkungen kommen neben der direkten Schwadeneinwirkung die Stosswelle im an den Sprengstoff angrenzenden Medium oder an der Sprengstoffoberfläche beschleunigte und dann ballistisch wirkende Materialteile in Betracht. Die bei den je nach der beabsichtigten Wirkung verschiedenen Anordnungen der Sprengobjekte auftretenden Fragen hier näher zu erörtern, verbietet sich bei der waffentechnischen Bedeutung spezieller Anordnungen von selbst. Auch bei mittelbaren Wirkungen werden die Vorgänge an der Sprengstoffoberfläche als in jedem Falle entscheidende Kraftquelle Ausgangspunkt weiterer Untersuchungen sein müssen.

Das Ergebnis der vorstehenden Überlegungen kann dahin zusammengefasst werden, dass Wege aufgezeigt und Untersuchungsmethoden angegeben werden, die detonativen Erscheinungen in den allgemeinen Rahmen der Physik einzuordnen. Eine solche Behandlung von Sprengstofffragen nach rein physikalischen Gesichtspunkten hat die Schaffung physikalischer Messmethoden für die die Wirkung und Handhabung bestimmenden Grössen zur notwendigen primären Folge. Die weitere Verfolgung dieser Methoden muss zu einer allgemeinen Theorie der Sprengwirkungen führen, die Ablauf und Auswirkung jeder Sprenganordnung rechnerisch zu beherrschen erlaubt und damit der Sprengtechnik wertvollste Unterlagen schafft. Rückwirkend auf die allgemeine Physik werden die sprengstoffphysikalischen Ergebnisse wieder dieser neue Erkenntnisse bringen, liegt doch im Detonationsvorgang die Materie unter Bedingungen vor, wie sie bei anderen physikalischen Erscheinungen experimentell nicht zu verwirklichen sind.

[...] The thoughts just expressed in the explanation of the explosive concept already suggest a theory of the entire effect of explosives. However, such a general theory must not only cover the processes on the surface of the explosive itself, but also effects at points further away. In addition to the direct effect of vapor, the cause of such indirect explosive effects can be the shock wave in the medium adjacent to the explosive or on the explosive surface, which accelerates and then causes ballistically acting matter components. The questions arising from the different arrangements of the explosives depending on the intended effect cannot be discussed here in detail because of the significance of special arrangements in terms of weapons technology. Even in the case of indirect effects, the processes on the surface of the explosives, as the decisive source of power in any case, will have to be the starting point for further investigations.

The result of the above considerations can be summarized as showing ways and indicating investigation methods to classify the detonative phenomena within the general framework of physics. Such a treatment of explosives issues from a purely physical point of view has the necessary primary consequence of creating physical measuring methods for the variables determining the effect and handling. The further pursuit of these methods must lead to a general theory of blasting effects which allows the sequence and effects of each blasting arrangement to be controlled mathematically and thus provides the blasting technique with valuable documentation. Retrospectively on the general physics, the results of blasting physics will again bring new insights, since in the detonation process, matter is present under conditions that cannot be experimentally realized in other physical phenomena.

qualitativen energetischen Verhältnisse erstreckt, vollständig dem stillen Zerfall von Sprengstoffmolekülen. Da die Kernenergien den chemischen Bindungsenergien, aus denen die Sprengstoffe ihre Leistungsfähigkeit schöpfen, um mindestens 6 Grössenordnungen überlegen sind, würde durch die Kernreaktionen die Möglihhkeit von Sprengstoffen unvorstellbar grosser Brisanz gegeben sein, wenn es gelingen würde, die Kernreaktion detonativ, d.h. durch Stosswellen, auszulösen. Ganz abgesehen von der geschichtlich einschneidenden Bedeutung einer solchen Möglichkeit, einen Stoff von wirklich gigantischer Zerstörungskraft in menschliche Hände zu geben, würden wir damit die Materie unter thermodynamischen Bedingungen vorzuliegen haben, wie sie sonst nur an ganz wenigen Stellen des Universums vorkommen. Fraglos wäre der kernreaktionäre Sprengstoff physikalische Realität, wenn es gelänge, eine Stosswelle genügender Intensität zu erzeugen, die einen Kernzerfall einleiten könnte. Da jedoch selbst bei den schwereren, am wenigsten stabilen Atomen die Aktivierungsenergie noch nach Millionenvolt gemessen wird, besitzen wir keine Möglichkeit, eine solch intensive Stosswelle zu erzeugen. Es fehlt bei den Kernreaktionen eben die Abstufung der Aktivierungsarbeiten, wie sie bei den Sprengstoffen von den Initial- bis zu

b. Sprengstoff. Die störende Wirkung von U_{238} nimmt mit wachsender Temperatur zu. Ein Sprengstoff würde daher höchstens sehr kleine Mengen von U_{238} erhalten dürfen. Außer der vollständigen Isotopentrennung, die grundsätzlich sicher durchführbar, aber technisch sehr schwierig ist, kommen wir heute theoretisch einen zweiten Web zur Herstellung eines Sprengstoffs, der aber erst erprobt werden kann, wenn eine Uranmaschine läuft. Aus U_{238} bildet sich nämlich durch die Absorption von Neutronen ein Stoff ("Element 94"), der noch leichter spaltbar sein muss als U_{235}. Da dieser Stoff chemisch von Uran verschieden ist, muss man ihn aus dem Uran einer stillgelegten Maschine leicht abtrennen können. Doch kennen wir heute weder die Menge, in der er entsteht, noch seine Eigenschaften genau genug für eine ganz sichere Voraussage.

b. Explosive. The disruptive effect of U_{238} increases with increasing temperature. An explosive would therefore only be allowed to contain very small quantities of U_{238} at most. Apart from the complete separation of isotopes, which can be carried out safely in principle but is technically very difficult, we now have a second theoretical way of producing an explosive, but this can only be tested when a uranium machine is running. From U_{238} a substance ("element 94") is formed by the absorption of neutrons, which must be even easier to fission than U_{235}. Since this substance is chemically different from uranium, it must be possible to separate it easily from the uranium of a previously operating machine [used reactor fuel]. But today we know neither the amount in which it is produced nor its properties precisely enough for a completely safe prediction.

Da sich in jeder Substanz einige freie Neutronen befinden, würde es zur Entzündung des Sprengstoffs genügen, eine hinreichende Menge (vermutlich etwa 10–100 kg) räumlich zu vereinigen.

Since there are some free neutrons in each substance, it would be enough to spatially combine a sufficient amount (probably about 10–100 kg) to ignite the explosive.

[Erich Schumann and his colleagues at the Heereswaffenamt (including Kurt Diebner) created this secret compendium and presented it to the German government in February 1942. Thus the major results in it are from 1941 or earlier. This document demonstrates that as of 1941, German scientists:

- Were actively working to develop a fission bomb, not just a reactor.
- Knew that ^{235}U could be separated from ^{238}U and that highly enriched ^{235}U would be quite suitable for use in a fission bomb.
- Knew that plutonium-239 (element 94) could be bred from ^{238}U in a fission reactor, could be chemically separated from the remaining uranium afterward, and would be highly suitable for use in a fission bomb.
- Knew that 10–100 kg of sufficiently pure fission fuel should be enough for a fission bomb. This is a very early and excellent conservative estimate of the required mass (compare the values in the table on p. 5162 for the case of no compression, no reflector, and no fusion boosting). It clearly disproves postwar historical myths claiming that Germans did not know the required mass or mistakenly believed it to be several tons.
- Knew that a bomb would need to "spatially combine" that fission fuel on a sufficiently rapid timescale before the explosion. That seems to be a clear connection to the work on implosion designs that Schumann and his colleagues had already been developing for quite some time.]

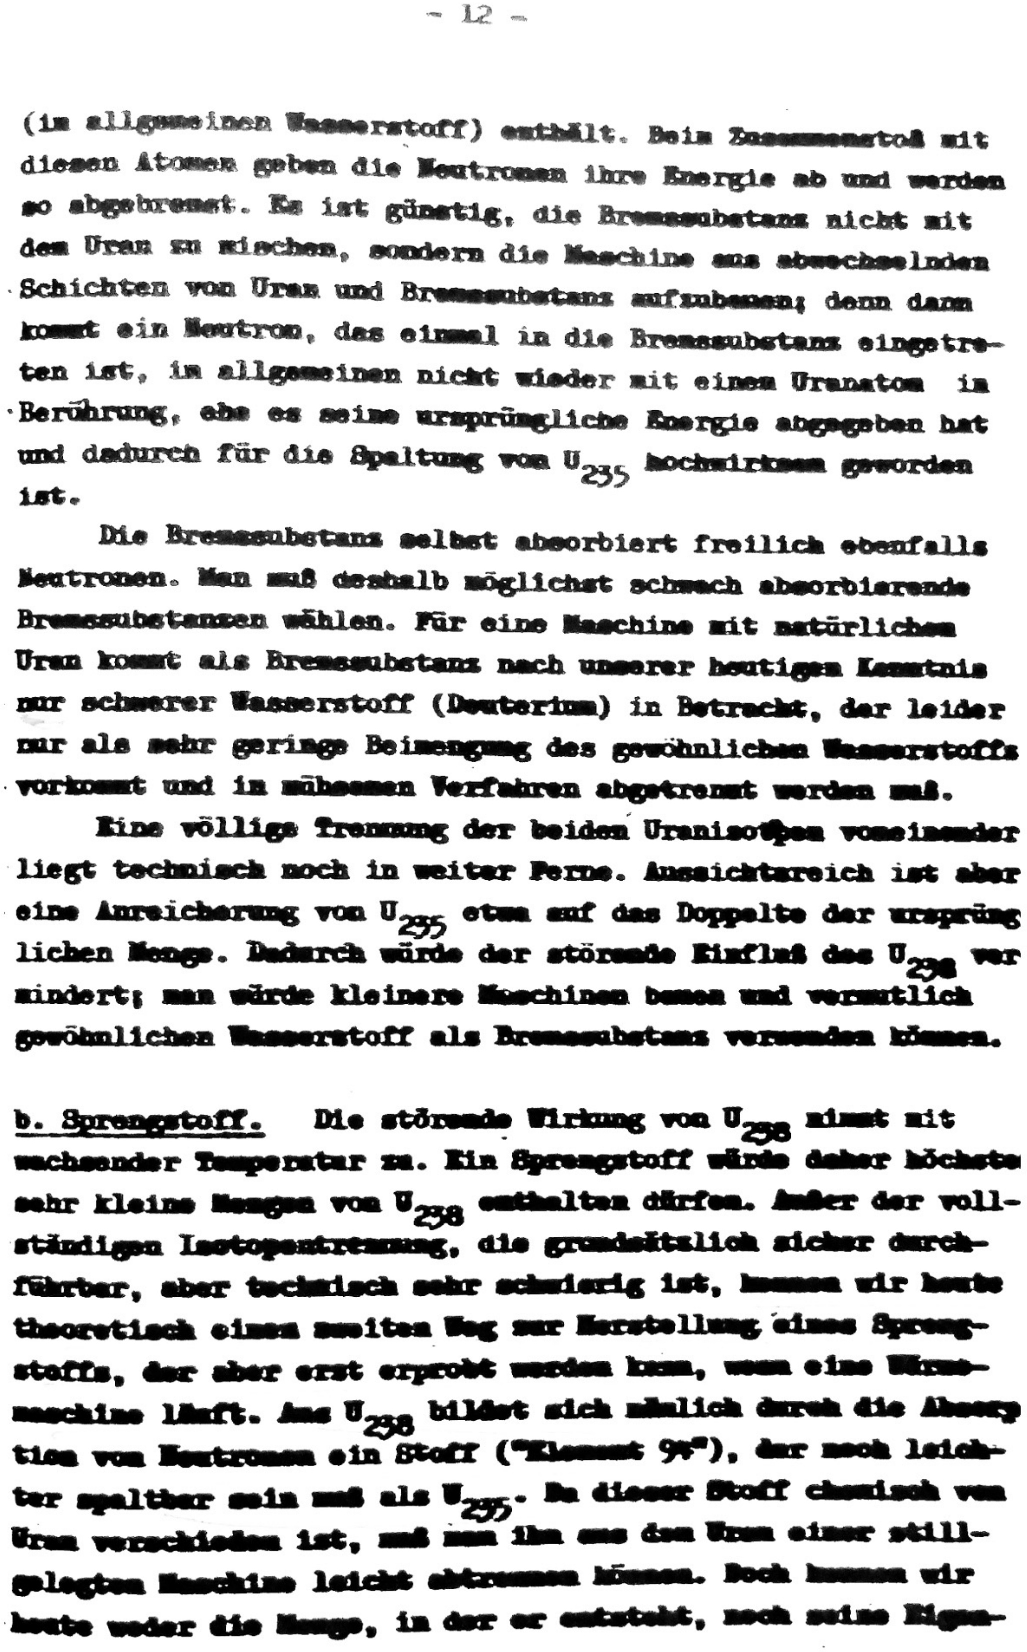
Figure D.571: Pages from Erich Schumann's February 1942 compendium, *Energiegewinnung aus Uran: Ergebnisse der vom Heereswaffenamt veranlassten Forschungsarbeiten zur Nutzbarmachung von Atomkernenergien*, informing the German government that an atomic bomb can be made with 10–100 kg of fissile material [Archiv der Max-Planck-Gesellschaft, I. Abteilung, Rep. 34, Nr. 105].



(im allgemeinen Wasserstoff) enthält. Beim Zusammenstoß mit diesen Atomen geben die Neutronen ihre Energie ab und werden so abgebremst. Es ist günstig, die Bremssubstanz nicht mit dem Uran zu mischen, sondern die Maschine aus abwechselnden Schichten von Uran und Bremssubstanz aufzubauen; denn dann kommt ein Neutron, das einmal in die Bremssubstanz eingetreten ist, im allgemeinen nicht wieder mit einem Uranatom in Berührung, ehe es seine ursprüngliche Energie abgegeben hat und dadurch für die Spaltung von U_{235} hochwirksam geworden ist.

Die Bremssubstanz selbst absorbiert freilich ebenfalls Neutronen. Man muß deshalb möglichst schwach absorbierende Bremssubstanzen wählen. Für eine Maschine mit natürlichem Uran kommt als Bremssubstanz nach unserer heutigen Kenntnis nur schwerer Wasserstoff (Deuterium) in Betracht, der leider nur als sehr geringe Beimengung des gewöhnlichen Wasserstoffs vorkommt und in mühsamen Verfahren abgetrennt werden muß.

Eine völlige Trennung der beiden Uranisotopen voneinander liegt technisch noch in weiter Ferne. Aussichtsreich ist aber eine Anreicherung von U_{235} etwa auf das Doppelte der ursprünglichen Menge. Dadurch würde der störende Einfluß des U_{238} vermindert; man würde kleinere Maschinen bauen und vermutlich gewöhnlichen Wasserstoff als Bremssubstanz verwenden können.

b. Sprengstoff. Die störende Wirkung von U_{238} nimmt mit wachsender Temperatur zu. Ein Sprengstoff würde daher höchste sehr kleine Mengen von U_{238} enthalten dürfen. Außer der vollständigen Isotopentrennung, die grundsätzlich sicher durchführbar, aber technisch sehr schwierig ist, kennen wir heute theoretisch einen zweiten Weg zur Herstellung eines Sprengstoffs, der aber erst erprobt werden kann, wenn eine Wärmemaschine läuft. Aus U_{238} bildet sich nämlich durch die Absorption von Neutronen ein Stoff ("Element 94"), der noch leichter spaltbar sein muß als U_{235}. Da dieser Stoff chemisch vom Uran verschieden ist, muß man ihn aus dem Uran einer stillgelegten Maschine leicht abtrennen können. schaften genau genug für eine ganz sichere Voraussage.

Da sich in jeder Substanz einige freie Neutronen befinden, würde es zur Entzündung des Sprengstoffs genügen, eine hinreichende Menge (vermutlich etwa 10 - 100 kg) räumlich zu vereinigen.

3. Experimentelle Untersuchung der Materialien.

Die Arbeitsgruppe hat zahlreiche Experimente durchgeführt, die im wesentlichen drei verschiedene Ziel verfolgten:

1. Genaue Kenntnis des Spaltungsvorgangs (Bericht III 1)
2. Feststellung der zum Bau der Maschine geeigneten Materialien.
3. Feststellung der richtigen Menge, räumlichen Anordnung und Dimensionierung der verwendeten Materialien.

Das erste Ziel ist rein wissenschaftlich und soll lediglich der technischen Anwendung eine möglichst breite Erkenntnisgrundlage liefern. Das zweite und dritte Ziel sind technischer Natur. Um diese beiden letzten Ziele zu erreichen, wurden zwei Sorten von Experimenten ausgeführt:

1. Untersuchung einzelner Materialien (Bericht III 2)
2. Modellversuche (Bericht III 3)

Es hat sich als notwendig erwiesen, die kernphysikalischen Eigenschaften der Materialien sehr viel genauer zu bestimmen, als es früher üblich war. Die Modellversuche prüfen eine der geplanten Maschine ähnliche, aber kleinere Anordnung; sie werden entsprechend den Fortschritten der Materialbeschaffung mit immer größeren Anordnungen wiederholt und sollen so schließlich zum Bau der ersten Maschine überleiten.

Das wichtigste Ergebnis der Experimente ist, daß aus etwa 5 to Uranmetall und 5 to schwerem Wasser eine selbsttätige Maschine gebaut werden könnte. Doch sind die genannten

INFORMATION PRELIMINARY TO REPORT 43 / 2

ON THE INCREASE OF THE EFFECT OF HOLLOW EXPLOSIVE SLABS

CAUSED BY CONTROL OF IGNITION (LENSES).

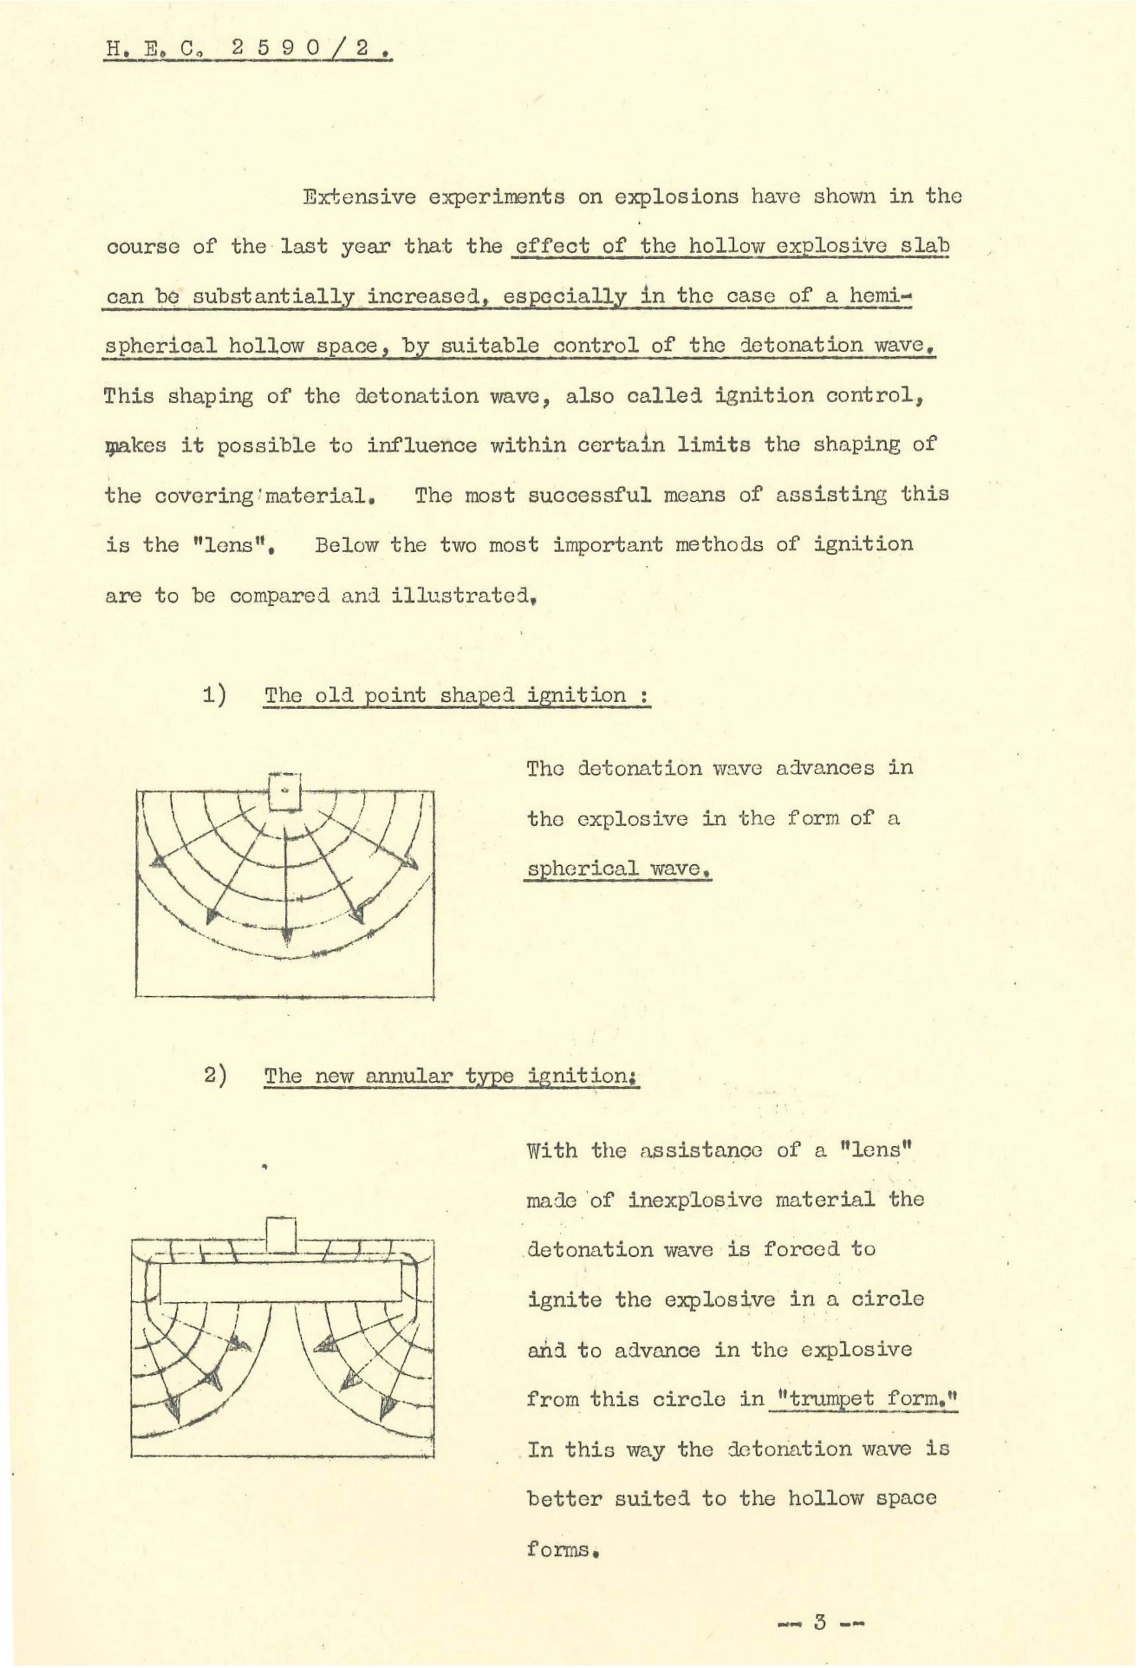
BY PROFESSOR DR. ERICH SCHUMANN AND DR. GERD HEINRICHS.

RESULT :

By suitable control of the detonation waves in the explosive by means of a lens an increase of efficiency of more than 25 % has been achieved with (H 15) explosive slabs for engineers. The application to short projectiles and mines is full of possibilities.

Figure D.574: Excerpts from a March 1943 report by Erich Schumann and Gerd Hinrichs showing the design and successful experimental demonstration of explosive lenses [HEC 2590, English translation, U.K. Imperial War Museum, Duxford Archive].

HEC 2590 (English translation). Erich Schumann and Gerd Hinrichs. March 1943. Report on tests of explosive lenses. Imperial War Museum, Duxford Archive.



H. E. C. 2590/2.

Extensive experiments on explosions have shown in the course of the last year that the effect of the hollow explosive slab can be substantially increased, especially in the case of a hemispherical hollow space, by suitable control of the detonation wave. This shaping of the detonation wave, also called ignition control, makes it possible to influence within certain limits the shaping of the covering material. The most successful means of assisting this is the "lens". Below the two most important methods of ignition are to be compared and illustrated.

1) The old point shaped ignition :

The detonation wave advances in the explosive in the form of a spherical wave.

2) The new annular type ignition:

With the assistance of a "lens" made of inexplosive material the detonation wave is forced to ignite the explosive in a circle and to advance in the explosive from this circle in "trumpet form." In this way the detonation wave is better suited to the hollow space forms.

H. E. C. 5919/27.

The effective velocity zone of the shell is consequently considerably expanded with coupled charges of this type with various ignition moments (echelon ignition).

Reports will be given shortly regarding the results of tests when firing with hollow charges of this type. Furthermore this arrangement can also be used for firing by means of the second charge smoke, gas or incendiaries through the hole, penetrated by the first charge.

C. Hollow charges with guided ignition.

The focussing process of the active vapours is decisive for the explosive efficiency of a hollow charge. This in itself is not solely dependent on the shape and cavity liner but also on the sequence, in which the individual liner elements are influenced by the detonation front, e.g. being influenced by guiding the detonation wave. In the g. Kdos. 229/41 Wa F (most secret document) such ignition guides, made of explosives of suitable detonation velocity and interlaid as lens shaped badies between the ignition point and the hollow space were suggested by myself. Still more effective and simple in practice is the guiding of the detonation wave by interlaying with inert materials (inert lenses) which do not convey the detonation. The fact that solely by means of guiding the detonating wave in this way a hollow charge effect without employing a cavity (see ill.8), can be achieved is of no little theoretical interest.

H. E. C. 5 9 1 9 / 28 .

I predicted the possibility of such an effect at the conference of the Academy of Aeronautical Research on 25.10.40; it was then generally considered to be quite incredible. Practical applications, of course, have not been made with the effect as yet.

However, the application of guided ignition with hollow charges proved to be of considerable importance. Even with the simplest possible construction by means of a disc arranged between the point of ignition and the hollow space (e.g. made of concrete) increases of performance up to 100 % were achieved with some hollow charges-hemispherical hollow space with low lying ignition point.

Even with a highly developed hollow charge as is represented by the Engineers charge H 15 in its latest design, the application of the lens increased the performance by over 25 % (HE physics report 43/2 preliminary report) (E.Schumann and G. Hinrichs : "Increase of effect with hollow charges by means of ignition guiding (lenses)".). A comparison of the penetration performances may be seen in ill. 9. It should be emphasized at this point that the greater depth effect of the lens charge is not connected with a decrease in the diameter of the hole.

For the application of the hemispherical shape with lens it is of importance when using hollow charge shells that with the maximum economy of HE weight the depth effect of distended pointed pointed hollow space shaped is achieved by means of a ballistically more favourable distribution of the mass. Tests regarding the application in shells and mortar shells are in progress.

G-303. Walter Herrmann, Georg Hartwig, Heinz Rackwitz, Walter Trinks, and H. Schaub. 1944. *Versuche über die Einleitung von Kernreaktionen durch die Wirkung explodierender Stoffe.* [*Experiments on Initiation of Nuclear Reactions by Explosives.*] Deutsches Museum number FA 002/0721. https://digital.deutsches-museum.de/item/FA-002-721/

[See document photos on pp. 4222–4224. This report describes one of the long series of Schumann-Trinks implosion experiments. This particular experiment was a simple test using fusion fuel but no fission fuel. The report showed both from experimental measurements and from theoretical calculations that implosion by chemical explosives had far too little energy to produce significant pure fusion reactions. Thus in other documents when members of the Schumann-Trinks group discussed "atomic bombs" that used implosion, they clearly knew that fission fuel was an essential component of such bombs: either fission fuel only, or a combination of fission and fusion fuel. Where are all the other reports on all the other experiments by the Schumann-Trinks group throughout the entire war?]

1) Es wurde des öfteren vorgeschlagen, zur Einleitung von Kern- und Kettenreaktionen die Schwadengeschwindigkeit bei der Explosion von Sprengstoffen zu benutzen. Es sollten dabei die entstehenden Kernprozesse die Wirkung von Explosionsstoffen erhöhen. Obwohl dieser Weg nach einfachen Ueberlegungen ungangbar scheint, wurden, um endlich eine experimentell begründete Aussage darüber geben zu können, auf Anregung von Herrn Prof. Gerlach in der Heeresforschungsstelle Kdf. einige orientierende Versuche durchgeführt.

2) Durchführung der Versuche:
In zylindrische Sprengkörper aus Trinitrotoluol (12 cm Ø, 10 cm Höhe); (5,0 cm Ø, 8 cm Höhe) wurden in der Mitte der Grundfläche kleine Kegel (1,5 cm Ø, 3,0 cm Höhe) aus Deutero-Paraffin eingesetzt. Die im Sprengstoff laufenden Druckwellen sollten die D-Atome des Deutero-Paraffins beschleunigen und durch zusammenstossende D-Atome Neutronen erzeugen. Zum Nachweis dieser D-D-Reaktion wurde unter dem Paraffinkegel ein Silber-Indikator vorgesehen, dessen Aktivität, durch die Neutronen der D-D-Reaktion angeregt, gemessen werden sollte. Die Aktivitätsmessungen wurden mit β-Zählrohr, Verstärker und Zählwerk ausgeführt.

1) It has often been proposed to use the gas velocity during the explosion of explosives to initiate nuclear and chain reactions. The resulting nuclear processes should increase the effect of explosives. Although this approach seems unfeasible on the basis of simple considerations, in order to finally be able to make an experimentally substantiated statement about it, a number of preliminary tests were carried out at the Army Research Center Kummersdorf at the suggestion of Prof. Gerlach.

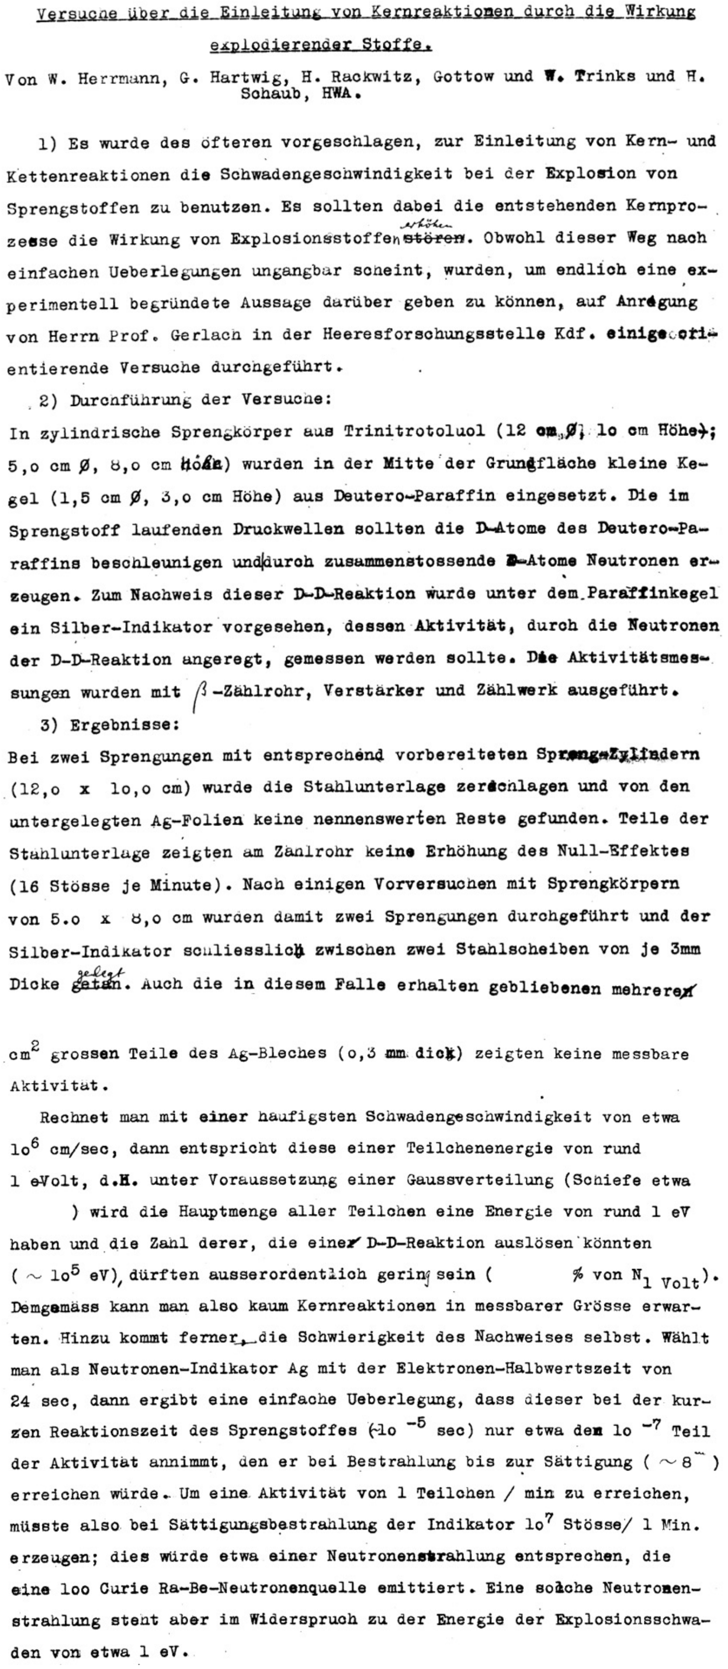
2) Performance of the experiments:
Small cones (1.5 cm Ø, 3.0 cm high) of deutero-paraffin were placed in the center of the base of cylindrical explosives made of trinitrotoluene (12 cm Ø, 10 cm high); (5.0 cm Ø, 8 cm high). The pressure waves in the explosive were intended to accelerate the D atoms of the deutero-paraffin and generate neutrons by colliding D atoms. To detect this D-D reaction, a silver indicator was placed under the paraffin cone, the radioactivity of which was to be measured after stimulation by the neutrons of the D-D reaction. The radioactivity measurements were carried out using a β detection tube, amplifier, and counter.

3) Ergebnisse:
Bei zwei Sprengungen mit entsprechend vorbereiteten Spreng-Zylindern (12,0 x 10,0 cm) wurde die Stahlunterlage zerechlagen und von den untergelegten Ag-Folien keine nennenswerten Reste gefunden. Teile der Stahlunterlage zeigten am Zählrohr keine Erhöhung des Null-Effektes (16 Stösse je Minute). Nach einigen Vorversuchen mit Sprengkörpern von 5,0 x 8,0 cm wurden damit zwei Sprengungen durchgeführt und der Silber-Indikator schliesslich zwischen zwei Stahlscheiben von je 3mm Dicke gelegt. Auch die in diesem Falle erhalten gebliebenen mehrere cm^2 grossen Teile des Ag-Bleches (0,3 mm dick) zeigten keine messbare Aktivität.

Rechnet man mit einer häufigsten Schwadengeschwindigkeit von etwa 10^6 cm/sec, dann entspricht diese einer Teilchenenergie von rund 1 e-Volt, d.H. unter Voraussetzung einer Gaussverteilung (Schiefe etwa ___) wird die Hauptmenge aller Teilchen eine Energie von rund 1 eV haben und die Zahl deren, die eine D-D-Reaktion auslösen könnten ($\sim 10^5$ eV), dürften ausserordentlich gering sein (___% von $N_{1\,\text{Volt}}$). Demgemäss kann man also kaum Kernreaktionen in messbarer Grösse erwarten. Hinzu kommt ferner, die Schwierigkeit des Nachweises selbst. Wählt man als Neutronen-Indikator Ag mit der Elektronen-Halbwertszeit von 24 sec, dann ergibt eine einfache Ueberlegung, dass dieser bei der kurzen Reaktionszeit des Sprengstoffes ($\sim 10^{-5}$ sec) nur etwa den 10^{-7} Teil der Aktivität annimmt, den er bei Bestrahlung bis zur Sättigung (~ 8) erreichen würde. Um eine Aktivität von 1 Teilchen/min zu erreichen, müsste also bei Sättigungsbestrahlung der Indikator 10^7 Stösse/1 Min. erzeugen; dies würde etwa einer Neutronenstrahlung entsprechen, die eine 100 Curie Ra-Be-Neutronenquelle emittiert. Eine solche Neutronenstrahlung steht aber im Widerspruch zu der Energie der Explosionsschwaden von etwa 1 eV.

3) Results:
In two blasts with appropriately prepared blasting cylinders (12.0 x 10.0 cm), the steel base was crushed and no significant remains of the Ag foils placed underneath were found. Parts of the steel base showed no increase over the background level (16 counts per minute) on the detection tube. After some preliminary tests with detonators measuring 5.0 x 8.0 cm, two detonations were carried out and the silver indicator was finally placed between two steel disks, each 3 mm thick. Even the parts of the Ag sheet (0.3 mm thick) measuring several cm^2 that remained in this case showed no measurable activity.

If one assumes a most probable gas velocity of about 10^6 cm/sec, then this corresponds to a particle energy of about 1 electron-volt, i.e. assuming a Gaussian distribution (deviation about ___); the bulk of all particles will have an energy of about 1 eV and the number of those that could trigger a D-D reaction ($\sim 10^5$ eV) is likely to be extremely small (___% von $N_{1\,\text{Volt}}$). Accordingly, one can hardly expect nuclear reactions of a measurable amount. In addition, there is the difficulty of the detection itself. If silver with a beta half-life of 24 seconds is chosen as the neutron indicator, then a simple consideration shows that with the short reaction time of the explosive ($\sim 10^{-5}$ seconds) it only attains about 10^{-7} parts of the activity that it would achieve if irradiated to saturation (~ 8). In order to achieve an activity of 1 particle/min, the indicator would therefore have to generate 10^7 counts/1 min at saturation irradiation; this would correspond approximately to neutron radiation emitted by a 100 Curie Ra-Be neutron source. However, such neutron radiation is in contradiction to the energy of the explosion gases of about 1 eV.



Versuche über die Einleitung von Kernreaktionen durch die Wirkung explodierender Stoffe.

Von W. Herrmann, G. Hartwig, H. Rackwitz, Gottow und W. Trinks und H. Schaub, HWA.

1) Es wurde des öfteren vorgeschlagen, zur Einleitung von Kern- und Kettenreaktionen die Schwadengeschwindigkeit bei der Explosion von Sprengstoffen zu benutzen. Es sollten dabei die entstehenden Kernprozesse die Wirkung von Explosionsstoffen ~~stören~~ erhöhen. Obwohl dieser Weg nach einfachen Ueberlegungen ungangbar scheint, wurden, um endlich eine experimentell begründete Aussage darüber geben zu können, auf Anregung von Herrn Prof. Gerlach in der Heeresforschungsstelle Kdf. einige orientierende Versuche durchgeführt.

2) Durchführung der Versuche:
In zylindrische Sprengkörper aus Trinitrotoluol (12 cm Ø, 1o cm Höhe; 5,o cm Ø, 8,o cm ~~Höhe~~) wurden in der Mitte der Grundfläche kleine Kegel (1,5 cm Ø, 3,o cm Höhe) aus Deutero-Paraffin eingesetzt. Die im Sprengstoff laufenden Druckwellen sollten die D-Atome des Deutero-Paraffins beschleunigen und durch zusammenstossende D-Atome Neutronen erzeugen. Zum Nachweis dieser D-D-Reaktion wurde unter dem Paraffinkegel ein Silber-Indikator vorgesehen, dessen Aktivität, durch die Neutronen der D-D-Reaktion angeregt, gemessen werden sollte. Die Aktivitätsmessungen wurden mit β-Zählrohr, Verstärker und Zählwerk ausgeführt.

3) Ergebnisse:
Bei zwei Sprengungen mit entsprechend vorbereiteten Sprengzylindern (12,o x 1o,o cm) wurde die Stahlunterlage zerschlagen und von den untergelegten Ag-Folien keine nennenswerten Reste gefunden. Teile der Stahlunterlage zeigten am Zählrohr keine Erhöhung des Null-Effektes (16 Stösse je Minute). Nach einigen Vorversuchen mit Sprengkörpern von 5.o x 8,o cm wurden damit zwei Sprengungen durchgeführt und der Silber-Indikator schliesslich zwischen zwei Stahlscheiben von je 3mm Dicke ~~getan~~ gelegt. Auch die in diesem Falle erhalten gebliebenen mehreren

cm^2 grossen Teile des Ag-Bleches (o,3 mm dick) zeigten keine messbare Aktivität.

Rechnet man mit einer häufigsten Schwadengeschwindigkeit von etwa 1o^6 cm/sec, dann entspricht diese einer Teilchenenergie von rund 1 eVolt, d.H. unter Voraussetzung einer Gaussverteilung (Schiefe etwa) wird die Hauptmenge aller Teilchen eine Energie von rund 1 eV haben und die Zahl derer, die eine D-D-Reaktion auslösen könnten ($\sim$ 1o^5 eV), dürften ausserordentlich gering sein (% von $N_{1\ Volt}$). Demgemäss kann man also kaum Kernreaktionen in messbarer Grösse erwarten. Hinzu kommt ferner, die Schwierigkeit des Nachweises selbst. Wählt man als Neutronen-Indikator Ag mit der Elektronen-Halbwertszeit von 24 sec, dann ergibt eine einfache Ueberlegung, dass dieser bei der kurzen Reaktionszeit des Sprengstoffes (1o^{-5} sec) nur etwa dem 1o^{-7} Teil der Aktivität annimmt, den er bei Bestrahlung bis zur Sättigung ($\sim$ 8^{-}) erreichen würde. Um eine Aktivität von 1 Teilchen / min zu erreichen, müsste also bei Sättigungsbestrahlung der Indikator 1o^7 Stösse/ 1 Min. erzeugen; dies würde etwa einer Neutronenstrahlung entsprechen, die eine 1oo Curie Ra-Be-Neutronenquelle emittiert. Eine solche Neutronenstrahlung steht aber im Widerspruch zu der Energie der Explosionsschwaden von etwa 1 eV.

Erich Schumann. 1949. *Die Wahrheit über die deutschen Arbeiten und Vorschläge zum Atomenergie-Problem (1939–45).* Unpublished manuscript from Schumann estate [courtesy of Rainer Karlsch].

[This manuscript is an unfinished, unpublished attempt by Schumann to describe the parts of the German nuclear program with which he was involved. In its current form, the manuscript is missing many pages, and those that do exist are often simply abbreviated notes for what Schumann intended to write.]

[S. 38] Wenn über die in Deutschland gegen Kriegsende geplanten und vorbereiteten Versuche bisher nichts berichtet worden ist, so hat das seinen Grund darin, das nur wenige Wissenschaftler darüber unterrichtet waren und die Akten im April 1945 vernichtet werden mußten.

[S. 39] Diese Vorschläge, die ich im Herbst 1944 dem Chef des Heereswaffenamts, General d. Art. Leeb, vorlegte, basieren auf gemeinsam mit Trinks angestellten Überlegungen im Anschluss an unsere Arbeiten2) auf dem Gebiet der Sprengstoffphysik.

2) niedergelegt in den Berichten des Reichsforschungsrats (Sprengstoffphysikberichte, herausgegeben vom Bevollmächtigten für Sprengstoffphysik), ferner in den Berichten der Forschungsabteilung des Heereswaffenamts und in etwa 40 Geheimpatentschriften.

[S. 121] Immer wieder, insbesondere in der Presse und von nicht kompetenten Stellen wird behauptet, Hitler habe an die A-Bomb geglaubt, diese sei die unausgesprochene Wunderwaffe in seinen Bluffreden gewesen.

Alle mit der Atomangelegenheit sachlich befassten amtlichen Stellen wissen, dass das nicht der Fall war. Erst Ende 1941 ist Hitler durch den Postminister Dr. Ohnesorge über das Atomenergieproblem unterrichtet worden. [...] Hitler war skeptisch und lehnte ab, noch schärfer als bei seiner Unterrichtung über die Rakete.

[p. 38] If nothing has been reported about the experiments planned and prepared in Germany towards the end of the war, this is due to the fact that only a few scientists were informed and the files had to be destroyed in April 1945.

[p. 39] These proposals, which I submitted to the Chief of the Army Ordnance Office in the fall of 1944, General d. Art. Leeb, presented, are based on considerations shared with Trinks following our work in the field of explosives physics2).

2) set forth in the reports of the Reich Research Council (Explosives Physics Reports, issued by the Explosives Physics Commissioner), in the reports of the Army Ordnance Research Department and in about 40 secret patents.

[p. 121] Again and again, especially in the press and from incompetent sources, it is alleged that Hitler had believed in the A-bomb, which had been the unspoken miracle weapon in his bluffing stories.

All the official bodies concerned with the nuclear issue know that this was not the case. At the end of 1941, Hitler was briefed by the postmaster Ohnesorge about the nuclear energy problem. [...] Hitler was skeptical and rejected it, even more sharply than his briefing on the rocket.

[S. 127] Im übrigen machte sich schon der Einfluss der Waffen-SS geltend, der dahin ging, ein eigenes Waffenamt aufzubauen und es selbstverständlich ablehnte, dass das OKW in irgendeiner Weise hinein zureden vermochte.

[S. 131] Deutschland hat nie reines ^{235}U in nennenswerten Mengen hergestellt; nur Harteck 1943 bis 44 mittels Zentrifuge (Anreicherung). Clusius-Verfahren ging nicht, weil Thermodiffusionskoeffizient negativ war.

[p. 127] Moreover, the influence of the Waffen-SS, which set out to set up its own weapons office and, of course, refused to allow the Army to speak in any way, became apparent.

[p. 131] Germany never made pure ^{235}U in appreciable quantities; only Harteck 1943 to 44 by means of centrifuge (enrichment). Clusius method did not work because thermal diffusion coefficient was negative.

[Erich Schumann's implosion systems would have been highly suitable for compressing fission fuel, thus making a complete fission bomb. In this manuscript, Schumann did not describe that; with the highly compartmentalized security of German secret weapons programs, he may not have known much about it. In any event, with postwar Allied interrogations, trials, prison sentences, and executions of Germans who had performed various tasks during the war, Schumann certainly would not have wanted to admit anything that he had known or been involved with.

Schumann stated that he filed "about 40 secret patents" during the war, which presumably covered the material for which he was granted patents in the postwar period. The view that Schumann's postwar papers reflect wartime work is strongly supported by the fact that in August 1945, the U.S. Army Ordnance Technical Intelligence office publicly stated that based on evidence they had collected, Erich Schumann was a "brilliant scientist" who "did much outstanding work" "in the development of atomic bombs"; other U.S. officials then threatened the Ordnance Technical Intelligence office "against making further statements on this subject" (p. 4187). The importance of Schumann's work is supported by Erwin Respondek's 1945 testimony too (p. 4194). The notion that Schumann's postwar papers accurately reflect wartime work is also supported by an April 1947 Russian report that is highly similar to Schumann's work and likely based on some of his wartime papers that were captured by the Russians [Kozyrev 2005].

Schumann confirmed (1) the fact that the SS eclipsed the Army Ordnance in the German nuclear program, (2) the extreme secrecy of the nuclear program during the war, and (3) the destruction of evidence at the end of the war, all consistent with the testimony of Werner Grothmann.

Schumann wrote that he was unaware of enriched uranium sources other than Paul Harteck's centrifuges. Yet Werner Holtz and Werner Schwietzke in his own Army Ordnance Office spent several years developing uranium centrifuges (pp. 3542–3544); the fact that Schumann completely omitted any mention of that fact demonstrates that he withheld important information in this and other writings.]

Schematische Darstellung einer sprengphysikalischen Anordnung zur Erzielung sehr hoher Drucke und Temperaturen: Metallische Hohlkugel, umgeben von einer Sprengstoffschicht mit einer Anzahl von Zündern, welche unter Verwendung von Hilfszündern Z_H und gleichlanger Stücke detonierender Zündschnur gleichzeitig angeregt werden können. Die punktierten Halbkreise in der schraffiert gezeichneten Sprengstoffschicht deuten die Fronten der von den einzelnen Zündern ausgehenden Detonationswellen kurz vor Erreichen der Außenbegrenzung der metallischen Hohlkugel an.

Figure D.587: A page from an unpublished 1949 manuscript by Erich Schumann, describing a spherical implosion bomb design with multiple concentric layers. (See also p. 4240.) Schumann's caption says: "Schematic representation of an explosive physical arrangement for achieving very high pressures and temperatures: Hollow metallic sphere surrounded by a layer of explosives with a number of detonators which can be triggered simultaneously using auxiliary detonators Z_H and pieces of detonating fuse of equal length. The dotted semicircles in the hatched explosive layer indicate the fronts of the detonation waves emanating from the individual detonators shortly before reaching the outer boundary of the hollow metallic sphere." Other pages from Schumann described additional details of the design, including explosive lenses of TNT and RDX within the outer layer, the arrangement of both fission and fusion fuel near the center, and methods of testing the device by mounting it on a tower and using sophisticated high-speed diagnostic instruments to record the explosion.

Letter from Erich Schumann to Ernst Telschow. 2 April 1948 [AMPG, Abt. III, Rep. 83, Nr. 286].

Prof. Dr. Erich Schumann
Göttingen, den 2. April 48
Vertraulich
An Herrn Gen. Dir. Dr. E. Telschow
Max-Planck-Gesellschaft zur
Förderung der Wissenschaften in Göttingen

Im Verlauf von sprengstoff-physikalischen Forschungsarbeiten, insbesondere der die Zündführung bei Hohlsprengkörpern betreffenden Untersuchungen, führten Überlegungen, die ich im Oktober 1943 gemeinsam mit Dr. Walter Trinks anstellte, zu dem Schluss, dass es zufolge der in unseren Berichten [Forschungsabteilung H Wa F, Reichsforschungsrat (Bevollmächtigter für Sprengstoffphysik) und etwa 40 Patentschriften] niedergelegten Erkenntnissen möglich sein müsse, Umwandlungen z. B. von Kohle in Diamant vorzunehmen und ferner Atomenergie auch durch Reaktionen zwischen leichten Elementen freizumachen.

Prinzip: Die außerordentliche Verdichtung der Materie und damit einhergehende ungeheuere Temperatursteigerung, wie sie sich im Entwicklungsgang der Sterne infolge der Gravitation vollzieht, soll im Experiment dadurch erzwungen werden, dass man die hohe Sprengstoff-physikalisch gewonnene kinetische Energie einer großen Masse auf eine wesentlich kleinere Masse überträgt. Siehe nachstehende schematische Darstellung. (Die zu verdichtende Substanz wird im gasförmigen Zustand in einer metallischen Hohlkugel untergebracht, welche außen mit einer Schicht eines brisanten Sprengstoffs belegt ist. Bei geeigneter, gleichmäßig über die ganze Oberfläche der Sprengstoffschicht eingeleiteter Zündung wird für eine gewisse kurze Zeit ein hoher Druck auf die metallische Kugel ausgeübt, unter dessen Einwirkung das Metall in den plastischen Zustand gerät und zum Mittelpunkt hin beschleunigt wird. Dadurch wird die eingeschlossene Gasmasse außerordentlich rasch verdichtet und dabei sehr hoch erhitzt):

Prof. Dr. Erich Schumann
Göttingen, 2 April 48
Confidential
To General Director Dr. E. Telschow
Max Planck Society for the
Advancement of Sciences in Göttingen

In the course of research work in the physics of explosives, in particular the investigations into the detonation of hollow explosives, considerations which I carried out in October 1943 with Dr. Walter Trinks, led to the conclusion that according to the findings laid down in our reports [Research Department H Wa F, Reich Research Council (Commissioner for Explosives Physics) and about 40 patent specifications], it must be possible to carry out transformations, e.g. of coal into diamond, and moreover to release nuclear energy also through reactions between light elements.

Principle: The extraordinary compression of matter and the associated enormous increase in temperature, as it occurs in the evolution of stars as a result of gravity, can be forcibly created in the experiment by transferring the high kinetic energy of a large mass, obtained by explosive physics, to a much smaller mass. See the schematic diagram below. (The substance to be compressed is placed in the gaseous state in a metallic hollow sphere, which is covered on the outside with a layer of explosive material. When a suitable ignition is applied uniformly over the entire surface of the explosive layer, a high pressure is applied to the metal sphere for a short time, which causes the metal to plasticize and accelerate towards the center. This causes the enclosed mass of gas to be compressed extremely rapidly and thereby to heat up very rapidly):

Figure D.588: A 1948 drawing by Erich Schumann, showing a spherical implosion bomb design with multiple concentric layers used to trigger nuclear reactions [AMPG, Abt. III, Rep. 83, Nr. 286].

Es war 1944/45 nicht mehr möglich, die bereits vorbereiteten Versuche durchzuführen, denn vom damaligen Ministerium für Bewaffnung und Munition wurden derartige Versuche nicht unterstützt, ja sogar verboten. Die experimentellen Möglichkeiten und theoretischen Überlegungen wurden aber damals von Dr. Trinks in einer Arbeit, die er als Habilitationsschrift zu benutzen gedachte, niedergelegt. Diese Arbeit wurde weisungsgemäß 1945 mit den übrigen Geheimakten vernichtet und 1947 nach Rücksprache mit Ihnen für die dortige Behörde von Dr. Trinks rekonstruiert.

Besteht beispielsweise die erwähnte Kugelschale aus Eisen, die Füllung aus Wasserstoffgas vom Anfangsdruck 1 Atm., beträgt die Wandstärke der Kugelschale etwa 1/50 ihres Durchmessers und rechnet man weiter mit einer Anfangsgeschwindigkeit der Schalenelemente von etwa 3200 m/sec, welche noch bequem erreichbar erscheint, so ergibt sich—nach Trinks—im Endzustand ein Energiegehalt des verdichteten Wasserstoffgases von etwa 10^{15} erg/g, d.h. mehr als 10 000 mal soviel, wie die brisantesten Sprengstoffe besitzen. Geht man von einem herabgesetzten Anfangsdruck des eingeschlossenen Gases aus, so ist mit noch höheren Energiedichten zu rechnen, also z.B. bei 0,1 Atm. etwa mit 10^{16} erg/g, das ist das 100 000-fache des Wertes für die brisantesten Sprengstoffe.

Durch extrem anwachsende Strahlungsverluste beim Überschreiten der Temperaturgrenze des nichtentarteten Elektronengases, sowie durch sprunghaft erhöhte Kompressibilität bei Überschreiten der Druckgrenze des nichtentarteten Elektronengases werden die theore- tisch möglichen Zündwerte (Temperaturen von 10–100 Millionen Grad und Drucke von 100 Milliarden bis 100 Billionen Atm) allerdings nur annährend erreicht werden können. Diese Schwierigkeiten beginnen jedoch erst von etwa 4 Millionen Grad bei einem Druck von 250 Millionen Atm. An merklich zu werden, während unter ihrer Inrechnungsetzung ein weiterer Anstieg auf etwa 10 Millionen Grad bei einem Druck von etwa 10 Milliarden Atm., das ist nahezu der Zustand im Sonnenmittelpunkt, erwartet werden kann.

In 1944/45 it was no longer possible to carry out the experiments already prepared, because the then Ministry of Armaments and Ammunition did not support such experiments and even prohibited them. The experimental possibilities and theoretical considerations were, however, laid down by Dr. Trinks at that time in a paper which he intended to use as his habilitation thesis. This work was destroyed together with the other secret files in 1945, as ordered, and in 1947, after consultation with you, it was reconstructed by Dr. Trinks for the local authorities.

If, for example, the spherical shell mentioned above consists of iron, the filling of hydrogen gas of the initial pressure of 1 Atm., the wall thickness of the spherical shell is about 1/50 of its diameter and if one continues to calculate with an initial speed of the shell elements of about 3200 m/sec, which still seems to be comfortably attainable, this results—after Trinks—in the final state an energy content of the compressed hydrogen gas of about 10^{15} erg/g, i.e. more than 10,000 times as much as the most explosive explosives possess. If one assumes a reduced initial pressure of the enclosed gas, even higher energy densities can be expected, e.g. at 0.1 atm. about 10^{16} erg/g, i.e. 100,000 times the value for the most explosive explosives.

However, due to extremely increasing radiation losses when the temperature limit of the non-degenerate electron gas is exceeded, as well as due to a sudden increase in compressibility when the pressure limit of the non-degenerate electron gas is exceeded, the theoretically possible ignition values (temperatures of 10–100 million degrees and pressures of 100 billion to 100 trillion Atm) can only be approximately reached. However, these difficulties only start from about 4 million degrees at a pressure of 250 million Atm. It is possible to notice them, whereas if they are taken into account, a further increase to about 10 million degrees at a pressure of about 10 billion Atm., which is almost the state in the center of the sun, can be expected.

Dann sind aber zumindest die beiden Deuteronen-Reaktionen

$$^{2}\mathrm{D} + {}^{2}\mathrm{D} = {}^{3}\mathrm{He} + {}^{1}\mathrm{n}$$

$$^{2}\mathrm{D} + {}^{2}\mathrm{D} = {}^{3}\mathrm{Tr} + {}^{1}\mathrm{H}\,,$$

deren Einsetzen im Entwicklungsgang der Sterne bereits bei 200 000^{o} beginnt$^{x)}$, genügend wahrscheinlich$^{xx)}$, so dass sie auch während der etwas kurzen Zeiten, die bei dem geplanten Hohlkugelverfahren zur Verfügung stehen (etwa 0,001 sec), in so ausreichendem Umfang stattfinden, dass erhebliche Energiebeträge gewonnen werden können.

Wird z.B. 1/2 Kubikmeter (ca 9 g) schweren Wasserstoffgases vom Druck 0,1 Atm. vollständig nach dem obigen Reaktionsgleichungen umgesetzt, so wird ein Energiebetrag von rund 10^{19} erg entsprechend etwa 275 to Trinitrotoluol, frei. Noch erheblich höhere Beträge können unter Heranziehung anderer leichter Elemente, z. B. Lithium oder Bor, gewonnen werden.

Erich Schumann

$^{x)}$ Vgl. Bethe u. Marshak, Rep. on Progr. in Phys. 6, 1–15, 1939.

$^{xx)}$Nachgewiesen in dem Hauptbericht Abschn. V, S. 36 unter Benutzung der von Gamow und Teller (Phys. Rev. (2) 53, 608, 1938) verbesserten theoretischen Beziehungen von Atkinson und Houtermans, der Rechnungen von Bethe (Phys. Rev. (2) 55, 434, 1939), sowie der experimentellen Werte des Wirkungsquerschnittes der Deuteronenreaktionen von Ladenburg u. Kanner (Phys. Rev. (2) 52, 911, 1937) und der Messungen von Burhop (Proc. Phil. Soc. 32, 643, 1936).

But then at least the two deuteron reactions

whose onset in the evolutionary process of stars already starts at 200,000$^{o\ x)}$, sufficiently probable$^{xx)}$, so that even during the somewhat short times available in the planned hollow-sphere process (about 0.001 sec), they take place in such a sufficient amount that considerable amounts of energy can be gained.

If e.g. 1/2 cubic meters (approx. 9 g) of heavy hydrogen gas of pressure 0.1 Atm. are completely converted according to the above reaction equations, an energy amount of about 10^{19} erg corresponding to about 275 tons of TNT is released. Even considerably higher amounts can be obtained by using other light elements, e.g. lithium or boron.

Erich Schumann

$^{x)}$ See Bethe and Marshak, Rep. on Progr. in Phys. 6, 1–15, 1939.

$^{xx)}$Proven in the main report, section V, p. 36, using the theoretical relations of Atkinson and Houtermans improved by Gamow and Teller (Phys. Rev. (2) 53, 608, 1938), the calculations of Bethe (Phys. Rev. (2) 55, 434, 1939), as well as the experimental values of the cross section of the deuteron reactions of Ladenburg and Kanner (Phys. Rev. (2) 52, 911, 1937) and the measurements of Burhop (Proc. Phil. Soc. 32, 643, 1936).

[This 1948 letter briefly described a spherical implosion bomb design with multiple concentric layers used to trigger nuclear reactions. While the letter did not delve into still-classified details such as uranium and explosive lenses, clearly it was closely tied both to Schumann's wartime work and to his postwar patents (which are presented on the following pages).]

Erich Schumann and Walter Trinks. Patent DE977825. Vorrichtung, um ein Material zur Einleitung von mechanischen, thermischen oder nuklearen Prozessen auf extrem hohe Drücke und Temperaturen zu bringen. [Device for the introduction of a material for the introduction of mechanical, thermal or nuclear processes to extremely high pressures and temperatures.] Filed 13 August 1952.

[...] In solchen Fällen kann man sich eines Verfahrens bedienen, das darauf beruht, die kinetische Energie einer größeren Masse nahezu vollständig auf eine möglichst kleine Masse in einem sehr kleinen Raumgebiet zu übertragen. Man erreicht durch den Übergang von großen zu kleinen Massen größte Energiedichten, ganz analog wie man einen hohen Druck beim Übergang von großen zu kleinen Flächen erhält oder große Lasten mit einer kleinen Kraft durch Anwendung langer Wege hebt.

Dieses Prinzip der Übertragung der kinetischen Energie großer Massen auf kleinere findet z.B. Anwendung beim sogenannten Wasserhammer oder hydraulischen Widder; eine größere in Strömung befindliche Wassermenge wird plötzlich gebremst; der dabei auftretende Staudruck hebt einen Bruchteil der gestauten Wassermenge auf eine bestimmte Höhe empor und verleiht demselben so einen höheren Betrag an potentieller Energie pro Volumeneinheit, als das ursprünglich fließende Wasser an kinetischer Energie besaß.

Gemäß der Erfindung wird für die Erzeugung extrem hoher Drücke und Temperaturen eine Vorrichtung vorgeschlagen, die eine geschlossene Kammer für das auf die Drücke und Temperaturen zu bringende Material besitzt, bei der eine jenem Material gegenüberliegende, selbst nicht aus Sprengstoff bestehende Wand der Kammer mit einem Sprengstoff belegt ist, wobei diese Wand und ihre Sprengstoffbelegung so ausgebildet sind, daß die Wand durch den bei der Detonation des Sprengstoffes auftretenden Druck auf das genannte Material hin bewegt und in eine zu dem genannten Material hin konkave Form plastisch verformt wird.

[...] In such cases, a method can be used which is based on transferring the kinetic energy of a larger mass almost completely to a mass as small as possible in a very small spatial region. From the transition from large to small masses one attains the greatest energy density, just as a high pressure is obtained in the transition from large to small surfaces, or large loads are lifted with a small force by the application of long paths.

This principle of transferring the kinetic energy of large masses to smaller ones is, for example, applied in the so-called water hammer or hydraulic ram; a larger stream of water is suddenly braked; the pressure occurring in the process lifts a fraction of the accumulated water to a certain height and thus gives it a higher amount of potential energy per unit volume than the kinetic energy of the initially flowing water.

According to the invention, an apparatus is proposed for the production of extremely high pressures and temperatures, which has a closed chamber for the material to be subjected to pressures and temperatures, in which a wall of the chamber, which does not consist of explosives itself, is lined with an explosive, this wall and its explosive covering being designed in such a way that the wall is moved towards the said material by the pressure occurring during the detonation of the explosive and is plastically deformed into a concave shape towards the said material.

Diese Vorrichtung beruht zum Teil auf dem Prinzip der sogenannten Hohlsprengladung. Der maßgebende Teil solcher Hohlsprengladungen besteht aus einem metallischen Hohlkörper von vorzugsweise kegel-, glocken- oder flaschenförmiger Gestalt, welcher außen mit einem Sicherheitssprengstoff, z.B. Hexogen oder Trinitrotoluol, umgeben ist. Bei der Detonation des letzteren gehen die einzelnen Wandelemente des genannten Hohlkörpers unter dem Einfluß des Druckes von etwa 100 000 Atm in den plastischen Zustand über und erhalten eine nach innen gerichtete Geschwindigkeit von mehreren Kilometern pro sec. Beim Zusammentreffen der beschleunigten Wandelemente auf der Hohlraumachse wird ihre Bewegung gebremst, wobei auf einen geschmolzenen Anteil ihrer Masse ein hoher Druck ausgeübt wird. Durch diesen Druck werden die flüssig gewordenen Teilchen in Form eines feinen Strahles mit großer Geschwindigkeit aus dem sich zusammenziehenden Hohlraum herausgepreßt. Bei geeigneter Hohlraumform erreicht man in solchen Hohlsprengladungen Strahlgeschwindigkeiten bis zur doppelten Detonationsgeschwindigkeit, also beispielsweise bei Hexogen 2 × 8 km/sec = 16 km/sec. Dieser Geschwindigkeit entspricht ein Druck im Quellgebiet des Strahles von etwa 10^7 kg/cm^2. [...]

An dem folgenden speziellen Beispiel soll dies näher erläutert werden. Die zu verdichtende Substanz sei in gasförmigem Zustand in einer metallischen Hohlkugel untergebracht, welche außen mit einer Schicht eines brisanten Sprengstoffes belegt ist. Bei geeigneter, gleichmäßig über die ganze Oberfläche eingeleiteter Zündung der Sprengstoffschicht wird für kurze Zeit ein sehr hoher Druck auf die Kugelschale ausgeübt, unter dessen Einwirkung das Metall wie bei den Hohlsprengkörpem in den plastischen Zustand gerät und zum Kugelmittelpunkt hin beschleunigt wird. Dadurch wird die eingeschlossene Gasmasse außerordentlich rasch verdichtet und dabei sehr hoch erhitzt.

This device is based, in part, on the principle of the so-called shaped-charge blasting. The decisive part of such hollow-spring bladders consists of a metallic hollow body of preferably conical, bell-shaped or bottle-shaped shape which is externally provided with a safety explosive, for example hexogen or trinitrotoluene. During the detonation of the latter, the individual wall elements of said hollow body are converted into the plastic state under the influence of the pressure of about 100,000 atmospheres, and receive an inward velocity of several kilometers per second. When the accelerated wall elements meet on the cavity axis, their movement is braked, a high pressure being exerted on a molten portion of their mass. By this pressure the particles, which have become fluid, are pressed out of the constricting cavity in the form of a fine jet at high speed. With a suitable cavity shape, jet velocities of up to twice the detonation velocity are achieved in such hollow-jet blowers, for example, in the case of hexogen 2 × 8 km/sec = 16 km/sec. This pressure corresponds to a pressure in the source region of the jet of about 10^7 kg/cm^2. [...]

This will be explained in more detail in the following specific example. The substance to be compacted is placed in a gaseous state in a metallic hollow sphere, which is externally coated with a layer of a high explosive. In the case of a suitable ignition of the explosive layer uniformly introduced over the entire surface, a very high pressure is exerted on the ball shell for a short time, under the effect of which the metal becomes, as in the case of the hollow bubble bodies, into the plastic state and is accelerated towards the ball center point. As a result, the enclosed gas mass is extremely rapidly compressed and thereby heated very high.

Die dabei auftretenden Beschleunigungen sind ungeheuer groß. Während der Kontraktion der Hohlkugel nimmt ihre Wandstärke dauernd zu. Nähert sich dabei die Innenfläche dem Kugelmittelpunkt, so erhalten die an der Innenfläche gelegenen Materialteilchen sehr hohe Geschwindigkeiten. Man erkennt dies sofort, wenn man sich vergegenwärtigt, welchen Raum das von der Außenfläche—auch bei einem nur kleinen zurückgelegten Weg derselben—überstrichene Volumen einnimmt, wenn es als Kugel um den Mittelpunkt angeordnet wird.

Geht man beispielsweise von einer Hohlkugel vom Innendurchmesser $2R = 100$ cm und der Wandstärke 2 cm aus, so füllt das Schalenmaterial eine Kugel vom Durchmesser

The accelerations occurring in this case are enormous. During the contraction of the hollow spheres their wall thickness increases continuously. As the inner surface approaches the center of the sphere, the material particles located on the inner surface are given very high velocities. This is immediately apparent when we consider the space being spanned—even for a small distance travelled—when it is arranged as a sphere around the center.

If, for example, a hollow sphere with an internal diameter of $2R = 100$ cm and wall thickness 2 cm is compacted, the shell material fills a sphere of diameter

$$2R_0 \;=\; 2\sqrt[3]{52^3 - 50^3} \;=\; 2\sqrt[3]{15608} \;\approx\; 50\,\text{cm}, \tag{D.1}$$

wenn die Hohlkugel völlig zusammengeschrumpft ist, und legt während des letzten Teiles der Kontraktion die Außenfläche einen Weg von nur ¹⁄₁₀ mm zurück, so beträgt in der gleichen Zeit der entsprechende Weg der Innenfläche 2,66 cm, das ist 266mal soviel.

In Fig. 1a bis 1d ist die Kontraktion einer Hohlkugel im Schnitt schematisch dargestellt. Die starke Schrumpfung des Innenraumes, besonders gegen Ende des Vorganges im Vergleich mit der verhältnismäßig geringen Abnahme des Außendurchmessers, macht das Auftreten enormer Beschleunigungen verständlich. [...]

Bei der Beschleunigung mittels detonierender Sprengstoffe sind Anfangsgeschwindigkeiten von $\bar{v}$ = 3000 bis 4000 m/sec. noch bequem erreichbar. [...]

when the hollow sphere is completely shrunk, and during the last part of the contraction the outer surface is a path of only ¹⁄₁₀ mm, the corresponding distance of the inner surface is 2.66 cm, which is 266 times as much.

In Figs. 1a to 1d, the contraction of a hollow sphere is shown schematically in section. The severe shrinkage of the interior, especially towards the end of the process compared with the relatively small decrease in the outside diameter, makes the occurrence of enormous accelerations understandable. [...]

During acceleration by means of detonating explosives, initial velocities from $\bar{v}$ = 3000 to 4000 m/sec are yet easily accessible. [...]

Figure D.589: Figure from Schumann-Trinks patent application showing the implosion of a spherical shell to form a solid sphere of matter.

Zur technischen Durchführung des vorgeschlagenen Verfahrens ist folgendes zu bemerken:

Bei der visuellen Beobachtung eines Sprengvorganges, beispielsweise der Detonation einer Bombe, gewinnt man leicht den Eindruck, als ob dieser Vorgang sich recht ungeordnet vollzöge und daß man sich bei den ungeheuren Belastungen des Materials immer mit gewissen nicht steuerbaren Zufälligkeiten abfinden müsse.

Die modernen Untersuchungsmethoden mit mechanischen Hochleistungszeitdehnern, Funken-, Kerrzellen- und Röntgenblitzkinematographen haben jedoch ergeben, daß Detonationsvorgänge mit derselben Exaktheit ablaufen wie andere physikalische Vorgänge und daß ihr Ablauf und der eintretende Endzustand genau reproduzierbar sind, wenn nur stets von den gleichen Anfangszuständen ausgegangen wird.

Man darf daher bei der Vorbereitung einer Sprengung nicht glauben, es komme nicht so genau darauf an, sondern es ist sehr wichtig, aber auch zugleich lohnend, äußerste Sorgfalt dabei aufzuwenden. Es ist häufig vorgekommen, daß erwartete Effekte erst verspätet nachgewiesen werden konnten, weil man sie nach einem nicht genügend sorgfältig vorbereiteten und deshalb mißglückten Vorversuch voreilig abgetan hat.

Für die Vorbereitung von Anordnungen zur Durchführung des beschriebenen Verfahrens gilt das eben Gesagte ganz besonders, und es ist nicht zuletzt aus diesem Grunde in den angeführten Beispielen von einer Hohlkugel mit dem verhältnismäßig großen Durchmesser von 1 m gesprochen worden, weil dann Ungenauigkeiten leichter zu vermeiden sind.

For the technical implementation of the proposed method, the following should be noted:

When visually observing a blasting process, for example the detonation of a bomb, one easily gains the impression that this process is quite disordered, and that with respect to the enormous loads, one must always accept certain uncontrollable, random incidents.

However, the modern methods of investigation with high-performance mechanical time-lengtheners, spark-, Kerr-cells, and X-ray flash kinematographs have shown that detonation processes proceed with the same exactness as other physical processes and that their sequence and the final state are exactly reproducible when only the same initial states are always assumed.

It is therefore not permissible, when preparing a blasting, to believe that it is not so important, but it is very important, but at the same time worthwhile, to devote extreme care to it. It has often happened that the expected effects could not be demonstrated until later, because they were prematurely dismissed after a preliminary experiment which had not been carefully prepared and therefore failed.

For the preparation of arrangements for carrying out the described method, the above is particularly true, and for this reason, in the examples given, a hollow sphere with the comparatively large diameter of 1 meter has been discussed, since inaccuracies are then easier to avoid.

Besonders ist es die möglichst strenge Einhaltung der Gleichzeitigkeit der Zündung, die in allen vorliegenden Fällen von besonderer Bedeutung ist und die sich bei größeren Körpern leichter erzielen läßt als bei kleineren. Es ist verhältnismäßig schwierig, einen Sprengkörper an allen Punkten einer beliebig geformten Oberfläche gleichzeitig zu zünden. Statt einer flächenhaften Zündung empfiehlt es sich deshalb, eine solche in möglichst vielen Einzelpunkten vorzunehmen.

Einen verhältnismäßig hohen Grad der Gleichzeitigkeit erreicht man dabei mit Hilfe der sogenannten detonierenden Zündschnur (kabelähnlich umsponnene Nitropentaerythrit-oder Fulminat-Seele), indem man Hilfszündpunkte Z_H anwendet, von denen man zu den eigentlichen Zündpunkten Z_1, Z_2, Z_3,... gleich lange Stücke dieser Zündschnur mit konstanter Detonationsgeschwindigkeit (etwa 7500 m/sec) führt.

In Fig. 7 ist eine spreng-physikalische Anordnung zur Erzielung sehr hoher Drücke und Temperaturen dargestellt. Die metallische Hohlkugel B ist von einer Sprengstoffschicht Sp umgeben mit einer Anzahl von Zündern Z, die unter Verwendung von Hilfszündern Z_H und gleich langer Stücke detonierender Zündschnüre gleichzeitig gezündet werden können. Die punktierten Halbkreise in der schraffiert gezeichneten Sprengstoffschicht deuten die Fronten der von den einzelnen Zündern ausgehenden Detonationswellen kurz vor Erreichen der Außenbegrenzung der metallischen Hohlkugel B an.

It is particularly important to observe as closely as possible the simultaneity of the ignition, which is of particular importance in all cases, and which is easier to obtain in larger bodies than in smaller ones. It is relatively difficult to simultaneously ignite an explosive at all points of any arbitrarily shaped surface. Instead of a large-area ignition, it is therefore recommended to carry out such an operation in as many individual points as possible.

To reach a relatively high degree of simultaneity place with the help of so-called detonating fuse (braided nitropentaerythrite or fulminate-soul) by introducing secondary ignition points Z_H, from which one of the actual ignition points Z_1, Z_2, Z_3,... pieces of equal length this detonating cord leads (about 7500 m/sec) at a constant velocity of detonation.

Fig. 7 shows an explosive physical arrangement for achieving very high pressures and temperatures. The metallic hollow sphere B is surrounded by an explosive layer Sp with a number of detonators Z which can be ignited simultaneously using auxiliary detonators Z_H and equally long pieces of detonating cords. The punctured semicircles in the shaded explosive layer indicate the fronts of the detonation waves emanating from the individual detonators shortly before the outer limit of the metallic hollow sphere B is reached.

Fig. 7

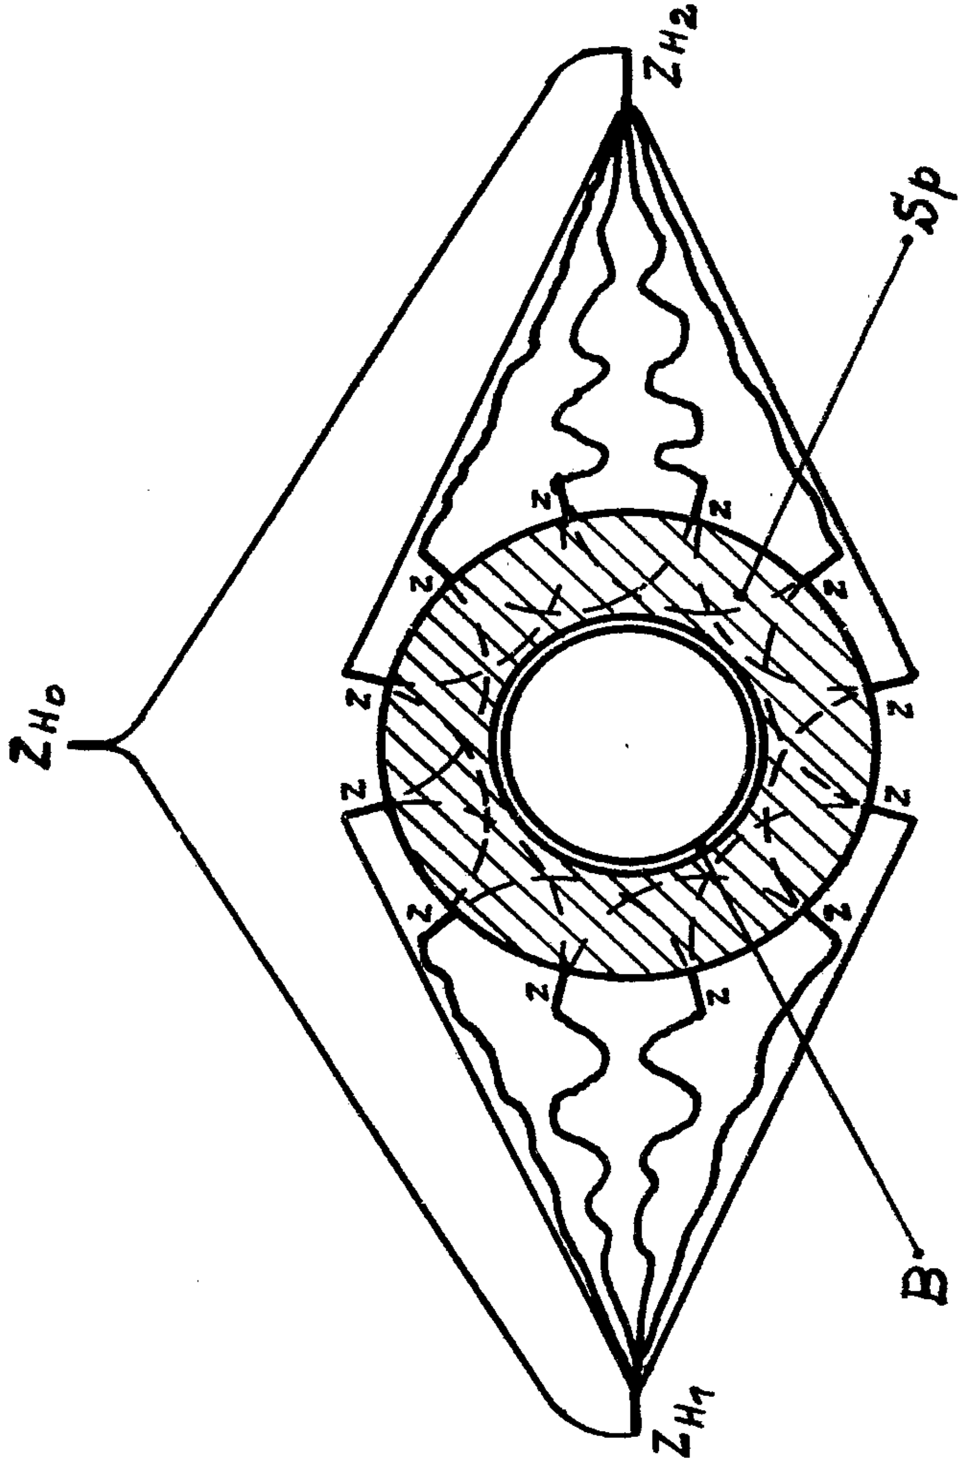

Figure D.590: Figure from Schumann-Trinks patent application showing a spherical implosion bomb design with multiple concentric layers used to trigger nuclear reactions. (See also p. 4229.)

Bei Verwendung elektrischer Zünder ist darauf zu achten, daß diese eine sehr geringe und konstante Verzugszeit aufweisen. Einer Zeitdifferenz von einer millionstel Sekunde entspricht bereits ein Weg der Detonationsfront von rund 1 cm, jedoch ebenfalls ein solches Stück der detonierenden Zündschnur, so daß bei deren Verwendung gute Genauigkeiten zustande kommen. Fehler durch etwa vorhandene Fehlstellen oder Unregelmäßigkeiten in der Schnur können dadurch vermieden werden, daß für jede Übertragungsstrecke mehrfache Schnüre verwendet werden.

Eine Glättung der gewünschten kugelförmigen, zum Mittelpunkt hinlaufenden Detonationsfront ist in Anlehnung an die Optik durch die Verwendung von “Sprengstofflinsen” möglich. Ähnlich wie dort die Lichtstrahlen kann man hier ein divergentes Bündel von Detonationsstrahlen in ein konvergentes umwandeln, indem man in dem Sprengkörper mit der Detonationsgeschwindigkeit D entweder konvexe oder konkave Linsen aus einem Sprengstoff mit größerer Detonationsgeschwindigkeit als D zwischen den Zünder und die zu beschleunigende Hohlkugeloberflache einschiebt. So kann man beispielsweise konvexe Linsen aus Trinitrotoluol bei einem Hauptsprengkörper aus Hexogen oder konkave Linsen aus Hexogen oder Nitropentaerythrit bei einem Hauptsprengkörper aus Trinitrotoluol verwenden.

Sprengstoffe mit noch kleineren Detonationsgeschwindigkeiten, beispielsweise Bergwerkssprengstoffe, sind für derartige Anwendungen nicht geeignet.

Obgleich sie einen größeren “Brechungsindex” ergeben würden, wird man doch wegen ihrer zu geringen Homogenität von ihrem Gebrauch für den vorliegenden Zweck absehen.

When using electric igniters, care must be taken that these have a very low and constant delay time. A time difference of one millionth of a second corresponds already to a distance of about 1 cm of the detonation front, but also to such a portion of the detonating fuse, so that good accuracies are obtained when they are used. Flaws caused by any imperfections or irregularities in the cord can be avoided by using multiple cords for each transfer path.

A smoothing of the desired spherical detonation front leading to the center is possible according to principles similar to those in optics through the use of “explosive lenses.” Similar to light beams, a divergent bundle of detonation beams can be transformed into a convergent one by inserting either the convex or concave lenses of an explosive with a greater detonation velocity than D between the detonators and the hollow spherical surface to be accelerated. For example, convex lenses made of trinitrotoluene can be used within a main body made of hexogen, or concave lenses made of hexogen or nitropentaerythrite within a main body made of trinitrotoluene.

Explosives with even lower detonation velocities, for example mining explosives, are not suitable for such applications.

Although they would give a larger “index of refraction,” their inadequate homogeneity will be considered to be of no use for the present purpose.

Die Form der Trennflächen zwischen den Sprengstoffen mit den verschiedenen Detonationsgeschwindigkeiten (D_1 und D_2) ergibt sich sehr einfach aus der folgenden Bedingung für die Wege s der Detonationsstrahlen

The shape of the interfaces between the explosives with the different detonation velocities (D_1 and D_2) is obtained very simply from the following condition for the paths s of the detonation rays

$$\frac{s_1}{D_1} + \frac{s_2}{D_2} = \text{const} = \frac{s_{10}}{D_1} + \frac{s_{20}}{D_2} \tag{D.2}$$

für eine einfache Trennfläche

for a simple separation surface

oder

or

$$\frac{s_1}{D_1} + \frac{s_2}{D_2} + \frac{s_1'}{D_1} = \text{const} = \frac{s_{10}}{D_1} + \frac{s_{20}}{D_2} + \frac{s_{10}'}{D_1} \tag{D.3}$$

für eine doppelte Trennfläche bei “Linsen”, wobei sich die Indizes 1 und 2 auf die beiden Sprengstoffe und der Index 0 auf den kürzesten Detonationsweg beziehen.

for a double separation surface for “lenses,” the indices 1 and 2 refer to the two explosives and the index 0 to the shortest detonation path.

In der Fig. 8 ist eine solche Umkehr der Krümmung der Detonationsflächen bei der Verwendung von Trinitrotoluol mit $D_1 = 6500$ m/sec und eines Zwischenkörpers aus Nitropentaerythrit mit $D_2 = 7800$ m/sec dargestellt. Die Figur zeigt, wie durch Einschaltung derartiger Sprengstoff-Linsen die gestrichelt dargestellten Detonationsflächen im Lauf ihres Fortschreitens der Krümmung der zu beschleunigenden Masse M angepaßt werden.

Fig. 8 shows such a reversal of the curvature of the detonation surfaces during the use of trinitrotoluene with $D_1 = 6500$ m/sec and an intermediate body of nitropentaerythritol with $D_2 = 7800$ m/sec. The figure shows how, by the activation of such explosive lenses, the detonation surfaces represented by dashed lines are adapted in the course of their progress to the curvature of the mass M to be accelerated.

Zur Erzielung einer möglichst großen Energiedichte ist es vorteilhaft, einen Sprengstoff mit möglichst hoher Detonationsgeschwindigkeit, z.B. Hexogen, für die Beschleunigung der Hohlkugelwand zu verwenden. Zweckmäßig preßt man dann die Sprengstoffumhüllung des Druckgefäßes als einzelne Teilstücke. Auf diese Weise läßt sich eine bessere Homogenität der Sprengstoffhülle und damit ein gleichmäßigerer Ablauf der Detonation erzielen als mit gegossenen Mischungen, welche häufig Lunker und andere Inhomogenitäten enthalten.

In order to achieve the greatest possible energy density, it is advantageous to use an explosive with the highest possible detonation speed, for example, hexogen [RDX], for the acceleration of the hollow ball wall. Expediently, the explosive lining of the pressure vessel is then pressed as individual parts. In this way, a better homogeneity of the explosive shell and thus a more uniform discharge of the detonation can be achieved than with cast mixtures, which often contain voids and other inhomogeneities.

Figure D.591: Figure from Schumann-Trinks patent application showing an explosive lens containing shaped segments of two different explosive materials with different explosion velocities.

Im Hinblick auf einen möglichst gleichmäßigen Ablauf der Detonation, insbesondere auch auf ein möglichst regelmäßiges Anlaufen derselben in der Umgebung der Zündstellen sowie auf eine gute Aus- nutzung des Sprengstoffes ist es ferner vorteilhaft, die Sprengstoffschicht außen mit einer Verdämmung zu versehen und den ganzen Körper beispielsweise in Beton oder Erdbereich einzubetten. Beispielsweise ist es zweckmäßig, die nach außen frei werdende Sprengstoffenergie zugleich anderweitig auszunutzen, indem man derartige Versuche in Bergwerken oder Steinbrüchen durchführt.

Zur besseren Beobachtung der Vorgänge während und kurz nach der Detonation sowie zur leichteren Auffindung der verbleibenden Rückstände, welche die wertvollen Endprodukte enthalten, wird es sich jedoch auch häufig empfehlen, den Sprengkörper unverdämmt einige Meter über einer möglichst ebenen und glatten Fläche des Erdbodens frei aufzuhängen.

Im übrigen ist eine Zerlegung der Hohlkugel in viele Einzelteile nicht zu erwarten, da sie zusammenschrumpft und ihre Wandstärke dann 20- bis 30-mal so groß wie der Innenraum weit ist. Nachteilig ist bei den erwähnten Ausführungsbeispielen, daß sich bei den größeren der geplanten Körper recht erhebliche Gewichte ergeben, so daß auch aus diesem Grunde gegossene Sprengkörper kaum in Frage kommen, weil diese zu unhandlich werden würden. Eine eiserne Hohlkugel vom Durchmesser 1 m und der Wandstärke von nur 1 cm wiegt z.B. etwa 250 kg. Dazu kommt bei 20 cm starker Belegung ein Sprengstoffgewicht von etwa 1500 kg. Zusammen mit der Außenverdämmung ergibt sich so ein Gesamtgewicht von rund 2 t. [...]

With a view to the as uniform as possible of the detonation, in particular also to a regular start-up of the same in the vicinity of the ignition points, as well as to a good utilization of the explosive, it is also advantageous to provide the explosive layer with an external tamper and to place the whole arrangement in concrete or in earth, too. For example, it is practical to simultaneously exploit the outwards-released explosive energy by performing such experiments in mines or quarries.

For the better observation of the processes during and shortly after the detonation as well as for the easier detection of the remaining residues, which contain the valuable end products, it is also frequently recommended to freely hang the explosive device a few meters above a flat and smooth surface of the ground.

Moreover, it is not to be expected that the hollow spheres will be decomposed into many parts, since they shrink together and their wall thickness is then 20 to 30 times as large as the interior space. It is disadvantageous in the case of the mentioned exemplary embodiments that the larger of the planned bodies produce quite considerable weights so that explosive bodies cast for this reason are scarcely to be considered because they would become too bulky. An iron hollow sphere of diameter 1 m and wall thickness of only 1 cm weighs for example about 250 kg. In addition, an explosive weight of about 1500 kg is obtained when the coating is 20 cm thick. Together with the outer insulation, this results in a total weight of around 2 tons. [...]

[Compare Erich Schumann's designs for a two-ton spherical implosion bomb with other descriptions of the German fission bomb design (p. 4157), especially Ivan Ilyichev's 23 March 1945 report (p. 4485).]

Neben der eben beschriebenen Abänderung der prinzipiell sehr einfachen, jedoch in der praktischen Durchführung etwas komplizierten rein kugelförmigen dynamischen Druckzelle gibt es noch eine ganze Reihe anderer Möglichkeiten, die Grundidee der Übertragung der kinetischen Energie größerer, sprengphysikalisch beschleunigter Massen auf wesentlich kleinere Massen und der Erzeugung hoher Drücke und Temperaturen auf diesem Wege zu verwirklichen.

Hierzu werden noch einige Ausführungsbeispiele angegeben. Zunächst soll auf eine Anordnung mit zylindrischer Druckkammer eingegangen werden. Diese hat eine Reihe von Vorzügen, insbesondere auch deshalb, weil sich dabei besonders einfache Wege zur Einleitung der Zündung ergeben. Als Beispiel hierfür ist in der Fig. 11 schematisch eine solche Anordnung im Aufriß dargestellt. Die Druckkammer B besteht aus einem Zylinder, auf dessen Grundflächen Halbkugeln aufgesetzt sind. Der Sprengstoff Sp umgibt die Zylinderwand in Form eines Doppelkegels, längs dessen Grundlinie die Zündung gleichzeitig erfolgt. Dazu ist der Sprengstoff Sp umhüllt mit einem Mantel aus inertem Material J, beispielsweise Zement, welcher selbst wiederum außen mit einer dünnen Sprengstoffschicht Sp verkleidet ist. Wird dann letztere gleichzeitig in den beiden Spitzen des entstandenen Doppelkegels gezündet, so läuft die Detonation zugleich in zwei Ästen die beiden Kegelmäntel entlang, ohne dabei zunächst den inneren Sprengkörper zu beeinflussen, weil jener durch die inerten Zwischenschichten geschützt ist.

In addition to the modification of the purely spherical dynamic pressure cell which has been described above, but which is somewhat complicated in practice, there are also a whole series of other possibilities for the transfer of the kinetic energy of larger, physically accelerated masses to substantially smaller masses and the generation of high pressures and temperatures in this way.

For this purpose, a few exemplary embodiments are given. First, an arrangement with a cylindrical pressure chamber will be described. This has a number of advantages, in particular also because there are particularly simple ways of initiating the ignition. An example of such an arrangement is shown schematically in Fig. 11. The pressure chamber B consists of a cylinder, on the bases of which are placed hemispheres. The explosive Sp surrounds the cylinder wall in the form of a double cone, along which the ignition takes place at the same time. For this purpose, the explosive Sp is covered with a jacket of inert material J, for example cement, which itself is once again covered with a thin explosive layer Sp. If the latter is then ignited simultaneously in the two peaks of the resulting double cone, the detonation runs simultaneously into two branches along the two conical coats, without first affecting the inner explosive, because the latter is protected by the inert intermediate layers.

J
Z_1
Z_2
J
B
M
Sp

Figure D.592: Figure from Schumann-Trinks patent application showing a biconic implosion bomb.

Bei dem Zusammentreffen der beiden Zündäste wird dann erst der innere Sprengstoffdoppelkegel längs seiner Grundlinie, an welcher die inerte Umhüllung unterbrochen ist, intensiv gezündet. Durch die Wahl der symmetrischen Zündungsäste von den beiden Spitzen des Doppelkegels aus wird eine größere Gleichmäßigkeit mit einer besonders kräftigen Einleitung der Zündung des Hauptkörpers verbunden. Bei dieser Zündung werden nun die Elemente der mittleren Zone des metallischen Hohlzylinders gleichzeitig von der Detonation erfaßt und zur Achse hin beschleunigt. Dort werden nun entweder durch die rasche Kompression einer Gas-oder Dampffüllung oder aber, bei evakuiertem Hohlraum, beim Zusammentreffen der Wandelemente auf der Hohlraumachse hohe Drücke und Temperaturen erzeugt.

Eine im Prinzip ähnliche Anordnung mit zylindrischer Druckkammer B ist in der Fig. 12 dargestellt. Der Unterschied gegenüber der im vorhergehenden beschriebenen besteht erstens darin, daß hier die Druckkammer B an ihren Grundflächen durch starke verdämmende Metallplatten Me abgeschlossen ist, und zweitens die Wellenfront bei der Detonation durch linsenähnliche Sprengstoffanordnungen, beispielsweise aus Trinitrotoluol und Hexogen, weitgehend einer Zylinderfläche angeglichen wird. Die Zündführung Z_f verläuft innerhalb einer Packung aus inertem Material J.

When the two ignition branches meet, the inner explosive double cone is then intensively ignited along its basic line, at which the inert enclosure is interrupted. By selecting the symmetrical ignition branches from the two tips of the double cone, greater uniformity is combined with a particularly powerful introduction of the ignition of the main body. At this time, the elements of the central zone of the metallic hollow cylinder are simultaneously caught by the detonation and accelerated towards the axis. In this case, high pressures and temperatures are generated either by the rapid compression of a gas or steam filling or, in the case of an evacuated cavity, when the wall elements meet on the cavity axis.

A basically similar arrangement with a cylindrical pressure chamber B is shown in Fig. 12. The difference compared to the one described above consists, first, in that the pressure chamber B is terminated at its base surfaces by strong, damming metal plates Me, and second the wavefront is largely matched to a cylinder surface by detonation by means of lens-like explosive arrangements, for example from trinitrotoluene and hexogen. The ignition guide Z_f runs within a pack of inert material J.

Figure D.593: Figure from Schumann-Trinks patent application showing a cylindrical implosion bomb.

Walter Trinks. German patent DE977862. Vorrichtung nach Patent 977825 zur Behandlung von Material mit hohen Drücken und Temperaturen. Filed 13 August 1952.

Die Verformung und Beschleunigung der Hilfsmasse erfordert eine beträchtliche Energiemenge, die für die Druckerzeugung innerhalb der Kammer verlorengeht. Es besteht daher das Bedürfnis, diese Hilfsmasse aus einem relativ leichten und plastischen Material herzustellen, und es bewährte sich besonders Aluminium.

Auch die Kammerwände kann man ganz oder teilweise aus Aluminium herstellen. [...]

PATENTANSPRUCH:

Vorrichtung nach Patent 977 825 zur Behandlung von Material mit hohen Drücken und Temperaturen, dadurch gekennzeichnet, daß die durch die Detonation zu beschleunigende Masse (und gegebenenfalls die Kammerwand) aus Aluminium besteht.

The deformation and acceleration of the auxiliary mass requires a considerable amount of energy which is lost for the generation of the printer within the chamber. There is therefore a need to manufacture these auxiliary materials from a relatively light and plastic material, and aluminum has proved particularly suitable.

The chamber walls can also be made entirely or partly from aluminum. [...]

PATENT CLAIM:

Apparatus according to patent 977,825 for the treatment of material with high pressures and temperatures, characterized in that the mass to be accelerated by the detonation (and, if appropriate, the chamber wall) consists of aluminum.

Walter Trinks. German patent DE977839. Vorrichtung nach Patent 977825 zur Erzielung hoher Drücke und Temperaturen zwecks Einleitung mechanischer, thermischer oder nuklearer Prozesse mittels einer gleichmaessig mit Sprengstoff belegten, die Reaktionskammer umschliessenden Hohlkugel. Filed 13 August 1952.

PATENTANSPRUCH:

Vorrichtung nach Patent 977 825 zur Behandlung von Material mit hohen Drücken und Temperaturen, dadurch gekennzeichnet, daß mehrere Kugeln mit von innen nach außen zunehmender Wandstärke und Sprengstoffbelegung ineinander angeordnet sind.

PATENT CLAIM:

A device according to patent 977,825 for the treatment of material with high pressures and temperatures, characterized in that a set of spherical shells are arranged concentrically with wall thickness and explosive material increasing from the inside outwards.

Erich Schumann and Walter Trinks. Patent DE977863. Vorrichtung zur Behandlung von Material mit hohen Drücken und Temperaturen. Filed 13 August 1952.

Das Hauptpatent betrifft eine Vorrichtung, um Material zur Einleitung von mechanischen, thermischen oder nuklearen Prozessen auf extrem hohe Drücke und Temperaturen zu bringen. Dabei sieht man eine geschlossene Kammer für das auf die Drücke und Temperaturen zu bringende Material vor und belegt eine jenem Material gegenüberliegende, selbst nicht aus Sprengstoff bestehende Wand der Kammer mit einem Sprengstoff. Die Wand und ihre Sprengstoffbelegung werden so ausgebildet, daß die Wand durch den bei einer Detonation des Sprengstoffes auftretenden Druck auf das genannte Material hin bewegt und in eine zu dem genannten Material hin konkave Form plastisch verformt wird.

Für die Freimachung von Atomenergie auf der Uranbasis ist es von großem Nachteil, daß, abgesehen von dem verhältnismäßig seltenen Vorkommen der Uranerze, ein ganz ungeheurer Aufwand erforderlich ist, um das spaltbare, nur mit ganz geringem Prozentsatz im Uran enthaltene Isotop abzutrennen oder um das ihm gleichwertige Plutonium zu gewinnen.

Bei diesem Sachverhalt ist es von großer Bedeutung, daß außer den Spaltungen der wenig stabilen schweren Kerne, z.B. des Uran 235 oder des Plutoniums, noch andere Kernprozesse existieren, bei denen ebenfalls große Energiebeträge frei werden, wobei jedoch die Ausgangsprodukte dieser Prozesse viel häufiger vorkommen und mit verhältnismäßig geringem Aufwand, z.B. aus Wasser, rein dargestellt werden können.

Es handelt sich hier im Gegensatz zu den Spaltprozessen der schweren Kerne, welche am Ende des periodischen Systems der Elemente stehen, um Reaktionen zwischen den Kernen der leichtesten Elemente, z.B. leichter und schwerer Wasserstoff, Lithium, Beryllium und Bor. [...]

The main patent relates to a device for bringing material to extremely high pressures and temperatures to initiate mechanical, thermal or nuclear processes. In this case, a closed chamber is provided for the material to be subjected to the pressures and temperatures, and a wall of the chamber, which is opposite to the material, is exposed to an explosive. The wall and its explosive coating are formed in such a way that the wall is moved towards the said material by the pressure occurring upon detonation of the explosive and is plastically deformed into a concave shape towards the said material.

For the liberation of atomic energy on the basis of uranium, it is a great disadvantage that, apart from the relatively rare occurrence of the uranium ores, a tremendous effort is required to produce the fissionable, separable small percentage of the isotope contained in the uranium or to obtain the equivalent plutonium.

In this state of affairs it is of great importance that, besides the fission of the less stable heavy nuclei, for example uranium 235 or plutonium, other nuclear processes also exist in which large amounts of energy are also released, but the starting products of these processes are much more common and are produced with relatively little effort, for example from water.

Here, in contrast to the fission processes of the heavy nuclei, which are at the end of the periodic table of the elements, in order to establish reactions between the nuclei of the lightest elements, for example light and heavy hydrogen, lithium, beryllium and boron. [...]

Temperaturen und Drucke der erforderlichen Höhe lassen sich experimentell und kurzzeitig mit sprengphysikalischen Mitteln erreichen und zur Einleitung und Durchführung von Atomkernreaktionen verwenden, wenn man die in dem Patent 977 825 beschriebenen Vorrichtungen zur Erzeugung höchster Drücke und Temperaturen nutzbar macht.

[...] Eine andere Form der Druckkammer besteht gemäß Fig. 4 in einer mit der zu behandelnden Substanz angefüllten, in brisanten Sprengstoff *Sp* eingebetteten Hohlkegel *B*, beispielsweise aus Eisen, Kupfer, Zink, Aluminium, Blei, Wolfram, Graphit od. dgl., deren Wandung gleichzeitig als zu beschleunigende Hilfsmasse dient. Die Schrumpfung des Innenraumes bei gleichzeitiger Zündung der auf der Oberfläche der Sprengstoffumhüllung angeordneten Zünder *Z* macht das Auftreten enormer Beschleunigungen verständlich.

Zur Glättung der Detonationsfront und zur Anpassung derselben an die Außenoberfläche der Kugel in der Umgebung der einzelnen Zündstellen können auch hier Linsen aus Sprengstoffen mit verschiedenen Detonationsgeschwindigkeiten angeordnet sein.

Zur Verlängerung der Einwirkungszeit können zwei oder mehrere der Hohlkugeln ineinandergeschachtelt sein, wobei Wandstärke und Sprengstoffbelegung der jeweils folgenden äußeren Hohlkugel stärker dimensioniert sind als diejenigen der jeweils vorhergehenden inneren Hohlkugel. [...]

Wird z.B. ½ Kubikmeter schweren Wasserstoffgases vom Anfangsdruck 0,1 at, das sind rund 9 g, nach den Reaktionsgleichungen

Temperatures and pressures of the required magnitude can be obtained experimentally and for short times by explosive-physical means and can be used to initiate and carry out atomic nuclear reactions if the devices described in patent 977,825 are used to generate the highest pressures and temperatures.

[...] According to Fig. 4, another form of the pressure chamber consists of a hollow cone *B*, which is filled with the substance to be treated and is embedded in explosive explosive *Sp*, for example of iron, copper, zinc, aluminum, lead, tungsten, graphite or the like, at the same time serves as an auxiliary mass to be accelerated. The shrinkage of the interior while simultaneously igniting the detonator *Z* located on the surface of the explosive envelope makes it possible to achieve enormous accelerations.

For smoothing the detonation front and adapting it to the outer surface of the ball in the vicinity of the individual ignition points, here, too, lenses of explosives with different detonation velocities can be arranged.

To prolong the exposure time, two or more of the hollow spheres can be nested within each other. Both the wall thickness and the thickness of the explosive liner of the next outer hollow sphere must be shaped larger than those of the preceding inner hollow spheres. [...]

For example, ½ cubic meter of deuterium gas with the initial pressure 0.1 atmosphere, which is about 9 g, according to the reaction equations becomes

$$ {}^{2}_{1}\mathrm{D} + {}^{2}_{1}\mathrm{D} = {}^{3}_{2}\mathrm{He} + {}^{1}_{0}\mathrm{n} + 3.3\,\mathrm{MeV} \tag{D.4} $$

und

and

$$ {}^{2}_{1}\mathrm{D} + {}^{2}_{1}\mathrm{D} = {}^{3}_{1}\mathrm{H} + {}^{1}_{1}\mathrm{H} + 4.0\,\mathrm{MeV} \tag{D.5} $$

[...] Ferner ist zu beachten, daß bei den dann erreichten hohen Temperaturen auch andere Kernprozesse genügend wahrscheinlich werden, so daß sie mit zur Energieerzeugung herangezogen werden können.

[...] It should also be noted that, in the case of the then high temperatures, other nuclear processes become sufficiently probable so that they can be used for the generation of energy.

Bei Anwesenheit von Protonen wird z.B. auch die sehr energiereiche Reaktion

In the presence of protons, for example, also the very energetic reaction

$$^{3}_{1}\mathrm{Tr} + {}^{1}_{1}\mathrm{H} = {}^{4}_{1}\mathrm{He} + 20\ \mathrm{MeV} \tag{D.6}$$

stattfinden, welche nach den Deuteronenprozessen die wahrscheinlichste Kernreaktion ist, oder bei Anwesenheit von Lithium die Reaktionen

takes place, which is the most probable nuclear reaction after the deuteron processes, or the reactions in the presence of lithium

$$^{7}_{3}\mathrm{Li} + {}^{1}_{1}\mathrm{H} = 2\,{}^{4}_{2}\mathrm{He} + 17\ \mathrm{MeV} \tag{D.7}$$

und

and

$$^{6}_{3}\mathrm{Li} + {}^{2}_{1}\mathrm{D} = 2\,{}^{4}_{2}\mathrm{He} + 22.5\ \mathrm{MeV} \tag{D.8}$$

sowie

just as

$$^{7}_{3}\mathrm{Li} + {}^{2}_{1}\mathrm{D} = 2\,{}^{4}_{2}\mathrm{He} + {}^{1}_{0}\mathrm{n} + 15\ \mathrm{MeV} \tag{D.9}$$

welch letztere wiederum Neutronen befreit.

which in turn liberates neutrons.

Die Deuteronenprozesse spielen dann vergleichsweise die Rolle des leicht entzündlichen Zündholzes, das die schwerer entzündlichen Brennstoffe anzündet.

The deuteron processes then play comparatively the role of the highly flammable match that ignites the heavy flammable fuel.

Diesem Umstand kann man gemäß der Erfindung dadurch nutzbringend Rechnung tragen, daß man zugleich mit der Füllung der anzuwendenden Druckzellen mit Wasserstoff, insbesondere schwerem Wasserstoff, andere leichte Elemente, z.B. Lithium, Beryllium, Bor oder auch leichten Wasserstoff als Elemente oder in Form von chemischen Verbindungen an der Innenwand der Druckzellen oder auch in der Wand der Druckzellen, durch dünne Schichten vom Innenraum getrennt, zur Anwendung bringt. So empfiehlt sich beispielsweise die Verwendung von schwerem Lithiumhydrid (LiD).

According to the invention, this circumstance can be taken advantage of by virtue of the fact that, at the same time as the filling of the pressure cells to be applied with hydrogen, in particular heavy hydrogen, other light elements, for example, lithium, beryllium, boron or also light hydrogen as elements or in the form of chemical compounds on the inner wall of the pressure cells or also in the wall of the pressure cells, separated from the inner space by thin layers. For example, the use of heavy lithium hydride (LiD) is recommended.

Insgesamt wird so die Befreiung eines Energiebetrages möglich, der die zur Einleitung dieser Kernreaktionen aufzuwendende chemische Energie des Sprengstoffes (ungefähr 10^{16} erg) sehr beträchtlich überschreitet.

Auch die bei der einen der D-Kernreaktionen frei werdenden Neutronen können zur weiteren Befreiung von Energie herangezogen werden. Die Reaktion

$$ {}^{6}_{3}\mathrm{Li} + {}^{1}_{0}\mathrm{n} = {}^{3}_{1}\mathrm{Tr} + {}^{4}_{2}\mathrm{He} \tag{D.10}$$

würde z.B. auf Grund der Massenbilanz die Energie von 4,7 MeV befreien, oder die entsprechende Reaktion mit Bor

$$ {}^{10}_{5}\mathrm{B} + {}^{1}_{0}\mathrm{n} = {}^{7}_{3}\mathrm{Li} + {}^{4}_{2}\mathrm{He} \tag{D.11}$$

würde ungefähr 3 MeV freisetzen.

Ferner kann man die bei der Deuteronenreaktion frei werdenden Neutronen dazu benutzen, die Spaltung des U^{235} in dem natürlichen Uran, also dem gewöhnlichen Isotopengemisch, vorzunehmen.

Wenn die Innenwand der das Deuterium enthaltenden Druckzelle mit einer genügend starken Graphitschicht ausgekleidet wird, auf die eine Schicht Uran folgt, werden die frei werdenden Neutronen mit sehr hohem Energiegehalt auf thermische Neutronen abgebremst, ehe sie die Uranschicht erreichen. Dort werden sie dann nicht vom U^{238} eingefangen, sondern können an dem U^{235} die Spaltung hervorrufen. Man müßte dann nur, wie in allen Fällen, in denen die frei werdenden Neutronen herangezogen werden sollen, durch eine geeignete Außenhülle der anzuwendenden Druckzellen ein Entweichen nach außen verhindern, ähnlich wie dies bei den Atombomben durch den sogenannten “Tamper” geschieht.

In general, the liberation of an energy supply is possible, which greatly exceeds the chemical energy of the explosive (about 10^{16} erg) to be expended for the initiation of these nuclear reactions.

The neutrons released in one of the D nuclear reactions can also be used to further release energy. The reaction

would, for example, free the energy of 4.7 MeV on account of the mass balance, or the corresponding reaction with boron

would release about 3 MeV.

Furthermore, the neutrons liberated in the deuteron reaction can be used to carry out the fission of U^{235} in natural uranium, that is, the ordinary isotope mixture.

When the inner wall of the pressure cell containing the deuterium is lined with a sufficiently strong graphite layer followed by a layer of uranium, the liberating neutrons with a very high energy content are decelerated to thermal neutrons before they reach the uranium layer. There they are not caught by the U^{238}, but can cause the fission of the U^{235}. As in all cases in which the neutrons which are liberated are released, it is only necessary to prevent the escape from the outside by means of a suitable outer shell of the pressure cells to be applied, similar to that of the atom bombs by the so-called “tamper.”

Man kann auch die frei werdenden Neutronen aus den D-Kernreaktionen zunächst zu einer unmittelbaren Temperatursteigerung im Zentrum der Druckzelle benutzen, indem man dort eine winzige Menge Cadmium anbringt, welches die Neutronen unter Erhitzung absorbiert.

Wesentlich wichtiger als die Befreiung von Atomenergie zu militärischen Zwecken ist die Herstellung und Verwendung von Neutronen für friedliche Aufgaben.

Auf die Bedeutung und die große Intensität der bei der Umsetzung von Deuterium entstehenden Neutronenstrahlung wurde bereits weiter vorn hingewiesen. Hier sei nur noch hinzugefügt, daß selbst, wenn mit Hilfe des beschriebenen Verfahrens nur eine Temperatur von 2 Millionen Grad erreichbar wäre, aus nur 2 g schwerem Wasserstoff während 1 zehntausendstel sec nach den Resultaten von Bethe sowie Gamow und Teller ungefähr $3 \cdot 10^{21}$ Neutronen frei gemacht werden, was etwa 10^{18} Curie bzw. einer Radium-Berylliumquelle von rund 1 Milliarde kg entspricht. Eine starke Hochspannungsanlage würde 350 Jahre benötigen, um diese Neutronenmenge zu erzeugen.

Derartige Neutronenintensitäten sind bisher nur in den “Uran-piles” beobachtet worden. Ihre Erzeugung erfordert dort jedoch einen unvergleichlich größeren Aufwand, als er bei dem vorgeschlagenen Verfahren erforderlich ist.

PATENTANSPRÜCHE:

1. Vorrichtung nach Patent 977 825 zur Behandlung von Material mit hohen Drücken und Temperaturen, dadurch gekennzeichnet, daß die Wandung der Wasserstoff, insbesondere schweren Wasserstoff, enthaltenden Druckzelle leichte Elemente, wie Lithium, Beryllium, Bor oder leichten Wasserstoff als Element oder in gebundener Form aufweist.

It is also possible to use the free neutrons from the deuterium nuclear reactions for a direct increase in temperature at the center of the pressure cell by applying a minute quantity of cadmium which absorbs the neutrons while heating.

Essentially more important than the liberation of nuclear energy for military purposes is the production and use of neutrons for peaceful tasks.

The importance and the great intensity of the neutron radiation generated during the reaction of deuterium has already been pointed out before. In this case, it should be added that even if, by means of the method described, only a temperature of 2 million degrees is attainable, from only 2 g of heavy hydrogen is formed during one ten-thousandth of a second, according to the results of Bethe, and Gamow and Teller, approximately $3 \cdot 10^{21}$ neutrons, which is about 10^{18} Curie, or corresponding to a radium-beryllium source of around one billion kg. A strong high-voltage system would take 350 years to produce this neutron quantity.

Such neutron intensities have hitherto been observed only in “uranium piles.” However, their production requires an incomparably greater effort there than is required in the proposed method.

PATENT CLAIMS:

1. Apparatus according to patent 977,825 for the treatment of material with high pressures and temperatures, characterized in that the wall of the pressure cell containing hydrogen, in particular heavy hydrogen, has light elements, such as lithium, beryllium, boron or light hydrogen as element or in bound form.

2. Vorrichtung nach Anspruch 1, dadurch-gekennzeichnet, daß die leichten Elemente die Innenwand der Zelle bedecken.	2. Device according to Claim 1, characterized in that the light elements cover the inner wall of the cell.
3. Vorrichtung nach Anspruch 2, dadurch gekennzeichnet, daß die leichten Elemente durch eine dünne Schicht abgedeckt sind.	3. Device according to Claim 2, characterized in that the light elements are covered by a thin layer.
4. Vorrichtung nach Anspruch 1 oder folgenden, dadurch gekennzeichnet, daß die Wand wenigstens teilweise aus Uran, insbesondere natürlichem Uran, besteht.	4. Device according to Claim 1 or the following, characterized in that the wall is at least partly of uranium, in particular of natural uranium.
5. Vorrichtung nach Anspruch 4, dadurch gekennzeichnet, daß das Uran durch Graphit abgedeckt ist.	5. Device according to Claim 4, characterized in that the uranium is covered by graphite.

Top Secret Cable from Warsaw to Secretary of State. 7 March 1946 [NARA RG 77, Entry UD-22A, Box 160, Folder 205.2 Cables Incoming, Top Secret]

From: Warsaw

To: Secretary of State

Nr: 300 7 March 1946

Nr 300. Signed Lane.

Information has been given this Embassy by a capable young engineer working in the zinc industry, that one of the best if not the only material for atomic bomb containers is cadmium. According to the informant the cadmium output of Poland in 1945 amounted to 49.15 tons, and in January of 1946 to 10.9 tons. In 1945 there was exported to Russia the total Polish cadmium output.

End

ACTION: General Groves

INFO: General Spaatz, General Hull, General Vandenberg

[See document photo on p. 4256.

A “capable young engineer” in Poland stated that atomic bomb case designs use a layer of cadmium, apparently based on his personal experience in the wartime German program. That detail is highly consistent with the bomb descriptions given by Schumann and Trinks (above) and also by Ilyichev (p. 4485).]

TO THE AMERICAN COMMAND OF THE INTERNMENT CAMP? CIC-STAFF.

When I was imprisoned at Bad Aibling an American officer in an address asked German scientists and specialists to present themselves. Having presented myself I was told to give further written information on my altuition [education] and my career. Having been transferred to this camp I could not do so. I am a Physicist and have been employed with the OKH [Oberkommando des Heeres] until the end of the war in the research dept. of the office for arms [Heereswaffenamt] as referee for the physics of explosions and blasting. The tasks of that dept. included:

1st Research of physical phenomena at the explosion

2nd Augmentation of and defense against the effect of blasting materials through physical methods

3rd Research of difficulties and troubles.

4th The replacement of valuable raw materials.

During the war the principal labor was dedicated to the principle of hollow charges and its use in armour breaking amunition as F-I-7,5 cm grenade, HL(ABC), 10 cm G.Hl, rifle grenade, Panzerfaust and Panzerschreck, Panzerhandgrenade, Redcap, Magnetic H 3 and H 15.

At the end of the war I was occupied with experiments for producing extreme high pressures and temperatures, extreme velocities (up to 15 km/sec) and heavy swingings of the air [shock waves]. The practical use of these researches comprises:

1st for the war: the defense against V-weapons super- and atomic bombs by destroying them before they reach their target and the initiation of atomic bombs.

2nd for peacetime: the producing of artificial diamonds and the enriching of minerals and materials.

3rd for purely scientific research of special molecules and atoms under extreme pressures and temperatures.

I esteem these researches to be important and promising and therefore ask to be allowed to prosecute them at the service of the U.S.A.

[See document photos on pp. 4258–4259. Due to the number of English spelling and capitalization mistakes, this document appears to have been written in English by Trinks himself, not translated by a native English speaker. For ease of understanding, I have corrected most of the document's English mistakes in the above transcription.

Trinks was imprisoned by the U.S. Army from June 1945 to June 1946, and he informed them that "At the end of the war I was occupied with experiments for... the initiation of atomic bombs." Where are the detailed reports on his interrogations and everything he told U.S. officials about his wartime work? What exactly did he work on after the war, and for whom?]

Kurt Diebner. UK Patent 841,387. Thermonuclear Reactions. Filed 30 November 1956.

I, Kurt Diebner, of Eppendorfer Stieg 8, Hamburg 39, Germany, of German nationality do hereby declare the invention, for which I pray that a patent may be granted to me, and the method by which it is to be performed, to be particularly described in and by the following statement:–

This invention relates to a method for the ignition of the thermonuclear fuels deuterium and tritium.

Amongst known attempts for the generation of very high temperatures, two in particular promise to be successful, of which each one currently permits when using a suitable arrangement, the attainment of temperatures of the order of 10^5 °K to 10^6 °K and over. One of these methods is the generation of converging shock waves through suitable ignition of an explosive in the form of a hollow body at its outer shell. The other method consists in generating highly ionised gases by concentrated discharges and making use of the pinch- effect in a restricted space. One possible method of execution recorded in the literature is given by an electric arc burning between two carbon electrodes, between which a condenser battery of high capacity and with a high voltage charge is briefly short-circuited.

The present invention consists in a method for the ignition of the thermonuclear fuels deuterium and tritium, to initiate thermonuclear reactions, wherein converging compression shock waves are produced in a hollow body by solid or liquid explosives, the generation of high temperatures in the centre of convergence of the shock waves being combined with an increase of temperature generated by concentrated electrical discharges in the fusionable nuclear fuels so that the temperature raising effects are superimposed and temperatures necessary for fusion processes are produced at the centre of the converging shock wave.

The invention further consists in a method for the ignition of thermonuclear fuels to promote thermonuclear reactions therein, which consists in detonating an explosive charge in the form of a hollow body surrounding the thermonuclear fuel, thereby generating a converging shock wave in the interior thereof, and creating a concentrated electrical discharge in the thermonuclear fuel at the centre of convergence of the shock wave in order to attain a temperature sufficient for the ignition of the thermonuclear fuel.

In the accompanying drawings:–

Figure 1 is a diagrammatic view of apparatus for carrying out the method according to the present invention, and

Figure 2 shows a wiring diagram for the apparatus of figure 1.

In carrying the invention into effect according to one convenient mode by way of example, reference 1 (figure 1) denotes an explosive body of spherical shell shape provided with two openings in the shape of a truncated cone, in which a spherically shaped high pressure container 5 is embedded for the uptake of the deuterium 2, perhaps in gaseous form under very high pressure. The spherically shaped high pressure container can however also be dispensed with, and the deuterium can be incorporated directly under pressure into the explosive material. The explosive body 1 can be surrounded by a further spherical shell 6, which tamps the explosive body towards the outside. Two insulated electrodes, for example lithium (lithium 6), between which an electric arc 4 can burn, are introduced into the high pressure container 5. For this purpose the electrode material should have a low nuclear charge number and be as thin as possible in order to maintain at a low level the larger proton reflection with its related higher nuclear charge number. Lithium 6 is furthermore particularly suitable because with it tritium is formed in the thermonuclear combustion process.

Fig. 2

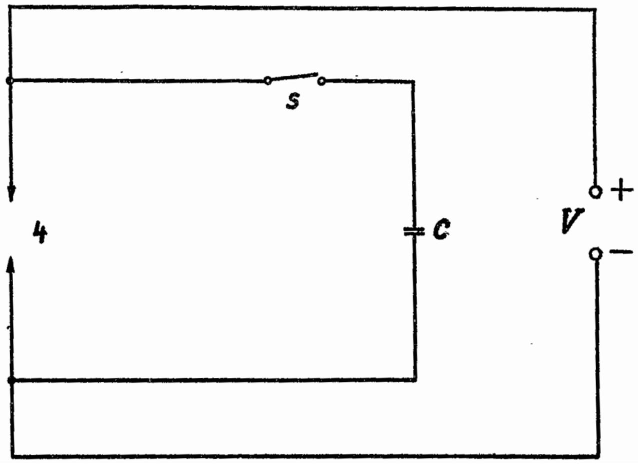

Figure D.597: Figures from Kurt Diebner's U.K. Patent 841,387.

An example is shown in Figure 2 of an electric connection for the electric arc and the connected condenser, in which C represents a condenser. S is a suitable switch which can connect the condenser to the electric arc. V is the source of tension for the electric arc 4. The release of the thermonuclear reaction in the deuterium gas 2 is now to proceed as follows:

The explosive material is so ignited at the boundary surface between 6 and 1, that a converging shock wave results, which after exceeding the boundary surface 5, runs towards the centre of the electric arc 4, and there contributes to an increase of the temperature of the already burning electric arc. The electric arc burns thereby in a gas of high pressure, so that under these circumstances it can already operate on its own at temperatures of the order of 10,000 degrees and more.

The height of the temperature to be reached in the moment when the shock wave reaches the centre of convergence 4, depends amongst other things on the geometry of the arrangement, and on the explosive material used (trinitrotoluol or hexogen or others). It also depends on whether a high pressure container 5 is used, and the material from which it is composed, as well as finally on the temperature, power and shape of the electric arc.

When the shock wave has reached the centre of convergence, further suitable measures are provided according to Figure 1, which permit further considerable heating of the gas (plasma) which is under the highest pressure and which has thereby become highly conductive. Because of this in the example provided, a further additional heating of the deuterium by the electric spark follows, directly before the compression shock reaches in its last phase the centre of convergence. Through this combination of the various methods in an appropriate sequence it is possible to attain the highest temperatures during the arrival of the shock wave in the centre of convergence. A further condition is that the electrodes are still active at the moment of the setting in of the discharge. Since it is an electrical process which is being dealt with, when the condenser C which has been charged with high voltage is suddenly discharged, and since on the other hand the deuterium gas in the electric arc 4 is already extensively pre-ionised, it is possible to add at least partially, to the convergence centre, the energy accumulated in the condenser. Furthermore, at the moment of connecting the condenser, because of the magnetic effects in the discharge path, an adiabatic contraction of the highly ionised plasma in the sense of the pinch-effect takes place, which has the effect of raising the temperature. In the given circumstances it is merely a question of the amount of energy accumulated in the condenser and which is available for the continuation of the working process, and the temperature in the convergence centre 4 can be increased additionally to such an extent, that the added energy is great enough to allow the thermonuclear ignition of the deuterium gas to take place.

Besides the given example, temperature effects can be superposed or supplemented, additional consideration being taken of an adiabatic compression and suitable temporal sequence with combination of gas discharges, spark discharges, a mechanically or chemically generated adiabatic compression, detonation wave or some of them, which are suitable for producing the temperatures necessary for the ignition of the gaseous, liquid, and if need be solid thermonuclear fuels. It is also possible for example, to fill the space 7 with liquid deuterium, tritium or D_2O, in the manner that the deuterium 2 serves as initiator for further larger quantities of thermonuclear fuel. Installations with half spherical-hollow bodies can also be constructed, which can also cause the ignition of the thermonuclear fuel, in the convergence centre,—such a fuel corresponding to the deuterium 2—and/or to use the latter for the initial ignition of further quantities of the same or of other thermonuclear fuels. Any other form of hollow body which permits the production of a suitable converging compression shock under suitable ignition is also admissible according to the purposes for which the ignited thermonuclear fuel is to be used, whereby it is particularly to be noted, that these installations can also be used to produce thermonuclear reactions which do not lead or need not lead to ignition.

It is also conceivable, for example, for deuterium enclosed in a volume, to be preheated by adiabatic compression, electrical discharges or any other means, and then to be ignited by a linear and/or if necessary converging compression shock, or else to achieve this with adiabatically pre-heated thermonuclear fuel, using concentrated electrical discharges. Such installations as mentioned in the last example are suitable when their intermittent activity is controlled for the production of mechanical energy. The process explained in Figure 1 can also be carried out in a large pressure container and thus be suitable for maintaining in this large boiler, pressures and/or temperatures required for energy withdrawal or energy generation for certain purposes. This can take place during the intermittent or continuous running of several such processes, respectively repeated any number of times, whereby temperatures and/or pressures can be added to any desired purpose, such as heat engines, the drive of turbines, and others.

What I claim is:–

l. A method for the ignition of the thermonuclear fuels deuterium and tritium, to initiate thermonuclear reactions, wherein converging compression shock waves are produced in a hollow body by solid or liquid explosives, the generation of high temperatures in the centre of convergence of the shock waves being combined with an increase of temperature generated by concentrated electrical discharges in the fusionable nuclear fuels so that the temperature-raising effects are superimposed and temperatures necessary for fusion processes are produced at the centre of the converging shock waves.

2. A method for the ignition of thermonuclear fuels to promote thermonuclear reactions therein, which consists in detonating an explosive charge in the form of a hollow body surrounding the thermonuclear fuel, thereby generating a converging shock wave in the interior thereof, and creating a concentrated electrical discharge in the thermonuclear fuel at the centre of convergence of the shock wave in order to attain a temperature sufficient for the ignition of the thermonuclear fuel.

3. A method as claimed in claim 1 or 2, wherein the processes of the converging percussion wave and of the concentrated electrical discharges are temporarily connected in sequence in such a manner that, the electrical discharge is first effected at the instant when the percussion wave just reaches the convergence centre.

4. A method as claimed in claim 1, 2, or 3, wherein in order to increase the effect of the converging percussion wave a tamping of the explosive is used on its outer side.

5. A method as claimed in any of claims 1 to 4, distinguished in that, the thermonuclear nuclear fuels to be ignited, whether gaseous or liquid, are under high pressure.

6. A method as claimed in any of claims 1 to 5, distinguished in that, the electrical discharges take place in a space which is considerably pre-heated by adiabatic compression which is generated chemically.

7. A method as claimed in any of claims 1 to 6, wherein the nuclear fuel to be ignited is surrounded by a pressure container, the components of which will further increase the action of the converging shock wave.

8. A method as claimed in any of claims 1 to 7, wherein by initiating thermonuclear reactions in

a small volume, the initial condition is created for initiating fusion reactions in a larger volume of thermonuclear fuel.

9. A method as claimed in any of claims 1 to 8, wherein the thermonuclear reactions take place in a suitable container for the maintenance of required pressures and/or required temperatures, and that thus the fusion energy can be utilized.

10. A method as claimed in claim 9, wherein the process is repeated periodically or not periodically, and it serves for driving turbines, heat engines and/or other power combinations.

11. A method for the ignition of thermonuclear fuels substantially as described with reference to the accompanying drawings.

Fusionsprozesse mit Hilfe konvergenter Stoßwellen – einige ältere und neuere Versuche und Überlegungen

Von K. Diebner

Forschungs- und Erprobungsstelle für Schiffsbetriebstechnik an der Staatlichen Schiffsingenieurschule, Flensburg

Zusammenfassung

In einem zusammenfassenden Bericht wird die Diskussion über die Anwendung konvergenter Stoßwellen für die Plasmaphysik rückblickend dargestellt. Ausgehend von den theoretischen und experimentellen Untersuchungen an Kugel- und Zylinderstoßwellen wird chronologisch über die wesentlichsten bis heute bekannten Vorschläge berichtet. Die notwendigen Abmessungen der Kugel und die Sprengstoffmenge der einfachsten Hohlkugelanordnungen sowie die Kombination mechanischer Stoßwellen mit adiabatischer magnetischer Kompression, Vorheizung durch eine Gasentladung und Knallfunkenstrecken zur Stoßwellenerzeugung werden diskutiert. Die Aussichten periodisch arbeitender Fusionsreaktormodelle, die auf der Basis konvergenter Stoßwellen beruhen, werden diskutiert.

Die Möglichkeiten der Aufheizung von Deuterium und Deuterium-Tritium-Gemischen auf Fusionstemperaturen mit Hilfe von mechanischen Stoßwellen werden heute bereits in den einführenden Lehrbüchern erwähnt und diskutiert. Eine Reihe von magnetischen Hochtemperatur-Plasmaerzeugern nutzen Stoßwellen für die Aufheizung der fusionsfähigen Gase praktisch aus. Allein diese Tatsachen rechtfertigen einen Rückblick auf die Anfänge dieser Entwicklung und einen zusammenfassenden Bericht über die bisher vorliegenden Vorschläge und Erfahrungen.

Das Verfahren, mit Stoßwellen hohe Temperaturen und Drucke zu erzeugen, wurde bereits während des Krieges bei der Formgebung von Sprengkörpern verwandt (Durchschlagskraft der Panzerfaust). Eine feste Sprengkörperhohlladung wird etwa in eine Form nach Abb. 1 gebracht und an der Stelle Z gezündet. Die sich an der kugelförmigen Innenoberfläche O bildenden Schwaden werden senkrecht abgestrahlt und vereinigen sich im Brennpunkt F des Hohlkörpers H. Obgleich die Wege der Detonationswelle im Sprengkörper verschieden lang sind, kann man durch geeignete Formgebung erreichen, daß die Schwaden gleichzeitig im Brennpunkt eintreffen und hohe Temperaturen erzeugen.

Vincent Nouzille and Olivier Huwart. 1999. Comment la France a recruté des savants de Hitler. *L'Express* no. 2498 (20 May), p. 122. https://www.lexpress.fr/informations/comment-la-france-a-recrute-des-savants-de-hitler_633743.html

La France recrute d'autres savants au passé controversé. En mars 1945, le Pr Hubert Schardin, l'un des patrons du centre de recherches de la Luftwaffe à Berlin-Gatow, formait des stagiaires en vue de créer une ultime "arme miracle" pour Hitler! Replié à Biberach, dans le Wurtemberg, il est fait prisonnier par le commandant Lutz, de la 1re division blindée de l'armée française. Le 7 mai 1945, Lutz indique à Schardin qu'il aura "toute liberté d'action". Le lendemain, jour de la capitulation allemande, le savant note dans son agenda: "Le travail a repris"... Avec une trentaine d'autres ingénieurs, il s'installe près de la frontière franco-allemande et devient codirecteur du Laboratoire de recherches balistiques et aérodynamiques de Saint-Louis (Haut-Rhin), créé spécialement par le ministère de l'Armement.

Parmi la centaine de recrues allemandes qui rejoignent progressivement ce laboratoire militaire se trouve le Dr Rudi Schall, un physicien berlinois de renom, venu d'un autre centre de recherches militaires. Agé aujourd'hui de 85 ans, retiré près du lac de Constance, il confie à L'Express: "C'est vrai que j'étais membre du parti nazi, comme beaucoup de mes collègues qui y étaient plus ou moins obligés, sans être forcément actifs. En 1945, les Américains nous ont embarqués, mais ils nous traitaient comme des moins-que-rien. Les Britanniques, eux, m'ont proposé de m'embaucher, mais sans que ma femme puisse me rejoindre. Alors que les Français ont été très chaleureux. La dénazification des postes était en cours en Allemagne. Mais on nous a dit que cela ne nous concernait pas. Je suis arrivé début 1946 à Saint-Louis." Rudi Schall succédera à Schardin comme codirecteur de ce laboratoire, devenu en 1959 le symbole de la nouvelle coopération militaire franco-allemande!

France is recruiting other scientists with a controversial past. In March 1945, Professor Hubert Schardin, one of the bosses of the Luftwaffe Research Centre in Berlin-Gatow, prepared assistants to create a final "miracle weapon" for Hitler! Folded back to Biberach, Württemberg, he was taken prisoner by Commander Lutz, of the 1st Armoured Division of the French Army. On May 7, 1945, Lutz told Schardin that he would have "complete freedom of action." The next day, the day of the German surrender, the scientist noted in his diary: "Work has resumed"... With about thirty other engineers, he settled near the Franco-German border and became co-director of the Laboratoire de recherches balistiques et aérodynamiques de Saint-Louis (Haut-Rhin), created especially by the Ministry of Armament.

Among the hundred German recruits who are gradually joining this military laboratory is Dr. Rudi Schall, a renowned Berlin physicist from another military research centre. Now 85 years old, retired near Lake Constance, he told L'Express: "It is true that I was a member of the Nazi party, like many of my colleagues who were more or less obliged to do so, without necessarily being active. In 1945, the Americans took us in, but they treated us like less than nothing. The British offered to hire me, but my wife could not join me. While the French were very warm and friendly. The denazification of posts was under way in Germany. But we were told that this did not concern us. I arrived in early 1946 in Saint-Louis." Rudi Schall succeeded Schardin as co-director of this laboratory, which became the symbol of the new Franco-German military cooperation in 1959!

Certaines embauches sont encore plus troublantes. Selon l'historien allemand Ulrich Albrecht, le comte Helmut Zborowski, ingénieur chez BMW, est emprisonné en 1945 à cause de son appartenance aux Waffen SS. Ce lourd passé n'empêche pas la France, en 1947, de convier Zborowski à rejoindre la Société européenne de propulsion par réaction (SEPR). Ce scientifique controversé créera, en 1950 à Paris, le Bureau technique Zborowski. Subventionné sur fonds publics par la Snecma, l'ex-SS concevra un drôle d'engin à décollage vertical, le Coléoptère, véritable gadget technique, dont les essais en vol se révéleront dangereux...

Le gouvernement tient également à conserver quelques chimistes allemands. Arrêtés par les Américains, Walter Reppe—qualifié de "nazi bon teint"—et Karl Wurster—présumé "criminel de guerre"—seront blanchis et rejoindront leurs postes à l'usine de Ludwigshafen, avec la bienveillance des Français. Tous les Alliés pratiquent le même cynisme. Le cas d'Otto Ambros, un des directeurs d'IG Farben, est exemplaire. Ambros a participé à la décision d'utiliser le zyklon B dans les chambres à gaz. Il a également supervisé une usine de caoutchouc synthétique à Auschwitz-Buna-Monowitz, dans laquelle de nombreux déportés ont été maltraités. Interrogé par des militaires français en août 1945, il rédige un rapport ultrasensible sur la production allemande de nouveaux gaz de combat (tabun, sarin, soman). De quoi intéresser les promoteurs d'armes chimiques françaises! Puis, selon l'historienne Marie-France Ludmann-Obier, ce scientifique, considéré comme "criminel de guerre", est invité par le ministère de la Guerre à Paris pour faire des conférences! Après des mois de pressions américaines, les Français finissent par livrer Ambros à des GI. Un tribunal de Nuremberg le condamne en 1948 à huit ans de prison pour esclavage. Libéré en 1951, il fera carrière comme conseiller d'un grand groupe chimique aux Etats-Unis...

Some hires are even more troubling. According to the German historian Ulrich Albrecht, Count Helmut Zborowski, an engineer at BMW, was imprisoned in 1945 because of his membership of the Waffen SS. This heavy history did not prevent France, in 1947, from inviting Zborowski to join the European Society for Jet Propulsion (SEPR). This controversial scientist created the Zborowski Technical Office in Paris in 1950. Subsidized on public funds by Snecma, the ex-SS will design a strange vertical take-off device, the Beetle, a real technical gadget, whose flight tests will prove dangerous...

The government also wants to keep some German chemists. Arrested by the Americans, Walter Reppe—described as a "well-rounded Nazi"—and Karl Wurster—allegedly a "war criminal"—were cleared and returned to their posts at the Ludwigshafen factory, with the goodwill of the French. All Allies practice the same cynicism. The case of Otto Ambros, one of the directors of IG Farben, is exemplary. Ambros was involved in the decision to use zyklon B in the gas chambers. He also supervised a synthetic rubber factory in Auschwitz-Buna-Monowitz, where many deportees were mistreated. When questioned by French soldiers in August 1945, he wrote a highly sensitive report on the German production of new poison gases (tabun, sarin, soman). This is of interest to French chemical weapons promoters! Then, according to historian Marie-France Ludmann-Obier, this scientist, considered a "war criminal," was invited by the Ministry of War in Paris to give lectures! After months of American pressure, the French finally delivered Ambros to GIs. A Nuremberg tribunal sentenced him in 1948 to eight years in prison for slavery. Released in 1951, he made a career as an advisor to a large chemical group in the United States...

[Ambros, Schardin, Schall, and Zborowski appear to have played important roles in the German nuclear weapons program, and likely used that knowledge to help the postwar French nuclear weapons program. Almost certainly there are extensive French files on their wartime and postwar work, but those files remain unavailable.]

Ingeborg Brandt, who worked in the Hans Lindemayer group in Anklam and then Friedland. Letter to Karl Spietz. 20 October 1995. Heimatmuseum Friedland, Akte Nr. 157. [Karlsch 2005, pp. 169, 230]

Vor unserer Halle war so eine Art Terrasse. Man nannte dies Prüfstand. Dort stand so eine Kugel [...] Ich selbst schätze sie auf einen Durchmesser von 1,80 Meter.

There was a kind of terrace in front of our hall. This was called the test stand. There was such a ball [...] I estimate it to be 1.80 meters in diameter.

Irene König, who worked in Anklam and then Friedland. 16 July 2004 interview by Heiko Petermann. [Karlsch 2005, pp. 169–170]

Da wurden zwei Aluminiumkugeln ineinander gesetzt, eine große und eine kleine, und die dampften. Zuerst dachte ich, die kochen darin Wasser. Aber ich habe mich natürlich nicht getraut zu fragen, das war ja alles so geheim. Wir wurden dann nach dem Bombenangriff nach Friedland verlagert. Lindemayer ging nach Nordhausen, und Johann Grüner übernahm die Leitung der Gruppe. In Friedland wurden die Kugeln in einem großen Kessel mit hoher Geschwindigkeit gedreht. Manchmal war ein gewaltiges Getöse und Donnern zu hören. Die Ingenieure erzählten uns dann, dass sie Versuche mit Druckminderern durchführen.

There were two aluminum spheres, one placed inside the other, one large and one small, and they steamed. At first I thought they were boiling water in them. But of course I did not dare to ask, it was all so secret. We were then transferred to Friedland after the bomb attack. Lindemayer went to Nordhausen, and Johann Grüner took over the management of the group. In Friedland the spheres were turned in a large cauldron at high speed. Sometimes there was a tremendous roar and thunder. The engineers then told us that they were doing experiments with pressure reducers.

[Ilyichev's March 1945 description of the German implosion bomb design (see p. 4485) includes two hollow aluminum spheres, a large outer aluminum explosive case and a smaller aluminum pusher inside that.

"In addition to the Lindemayer group, a second research team headed by Dr. Ing. Wolfgang Steurer came to Friedland in 1944. He was considered to be one of the best experts in the field of material testing and was particularly well-known in aluminum alloys. His group consisted of 24 scientists, technicians and assistants. [...] Employees had been seen in protective suits during materials transport and at work. Details were not disclosed." [Karlsch 2005, p. 170]

[S. 9] Was ich weiß ist die tatsächliche Vorbereitung für die Prototypenproduktion der zwei durchkonstruierten Atombombentypen für Uran und Plutonium. [...] Ich durfte davon nichts wissen, deshalb kann ich nur sagen, dass es um zwei Standardtypen für den Einsatz gegen Städte ging und noch zwei weitere unterschiedlich grosse, die sollten frontverwendungsfähig sein und kleinere Ladungen enthalten. Ich erfuhr erst nach dem Krieg davon, dass die eine von den beiden kleineren ein Ladungsäquivalent, also eine vergleichbare Sprengmaterialmenge, von ich glaube 130 Tonnen gehabt hätte. Die sollte gegen Bahntunnels, Hafenanlagen und Militäreinrichtungen eingesetzt werden. Der Punkt war, dass die kleinen Waffen nur ganz wenig Material benötigten, denn daran bestand ja erstmal der Mangel. Von der grösseren hörte ich nur eine Angabe, die ich nicht bestätigen kann, da ging es um drei Kilotonnen, das muss offen bleiben.

[p. 9] What I know is the actual preparation for the prototype production of the two fully constructed atomic bomb types for uranium and plutonium. [...] I was not allowed to know anything about it, so I can only say that there were two standard types for use against cities and two more of a different size, which were supposed to be front-usable [for tactical battlefield use] and contain smaller charges. I learned only after the war that one of the two smaller ones would have had a charge equivalent, that is a comparable explosive material quantity, of I believe 130 tons. This was supposed to be used against railway tunnels, port facilities and military installations. The point was that the small weapons required only very little material, which overcame first of all the shortage [of fission fuel]. Of the larger one I heard only a statement, which I cannot confirm, that it was about three kilotons, that must remain [an] open [question].

[S. 18] Was da im einzelnen alles gelaufen ist, erfuhr ich nie. Es war aber so, dass es zwei ganz verschiedene Konstruktionen gab, von einer dritten, zu der ich sonst nichts weiß, hörte ich erst recht nicht viel. Die muß wie eine aufgequollene Bombe ausgesehen haben. Zu den beiden anderen weiß ich, dass die kleinere ungefähr die Größe der SC 250 gehabt hatte, aber das Gewicht war höher. Die größere Waffe hätte eine Kugelform besessen mit einem Durchmesser von über einem Meter. Die war sehr schwer, obwohl der Bombenkörper selbst aus Aluminium gewesen sein soll. Es hieß, wenn man das Gewicht reduziert, geht die Ladung nicht hoch. Dann war eine Variante geplant, bei der der Bombenkörper selbst Bestandteil des Sprengsytems gewesen sein soll. Ich kann das jetzt nicht besser sagen, es ging jedenfalls darum, das Gewicht zu reduzieren und trotzdem eine richtig große Sprengkraft zu erhalten.

[p. 18] I never heard what all was going on in detail. It was true, however, that there were two entirely different constructions; of a third, about which I do not know anything else, I did not hear much. It must have looked like a swollen bomb. About the other two, I know that the smaller was about the size of the SC 250, but the weight was higher. The larger weapon would have possessed a spherical shape with a diameter of over one meter. It was very heavy, even though the bomb body itself was supposed to be out of aluminum. It was said, if one reduces the weight, the yield is not as high. For this purpose, a variant was planned, in which the bomb body itself was supposed to have been a component of the explosive system. I cannot say better now, it was anyway to reduce the weight and still get a really big explosive energy.

[S. 44] Ja, jetzt kommt noch das dritte Problem. Wir haben ja schon mal darüber gesprochen, dass die Wissenschaftler eine Zündung in der Luft in einer bestimmten Höhe haben wollten. Es sollte eine Höhe von ungefähr 400 Metern sein. Es gab aber erst mal keinen einzigen Zündmechanismus, der das zuverlässig schaffte, obwohl viele daran gearbeitet hatten. Es ist sogar überlegt worden, das mit Zeitzünder zu machen, ich weiß aber nicht, ob das durchgeführt worden ist. Das Problem war ja, wenn man einen Aufschlagzünder nimmt, verpufft der größte Teil der Wirkung. Dann wäre die Waffe die ganze Mühe nicht wert gewesen. Bei dem Versuch, der im Spätherbst 44 mit dem Fallschirmabwurf durchgeführt worden war, hatten sie etwas ausprobiert. Ich weiß aber nicht, ob das wirklich ein Annäherungszünder gewesen ist.

[S. 42] Übrigens, was die Physiker Himmler im Privatvortrag zur Wasserstoffbombe sagten, das hatte ihn wirklich elektisiert, weil er hörte, dass die Sprengwirkung hundertmal größer sein würde als bei der Uranbombe.

[p. 44] Yes, now comes the third problem. We have already talked about the fact that the scientists wanted to have an ignition in the air at a certain altitude. It should be an altitude of approximately 400 meters. But there was not even a single ignition mechanism that made it reliable, even though many had worked on it. It was even thought of doing this with a time fuse, but I do not know if this was done. The problem was, if one uses an impact fuse, most of the effect fizzles. Then the weapon would not have been worth the effort. In the test, which was carried out in late autumn 44 with the parachute drop, they had tried out something. But I do not know if this was really a proximity fuse.

[p. 42] By the way, what the physicists told Himmler in their private lecture on the hydrogen bomb had really electrified him, because he heard that the explosive effect would be a hundred times greater than that of the uranium bomb.

[Grothmann appeared to describe work on at least five different types of nuclear weapons:

1. A tactical bomb using U-235 (produced in any of several uranium enrichment facilities that Grothmann alluded to) with an explosive yield of less than a kiloton (Grothmann thought he remembered 130 tons). He compared it to the size of an SC 250 bomb, a common cylindrical German bomb with a 37-cm diameter and 120-cm body length (Fig. D.601), but said it was heavier than an SC 250 (heavier than 250 kg). In principle, a bomb of that size might have been an implosion bomb design employing cylindrical compression as considered by Gottfried Guderley as well as Erich Schumann and Walter Trinks; see p. 4248. Alternatively it might have been a biconic implosion bomb design employing focused compression from each end, as considered by Schumann and Trinks; see p. 4246. R. P. Linstead and T. J. Betts, the U.K. and U.S. chairs of CIOS, wrote in their final report about German V-rockets armed with atomic bombs that were much smaller than the standard V-2 payload of 1000 kg (p. 5030). The bomb described by Grothmann and the CIOS chairs does not match the characteristics of a gun-type fission bomb. For example, the U.S. Little Boy had a mass of 4400 kg, diameter of 71 cm, and length of 300 cm, and because of its inherent physics used a very large amount of uranium, had a very low efficiency, and produced a large explosive yield, in contrast to the weapon that Grothmann described.

2. A tactical bomb using Pu-239 (produced in any of several plutonium breeding facilities that Grothmann alluded to). Other than the difference in fuel, presumably this bomb had the same design as the tactical uranium bomb, as well as a roughly comparable yield.

3. A strategic bomb using U-235 with an explosive yield of several kilotons. (Grothmann thought he remembered 3 kilotons, but he seemed uncertain; that value may have been the yield of one of the small tests, not the yield that a fully fueled and deployed version of the bomb would have.) The bomb was a sphere with a diameter of somewhat over 1 meter, an aluminum shell, and a large mass. It apparently used a sophisticated implosion system. All of these details are highly consistent with the bomb design reported by Ilyichev (pp. 4481 and 4485).

4. A strategic bomb using Pu-239. Presumably this bomb had the same design as the strategic uranium bomb, as well as a roughly comparable yield.

5. A hydrogen bomb or H-bomb using fusion reactions but initiated by reactions in fission fuel. According to Grothmann, its explosive yield would be a hundred times larger than a fission bomb, or on the order of a megaton. Grothmann knew much less about this bomb design, but he described it as “a swollen bomb.” That might be taken to mean an oversized spherical implosion bomb, which could match the description of a “sloika” or layer-cake H-bomb design. Alternatively, Grothmann’s wording might be construed to mean an ellipsoidal shape, which could match the description of a Prandtl-Meyer two- or three-stage H-bomb design (p. 4373). This bomb was expected to be operational by late 1945 (p. 4367) or early 1946 (p. 3401), which suggests that it was at a fairly advanced stage of development, not merely a paper design. For more information on German development of fusion fuels and fusion bombs, see Sections D.9 and D.15.6.]

16. Microbe Bombs

PW saw appr one hundred 250 kg bombs stored in a hall at Flughorst Ost, MAGDEBURG. PW was told that these were microbe bombs.

As described to PW, the bomb has two detonating chambers (one in front and one in back) with 2 side fuses. In the center of the shell is an empty lead lined chamber with threaded opening on the side into which a tube is screwed. The opening has 8 threads and when the tube is screwed into the last thread it is opened and the microbes which have been stored in the tube escape into the chamber. The opening is smeared with a gelatinous substance to prevent the escape of germs.

PW thinks the germs are of cholera type.

G-2 COMMENT:

This (250 kg) seems quite large for a single BW bomb. Further interrogation is contemplated, and information will be forwarded.

[The German PW said he had seen special bombs stored at a Luftwaffe base and gave a relatively detailed description of their design. The PW had heard and the Allied interrogators just assumed that the bombs were biological. Since the design was "only" biological, the report was ultimately declassified by the U.S. government.

The design as given by the PW makes absolutely no scientific sense if the small, dangerous, final component that must be inserted in the middle is biological. There is too much explosive, too little "biological agent," and a mysterious tamper in between made of lead or some other extremely dense metal. Any biological agent in the middle would be destroyed by the intense heat and intense pressure created by the explosives at both ends. The design also does not make any sense for chemical weapons or fuel-air explosives.

But what if that small, dangerous, final component in the PW's design is nuclear? Compare the PW's design with the descriptions from Werner Grothmann and Erich Schumann.

Notice how many of these special bombs the PW said he saw.]

15. Pressluft (Continued)

Employment

PW saw the shells only at HEESEN trng grounds. Pressluft Granaten were thought to be especially effective against tk concentrations. Instructing Officer stated that they would be used only as a last resort for fear of Allied gas retaliation.

The supply at that time (Nov 44) was too small for effective use.

(Source: Uffz Rene MERTENS (Belgian) 1 Coy 1501 Heeres Kost Arty Abt captured 5 March BAERL)

Shipments of Pressluft Granaten

PW reports that he saw ammo being evacuated from an ammo dump nr KÖLN in the STADTWALD-KÖLN Forest. PW was prevented from entering the dump, and was told that Pressluft ammo was stored here. The ammo was packed in gray painted boxes appr 45-50 x 35-40 cm. PW thinks the boxes had no markings (?).

(Source: Gren Felix ZYTINSKI (Pole) 2 Tp 3 Arty Regt captured 5 March)

July 44 PW helped load 16 freight cars with 45 Pressluft Granaten each. Shells were appr 17 cm diameter and shaped like an hour-glass. Loading took place in BERLIN W of the S edge of the small KIENHORST (GSGS 4480/BERLIN/I/A 1b). Shells were shipped to XANTEN for use on the W front.

(Source: O/Gefr Johannes CARSTENS 8 Coy 1225 Inf Regt captured 2 Mar vic BROCKHUYSEN)

16. Microbe Bombs

PW saw appr one hundred 250 kg bombs stored in a hall at Flughorst Ost, MAGDEBURG. PW was told that these were microbe bombs.

As described to PW, the bomb has two detonating chambers (one in front and one in back) with 2 side fuses. In the center of the shell is an empty lead lined chamber with threaded opening on the side into which a tube is screwed. The opening has 8 threads and when the tube is screwed into the last thread it is opened and the microbes which have been stored in the tube escape into the chamber. The opening is smeared with a gelatinous substance to prevent the escape of germs.

PW thinks the germs are of cholera type.

D.9 Fusion Fuel and Bomb Design

[Wolfgang Ferrant (German?, ??–??), Ulrich Jetter (German, 1914–??), Alfred Klemm (German, 1913–2013), Karl Lintner (Austrian, 1917–2015), Josef Mattauch (Austrian, 1895–1976), Erich Schumann, Georg Stetter (Austrian, 1895–1988), Walter Trinks (German, 1910–1995), and many others worked in teams that researched and produced significant amounts of fusion fuels and potential methods to use them:

- German patents, articles, and other documents from 1933 through 1945 discussed how to produce fusion reactions in high-voltage tubes (pp. 3958–3970 and 4281–4327). That technology would have been very useful as a fusion neutron initiator in a fission bomb, as described by Kurt Diebner (p. 4261) and Ivan Ilyichev (p. 4485).

- In postwar papers apparently based on wartime work, Erich Schumann and Walter Trinks (pp. 4250–4255) and Kurt Diebner (pp. 4260–4267) independently described spherical implosion bomb designs with a center of fusion fuel inside a spherical shell of fission fuel. That "fusion boosting" approach could have greatly increased the yield of a fission bomb by supplying far more neutrons to induce fission reactions.

- A number of documents show that there was wartime work using lithium and deuterium together as fusion fuel (pp. 4305–4341). Because lithium deuteride is solid and not a gas or cryogenic liquid, it makes an ideal fuel for hydrogen bombs.

- During the war, Alfred Klemm (under the direction of Josef Mattauch) perfected a method to separate the lithium-6 isotope from the predominant lithium-7 in natural lithium (pp. 4344–4347). That would only be useful for nuclear applications. Klemm also stated that there was wartime work to produce tritium, another very potent fusion fuel (p. 4346).

- In 1950 Ulrich Jetter (German, 1914–??) published a detailed proposal that fusion bombs could use lithium-6 deuteride as readily storable solid fuel, rather than the much more troublesome cryogenic deuterium and tritium (p. 4348). Based on the other documents available, Jetter's description appears to be based on wartime German work. Officially, lithium-6 deuteride was first considered in the United States by Edward Teller in 1947 and in the Soviet Union by Vitaly Ginzberg in 1949, was first tested by the United States in 1954, and is commonly used in modern H bombs [Goncharov 1996a, 1996b; Chuck Hansen 1988, 2007; Rhodes 1995; Sublette 2019; Wellerstein and Geist 2017].

- In 1946, several scientists and engineers reported that during the war, Germany had been working on a 6-ton radioactive bomb, as well as methods to deliver it by rockets or aircraft (pp. 4338, 4350–4363, and 5343). Such a massive bomb would have been very challenging to deliver, and could presumably only have been justified if it were a hydrogen bomb. Conventional explosives, a dirty bomb of conventional explosives with radioactive material, chemical weapons, biological weapons, and even fission bombs could have been packaged into much smaller and much more easily deliverable sizes (and if necessary, several of them could have been delivered separately to the same target).

- A 1946 U.S. intelligence document mentioned wartime German research on H-bomb development as well as nuclear-armed ballistic missiles (p. 4368).

- In 1944–1945, several independent sources reported that Germany was developing a bomb with a six-mile blast radius, which is characteristic of the several-megaton energy of an H bomb, in stark contrast to the much smaller several-kiloton energy of a plain fission bomb (pp. 4365–4367).

- Friedwardt Winterberg, who worked very closely with Kurt Diebner after the war, published a highly distinctive ellipsoidal H-bomb design that looks rather different than standard U.S. H-bomb designs, but that is deeply steeped in earlier German hydrodynamics and physics research (p. 4373). A surviving 1944 sketch from Walther Gerlach shows an ellipsoid in conjunction with nuclear reactions involving deuterium, which seems to support the wartime origin of Winterberg's ellipsoidal H-bomb design (p. 4377).

- Werner Grothmann stated that the German nuclear program was developing several different bomb types, including a hydrogen bomb. He said that the hydrogen bomb looked like a "swollen bomb" (ellipsoidal?), would have been a hundred times more powerful than a fission bomb (megatons vs. tens of kilotons), and was expected to be ready in 1946 (which suggests that it had already progressed far in its development by 1945); see pp. 3401 and 4272. Other sources expected the German hydrogen bomb to be ready even sooner, sometime in 1945, if the war had continued (pp. 4367, 4334, 4359).

- In 1947, when Edward Teller was trying unsuccessfully to invent a workable design for the U.S. hydrogen bomb, he sent a highly unusual, specific, and urgent request for Siegfried Flügge to help him with a "physics... program... of interest and importance to the national security," stating that Flügge would "be of marked assistance in carrying out the aforementioned program" (p. 4996). In fact, the late-wartime and postwar influx of scientists and engineers who were from or at least had knowledge of the German nuclear program included Karl-Friedrich Bonhoeffer, Wernher von Braun, Rudolf Brill, Adolf Busemann, Walter Dornberger, Rudolf Edse, Krafft Ehricke, Wilhelm Eitel, Gerhard Falck, Karl Fiebinger, Wolfgang Finkelnburg, Rudolf Fleischmann, Siegfried Flügge, Walter Glaser, Wilhelm Groth, Gottfried Guderley, Paul Harteck, Otto Haxel, Richard Herzog, Johannes Hans Jensen, Willibald Jentschke, Ulrich Jetter, Georg Joos, Hartmut Kallmann, Hans Kammler, Gerald Klein, Stanley Kronenberg, Heinz Maier-Leibnitz, Werner Maurer, Hugo Neuert, Walter Nielsch (?), Edgar Petersen, Heinz Schlicke, Erich Schumann, Otto Schwede, Edmund Sorg, Kurt Starke, Ernst Stuhlinger, Hans Suess, Herbert Wagner, Wilhelm Westphal, Friedwardt Winterberg, Karl Wirtz, Gernot Zippe, etc. (p. 4992). Many of those scientists appear to have been closely tied to the wartime German work on H-bombs, and may have especially aided the U.S. H-bomb development program between 1945 and 1954.

Table D.3 summarizes some of the major sources and details regarding the megaton-level H-bomb that was under development during the war.]

Table D.3: Details about hydrogen bomb design from primary sources.

Rausch von Traubenberg. 1933. Die bei der Lithiumzertrümmerung auftretende durchdringende Strahlung. *Die Naturwissenschaften* 21:694.

Wie wir kürzlich zeigen konnten, treten bei der künstlichen Umwandlung des Lithiumkernes durch Protonen auch γ-Strahlen auf, deren Nachweis uns mit Hilfe des Geiger-Müllerschen Zählrohres gelang. Wir haben inzwischen die Versuche mit verbesserten Hilfsmitteln wiederholt und eine Abschätzung der Härte der γ-Strahlen vorgenommen. Die Messungen wurden wieder so gestaltet, daß Lithium und ein bei unseren geringen Protonengeschwindigkeiten nicht zertrümmerbares Element, in diesem Falle Eisen, abwechselnd in den Gang der Wasserstoffkanalstrahlen gestellt wurden. Durch solche Differenzmessungen machten wir uns ebenso wie bei den früheren Untersuchungen von der Röntgenstrahlen sowie von der NZ (= Höhenstrahlen + radioaktiven Strahlen) frei und maßen die Lithiumstrahlung allein. Es wurde durch Zwischenschalten verschieden dicker Bleischichten als Hauptanteil eine weiche Komponente nachgewiesen, deren Intensität durch etwas 0,3 mm Blei auf die Hälfte geschwächt wurde. Bei einer maximalen Röhrenspannung von 58 kV und einem Röhrenstrom von 1 mA erhielten wir bei 1 mm Blei und einem Abstand von 48 mm des Zählrohrendes vom Lithium etwa 3 Quanten pro Minute.

As we have recently shown, the artificial transformation of the lithium nucleus by protons also involves γ rays, which we were able to detect with the aid of the Geiger-Müller tube. In the meantime we have repeated the experiments with improved aids and made an estimate of the intensity of the γ rays. The measurements were again designed in such a way that lithium and an element which can not be broken down at our low proton velocities, in this case iron, were alternately placed in the path of the hydrogen beams. As a result of these differences, we were able to distinguish between the effects of the X-ray beams and the NZ (= cosmic radiation + radioactive rays) and the lithium. A soft component, the intensity of which was weakened by half by 0.3 millimeter of lead, was detected as a major component by interposing different thicknesses of lead. At a maximum tube voltage of 58 kV and a tube current of 1 mA, we obtained about 3 quanta per minute with 1 mm lead and a distance of 48 mm from the tube end of the lithium.

[H. Rausch von Traubenberg did important very early work on fusion reactions and tritium production. See also:

> H. Rausch von Traubenberg, A. Eckardt, and R. Gebauer. 1933. Über den Nachweis von γ-Strahlen bei der Zertrümmerung von Lithium. *Zeitschrift für Physik* 80:557–558.

Von Traubenberg and other German scientists began using neutron reflectors around their nuclear reaction experiments no later than 1936. See pp. 4158–4159. Neutron reflectors are important for both fission reactors and fission bombs.]

Arno Brasch and Fritz Lange, AEG, German Patent DE 662036. Verfahren zur Anregung und Durchführung von Kernprozessen [Process for the Excitation and Execution of Nuclear Processes]. Filed 21 December 1934. Issued 9 June 1938.

[See document photos on pp. 4286–4287.]

Die vorliegende Erfindung bezieht sich auf ein Verfahren, um Eingriffe in den Atomkern in erheblich größerem Umfange und vor allen Dingen mit größerem Nutzeffekt vorzunehmen, als dies bisher möglich war.

Erfindungsgemäß können nicht nur radioaktive Substanzen in wesentlicher Menge wirtschaftlich erzeugt werden, sondern es bietet sich auch die Möglichkeit, zur Energiegewinnung aus dem Atomkern zu gelangen. [...]

Die wesentlichen Methoden zur Erzeugung von Neutronen sind bisher:

1. Heliumteile werden auf Beryllium geworfen und lösen dort Neutronen aus.

2. Röntgen- oder Gammastrahlen von mehr als 1,5 Milionen Volt fallen auf Beryllium und rufen dort den gleichen Vorgang hervor.

3. Der kürzlich entdeckte sog. schwere Wasserstoff (Diplogen) wird auf Diplogen geschossen.

Das letzte Verfahren ist das weitaus ergiebigste und im Rahmen der vorliegenden Erfindung deshalb von Bedeutung, weil es damit möglich war, die Auslösung von Neutronen und anderen Kernreaktionen bei sehr niedrigen Spannungsbereichen bis hinunter zu einigen 1000 Volt zu erzielen.

The present invention relates to a method for carrying out reactions of the atomic nucleus to a considerably greater extent and, above all, with greater efficiency than was previously possible.

According to the invention, not only can radioactive substances be produced economically in a substantial amount, but there is also the possibility of getting energy from the atomic nucleus. [...]

So far the essential methods for the generation of neutrons are:

1. Helium particles impact on beryllium and release neutrons.

2. X-rays or gamma-rays of more than 1.5 million volts fall on beryllium and there cause the same process.

3. The recently discovered so-called heavy hydrogen (deuterium) is fired at deuterium.

The last method is by far the most productive and important in the present invention, since it has thus been possible to achieve the triggering of neutrons and other nuclear reactions at very low voltage ranges up to a few thousand volts.

Die kinetische Energie von Atomen oder Elektronen, die mit etwa 0.13 Volt beschleunigt sind, ist etwa gerade so groß wie die von Atomen oder Elektronen, deren Temperatur 1000^o C beträgt. Wenn man sich die Aufgabe stellt, Kernprozesse dadurch anzuregen und durchzuführen, daß man Stoffe niedriger Ordnungszahl hohen Temperaturen unterwirft, so gelingt dies nur, wenn man die Temperatur so hoch steigert, daß die kinetische Energie der Atome oder Elektronen etwa gerade so groß ist, wie zur Einleitung von Kernprozessen mit Hilfe von durch elektrische Felder beschleunigten Atomen oder Elektronen erforderlich wäre. Es ist somit zur Einleitung derartiger Prozesse eine Steigerung der Temperatur auf ungefähr 10 Millionen Grad Celsius erforderlich. [...]

Zur Herstellung des gleichzeitigen Auftretens beider Vorgänge wird man den Vorgang der Erzeugung des Vordrucks verhältnismäßig langzeitig im Vergleich zu dem eigentlichen Entladungsprozeß wählen. Wenn z.B. die Dauer des Funkenentladungsvorganges etwa 10^{-6} Sek. beträgt, wird man die Dauer des Vordrucks etwa zu 10^{-4} Sek. wählen.

Die Erzeugung des Vordrucks kann entweder mit dem Verfahren nach Ramsauer, wo Zeiten von ungefähr 10^{-4} Sek. gerade erreicht werden können, vorgenommen werden oder ebenfalls durch eine zweite länger dauernde Entladung, die räumlich von der eigentlichen Funkenentladung getrennt ist.

Zu ihrer Herstellung kann man sich mit Vorteil einer schnellaufenden Dynamomaschine bedienen, die durch Entnahme elektrischer Energie in sehr kurzer Zeit abgebremst wird und in Zeiten bis zu ¹⁄₁₀ Sek. Leistungen von der Größenordnung 1 Million kW zu entnehmen erlaubt.

The kinetic energy of atoms or electrons accelerated at about 0.13 volts is about the same as that of atoms or electrons whose temperature is 1000^o C. If the task is to stimulate and carry out nuclear processes by subjecting substances of low atomic number to high temperatures, this is only achieved by raising the temperature so high that the kinetic energy of the atoms or electrons is about the same as that for the initiation of nuclear processes by means of electrons accelerated by electric fields. Thus, an increase of the temperature to about 10 million degrees Celsius is required to initiate such processes. [...]

In order to produce the simultaneous occurrence of both processes, the process of producing the preliminary pressure will be selected relatively long in comparison with the actual discharge process. If, for example, the duration of the spark discharge process is approximately 10^{-6} seconds, the duration of the pre-pressurization will be chosen to be about 10^{-4} seconds.

The pre-pressurization can be produced either by means of the method of Ramsauer, where times of approximately 10^{-4} seconds can be achieved, or by a second longer-lasting discharge which is spatially separated from the actual spark discharge.

To establish the pre-pressurization, one can advantageously use a high-speed dynamo machine, which is decelerated by withdrawal of electrical energy in a very short time and in periods of up to ¹⁄₁₀ seconds, of the order of magnitude of a million kilowatts.

Die mit diesen Verfahren erzeugbaren Temperaturen und Drucke sollen nun erfindungsgemäß angewendet werden zur Einleitung von Kernreaktionen. Hierfür kommen insbesondere Elemente niederer Ordnungszahl in Betracht, also Wasserstoff, schwerer Wasserstoff, Lithium und Bor.

Die Reaktion, die mit den geringsten Hilfsmitteln einzuleiten ist, ist die Reaktion eines schweren Wasserstoffkernes mit einem anderen schweren Wasserstoffkern. In diesem Falle würde also entweder bei der Ramsauer Methode der Gewehrlauf, in den hineingeschossen wird, mit Diplogengas gefüllt sein bzw. bei dem Funkenverfahren würde die Entladung in schwerem Wasser oder vielleicht einem Kohlenwasserstoff, dessen Wasserstoffatome aus schwerem Wasserstoff bestehen, stattfinden. Hierbei bilden sich dann Neutronen, die natürlich in üblicher Weise zur Erzeugung radioaktiver Elemente verwendet werden können. Es ist auch denkbar, daß Reaktionen von dem Gas bzw. der Flüssigkeit mit Stoffen der Kammerwand bzw. in der Flüssigkeit suspendierter Teilchen eingeleitet werden. Es sind aber bekanntlich zu allen Prozessen mit Elementen höherer Ordnungszahl entsprechend höhere Temperaturen notwendig.

Als weitere Reaktionen kommen in Frage die Reaktion von Wasserstoff mit Lithium und Bor. Wenn es gelingt, überhaupt einmal so hohe Temperaturen zu erreichen, daß Kernreaktionen in Gang kommen, so ist die Möglichkeit gegeben, die aus diesen Reaktionen frei werdenden Energien wieder zu benutzen, um neue Stoffmengen auf die nötige Reaktionstemperatur zu bringen.

Im Falle des Arbeitens mit Gasen wird es erforderlich sein, beträchtliche Drucke anzuwenden.

The temperatures and pressures which can be produced with these processes are now to be used according to the invention for initiating nuclear reactions. Particularly suitable for this purpose are elements of low atomic number, such as hydrogen, heavy hydrogen, lithium and boron.

The reaction to be initiated with the slightest aid is the reaction of a heavy hydrogen nucleus with another heavy hydrogen nucleus. In this case, therefore, either the Ramsauer method's gun barrel, into which one would shoot, would be filled with deuterium gas, or the spark would be discharged in heavy water, or perhaps a hydrocarbon, the hydrogen atoms of which are composed of heavy hydrogen. In this case, neutrons are formed, which can, of course, be used in a conventional manner to generate radioactive elements. It is also conceivable that reactions from the gas or the liquid are introduced with substances of the chamber wall or in the liquid of suspended particles. However, as is known, correspondingly higher temperatures are necessary for all processes with elements of higher order number.

Further reactions are the reaction of hydrogen with lithium and boron. If it is possible at all to reach such high temperatures as to cause nuclear reactions to take place, the possibility exists of reusing the energies released from these reactions in order to bring new quantities of matter to the necessary reaction temperature.

In the case of working with gases, it will be necessary to apply considerable pressures.

Bei Reaktionen oder Radioaktivitäten, die mit der Emission schneller geladener Korpuskeln verbunden sind, besteht die Möglichkeit, die Energie dieser Teilchen auszunutzen, indem man sie in einem Vakuumentladungsgefäß für sehr hohe Spannungen, insbesondere einem Ring oder Lamellenrohr, gegen ein elektrisches Feld entsprechender Höhe anlaufen läßt. Als besondere Anwendungsgebiete der Strahlungen, die bei Kernreaktionen bzw. künstlicher Radioaktivität auftreten, muß die Möglichkeit der Wetterbeeinflussung durch Schaffung von Kondensationskernen in Luft, insbesondere vom Flugzeug aus, erwähnt werden. Dabei wird es zweckmäßig sein, die Strahler in möglichst großem Abstand vom Flugzeug zu halten (durch Nachschleppen).

Außerdem kommen die Strahlungen von den erwähnten und anderen Kernreaktionen für medizinische Zwecke in Frage. Dabei wird besonders eine schnelle Elektronenstrahlung von Wert sein.

Da bekanntlich das Geschwindigkeitsspektrum aller β-Strahlungen kontinuierlich ist und bis zu sehr geringen Geschwindigkeiten herabreicht, ist es erforderlich, für den erwähnten Zweck eine solche Strahlenquelle immer in Verbindung mit einer magnetischen Monochromatisierungseinrichtung zu verwenden.

Als wesentlichster Punkt kommt ganz allgemein die Gewinnung von Energie aus dem Atomkern in Frage, indem man z.B. die Wärmeentwicklung der auftretenden Strahlen benutzt, um damit eine Wärmekraftmaschine zu betreiben.

Hierbei ergibt sich die Möglichkeit, unter Verzicht auf großen Nutzeffekt Maschinen mit sehr großer Leistung pro Gewichtseinheit zu bauen.

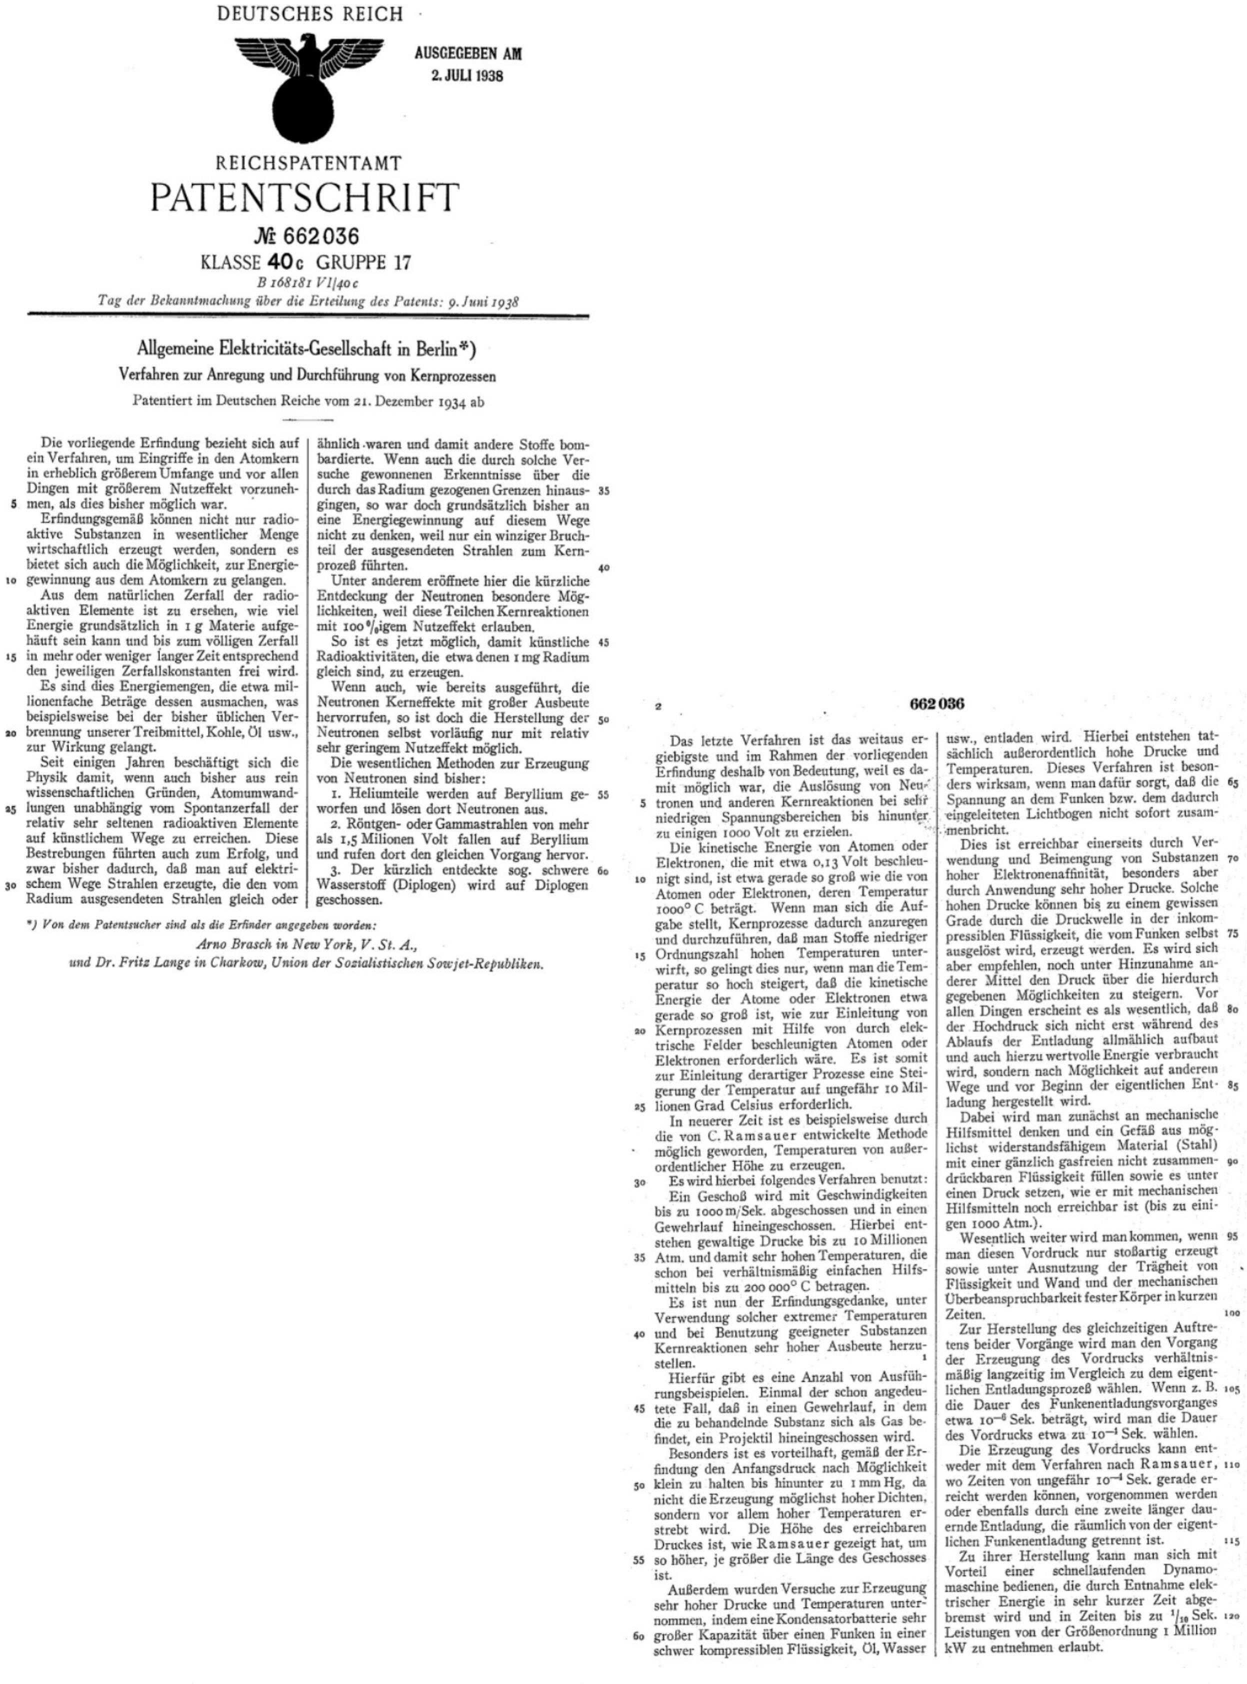
In the case of reactions or radioactivities which are associated with the emission of fast charged particles, it is possible to utilize the energy of these particles by starting them in a vacuum charging vessel for very high voltages, in particular a ring or lamellar tube, against an electric field of corresponding magnitude. The possibility of influencing the weather by the formation of condensation nuclei in air, in particular from aircraft, must be mentioned as special fields of application of the radiation which occur during nuclear reactions or artificial radioactivity. In this case, it will be expedient to keep the radiators as far as possible from the aircraft (by towing them).

In addition, the radiations from the mentioned and other nuclear reactions for medical purposes come into question. A high-speed electron beam will be of particular value.

Since, as is known, the velocity spectrum of all beta-rays is continuous and runs down to very low velocities, it is necessary for such a purpose to always use such a radiation source in conjunction with a magnetic monochromatization device.

In general, the most important point is to obtain energy from the atomic nucleus, for example by using the heat produced by the emitted rays in order to operate a heat engine.

This makes it possible to build machines with both high efficiency and very high power per unit of weight.



DEUTSCHES REICH

AUSGEGEBEN AM

Tag der Bekanntmachung über die Erteilung des Patents: 9. Juni 1938

Allgemeine Elektricitäts-Gesellschaft in Berlin*)

Verfahren zur Anregung und Durchführung von Kernprozessen

Patentiert im Deutschen Reiche vom 21. Dezember 1934 ab

Die vorliegende Erfindung bezieht sich auf ein Verfahren, um Eingriffe in den Atomkern in erheblich größerem Umfange und vor allen Dingen mit größerem Nutzeffekt vorzunehmen, als dies bisher möglich war.

Erfindungsgemäß können nicht nur radioaktive Substanzen in wesentlicher Menge wirtschaftlich erzeugt werden, sondern es bietet sich auch die Möglichkeit, zur Energiegewinnung aus dem Atomkern zu gelangen.

Aus dem natürlichen Zerfall der radioaktiven Elemente ist zu ersehen, wie viel Energie grundsätzlich in 1 g Materie aufgehäuft sein kann und bis zum völligen Zerfall in mehr oder weniger langer Zeit entsprechend den jeweiligen Zerfallskonstanten frei wird.

Es sind dies Energiemengen, die etwa millionenfache Beträge dessen ausmachen, was beispielsweise bei der bisher üblichen Verbrennung unserer Treibmittel, Kohle, Öl usw., zur Wirkung gelangt.

Seit einigen Jahren beschäftigt sich die Physik damit, wenn auch bisher aus rein wissenschaftlichen Gründen, Atomumwandlungen unabhängig vom Spontanzerfall der relativ sehr seltenen radioaktiven Elemente auf künstlichem Wege zu erreichen. Diese Bestrebungen führten auch zum Erfolg, und zwar bisher dadurch, daß man auf elektrischem Wege Strahlen erzeugte, die den vom Radium ausgesendeten Strahlen gleich oder ähnlich waren und damit andere Stoffe bombardierte. Wenn auch die durch solche Versuche gewonnenen Erkenntnisse über die durch das Radium gezogenen Grenzen hinausgingen, so war doch grundsätzlich bisher an eine Energiegewinnung auf diesem Wege nicht zu denken, weil nur ein winziger Bruchteil der ausgesendeten Strahlen zum Kernprozeß führten.

Unter anderem eröffnete hier die kürzliche Entdeckung der Neutronen besondere Möglichkeiten, weil diese Teilchen Kernreaktionen mit 100%igem Nutzeffekt erlauben.

So ist es jetzt möglich, damit künstliche Radioaktivitäten, die etwa denen 1 mg Radium gleich sind, zu erzeugen.

Wenn auch, wie bereits ausgeführt, die Neutronen Kerneffekte mit großer Ausbeute hervorrufen, so ist doch die Herstellung der Neutronen selbst vorläufig nur mit relativ sehr geringem Nutzeffekt möglich.

Die wesentlichen Methoden zur Erzeugung von Neutronen sind bisher:

1. Heliumteile werden auf Beryllium geworfen und lösen dort Neutronen aus.
2. Röntgen- oder Gammastrahlen von mehr als 1,5 Milionen Volt fallen auf Beryllium und rufen dort den gleichen Vorgang hervor.
3. Der kürzlich entdeckte sog. schwere Wasserstoff (Diplogen) wird auf Diplogen geschossen.

2 **662 036**

Das letzte Verfahren ist das weitaus ergiebigste und im Rahmen der vorliegenden Erfindung deshalb von Bedeutung, weil es damit möglich war, die Auslösung von Neutronen und anderen Kernreaktionen bei sehr niedrigen Spannungsbereichen bis hinunter zu einigen 1000 Volt zu erzielen.

Die kinetische Energie von Atomen oder Elektronen, die mit etwa 0,13 Volt beschleunigt sind, ist etwa gerade so groß wie die von Atomen oder Elektronen, deren Temperatur 1000° C beträgt. Wenn man sich die Aufgabe stellt, Kernprozesse dadurch anzuregen und durchzuführen, daß man Stoffe niedriger Ordnungszahl hohen Temperaturen unterwirft, so gelingt dies nur, wenn man die Temperatur so hoch steigert, daß die kinetische Energie der Atome oder Elektronen etwa gerade so groß ist, wie zur Einleitung von Kernprozessen mit Hilfe von durch elektrische Felder beschleunigten Atomen oder Elektronen erforderlich wäre. Es ist somit zur Einleitung derartiger Prozesse eine Steigerung der Temperatur auf ungefähr 10 Millionen Grad Celsius erforderlich.

In neuerer Zeit ist es beispielsweise durch die von C. Ramsauer entwickelte Methode möglich geworden, Temperaturen von außerordentlicher Höhe zu erzeugen.

Es wird hierbei folgendes Verfahren benutzt:

Ein Geschoß wird mit Geschwindigkeiten bis zu 1000 m/Sek. abgeschossen und in einen Gewehrlauf hineingeschossen. Hierbei entstehen gewaltige Drucke bis zu 10 Millionen Atm. und damit sehr hohen Temperaturen, die schon bei verhältnismäßig einfachen Hilfsmitteln bis zu 200 000° C betragen.

Es ist nun der Erfindungsgedanke, unter Verwendung solcher extremer Temperaturen und bei Benutzung geeigneter Substanzen Kernreaktionen sehr hoher Ausbeute herzustellen.

Hierfür gibt es eine Anzahl von Ausführungsbeispielen. Einmal der schon angedeutete Fall, daß in einen Gewehrlauf, in dem die zu behandelnde Substanz sich als Gas befindet, ein Projektil hineingeschossen wird.

Besonders ist es vorteilhaft, gemäß der Erfindung den Anfangsdruck nach Möglichkeit klein zu halten bis hinunter zu 1 mm Hg, da nicht die Erzeugung möglichst hoher Dichten, sondern vor allem hoher Temperaturen erstrebt wird. Die Höhe des erreichbaren Druckes ist, wie Ramsauer gezeigt hat, um so höher, je größer die Länge des Geschosses ist.

Außerdem wurden Versuche zur Erzeugung sehr hoher Drucke und Temperaturen unternommen, indem eine Kondensatorbatterie sehr großer Kapazität über einen Funken in einer schwer kompressiblen Flüssigkeit, Öl, Wasser usw., entladen wird. Hierbei entstehen tatsächlich außerordentlich hohe Drucke und Temperaturen. Dieses Verfahren ist besonders wirksam, wenn man dafür sorgt, daß die Spannung an dem Funken bzw. dem dadurch eingeleiteten Lichtbogen nicht sofort zusammenbricht.

Dies ist erreichbar einerseits durch Verwendung und Beimengung von Substanzen hoher Elektronenaffinität, besonders aber durch Anwendung sehr hoher Drucke. Solche hohen Drucke können bis zu einem gewissen Grade durch die Druckwelle in der inkompressiblen Flüssigkeit, die vom Funken selbst ausgelöst wird, erzeugt werden. Es wird sich aber empfehlen, noch unter Hinzunahme anderer Mittel den Druck über die hierdurch gegebenen Möglichkeiten zu steigern. Vor allen Dingen erscheint es als wesentlich, daß der Hochdruck sich nicht erst während des Ablaufs der Entladung allmählich aufbaut und auch hierzu wertvolle Energie verbraucht wird, sondern nach Möglichkeit auf anderem Wege und vor Beginn der eigentlichen Entladung hergestellt wird.

Dabei wird man zunächst an mechanische Hilfsmittel denken und ein Gefäß aus möglichst widerstandsfähigem Material (Stahl) mit einer gänzlich gasfreien nicht zusammendrückbaren Flüssigkeit füllen sowie es unter einen Druck setzen, wie er mit mechanischen Hilfsmitteln noch erreichbar ist (bis zu einigen 1000 Atm.).

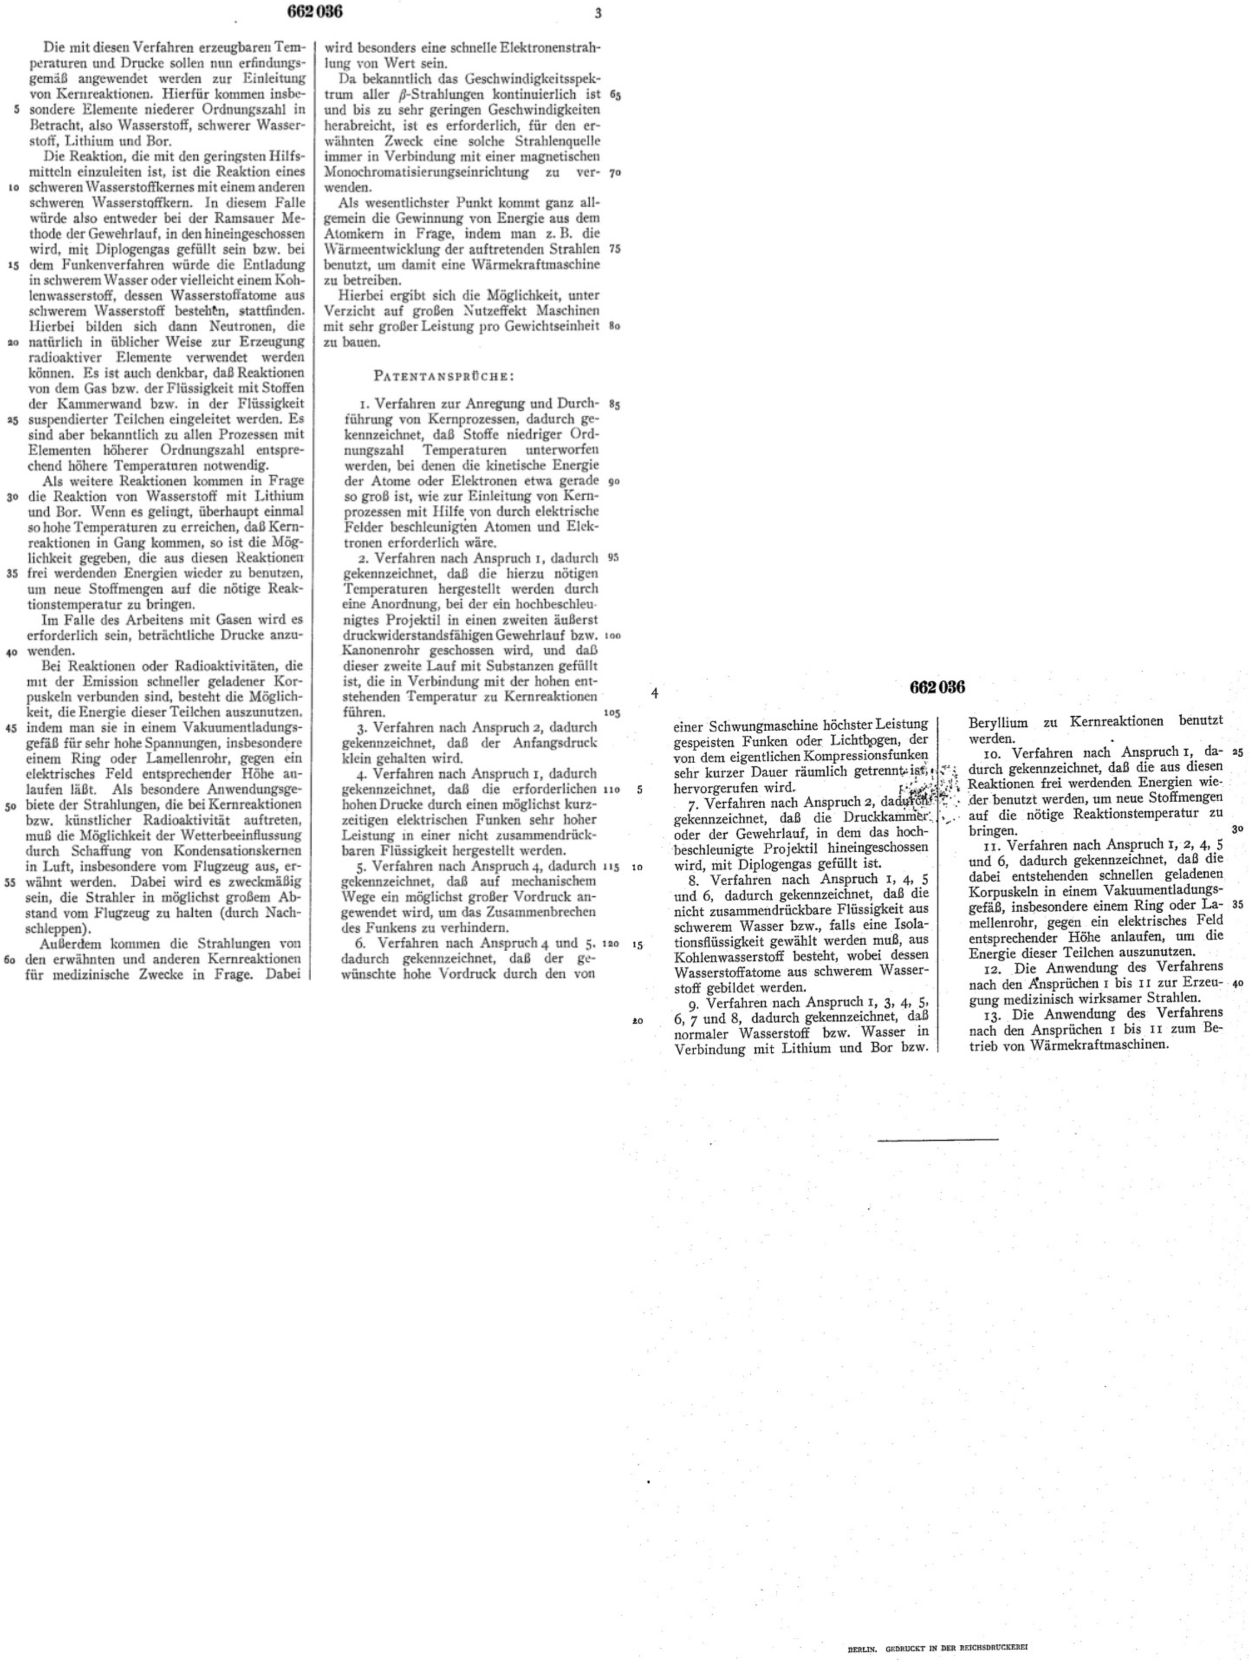
Wesentlich weiter wird man kommen, wenn man diesen Vordruck nur stoßartig erzeugt sowie unter Ausnutzung der Trägheit von Flüssigkeit und Wand und der mechanischen Überbeanspruchbarkeit fester Körper in kurzen Zeiten.

Zur Herstellung des gleichzeitigen Auftretens beider Vorgänge wird man den Vorgang der Erzeugung des Vordrucks verhältnismäßig langzeitig im Vergleich zu dem eigentlichen Entladungsprozeß wählen. Wenn z. B. die Dauer des Funkenentladungsvorganges etwa 10^{-6} Sek. beträgt, wird man die Dauer des Vordrucks etwa zu 10^{-4} Sek. wählen.

Die Erzeugung des Vordrucks kann entweder mit dem Verfahren nach Ramsauer, wo Zeiten von ungefähr 10^{-4} Sek. gerade erreicht werden können, vorgenommen werden oder ebenfalls durch eine zweite länger dauernde Entladung, die räumlich von der eigentlichen Funkenentladung getrennt ist.

Zu ihrer Herstellung kann man sich mit Vorteil einer schnellaufenden Dynamomaschine bedienen, die durch Entnahme elektrischer Energie in sehr kurzer Zeit abgebremst wird und in Zeiten bis zu $^1/_{10}$ Sek. Leistungen von der Größenordnung 1 Million kW zu entnehmen erlaubt.

Figure D.604: Arno Brasch and Fritz Lange, AEG. German Patent DE 662036. Verfahren zur Anregung und Durchführung von Kernprozessen [Process for the Excitation and Execution of Nuclear Processes]. Filed 21 December 1934. Issued 9 June 1938.



Die mit diesen Verfahren erzeugbaren Temperaturen und Drucke sollen nun erfindungsgemäß angewendet werden zur Einleitung von Kernreaktionen. Hierfür kommen insbesondere Elemente niederer Ordnungszahl in Betracht, also Wasserstoff, schwerer Wasserstoff, Lithium und Bor.

Die Reaktion, die mit den geringsten Hilfsmitteln einzuleiten ist, ist die Reaktion eines schweren Wasserstoffkernes mit einem anderen schweren Wasserstoffkern. In diesem Falle würde also entweder bei der Ramsauer Methode der Gewehrlauf, in den hineingeschossen wird, mit Diplogengas gefüllt sein bzw. bei dem Funkenverfahren würde die Entladung in schwerem Wasser oder vielleicht einem Kohlenwasserstoff, dessen Wasserstoffatome aus schwerem Wasserstoff bestehen, stattfinden. Hierbei bilden sich dann Neutronen, die natürlich in üblicher Weise zur Erzeugung radioaktiver Elemente verwendet werden können. Es ist auch denkbar, daß Reaktionen von dem Gas bzw. der Flüssigkeit mit Stoffen der Kammerwand bzw. in der Flüssigkeit suspendierter Teilchen eingeleitet werden. Es sind aber bekanntlich zu allen Prozessen mit Elementen höherer Ordnungszahl entsprechend höhere Temperaturen notwendig.

Als weitere Reaktionen kommen in Frage die Reaktion von Wasserstoff mit Lithium und Bor. Wenn es gelingt, überhaupt einmal so hohe Temperaturen zu erreichen, daß Kernreaktionen in Gang kommen, so ist die Möglichkeit gegeben, die aus diesen Reaktionen frei werdenden Energien wieder zu benutzen, um neue Stoffmengen auf die nötige Reaktionstemperatur zu bringen.

Im Falle des Arbeitens mit Gasen wird es erforderlich sein, beträchtliche Drucke anzuwenden.

Bei Reaktionen oder Radioaktivitäten, die mit der Emission schneller geladener Korpuskeln verbunden sind, besteht die Möglichkeit, die Energie dieser Teilchen auszunutzen, indem man sie in einem Vakuumentladungsgefäß für sehr hohe Spannungen, insbesondere einem Ring oder Lamellenrohr, gegen ein elektrisches Feld entsprechender Höhe anlaufen läßt. Als besondere Anwendungsgebiete der Strahlungen, die bei Kernreaktionen bzw. künstlicher Radioaktivität auftreten, muß die Möglichkeit der Wetterbeeinflussung durch Schaffung von Kondensationskernen in Luft, insbesondere vom Flugzeug aus, erwähnt werden. Dabei wird es zweckmäßig sein, die Strahler in möglichst großem Abstand vom Flugzeug zu halten (durch Nachschleppen).

Außerdem kommen die Strahlungen von den erwähnten und anderen Kernreaktionen für medizinische Zwecke in Frage. Dabei wird besonders eine schnelle Elektronenstrahlung von Wert sein.

Da bekanntlich das Geschwindigkeitsspektrum aller β-Strahlungen kontinuierlich ist und bis zu sehr geringen Geschwindigkeiten herabreicht, ist es erforderlich, für den erwähnten Zweck eine solche Strahlenquelle immer in Verbindung mit einer magnetischen Monochromatisierungseinrichtung zu verwenden.

Als wesentlichster Punkt kommt ganz allgemein die Gewinnung von Energie aus dem Atomkern in Frage, indem man z. B. die Wärmeentwicklung der auftretenden Strahlen benutzt, um damit eine Wärmekraftmaschine zu betreiben.

Hierbei ergibt sich die Möglichkeit, unter Verzicht auf großen Nutzeffekt Maschinen mit sehr großer Leistung pro Gewichtseinheit zu bauen.

PATENTANSPRÜCHE:

1. Verfahren zur Anregung und Durchführung von Kernprozessen, dadurch gekennzeichnet, daß Stoffe niedriger Ordnungszahl Temperaturen unterworfen werden, bei denen die kinetische Energie der Atome oder Elektronen etwa gerade so groß ist, wie zur Einleitung von Kernprozessen mit Hilfe von durch elektrische Felder beschleunigten Atomen und Elektronen erforderlich wäre.

2. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß die hierzu nötigen Temperaturen hergestellt werden durch eine Anordnung, bei der ein hochbeschleunigtes Projektil in einen zweiten äußerst druckwiderstandsfähigen Gewehrlauf bzw. Kanonenrohr geschossen wird, und daß dieser zweite Lauf mit Substanzen gefüllt ist, die in Verbindung mit der hohen entstehenden Temperatur zu Kernreaktionen führen.

3. Verfahren nach Anspruch 2, dadurch gekennzeichnet, daß der Anfangsdruck klein gehalten wird.

4. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß die erforderlichen hohen Drucke durch einen möglichst kurzzeitigen elektrischen Funken sehr hoher Leistung in einer nicht zusammendrückbaren Flüssigkeit hergestellt werden.

5. Verfahren nach Anspruch 4, dadurch gekennzeichnet, daß auf mechanischem Wege ein möglichst großer Vordruck angewendet wird, um das Zusammenbrechen des Funkens zu verhindern.

6. Verfahren nach Anspruch 4 und 5, dadurch gekennzeichnet, daß der gewünschte hohe Vordruck durch den von

einer Schwungmaschine höchster Leistung gespeisten Funken oder Lichtbogen, der von dem eigentlichen Kompressionsfunken sehr kurzer Dauer räumlich getrennt ist, hervorgerufen wird.

7. Verfahren nach Anspruch 2, dadurch gekennzeichnet, daß die Druckkammer oder der Gewehrlauf, in dem das hochbeschleunigte Projektil hineingeschossen wird, mit Diplogengas gefüllt ist.

8. Verfahren nach Anspruch 1, 4, 5 und 6, dadurch gekennzeichnet, daß die nicht zusammendrückbare Flüssigkeit aus schwerem Wasser bzw., falls eine Isolationsflüssigkeit gewählt werden muß, aus Kohlenwasserstoff besteht, wobei dessen Wasserstoffatome aus schwerem Wasserstoff gebildet werden.

9. Verfahren nach Anspruch 1, 3, 4, 5, 6, 7 und 8, dadurch gekennzeichnet, daß normaler Wasserstoff bzw. Wasser in Verbindung mit Lithium und Bor bzw. Beryllium zu Kernreaktionen benutzt werden.

10. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß die aus diesen Reaktionen frei werdenden Energien wieder benutzt werden, um neue Stoffmengen auf die nötige Reaktionstemperatur zu bringen.

11. Verfahren nach Anspruch 1, 2, 4, 5 und 6, dadurch gekennzeichnet, daß die dabei entstehenden schnellen geladenen Korpuskeln in einem Vakuumentladungsgefäß, insbesondere einem Ring oder Lamellenrohr, gegen ein elektrisches Feld entsprechender Höhe anlaufen, um die Energie dieser Teilchen auszunutzen.

12. Die Anwendung des Verfahrens nach den Ansprüchen 1 bis 11 zur Erzeugung medizinisch wirksamer Strahlen.

13. Die Anwendung des Verfahrens nach den Ansprüchen 1 bis 11 zum Betrieb von Wärmekraftmaschinen.

[See document photos on p. 4289.

Werner von Blomberg was the Reichsminister of War from May 1935 to January 1938. Thus no later than January 1938, the German government, and in particular the German military, was actively pursuing nuclear weapons. They attempted to recruit Arno Brasch to work on that program despite the fact that he was Jewish. Similarly, Gustav Hertz appears to have held an important position in the German nuclear weapons program throughout the war despite his Jewish ancestry (Section D.4.4).]

Dear Mike:

In connection with investigational work now underway relative to the development of Manhattan District projects by the Germans, a certain amount of information probably can be obtained from Mr. A. Brasch of the Electronized Chemical Corporation at 122 East 42nd Street, New York City.

Mr. Brasch is a former German citizen, and I am sure he has been thoroughly investigated. As an atomist physicist in 1938 he was approached by members of the general German staff to initiate research along lines of interest to the Manhattan District. Because of his connections with Siemens Halske and A. E. G. and the University of Berlin some information might be forthcoming if required at this late date.

Sincerely yours,

/s/ R. S. Malton

Tom Malton

Auergesellschaft. U.K. Patent GB 508,233. Method for Carrying Out Nuclear Reactions. Filed 7 February 1937. Issued 28 June 1939.

We, DEGEA AKTIENGESELLSCHAFT (AUERGESELLSCHAFT), of 16–19, Rotherstrasse, Berlin, 0.17, Germany, a German Company, do hereby declare the nature of this invention and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:-

Artificial nuclear reactions are initiated by the bombardment of nuclei with light elementary particles. With the use of charged particles (protons, α particles) energies of 10^3 to 10^7 volts are necessary for overcoming the coulombic repulsion powers, in order to ensure a sufficient yield for the penetration of the particles into the bombarded nucleus.

Such a repulsion does not exist for neutrons, so that neutrons of small speed can penetrate into nuclei and produce reactions, as experiments actually show.

Unfortunately, there are no direct sources producing neutrons; they arise, if nuclei, for example, Be, are irradiated with α-particles of high energies (about 10^6 volts) or γ-rays very rich in energy (about $2{\cdot}10^6$ volts) or by bombardment of certain nuclei with fast particles of the heavy isotope of hydrogen. As sources of α-particles of sufficiently high energy, only the naturally radioactive elements have hitherto been available. In the two other cases, for accelerating elementary particles it is necessary to have recourse to the use of very considerable amounts of energy. With the remaining hitherto known methods for the production of elementary particles rich in energy, which have been used directly, or indirectly through the production of very hard Röntgen rays, for the production of neutrons and generally for the initiation of nuclear reactions, there came to be used an acceleration of the desired particles in high vacuum. This method indeed produces definite speeds, but only at the expense of very heavy outlay in the matter of electro-technical apparatus for building up an increase in the current density of the accelerated particles, and also gives a greater absolute yield from the nuclear reactions. The output attained in this way probably corresponds, at best, to that of a few grams of radium. The method of repeated secondary acceleration by means of high frequency alternating fields (Cyclotron) certainly produces greater absolute yields than those just stated, but necessitates however a great increase in the expense of apparatus (extremely large magnets).

The present invention therefore proposes to allow the nuclear reactions to take place under completely different conditions, namely, in the gas phase, under a mean numerical concentration of more than 10^{19} molecules of the gas per cubic centimetre, and preferably under a concentration corresponding to a pressure of one atmosphere at normal temperature of 18^o C. 70 Since in this case, a selective acceleration of elementary particles is not possible, the attainment of a thermal equilibrium with very high temperatures (greater than $10^{7\,o}$ C.) is the objective. For reasons of energy consumption such conditions can only be maintained by extraordinarily high momentary outputs and only for very short times. Accordingly, this invention contemplates the production of energies of 100 watt seconds and more during intervals of 10^{-6} second and less, corresponding to momentary outputs of 100,000 kilowatts and more.

Theoretical calculations based on experiments with exploding wires, and also observations made in connection with mercury discharges in which the number of glowing atoms could be determined with some degree of certainty, lead to the conclusion that high temperatures of the order specified occur with condenser discharges in the gaseous phase. Such operating conditions have in themselves the advantage that because of the practically complete ionisation in the discharge canal the braking action of the electron cloud falls away, and therefore still larger yields of the nuclear reactions are to be expected than have been observed hitherto with neutral atoms. It is therefore proposed for the realisation of the operating conditions set forth above, to utilise condenser discharges. For this it is necessary that

1) the gas concentration (number of molecules per cubic centimetre) be so great that thermal equilibrium can be established within the time of discharge of the condenser.

2) the momentary output, which is given by the size and charging voltage of the condenser, be made so great that the equilibrium temperature becomes established at the desired level.

The experimenter is at liberty to increase the action of the individual extremely short condenser discharge (duration of 10^{-6} second), after the lapse of a certain time which might be approximately of the order of magnitude of 10^{-3} second by allowing a further condenser discharge to traverse the gas. In this way it is possible to intensify the total effect of the method within the limits imposed by the thermal resistance of the discharge vessel used. A discharge rate of 5 discharges per second is probably about as high a rate as can normally be expected to be endured by a glass vessel.

The deciding factors given by these two conditions, viz., gas concentration and the size and charging voltage of the condensers, can be calculated for each individual process.

This calculation has been carried out for the production of neutrons by means of condenser discharge in heavy hydrogen gas. It gives, for about 1 atmosphere pressure, C=50,000 cm. V=10^5 volts (C being the capacity of the condenser and V being the charging voltage) and with a discharge rate of 5 discharges per second, an efficiency which is equivalent to about 50 gms. Ra + Be. Similar results are obtained when using a mixture of heavy and light hydrogen gas.

The method is naturally not limited to the production of neutrons but is equally applicable to a great number of nuclear reactions which may be carried out in this manner on a large scale, for example, the production of helium. For this purpose a discharge of the nature described above may be effected in a mixture of lithium vapour and light hydrogen, the resulting reaction being typified by the following equations:

$$^{7}_{3}\mathrm{Li} + ^{1}_{1}\mathrm{H} = ^{4}_{2}\mathrm{He}; \qquad ^{6}_{3}\mathrm{Li} + ^{1}_{1}\mathrm{H} = ^{4}_{2}\mathrm{He} + ^{3}_{2}\mathrm{He}$$

The pressures and outputs used are the same as in the above described reaction for the production of neutrons by condenser discharges in heavy hydrogen gas.

It is also possible to obtain helium indirectly through neutron irradiation in accordance with the following reaction formula:

$$^{10}_{5}\mathrm{B} + ^{1}_{0}\mathrm{n} = ^{4}_{2}\mathrm{He} + ^{7}_{3}\mathrm{Li}$$

For this purpose the vessel in which the neutron producing discharge takes place requires to be lined on the inside with a substance containing boron and hydrogen, e.g., $B(OCH_3)_3$ or the discharge vessel has to be arranged adjoining an outer flask filled with such substance.

Having now particularly described and ascertained the nature of our said invention and in what manner the same is to be performed, we declare that what we claim is:-

1. Method of carrying out nuclear reactions in which the energy requisite for activating the elementary particles to be caused to participate in a desired reaction is produced in a gas discharge under a mean gas concentration of more than 10^{19} molecules per cubic centimetre, and energies of 100 watt seconds and more during intervals of 10^{-6} second and less are produced, corresponding to momentary outputs of 100,000 kilowatts and more.

2. Method as claimed in claim 1 wherein the reaction is carried out under a gas concentration which corresponds to a pressure of one atmosphere at normal temperature of 18^o C.

3. Method as claimed in claim 1 for producing neutrons, wherein heavy hydrogen gas or a mixture of light and heavy hydrogen gas is utilised as reagent gas.

[See document photos on p. 4293.

This patent did not name any specific inventors, but Nikolaus Riehl was probably the inventor, or at least one of the inventors.

The patent reported that this high-voltage fusion neutron generator had a neutron output comparable to a 50-gram radium-beryllium source, which produces approximately $7.6 \cdot 10^8$ neutrons/second.

The patent also reported that this fusion neutron generator could produce five pulses per second, each with a duration of 10^{-6} second.

Thus the pulses would produce approximately $1.5 \cdot 10^8$ neutrons per pulse, or a neutron intensity of $1.5 \cdot 10^{14}$ neutrons/second during each pulse.]

COMPLETE SPECIFICATION

Method for Carrying out Nuclear Reactions

We, DEGEA AKTIENGESELLSCHAFT (AUERGESELLSCHAFT), of 16—19, Rotherstrasse, Berlin, O.17, Germany, a German Company, do hereby declare the nature of this invention and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

Artificial nuclear reactions are initiated by the bombardment of nuclei with light elementary particles. With the use of charged particles (protons, α particles) energies of 10^5 to 10^7 volts are necessary for overcoming the coulombic repulsion powers, in order to ensure a sufficient yield for the penetration of the particles into the bombarded nucleus.

Such a repulsion does not exist for neutrons, so that neutrons of small speed can penetrate into nuclei and produce reactions, as experiments actually show.

Unfortunately, there are no direct sources producing neutrons; they arise, if nuclei, for example, Be, are irradiated with α-particles of high energies (about 10^6 volts) or γ-rays very rich in energy (about 2.10^6 volts) or by bombardment of certain nuclei with fast particles of the heavy isotope of hydrogen. As sources of α-particles of sufficiently high energy, only the naturally radioactive elements have hitherto been available. In the two other cases, for accelerating elementary particles it is necessary to have recourse to the use of very considerable amounts of energy. With the remaining hitherto known methods for the production of elementary particles rich in energy, which have been used directly, or indirectly through the production of very hard Röntgen rays, for the production of neutrons and generally for the initiation of nuclear reactions, there came to be used an acceleration of the desired particles in high vacuum. This method indeed produces definite speeds, but only at the expense of very heavy outlay in the matter of electro-technical apparatus for building up an increase in the current density of the accelerated particles, and also gives a greater absolute yield from the nuclear reactions. The output attained in this way probably corresponds, at best, to that of a few grams of radium. The method of repeated secondary acceleration by means of high frequency alternating fields (Cyclotron) certainly produces greater absolute yields than those just stated, but necessitates however a great increase in the expense of apparatus (extremely large magnets).

The present invention therefore proposes to allow the nuclear reactions to take place under completely different conditions, namely, in the gas phase, under a mean numerical concentration of more than 10^{19} molecules of the gas per cubic centimetre, and preferably under a concentration corresponding to a pressure of one atmosphere at normal temperature of 18° C. Since in this case, a selective acceleration of elementary particles is not possible, the attainment of a thermal equilibrium with very high temperatures (greater than 10^{7}° C.) is the objective. For reasons of energy consumption such conditions can only be maintained by extraordinarily high momentary outputs and only for very short times. Accordingly, this invention contemplates the production of energies of 100 watt seconds and more during intervals of 10^{-6} second and less, corresponding to momentary outputs of 100,000 kilowatts and more.

Theoretical calculations based on experiments with exploding wires, and also observations made in connection with mercury discharges in which the number of glowing atoms could be determined with some degree of certainty, lead to the conclusion that high temperatures of the order specified occur with condenser discharges in the gaseous phase. Such operating conditions have in themselves the advantage that because of the practically complete ionisation in the discharge canal the braking action of the electron cloud falls away, and therefore still larger yields of the nuclear reactions are to be expected than have been observed hitherto with neutral atoms. It is therefore proposed for the realisation of the operating conditions set forth above, to utilise condenser discharges. For this it is necessary that

1) the gas concentration (number of molecules per cubic centimetre) be so great that thermal equilibrium can be established within the time of discharge of the condenser.

[Price 1/-]

2 508,233

2) the momentary output, which is given by the size and charging voltage of the condenser, be made so great that the equilibrium temperature becomes established at the desired level.

The experimenter is at liberty to increase the action of the individual extremely short condenser discharge (duration of 10^{-6} second), after the lapse of a certain time which might be approximately of the order of magnitude of 10^{-3} second by allowing a further condenser discharge to traverse the gas. In this way it is possible to intensify the total effect of the method within the limits imposed by the thermal resistance of the discharge vessel used. A discharge rate of 5 discharges per second is probably about as high a rate as can normally be expected to be endured by a glass vessel.

The deciding factors given by these two conditions, viz., gas concentration and the size and charging voltage of the condensers, can be calculated for each individual process.

This calculation has been carried out for the production of neutrons by means of condenser discharge in heavy hydrogen gas. It gives, for about 1 atmosphere pressure, $C=50,000$ cm. $V=10^5$ volts (C being the capacity of the condenser and V being the charging voltage) and with a discharge rate of 5 discharges per second, an efficiency which is equivalent to about 50 gms. Ra+Be. Similar results are obtained when using a mixture of heavy and light hydrogen gas.

The method is naturally not limited to the production of neutrons but is equally applicable to a great number of nuclear reactions which may be carried out in this manner on a large scale, for example, the production of helium. For this purpose a discharge of the nature described above may be effected in a mixture of lithium vapour and light hydrogen, the resulting reaction being typified by the following equations:

$$ {}^{7}_{3}\mathrm{Li} + {}^{1}_{1}\mathrm{H} = {}^{4}_{2}\mathrm{He}; \quad {}^{6}_{3}\mathrm{Li} + {}^{1}_{1}\mathrm{H} = {}^{4}_{2}\mathrm{He} + {}^{3}_{2}\mathrm{He} $$

The pressures and outputs used are the same as in the above described reaction for the production of neutrons by condenser discharges in heavy hydrogen gas.

It is also possible to obtain helium indirectly through neutron irradiation in accordance with the following reaction formula:

$$ {}^{10}_{5}\mathrm{B} + {}^{1}_{0}\mathrm{n} = {}^{4}_{2}\mathrm{He} + {}^{7}_{3}\mathrm{Li}. $$

For this purpose the vessel in which the neutron producing discharge takes place requires to be lined on the inside with a substance containing boron and hydrogen, e.g., $B(OCH_3)_3$, or the discharge vessel has to be arranged adjoining an outer flask filled with such substance.

Having now particularly described and ascertained the nature of our said invention and in what manner the same is to be performed, we declare that what we claim is:—

1. Method of carrying out nuclear reactions in which the energy requisite for activating the elementary particles to be caused to participate in a desired reaction is produced in a gas discharge under a mean gas concentration of more than 10^{19} molecules per cubic centimetre, and energies of 100 watt seconds and more during intervals of 10^{-6} second and less are produced, corresponding to momentary outputs of 100,000 kilowatts and more.

2. Method as claimed in claim 1 wherein the reaction is carried out under a gas concentration which corresponds to a pressure of one atmosphere at normal temperature of 18° C.

3. Method as claimed in claim 1 for producing neutrons, wherein heavy hydrogen gas or a mixture of light and heavy hydrogen gas is utilised as reagent gas.

Dated this 7th day of February, 1938.

Figure D.607: Auergesellschaft. U.K. Patent GB 508,233. Method for Carrying Out Nuclear Reactions. Filed 7 February 1937. Issued 28 June 1939.

Hartmut Kallmann and Ernst Kuhn. U.S. Patent 2,251,190. Method of Producing Neutrons. Filed 16 March 1938. Issued 29 July 1941.

This invention relates to a method for the production of neutrons, particularly by the interaction of deuterons.

In order to obtain neutrons with the aid of ions with relatively slight acceleration (for instance 300 kv.) the nuclear reaction

$$\mathrm{D} + \mathrm{D} \;=\; \mathrm{He}_3 + \mathrm{n} \tag{D.12}$$

is employed. The procedure in this connection is to bombard a layer containing heavy hydrogen nuclei with heavy hydrogen ions or deuterons. For the layer containing hydrogen, use is often made of ice, sal ammoniac, phosphoric acid and similar substances in which ordinary hydrogen is replaced by heavy hydrogen. These layers very rich in hydrogen have the disadvantage that they conduct heat and electricity poorly and are therefore easily destroyed by ionic bombardment. It would be better if more resistant layers were used, for instance, metallic layers. That is possible, however, only when metals that contain large amounts of dissolved or adsorbed hydrogen are employed. These are a few such metals, but they have the disadvantage that they gradually give off hydrogen in the vacuum. It would be still better therefore if substances could be used that contain hydrogen adsorbed only on the surface or in a surface layer but give it off to the outside less easily. These substances placed in the ion stream give only a small output of neutrons when impinged on vertically since the thickness of the adsorbed hydrogen layer is very small in comparison with the range of the ions projected into the metal. Nuclear processes can occur therefore only in a fractional portion of the path of the ions. In case, however, the path of the ions is maintained as nearly as possible entirely within the thin hydrogen layer, a large neutron output is obtained with the aid of these thin adsorbed hydrogen layers.

A principal purpose of the invention is the provision of a highly efficient method for the production of neutrons by the interaction of deuterons. According to the invention this is attained by allowing the stream of ions to impinge on the layer at an angle—preferably in as grazing a manner as possible.

The adsorption layer containing hydrogen need not consist of pure hydrogen. It might under certain conditions be more advantageous if the adsorption layer consists of gases or vapors containing hydrogen, for instance, methane or water. This is particularly satisfactory when these substances are adsorbed especially strongly.

The body impinged on by the ions is preferably made of a substance that strongly adsorbs the molecules containing heavy hydrogen and at the same time possesses only a slight retarding capacity for the impinging ions. Carbon and beryllium have been found useful for these reasons. It is especially desirable to employ substances that adsorb the molecules containing hydrogen in as thick a layer as possible. This can be accomplished for instance by using, as adsorption body, a substance that is porous or roughened at least at the surface.

The surface of the adsorbing body is heated up by the energy of the impinging ions. In this way the giving off of the adsorbed substance is promoted. It is, therefore, advisable to cool the adsorbing body. This cooling has the advantage, moreover, that at low temperature the adsorbed layer adheres much more firmly. A reduction of the temperature of only 10^{o}C., for instance from 20^{o}C. room temperature to 10^{o}C., can produce a considerable improvement. In many cases, it is advisable to use solid carbon dioxide or even liquid air for the cooling.

The adsorbed layer can be produced in the usual way, for instance by taking up heavy hydrogen or molecules containing heavy hydro gen from the surroundings, for instance from the gas chamber; but it may also be produced by bombarding the surface with heavy hydrogen ions. It is advisable to free the surface intended for the adsorption of heavy hydrogen as far as possible from other adsorbed molecules, such as ordinary hydrogen, for example, by heating in vacuum.

The replacement of the hydrogen given off during the ion bombardment can be accomplished, for instance, by simultaneous or subsequent bombardment with ions containing heavy hydrogen. This bombardment can be accomplished, for instance, with advantage from a different direction, for example, from the back or at a more acute angle from the front, than the bombardment for producing neutrons. The replacement of the heavy hydrogen may be accomplished, for example, by diffusion or by adsorption from the surroundings.

The principles of the invention are illustrated in the accompanying drawing in which:

Fig. l is a diagrammatic representation of apparatus embodying the principles of the invention; and

Fig. 2 is a partial diagrammatic representation of a modified embodiment of the invention.

In Fig. 1 a beam of high velocity ions of heavy hydrogen 14 is produced by the device described in copending application Serial No. 234,504 of Kuhn and Kallmann, filed October 11, 1938. In this device a beam of negative ions 4 generated at cathode 1 and focussed at 2 by electrode 16 is transformed into a beam of positive heavy hydrogen ions of increased velocity by means of the transforming electrode 5, supported in space 3 by tube 7 and insulator 15. A low pressure is maintained in 3 by means of a pump (not shown) connected at 8. A stream of heavy hydrogen is supplied to channel 6 through tube 7. The high velocity beam of heavy hydrogen ions obtained in this manner passes through apertured member 9 into cathode 10 where they impinge at a grazing angle on the target 11. The high velocity heavy hydrogen ions in the beam react with heavy hydrogen adsorbed on the surface of 11 to produce neutrons.

In the form shown in Fig. 2, a supply of heavy hydrogen is maintained on target 11 by diffusion into 11 of a substance 13 containing heavy hydrogen which is maintained in capsule 12.

METHOD OF PRODUCING NEUTRONS

Hartmut Israel Kallmann, formerly known as Hartmut Kallmann, Berlin-Charlottenburg, and Ernst Kuhn, Berlin, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany, a corporation of Germany

Application March 10, 1939, Serial No. 261,156
In Germany March 16, 1938

16 Claims. (Cl. 250—84)

This invention relates to a method for the production of neutrons, particularly by the interaction of deuterons.

In order to obtain neutrons with the aid of ions with relatively slight acceleration (for instance 300 kv.) the nuclear reaction

$$D+D=He_3+n$$

is employed. The procedure in this connection is to bombard a layer containing heavy hydrogen nuclei with heavy hydrogen ions or deuterons. For the layer containing hydrogen, use is often made of ice, sal ammoniac, phosphoric acid and similar substances in which ordinary hydrogen is replaced by heavy hydrogen. These layers very rich in hydrogen have the disadvantage that they conduct heat and electricity poorly and are therefore easily destroyed by ionic bombardment. It would be better if more resistant layers were used, for instance, metallic layers. That is possible, however, only when metals that contain large amounts of dissolved or adsorbed hydrogen are employed. These are a few such metals, but they have the disadvantage that they gradually give off hydrogen in the vacuum. It would be still better therefore if substances could be used that contain hydrogen adsorbed only on the surface or in a surface layer but give it off to the outside less easily. These substances placed in the ion stream give only a small output of neutrons when impinged on vertically since the thickness of the adsorbed hydrogen layer is very small in comparison with the range of the ions projected into the metal. Nuclear processes can occur therefore only in a fractional portion of the path of the ions. In case, however, the path of the ions is maintained as nearly as possible entirely within the thin hydrogen layer, a large neutron output is obtained with the aid of these thin adsorbed hydrogen layers.

A principal purpose of the invention is the provision of a highly efficient method for the production of neutrons by the interaction of deuterons. According to the invention this is attained by allowing the stream of ions to impinge on the layer at an angle,—preferably in as grazing a manner as possible.

The adsorption layer containing hydrogen need not consist of pure hydrogen. It might under certain conditions be more advantageous if the adsorption layer consists of gases or vapors containing hydrogen, for instance, methane or water. This is particularly satisfactory when these substances are adsorbed especially strongly.

The body impinged on by the ions is preferably made of a substance that strongly adsorbs the molecules containing heavy hydrogen and at the same time possesses only a slight retarding capacity for the impinging ions. Carbon and beryllium have been found useful for these reasons. It is especially desirable to employ substances that adsorb the molecules containing hydrogen in as thick a layer as possible. This can be accomplished for instance by using, as adsorption body, a substance that is porous or roughened at least at the surface.

The surface of the adsorbing body is heated up by the energy of the impinging ions. In this way the giving off of the adsorbed substance is promoted. It is, therefore, advisable to cool the adsorbing body. This cooling has the advantage, moreover, that at low temperature the adsorbed layer adheres much more firmly. A reduction of the temperature of only 10° C., for instance from 20° C. room temperature to 10° C., can produce a considerable improvement. In many cases, it is advisable to use solid carbon dioxide or even liquid air for the cooling.

The adsorbed layer can be produced in the usual way, for instance by taking up heavy hydrogen or molecules containing heavy hydrogen from the surroundings, for instance from the gas chamber; but it may also be produced by bombarding the surface with heavy hydrogen ions. It is advisable to free the surface intended for the adsorption of heavy hydrogen as far as possible from other adsorbed molecules, such as ordinary hydrogen, for example, by heating in vacuum.

The replacement of the hydrogen given off during the ion bombardment can be accomplished, for instance, by simultaneous or subsequent bombardment with ions containing heavy hydrogen. This bombardment can be accomplished, for instance, with advantage from a different direction, for example, from the back or at a more acute angle from the front, than the bombardment for producing neutrons. The replacement of the heavy hydrogen may be accomplished, for example, by diffusion or by adsorption from the surroundings.

The principles of the invention are illustrated in the accompanying drawing in which:

Fig. 1 is a diagrammatic representation of apparatus embodying the principles of the invention; and

Fig. 2 is a partial diagrammatic representation of a modified embodiment of the invention.

2 2,251,190

In Fig. 1 a beam of high velocity ions of heavy hydrogen 14 is produced by the device described in copending application Serial No. 234,504 of Kuhn and Kallmann, filed October 11, 1938. In this device a beam of negative ions 4 generated at cathode 1 and focussed at 2 by electrode 16 is transformed into a beam of positive heavy hydrogen ions of increased velocity by means of the transforming electrode 5, supported in space 3 by tube 7 and insulator 15. A low pressure is maintained in 3 by means of a pump (not shown) connected at 8. A stream of heavy hydrogen is supplied to channel 6 through tube 7. The high velocity beam of heavy hydrogen ions obtained in this manner passes through apertured member 9 into cathode 10 where they impinge at a grazing angle on the target 11. The high velocity heavy hydrogen ions in the beam react with heavy hydrogen adsorbed on the surface of 11 to produce neutrons.

In the form shown in Fig. 2, a supply of heavy hydrogen is maintained on target 11 by diffusion into 11 of a substance 13 containing heavy hydrogen which is maintained in capsule 12.

We claim:

1. A method for the production of neutrons which comprises bombarding a body containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal.

2. A method for the production of neutrons which comprises bombarding a body containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a grazing angle.

3. A method for the production of neutrons which comprises bombarding a body containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal while cooling the body to a temperature below room temperature.

4. A method for the production of neutrons which comprises bombarding a body containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal and replacing the adsorbed heavy hydrogen by bombardment of said body with heavy hydrogen ions.

5. A method for the production of neutrons which comprises bombarding a body containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal and replacing the adsorbed heavy hydrogen by diffusion of substances containing heavy hydrogen into the body.

6. A method for the production of neutrons which comprises bombarding a body containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal and continuously replacing the adsorbed heavy hydrogen during the bombardment.

7. A method for the production of neutrons which comprises bombarding a body comprising carbon and containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal.

8. A method for the production of neutrons which comprises bombarding a body comprising beryllium and containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal.

9. A method for the production of neutrons which comprises bombarding a body, at least the surface portion of which is porous, containing heavy hydrogen adsorbed in its surface with heavy hydrogen ions impinging thereon at a substantial angle to the normal.

10. A device for the production of neutrons comprising means for generating a beam of heavy hydrogen ions, and a body containing heavy hydrogen adsorbed in the surface thereof positioned in said beam with said surface at an acute angle to the direction of travel thereof.

11. A device for the production of neutrons comprising means for generating a beam of heavy hydrogen ions, and a body containing heavy hydrogen adsorbed in the surface thereof positioned in said beam with said surface at a grazing angle to the direction of travel thereof.

12. A device for the production of neutrons comprising means for generating a beam of heavy hydrogen ions, a body containing heavy hydrogen adsorbed in the surface thereof positioned in said beam with said surface at an acute angle to the direction of travel thereof, and means for supplying heavy hydrogen to said body.

13. A device for the production of neutrons comprising means for generating a beam of heavy hydrogen ions, and a body comprising carbon and containing heavy hydrogen adsorbed in the surface thereof positioned in said beam with said surface at an acute angle to the direction of travel thereof.

14. A device for the production of neutrons comprising means for generating a beam of heavy hydrogen ions, and a body comprising beryllium and containing heavy hydrogen adsorbed in the surface thereof positioned in said beam with said surface at an acute angle to the direction of travel thereof.

15. A device for the production of neutrons comprising means for generating a beam of heavy hydrogen ions, and a body having a porous surface and containing heavy hydrogen adsorbed in the surface thereof positioned in said beam with said surface at an acute angle to the direction of travel thereof.

16. A method for the production of neutrons which comprises bombarding a body with heavy hydrogen ions impinging on the body at a substantial angle to the normal, said body having a high adsorptive capacity for a substance containing heavy hydrogen and having a low retarding effect upon impinging heavy hydrogen and containing heavy hydrogen adsorbed in its surface.

Figure D.609: High-voltage tube for generating fusion neutrons from Kallmann and Kuhn's U.S. Patent 2,251,190.

Hartmut Kallmann and Ernst Kuhn. U.S. Patent 2,288,717. Method for Investigation of Substances with the Aid of Neutrons. Filed 10 March 1939. Issued 7 July 1942.

The present invention relates to improvements in methods of, and means for, investigating objects or substances with the aid of neutrons.

It has already been suggested to investigate substances by depicting them with the aid of neutrons. This investigation may be carried out by directing a beam of neutrons through the body or substance under investigation and causing the neutrons that emerge from it to encounter a layer in which heavy charged particles or electrons (+ and -) or gamma rays are produced under the action of the impinging neutrons upon an element, contained in said layer, which is reactive toward neutrons. These particles are in turn caused to act upon a layer of fluorescent material, or an adjacent photographic layer or a combination thereof, thus depicting the investigated body or substance visibly or photographically. Neutron reactive layers particularly suited for this purpose are, for instance, such containing lithium or boron. In these two substances the following reactions take place under the influence of the impinging neutrons:

$$1.\quad n_0^1 + Li_3^6 = He_2^4 + H_1^3 \tag{D.13}$$

$$2.\quad n_0^1 + B_5^{10} = Li_3^7 + He_2^4 \tag{D.14}$$

In the lithium or lithium compounds existing in nature the contents of the effective Li_3^6 amounts only to about 10%, and in the boron and boron compounds existing in nature the contents of the effective B_5^{10} amounts only to about 20%. The main mass of these elements consists of Li_3^7, or B_5^{11}, respectively.

It is an object of the present invention to increase the sensitiveness of the above-mentioned method of depicting objects by means of neutrons. Another object of the invention is to provide improved means for depicting objects by means of neutrons.

This inventive object is attained by using as neutron reactive layer containing an element in which the neutron reactive sort of isotopes is enriched beyond the proportion corresponding to the natural distribution of this isotope in the respective element. Using the above mentioned special reactions the neutron reactive sorts of isotopes being artificially enriched are Li_3^6 or B_5^{10}. The enrichment may be accomplished by any of the known methods for separating or concentrating isotopes, i.e. diffusion, mass spectrograph, electrolysis and chemical processes.

With a given intensity of the neutron radiation the number of the emitted heavy particles and therewith the blackening of the photographic plate, or the excitation of the fluorescent screen respectively, is determined not by the thickness of the intermediate layer, but by the range of the heavy particles liberated from said layer if the thickness of said intermediate layer is larger than said range. The number of the heavy particles emitted per neutron is the greatest if within a layer adjacent to the surface the thickness of which corresponds to the range as many neutrons as possible cause the emission of heavy particles by collision with neutron reactive atomic nuclei. As in general within a layer the thickness of which being equal to the range of said particles only a small fraction of the neutrons passing through liberate heavy particles, it is extremely important, as regards the output, to provide in said layer as many neutron reactive atomic nuclei as possible. An increase of the number of the neutron reactive atomic nuclei is obtained, by artificially enriching the intermediate element with Li_3^6 or B_5^{10}, respectively, beyond the proportion of its natural distribution in the respective element.

This method can advantageously be used also in connection with intermediate layers which do not emit heavy particles, but which emit electrons or gamma rays under the action of impinging neutrons, if the mixture of isotopes of the respective element, as existing in nature, is not the most favorable one for one of said neutron reactions. Therefore, the present improved method is not restricted to boron and lithium, but it will prove advantageous with every other neutron reactive element if only a fraction of all neutrons passing through the neutron-reactive layer is being absorbed in it, or if very thin neutron-reactive layers are used, or if the neutrons in the neutron-reactive layer are also absorbed by atomic nuclei which only contribute very little to the blackening of the photographic layer, or to the excitation of the fluorescent screen respectively by the emission of particles or gamma rays. The present improved method becomes particularly important if the neutron reactive element is applied as an emulsion upon the photographic layer or upon the fluorescent screen. Such emulsions are able to contain a small concentration of the neutron reactive element only. If, therefore the element contained in the emulsion is artificially enriched with the effective sort of isotopes beyond the proportion of its nature distribution in the respective element, an extraordinarily great increase of the sensitiveness can be attained.

Also neutron reactive layers containing cadmium may be used in which the cadmium is artificially enriched with its active isotope beyond the proportion corresponding to its natural distribution in cadmium. The isotope of cadmium to be used in each instance depends upon the neutron energy employed. The choice is made by observing which gives the greatest effect.

The accompanying drawing is a diagrammatic representation of an embodiment of the invention. The neutron beam 2 emitted by the neutron source 1 passes through the investigated substance or body 3. The emerging neutrons 4 impinge upon the neutron reactive layer 5 which is enriched with the effective sort of isotopes beyond the proportion corresponding to its natural distribution in the respective elements. In this layer 5 the neutrons liberate charged particles or gamma rays which energize the adjacent layer 6 which consists of fluorescent or photo-sensitive material thus producing a visible or photographic image of the investigated substance or body 3.

[See document photos on pp. 4300–4301.

The patents of Kallmann and Kuhn are directly relevant to high-voltage fusion neutron initiators for fission bombs, but also to neutron imaging, analysis of materials, well logging, etc. These technologies have had wide-reaching influence from the postwar period to the modern world. In connection to nuclear weapons, note that in March 1939 Kallmann and Kuhn specifically described:

- The reaction $\mathrm{n}_0^1 + \mathrm{Li}_3^6 \rightarrow \mathrm{He}_2^4 + \mathrm{H}_1^3$, half of the Jetter cycle (p. 4348 of this appendix).
- The need to enrich the lithium-6 isotope from naturally occurring lithium, as Alfred Klemm did in 1942–1943 (p. 4344).

METHOD FOR THE INVESTIGATION OF SUBSTANCES WITH THE AID OF NEUTRONS

Hartmut Israel Kallmann, Berlin-Charlottenburg, and Ernst Kuhn, Berlin, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany, a corporation of Germany

Application January 31, 1940, Serial No. 316,698
In Germany March 10, 1939

17 Claims. (Cl. 250—65)

The present invention relates to improvements in methods of, and means for, investigating objects or substances with the aid of neutrons.

It has already been suggested to investigate substances by depicting them with the aid of neutrons. This investigation may be carried out by directing a beam of neutrons through the body or substance under investigation and causing the neutrons that emerge from it to encounter a layer in which heavy charged particles or electrons (+ and —) or gamma rays are produced under the action of the impinging neutrons upon an element, contained in said layer, which is reactive toward neutrons. These particles are in turn caused to act upon a layer of fluorescent material, or an adjacent photographic layer or a combination thereof, thus depicting the investigated body or substance visibly or photographically. Neutron reactive layers particularly suited for this purpose are, for instance, such containing lithium or boron. In these two substances the following reactions take place under the influence of the impinging neutrons:

1. $n_0^1+Li_3^6=He_2^4+H_1^3$

2. $n_0^1+B_5^{10}=Li_3^7+He_2^4$

In the lithium or lithium compounds existing in nature the contents of the effective Li_3^6 amounts only to about 10%, and in the boron and boron compounds existing in nature the contents of the effective B_5^{10} amounts only to about 20%. The main mass of these elements consists of Li_3^7, or B_5^{11}, respectively.

It is an object of the present invention to increase the sensitiveness of the above-mentioned method of depicting objects by means of neutrons. Another object of the invention is to provide improved means for depicting objects by means of neutrons.

This inventive object is attained by using as neutron reactive layer containing an element in which the neutron reactive sort of isotopes is enriched beyond the proportion corresponding to the natural distribution of this isotope in the respective element. Using the above mentioned special reactions the neutron reactive sorts of isotopes being artificially enriched are Li_3^6 or B_5^{10}. The enrichment may be accomplished by any of the known methods for separating or concentrating isotopes, i. e. diffusion, mass spectrograph, electrolysis and chemical processes.

With a given intensity of the neutron radiation the number of the emitted heavy particles and therewith the blackening of the photographic plate, or the excitation of the fluorescent screen respectively, is, determined not by the thickness of the intermediate layer, but by the range of the heavy particles liberated from said layer if the thickness of said intermediate layer is larger than said range. The number of the heavy particles emitted per neutron is the greatest if within a layer adjacent to the surface the thickness of which corresponds to the range as many neutrons as possible cause the emission of heavy particles by collision with neutron reactive atomic nuclei. As in general within a layer the thickness of which being equal to the range of said particles only a small fraction of the neutrons passing through liberate heavy particles, it is extremely important, as regards the output, to provide in said layer as many neutron reactive atomic nuclei as possible. An increase of the number of the neutron reactive atomic nuclei is obtained, by artificially enriching the intermediate element with Li_3^6 or B_5^{10}, respectively, beyond the proportion of its natural distribution in the respective element.

This method can advantageously be used also in connection with intermediate layers which do not emit heavy particles, but which emit electrons or gamma rays under the action of impinging neutrons, if the mixture of isotopes of the respective element, as existing in nature, is not the most favorable one for one of said neutron reactions. Therefore, the present improved method is not restricted to boron and lithium, but it will prove advantageous with every other neutron reactive element if only a fraction of all neutrons passing through the neutron-reactive layer is being absorbed in it, or if very thin neutron-reactive layers are used, or if the neutrons in the neutron-reactive layer are also absorbed by atomic nuclei which only contribute very little to the blackening of the photographic layer, or to the excitation of the fluorescent screen respectively by the emission of particles or gamma rays. The present improved method becomes particularly important if the neutron reactive element is applied as an emulsion upon the photographic layer or upon the fluorescent screen. Such emulsions are able to contain a small concentration of the neutron reactive element only. If, therefore the element contained in the emulsion is artificially enriched with the effective sort of isotopes beyond the proportion of its nature distribution in the respective element, an extraordinarily great increase of the sensitiveness can be attained.

Also neutron reactive layers containing cadmium may be used in which the cadmium is ar-

In this layer **5** the neutrons liberate charged particles or gamma rays which energize the adjacent layer **6** which consists of fluorescent or photo-sensitive material thus producing a visible or photographic image of the investigated substance or body **3**.

We claim:

1. In a method of obtaining an image of an object by directing a beam of neutrons upon the object, causing the emergent beam of neutrons to impinge upon a layer comprising an element which reacts with neutrons to produce radiation, and forming a visible image of said object by means of the resulting radiation, the improvement which consists in using a neutron-reactive layer in which the neutron-reactive element thereof has been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element.

2. In a method of obtaining an image of an object by directing a beam of neutrons upon the object, causing the emergent beam of neutrons to impinge upon a layer comprising an element which reacts with neutrons to produce radiation, and forming a visible image of said object by means of the resulting radiation, the improvement which consists in using a neutron-reactive layer in which the neutron-reactive element thereof has been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element and in which the neutron-reactive isotope-enriched element is contained in said layer in the form of an emulsion.

3. In a method of obtaining an image of an object by directing a beam of neutrons upon the object, causing the emergent beam of neutrons to impinge upon a layer comprising an element which reacts with neutrons to produce radiation of charged particles, and forming a visible image of said object by means of the resulting radiation, the improvement which consists in using a neutron-reactive layer in which the neutron-reactive element thereof has been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element.

4. The invention defined in claim 3, in which lithium which has been enriched with Li_3^6 beyond the proportion of its natural distribution in lithium constitutes the neutron-reactive element employed.

5. The invention defined in claim 3, in which boron which has been enriched with B_5^{10} beyond the proportion of its natural distribution in boron constitutes the neutron-reactive element employed.

6. A device for forming an image of the distribution of the intensity of a beam of neutrons, which comprises a layer containing an element which reacts with neutrons to produce radiation, said element having been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element, and a substance sensitive to emitted radiation.

7. A device for forming an image of the distribution of the intensity of a beam of neutrons, which comprises a layer containing an element which reacts with neutrons to produce radiation, said element having been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element, and a layer containing a substance sensitive to emitted radiation.

8. A device for forming an image of the distribution of the intensity of a beam of neutrons, which comprises a layer containing an element which reacts with neutrons to produce radiation, said element having been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element, and a layer comprising fluorescent material sensitive to emitted radiation.

9. A device for forming an image of the distribution of the intensity of a beam of neutrons, which comprises a layer containing an element which reacts with neutrons to produce radiation, said element having been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element, and a layer comprising photosensitive material sensitive to emitted radiation.

10. A device for forming an image of the distribution of the intensity of a beam of neutrons, which comprises a layer containing an element which reacts with neutrons to produce radiation of charged particles, said element having been enriched with a neutron-reactive isotope of said element in an amount greater than the proportion of its natural distribution in said element, and a substance sensitive to emitted radiation.

11. The device defined in claim 10, in which the neutron-reactive element is lithium which has been enriched with Li_3^6 beyond the proportion of its natural distribution in lithium.

12. The device defined in claim 10, in which the neutron-reactive element is boron which has been enriched with B_5^{10} beyond the proportion of its natural distribution in boron.

13. The device defined in claim 6, in which the neutron-reactive isotope-enriched element is contained in said neutron-reactive layer in the form of an emulsion.

14. A method of obtaining an image as defined in claim 1 in which the radiation is gamma radiation.

15. A method as defined in claim 1 in which the element is cadmium.

16. A device as defined in claim 6 in which the radiation is gamma radiation.

17. A device as defined in claim 6 in which the element is cadmium.

NOTES ON ALLGEMEINE ELEKTRICITÄTS GESELLSCHAFT (AEG) HENNIGSDORF NEAR BERLIN, AND THE FOREIGN WORKERS' COLONY

PREAMBLE

1. PW is 40 years old and has been with the German Army for three months only. He was born in CZECHOSLOVAKIA and served with the Czech Army during 1924 and 1925. Shortly after the annexation of the SUDETENLAND PW was ordered to GERMANY and was employed in the lacquer factory of the AEG HENNIGSDORF near BERLIN. Late Feb 41 he was taken from the factory to occupy a post as an interpreter and supervisor among the Czechs in the newly-established Foreign Workers' Camp of the AEG, HENNIGSDORF. From that date until Jul 44 PW has been an active and observant official of this camp. He is very cooperative and the information is considered reliable.

I. NOTES ON AEG AND EMPLOYEES

2. The AEG plant in question is located at the Southern outskirts of HENNIGSDORF (GSGS 4414. 3345/7061 and 7062). (Popl. approx. 18,000). This plant is one of ten or eleven branches of the AEG in BERLIN and ever since PW can remember new buildings have been added, and today the plant comprises an estimated area of 800 x 400 m.

TAILPIECE

62. A 2-storey ordinary wooden barrack hut 8 x 8 m has been seen by PW, and on two occasions he had the opportunity of entering the building and talking to the electrician who takes care of the equipment. This electrician did not talk of the purposes of the station, and PW believed that it was most secret, but did mention several times that a voltage of one million must be reached before great results could be expected. By the end of Jun 44 they had come up from 120000 to 420000 volts.

63. Once or twice a week two professors and an engineer arrived at the station and during each visit PW saw the four 1½ inch cables from the building to the steel mast approx 80 m away begin to glow in various colours, usually, however, changing from bluish to green, accompanied by a low hum of great intensity. The visitors stayed for 1½ to 2 hours, the test itself lasting approx 15 mins. Shortly after a test PW went to see his friend, the electrician, and heard him say that each test cost RM 24 in electricity alone. Then PW watched him cleaning spherical containers, removing heavy metal bars from each one and putting them into troughs of acid. Each container had a mirror fixed on top which stood at an angle of 45° and which turned through 90° the line of sight from a telescope some 10 feet away to the small mica covered opening at the top of each container.

64. There were four such spherical containers of different sizes and PW states that he observed that the smallest one, approx 1 m in diameter, was used that day in Jun 44. The size of the others ranged between approx 1 m to 2 m in diameter but otherwise they were identical. The cables leading from an amplifier to each one of the spheres were about the same size but the cables leading from the spheres to heavy insulator and apparently farther to the steel mast were considerably heavier from the 2 m sphere than from the 1 m sphere.

65. Upon being prompted PW suddenly remembered that the electrician at the station had used the terms cyclotron and atom splitting.

ECHINGHEN nr BOULOGNE 19 Sep 44

NOTES ON ALLGEMEINE ELEKTRIZITATS GESELLSCHAFT (AEG) HENNIGSDORF NEAR BERLIN, AND THE FOREIGN WORKERS' COLONY

PREAMBLE

1. PW is 40 years old and has been with the German Army for three months only. He was born in CZECHOSLOVAKIA and served with the CZech Army during 1924 and 1925. Shortly after the annexation of the SUDETENLAND PW was ordered to GERMANY and was employed in the lacquer factory of the AEG HENNIGSDORF near BERLIN. Late Feb 41 he was taken from the factory to occupy a post as an interpreter and supervisor among the Czechs in the newly-established Foreign Workers' Camp of the AEG, HENNIGSDORF. From that date until Jul 44 PW has been an active and observant official of this camp. He is very cooperative and the information is considered reliable.

I. NOTES ON AEG AND EMPLOYEES

LOCATION 2. The AEG plant in question is located at the Southern outskirts of HENNIGSDORF (GSGS 4414. 3345/7061 and 7062). (Popl approx. 18,000). This plant is one of ten or eleven branches of the AEG in BERLIN and ever since PW can remember new buildings have been added, and today the plant comprises an estimated area of 800 x 400 m.

TAILPIECE

EXPERIMENTAL STATION GSGS 4414/3345: 69826018 62. A 2-storey ordinary wooden barrack hut 8 x 8 m has been seen by PW, and on two occasions he had the opportunity of entering the building and talking to the electrician who takes care of the equipment. This electrician did not talk of the purposes of the station, and PW believed that it was most secret, but did mention several times that a voltage of one million must be reached before great results could be expected. By the end of Jun 44 they had come up from 120000 to 420000 volts.

63. Once or twice a week two professors and an engineer arrived at the station and during each visit PW saw the four $1\frac{1}{2}$ inch cables from the building to the steel mast approx 80 m away begin to glow in various colours, usually, however, changing from bluish to green, accompanied by a low hum of great intensity. The visitors stayed for $1\frac{1}{2}$ to 2 hours, the test itself lasting approx 15 mins. Shortly after a test PW went to see his friend, the electrician, and heard him say that each test cost RM 24 in electricity alone. Then PW watched him cleaning spherical containers, removing heavy metal bars from each one and putting them into troughs of acid. Each container had a mirror fixed on top which stood at an angle of 45^0 and which turned through 90^0 the line of sight from a telescope some 10 feet away to the small mica covered opening at the top of each container.

64. There were four such spherical containers of different sizes and PW states that he observed that the smallest one, approx 1 m in diameter, was used that day in Jun 44. The size of the others ranged between approx 1 m to 2 m in diameter but otherwise they were identical. The cables leading from an amplifier to each one of the spheres were about the same size but the cables leading from the spheres to heavy insulator and apparently farther to the steel mast were considerably heavier from the 2 m sphere than from the 1 m sphere.

65. Upon being prompted PW suddenly remembered that the electrician at the station had used the terms cyclone and atom splitting.

G-367. Wolfgang Ferrant. Proposal for a New Method of Releasing Nuclear Energy by a Beam of Heavy Particles. 1945. pp. 13, 21, 23–24, 35.

Unfortunately it was not possible to make use of the correct density figure for Li D in making the computation ($\rho = 1$ was merely estimated); because my books, photostats, and notes were left behind, in part, in Dresden, together with my laboratory (13–14 February) where they were burned, and in part this material was left behind in the Russian Zone. [...]

1. Suitable Substances

Our purpose was to produce, within an extensive reaction area which contains a very large number of atoms capable of reacting, a temperature or an almost entirely uncoordinated heat motion, such as prevails on the stars. At the same time, the density of the reacting material should be as great as possible.

Under these circumstances atomic reactions will occur[...]

The decision in this matter involves an additional demand we must make upon the reacting mass: the demand that this mass should be ionizable in its totality with the lowest possible expenditure of energy.

2. THE PROBLEM OF KEEPING THE WORK OF IONIZATION AT A MINIMUM

However, the choice is in fact restricted to lithium, the latter being a substance which does not carry more than three enveloping electrons. Moreover, the lithium readily combines with heavy hydrogen to form a hydride: LiD. The compound, that is the lithium D hydride, contains a total of only four electrons, so that the total work of ionization is, at worst, only a small amount.

All aside from other considerations, lithium D hydride is well suited as the choice of substance both for the “large particles” and for the recipient substance, not only because heavy hydrogen participates in the atomic reaction, but also because the lithium, likewise, participates. The following reactions are to be anticipated: ${}^{2}_{1}\mathrm{D}(\mathrm{d,n})^{3}_{2}\mathrm{He}$; ${}^{2}_{1}\mathrm{D}(\mathrm{d,p})^{3}_{1}\mathrm{H}$ and ${}^{6}_{3}\mathrm{Li}(\mathrm{d,p})^{7}_{3}\mathrm{Li}$; ${}^{6}_{3}\mathrm{Li}(\mathrm{d},\alpha)^{4}_{2}\mathrm{He}$; ${}^{7}_{3}\mathrm{Li}(\mathrm{d,n})^{4}_{2}\mathrm{He}$.

There occurs in the reaction area a formation of charged particles α, p, but also a formation of neutrons that can easily split off. Our method, therefore, results directly in the creation of a source of neutrons of greatest intensity.

This method, consequently, has nothing to do, directly, with the splitting of the uranium atom.

Advantage will be taken, of course, of Hahn’s discovery; especially when the purpose is to obtain pure energy, and not merely to obtain neutrons and an incidental supply of energy.

If the purpose is to obtain energy alone, the neutrons formed will be utilized in splitting the uranium atom; and in that manner extraordinary amounts of energy will be liberated, as a first product, by way of the neutrons.

The lithium-D-hydride, recipient, therefore, will be surrounded by a coat of uranium.

Quite possibly a special advantage could be obtained by adding a quantity of uranium D compound to the "large particles" and to the recipient mass; because in this manner a considerable amount of energy will be given off by uranium fragments located within the reaction area, and this state of affairs might possibly result in further increases of temperature within the reaction area. [...]

4. SELF HEATING

Under this subject it will be necessary to distinguish between two types of cases: Self heating of the reaction area, and self heating in the reaction field outside the reaction area proper.

1) If a very great number of atomic reactions comes about within the reaction area itself, the particles charged as a result of these reactions (α, p) will produce heat within the reaction area, increasing the latter's temperature until the entire material within the reaction area is consumed.

2) The alpha rays and protons of high energy resulting from the atomic reactions will pass through the reaction area, penetrating to the latter's "wall;" and they will penetrate much more deeply than the D and Li atoms, since the alpha rays and protons are much richer in energy.

If the alpha, p particles occur in such large numbers about the environs of the reaction area become ionized and heated, there will be formed an external reaction zone within which atomic reactions may likewise occur. Finally, the outer reaction zone will assume such dimensions that even the alpha rays and protons forming the reactions no longer leave that zone, and are compelled by the magnetic field to move along circular paths.

If an external reaction zone of this nature is developed, there will result an explosion of the entire LiD mass, since the external reaction zone is capable of enlarging itself on the strength of its own energy production.

[See document photos on pp. 4308–4312.

Wolfgang Ferrant wrote this report after the war, apparently at the behest of the U.S. Alsos Mission. The report seems to have been based on wartime work that Ferrant conducted, participated in, or was aware of, and he complained in this report that he did not have access to any wartime documents in order to more accurately reconstruct the scientific details.

In writing this report, Ferrant appears to have censored himself and/or to have been censored by U.S. officials. The report primarily focused on proposed methods for controlled fusion reactors using magnetic confinement, and it was amazingly prescient on that topic. However, the report also touched on applications to nuclear explosives, and its insights in that direction were extraordinary. Specifically, the report described:

- Using lithium deuteride as a storable solid fusion fuel with excellent physics properties.

- Harnessing a number of fusion reactions that can occur within the lithium deuteride fuel. Ferrant omitted the ${}^{6}_{3}\mathrm{Li}(\mathrm{n},\alpha){}^{3}_{1}\mathrm{H}$ reaction from his list, likely either because he wrote this report without access to any wartime papers or because he was censored or self-censored. Nonetheless, two of his research colleagues at AEG, Hartmut Kallmann and Ernst Kuhn, filed a patent featuring that reaction in 1939 (p. 4298), so the reaction would have been known to Ferrant.

- Initiating fusion reactions in the lithium deuteride by creating sufficiently high initial temperatures, pressures, and densities in the fuel.

- Creating an explosive chain reaction in which fusion reactions within a small region of the lithium deuteride produce enough radiation, heat, and pressure to induce fusion reactions in surrounding regions of the lithium deuteride.

- Producing large amounts of high-energy fusion neutrons from reactions in the lithium deuteride.

- Surrounding the lithium deuteride with a layer of uranium that would absorb the fusion neutrons, undergo fission reactions, and greatly increase the total energy that is released.

- Utilizing the fission reactions in the uranium to increase the heat and pressure and therefore the fusion reaction rate in the lithium deuteride.

All of these details are directly relevant for producing a hydrogen bomb. Ferrant's report demonstrates that all of these details were known and being actively utilized in wartime Germany.

What exactly did Ferrant work on throughout the war?

During the early part of the war, he worked at AEG in Berlin, alongside Hartmut Kallmann and Ernst Kuhn.

In this report, he mentioned working at a nuclear laboratory in Dresden. (There was at least one independent report of a nuclear laboratory in Dresden, which was apparently part of a secret Reichspost/SS collaboration on nuclear weapons—see p. 4507.) Ferrant referred to the U.S./U.K. firebombing of Dresden on 13–14 February 1945.

In this report, Ferrant also referenced a letter he had written in Linz in September 1945, so he apparently was working in Austria at the end of the war, or had connections there earlier in the war too. With whom did he work in Austria? AEG had its own "Bauleitung" (construction directorate) at St. Georgen/Gusen near Linz, and St. Georgen appears to have been involved in nuclear work (p. 3874). Did Ferrant work or visit there during the war?

Did Ferrant tell U.S. officials anything that is not in this report? Did he write an uncensored, more highly classified version of this report, or divulge more details in classified interrogations?

After the war, where did Ferrant work, and what did he work on?

Can additional information be located in archives, and declassified if necessary?]

For distance ranges in the lithium D hydride, corresponding equations will be found simply by computing the density[1] in inverse proportion.

Distance ranges ($R_\alpha = 1.16 \cdot 10^{-30} v_\alpha^3$
in Lithium D ($R_D = 2.395 \cdot 10^{-30} v_D^3$
hydride ($R_{Li} = 1.03 \cdot 10^{-30} v^3_{Li}$
$\rho = 1$

---

[1] Unfortunately it was not possible to make use of the correct density figure for Li D in making the computation ($\rho = 1$ was merely estimated); because my books, photostats, and notes were left behind, in part, in Dresden, together with my laboratory (13-14 February) where they were burned, and in part this material was left behind in the Russian Zone. I do remember taking notes from an old publication where a compound richer in hydrogen is described, that is, richer in hydrogen than Li H. A compound of this type, of course, would be better suited for our method. I was unable to obtain here the literature on that subject.

Ror D atoms and Li atoms derived from a large particle which has a velocity of $v_T = 1{,}03.10^8$ cm/s, ($F_T = 10^8$ volt/cm, V = 100 volts U = 20 MV) we get the following equations for:

The Distance range of ($R_D = 2.62 \cdot 10^{-6}$ cm
D atoms and (
Li atoms in (
Lithium D hydride ($R_{Li} = 1{,}13 \cdot 10^{-6}$ cm

(By way of comparison we would obtain for the distance range of Ra C^1_α particles in Li D hydride: x $8.28 \cdot 10^{-3}$ cm)

tubes H_1' H_2' H_3' ... The first of these cascade is operated with a frequency of v, and the second with a frequency of 2v. Under this procedure, the higher frequency is produced from the lower by means of frequency-doubling, so that the two cascades vibrate in dependency on one another. The frequency-doubling and the coupling of the cascades is effected in the usual, familiar manner.

V. THE TYPES OF ATOMIC PROCESS

1. Suitable Substances

Our purpose was to produce, within an extensive reaction area ~~that~~ which contains a very large number of atoms capable of reacting, a temperature or an almost entirely uncoordinated heat motion, such as prevails on the stars. At the same time, the density of the reacting material should be as great as possible.

Under these circumstances atomic reactions will occur; and these reactions will enjoy the advantage of optimum exploitation of the energies present, since there is no possibility of energy losses from the thrusting atoms, due to the fact that all of the atoms present have as an average the same kinetic energy. Consequently it cannot happen that any of the thrusting atoms of great energy collide continually with particles possessed of lower energy, thus constantly losing energy even if no atomic reactions occur. If the mass within the reaction area is ionized, the thrusting atoms, again, are no longer capable of giving off ionization energy.

Formation of an ionized reaction area presupposes the existence of a fairly large area containing a great number of atoms which likewise are in a condition of thermic movement.

It is worth mentioning, briefly, and by way of contrast, how unfavorable conditions are when the ordinary experimental arrangement is adopted. Thus if α particles, deuterons, or protons are greatly accelerated, and these rays are

The lithium-D-hydride, recipient, therefore, will be surrounded by a coat of uranium.

Quite possibly a special advantage could be obtained by adding a quantity of uranium D compound to the "large particles" and to the recipient mass; because in this manner a considerable amount of energy will be given off by uranium fragments xxx located within the reaction area, and this state of affairs might possibly result in further increases of temperature within the reaction area. Of course, a tremendous energy is required to obtain complete ionization of the uranium atom. Unfortunately I am unable correctly to estimate at this time whether an admixture of uranium would in the end be profitable or not. 1) Because it might happen that the energies to be expended in complete ionization of the uranium admixture are of such magnitude that temperatures in the reaction area would drop to a point where the reaction could not xxxxxx get under way.

VI LOCALIZATION OF THE ENERGY

1. Extent of the Ionized Areas; Walls of the Reaction Area.

It is of the very essence of our method to concentrate the energy upon a small, but not too small area; and this purpose is achieved by making use of the "large particles."

Now the question arises whether a completely ionized reaction area is in any way stable.

---

1) To make such forecast, it would be necessary to have on hand the requisite tables and numerical data, such as could be obtained, for instance, from the tables of nuclear physics. But these tables are no longer obtainable. This defect, I hope, will not prove highly detrimental, however, so far as the basic ideas for our method are concerned.

Boron absorption cross section = 545 barns. Lithium = 55.6 barns.

G-298. Karl G. Zimmer and Otto Peter. Radiobiological Investigations with Fast Neutrons. 1944.

Biological effects were compared with 180 kV x-ray and Li + D fast neutron total body irradiations on blood, haemopoietic organs and male gonads of rats. Fast neutrons cause noticeable radiation injuries with much smaller dosages than x rays. Effects of intensity of radiation could not be detected in the range of fast neutrons investigated. Secondary radiation injuries in the blood were found for prolonged periods after radiation and speedy recovery after irradiation with neutrons cannot be expected. Urgency of further investigations and determinations of tolerance dosages are emphasized in the interest of personnel working in nuclear physics installations.

II. PROF. SIZOO of the VRIJE UNIVERSITEIT AMSTERDAM supplied the following information regarding BÖTTCHER:

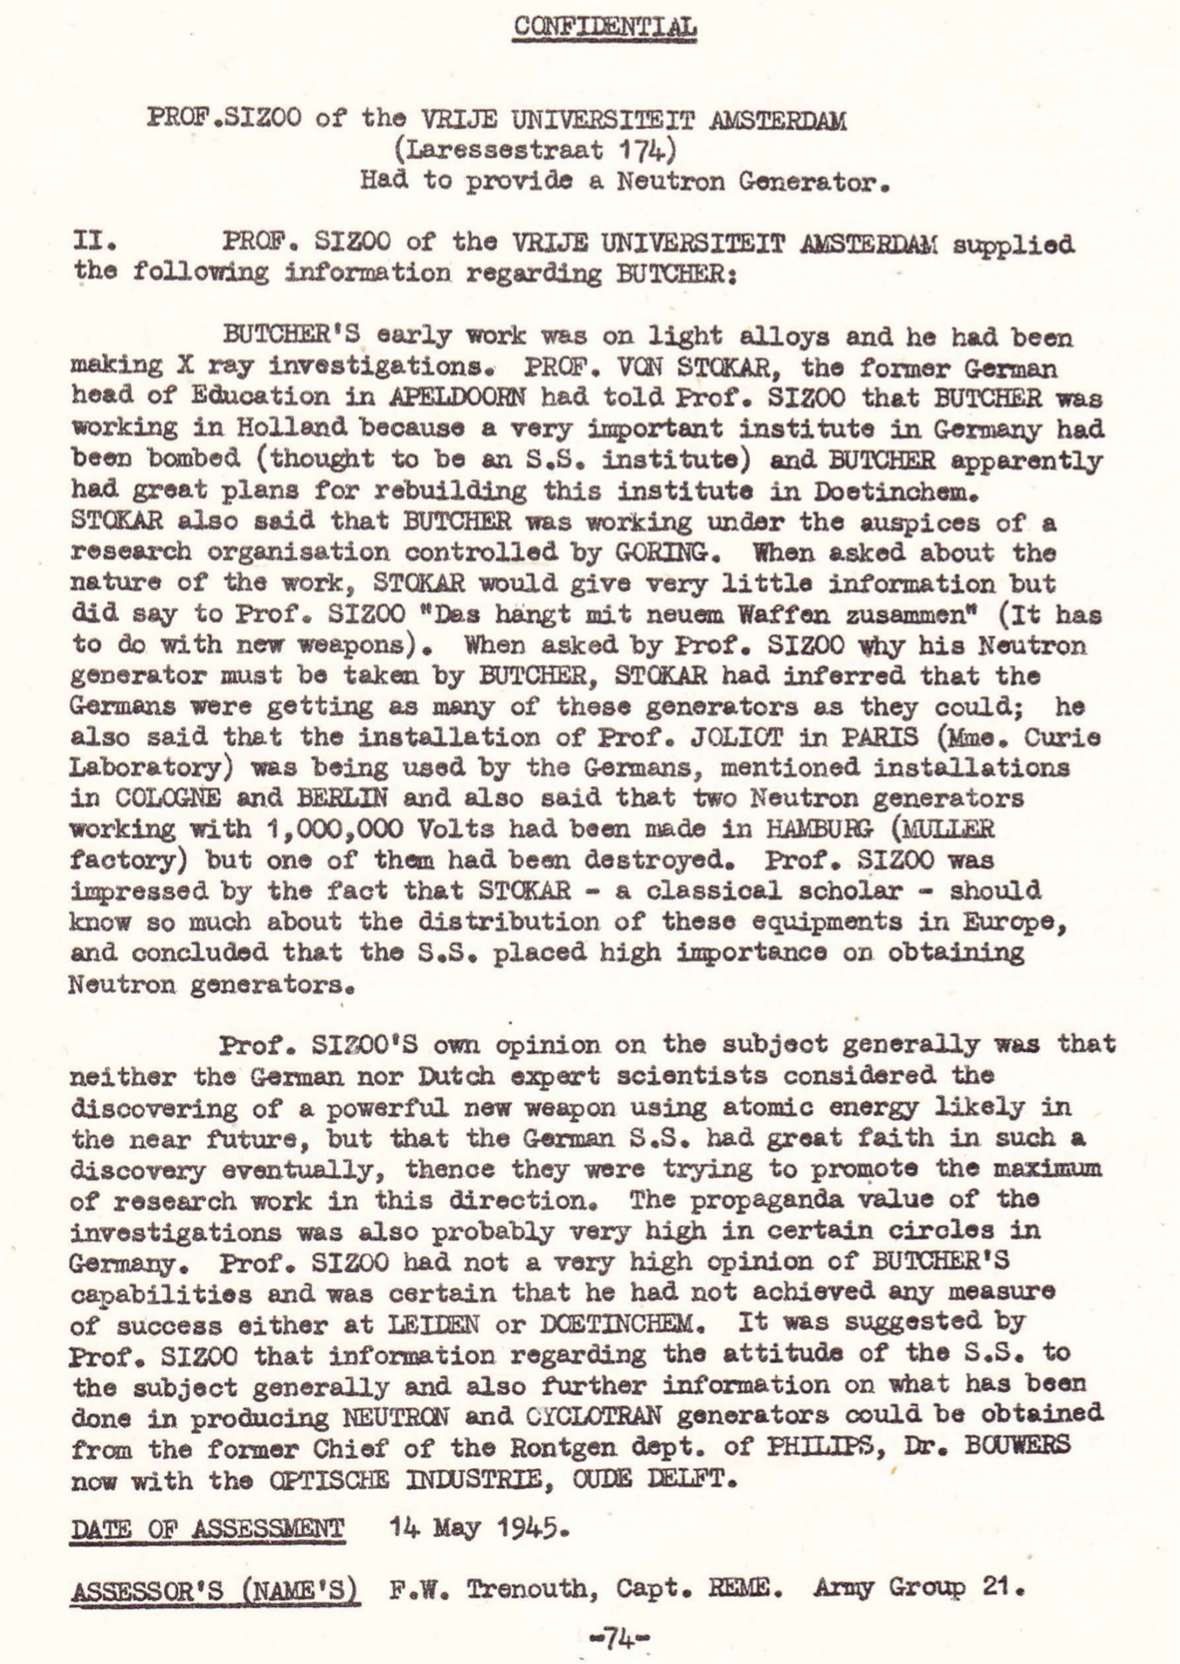
BÖTTCHER'S early work was on light alloys and he had been making X ray investigations. PROF. VON STOKAR, the former German head of Education in APELDOORN had told Prof. SIZOO that BÖTTCHER was working in Holland because a very important institute in Germany had been bombed (thought to be an S.S. institute) and BÖTTCHER apparently had great plans for rebuilding this institute in Doetinchem. STOKAR also said that BÖTTCHER was working under the auspices of a research organization controlled by GÖRING. When asked about the nature of the work, STOKAR would give very little information but did say to Prof. SIZOO "Das hängt mit neuem Waffen zusammen" (It has to do with new weapons). When asked by Prof. SIZOO why his Neutron generator must be taken by BÖTTCHER, STOKAR had inferred that the Germans were getting as many of these generators as they could; he also said that the installation of Prof. JOLIOT in PARIS (Mme. Curie Laboratory) was being used by the Germans, mentioned installations in COLOGNE and BERLIN and also said that two Neutron generators working with 1,000,000 Volts had been made in HAMBURG (MÜLLER factory) but one of them had been destroyed. Prof. SIZOO was impressed by the fact that STOKAR—a classical scholar—should know so much about the distribution of these equipments in Europe, and concluded that the S.S. placed high importance on obtaining Neutron generators.

[...] It was suggested by Prof. SIZOO that information regarding the attitude of the S.S. to the subject generally and also further information on what has been done in producing NEUTRON and CYCLOTRON generators could be obtained from the former Chief of the Röntgen dept. of PHILIPS, Dr. BOUWERS now with the OPTISCHE INDUSTRIE, OUDE DELFT.

DATE OF ASSESSMENT 14 May 1945.

ASSESSOR'S (NAME'S) F.W. Trenouth, Capt. REME. Army Group 21.

[See document photo on p. 4315.]



CONFIDENTIAL

PROF.SIZOO of the VRIJE UNIVERSITEIT AMSTERDAM
(Laressestraat 174)
Had to provide a Neutron Generator.

II. PROF. SIZOO of the VRIJE UNIVERSITEIT AMSTERDAM supplied the following information regarding BUTCHER:

BUTCHER'S early work was on light alloys and he had been making X ray investigations. PROF. VON STOKAR, the former German head of Education in APELDOORN had told Prof. SIZOO that BUTCHER was working in Holland because a very important institute in Germany had been bombed (thought to be an S.S. institute) and BUTCHER apparently had great plans for rebuilding this institute in Doetinchem. STOKAR also said that BUTCHER was working under the auspices of a research organisation controlled by GORING. When asked about the nature of the work, STOKAR would give very little information but did say to Prof. SIZOO "Das hangt mit neuem Waffen zusammen" (It has to do with new weapons). When asked by Prof. SIZOO why his Neutron generator must be taken by BUTCHER, STOKAR had inferred that the Germans were getting as many of these generators as they could; he also said that the installation of Prof. JOLIOT in PARIS (Mme. Curie Laboratory) was being used by the Germans, mentioned installations in COLOGNE and BERLIN and also said that two Neutron generators working with 1,000,000 Volts had been made in HAMBURG (MULLER factory) but one of them had been destroyed. Prof. SIZOO was impressed by the fact that STOKAR - a classical scholar - should know so much about the distribution of these equipments in Europe, and concluded that the S.S. placed high importance on obtaining Neutron generators.

Prof. SIZOO'S own opinion on the subject generally was that neither the German nor Dutch expert scientists considered the discovering of a powerful new weapon using atomic energy likely in the near future, but that the German S.S. had great faith in such a discovery eventually, thence they were trying to promote the maximum of research work in this direction. The propaganda value of the investigations was also probably very high in certain circles in Germany. Prof. SIZOO had not a very high opinion of BUTCHER'S capabilities and was certain that he had not achieved any measure of success either at LEIDEN or DOETINCHEM. It was suggested by Prof. SIZOO that information regarding the attitude of the S.S. to the subject generally and also further information on what has been done in producing NEUTRON and CYCLOTRAN generators could be obtained from the former Chief of the Rontgen dept. of PHILIPS, Dr. BOUWERS now with the OPTISCHE INDUSTRIE, OUDE DELFT.

Visit to Eindhoven, Holland, October 1944 [CIOS X-13 Appendix B]

Developments in Germany of Radiological Apparatus and Applications

Very little real information was known at Philips, Eindhoven, Holland, or in German occupied countries but the following points were notes as being potentially interesting: [...]

3. Dr. Böttcher, Research Station at Doetinchem, Holland, is stated to have collected ultra-high voltage X-ray apparatus up to 5 million volts.

4. F. Kirchner (Köln) is reported to have built a 5 million volt Van de Graaff machine.

5. Mattauch & Hahn, Kaiser Wilhelm Institut (Berlin-Dahlem) are said to have built similar machines.

The same Institute is reputed to have in operation a 2 million volt Müller Cascade generator.

6. K.W. Institut für Hirnforschung (Berlin Buch)

Dr. Karl Zimmer is known to have been working on a neutron generator of 600 k.v. and in one of his laboratories there was seen in July, 1943, a few boxes (20 x 30 x 30 cms) filled with Uranium.

It is not known whether any work was done on the separation of isotopes of Uranium.

7. Dr. W. Heisenberg, Siemens, Berlin Dahlem, said to have built special H.T. plant.

8. Dr. W. Bothe, Heidelberg & Dr. G. Herk, Siemens-Gesellschaft said to be operating several cyclotrons.

9. Dr. K. Clusius, Breslau, said to be engaged on the problem of separating isotopes of Uranium.

Developments in Germany of Radiological Apparatus and Applications

Very little real information was known at Philips, Eindhoven, Holland, or in German occupied countries but the following points were notes as being potentially interesting:-

1. The Broere Foundry, situated in Amsterdam opposite the Blookers Cocoa Factory, Omval, had X-ray industrial equipment delivered early last year on the very highest priority. It was thought to be in connection with V 2 projectiles.

Similar apparatus was delivered to Warsitz Werke, Valckenierstraat 69-87. Amsterdam.

2. Ruhrstahl., Annen., Witten-Armen (Ruhr) Commisair Lindner is stated to have special X-ray plant for the examination of V 2 parts.

3. Dr. Böttcher, Research Station at Doetinchem, Holland, is stated to have collected ultra-high voltage X-ray apparatus up to 5 million volts.

4. F. Kirchner (Köln) is reported to have built a 5 million volt Van de Graaff machine.

5. Mattanch & Hahn. Kaiser Wilhelm Institut (Berlin-Dahlem) are said to have built similar machines.

The same Institute is reputed to have in operation a 2 million volt Müller Cascade generator.

6. K.W. Institut fur Hirnforschung (Berlin Buch)

Dr. Karl Zimmer, is known to have been working on a neutron generator of 600 k.v. and in one of his laboratories there was seen in July, 1943, a few boxes (20 x 30 x 30 cms) filled with Uranium.

It is not known whether any work was done on the separation of isotopes of Uranium.

7. Dr. W. Heisenberg,Siemens, Berlin Dahlem, said to have built special H.T. plant.

8. Dr. W. Bothe, Heidelberg & Dr. G. Herk, Siemens - Gesellschaft said to be operating several cyclotrons.

9. Dr. K. Clisius, Breslau, said to be engaged on the problem of separating isotopes of Uranium.

Figure D.619: Visit to Eindhoven, Holland, October 1944 [CIOS X-13 Appendix B]

CIOS XXVIII-31. ***Investigation of the X-Ray Industry in Germany.*** [See document photos on pp. 3957–3970.]

During the past two years, C. H. F. Müller has constructed and delivered five "neutron generators". Three of these were rated at 1.5 megavolts, one at 1.2 megavolts, and one at .9 megavolts. They have on order, but have not yet completed, one additional neutron generator rated at .9 megavolts and another rated at 2.4 megavolts. These "neutron generators", or "deuteron accelerators", accelerate ionized heavy hydrogen against a beryllium or a lithium target. The neutron output at .9 megavolts when using a beryllium target was estimated to be equivalent to the neutron output of 2 kilograms of radium plus beryllium [$3.0 \cdot 10^{10}$ neutrons/sec]; when using a lithium target, 3 kilograms [$4.6 \cdot 10^{10}$ neutrons/sec]; when using a beryllium target at 1.5 megavolts, 13 kilograms [$2.0 \cdot 10^{11}$ neutrons/sec]; when using a lithium target, 8 kilograms [$1.2 \cdot 10^{11}$ neutrons/sec].

The Phillips "cascade" circuit was used for these neutron generators. Although the electrical output of these generators could be as high as 5 ma., the ion source limited this equipment to 0.8 ma. for continuous operation, regardless of the voltage.

INTERROGATION OF DR. HANS RITZ

MANAGING DIRECTOR OF C.H.F. MÜLLER AT RÖNTGENSTRASSE,

FUHLSBÜTTEL, HAMBURG

May 11, 1945

In November and December 1945, Ritz was experimenting in the manufacture of infra red tubes to be installed in a mobile set for use by the Wehrmacht. Though all three services were probably interested in his production Ritz came into contact only with the army. He was working in conjunction with the firm of A.E.G. Berlin and delivered to them and to the Wehrmacht itself. His factory is located in Greiz, Thüringen. [...]

The firm also has a factory at Freiburg in Schlesien.

Ritz also proudly stated that he had been engaged on research work connected with splitting the atom and hinted that this was far enough advanced for the Europeans to combine forces and develop this "terrific" potential energy for use in any future war with the Asiatics. The subject was not pursued owing to the complete lack of knowledge on the part of the interrogator.

Robert R. Furman to John Lansdale Jr. and Francis J. Smith. 7 June 1945. [NARA RG 77, Entry UD-22A, Box 169, Folder 32.32. Germ. Ind. TA] [See photo p. 4320.]

1. The interrogation of Dr. Hans Ritz revealed that Ritz was experimenting in the manufacture of infra-red tubes which was his main scientific research project. However, the following is quoted from a CIOS report of 11 May 1945 made by S. Wheeler, Captain, R. M. (It should be recalled that Müller had a small tonnage of U_3O_8). [...]

~~CONFIDENTIA~~L

INTERROGATION OF DR. HANS RITZ

MANAGING DIRECTOR OF C.F.H. MULLER AT RONTGENSTRASSE,

FUHLSBUTTEL, HAMBURG

May 11, 1945

In November and December 1944, Ritz was experimenting in the manufacture of infra red tubes to be installed in a mobile set for use by the Wehrmacht. Though all three services were probably interested in his production Ritz came into contact only with the army. He was working in conjunction with the firm of A.E.G. Berlin and delivered to them and to the Wehrmacht itself. His factory is located in Greiz, Thuringen. In December he returned to Hamburg and remained in touch with Griez which carried on production until, he thinks, about April when our bombing of communications virtually paralysed it.

Ritz would at first not commit himself on the use of his infra red tubes, insisting that they could be built in to almost any kind of set and stating that his job was morely to produce them. Eventually however, he became so keen to show how advanced this type of research in Germany had become that he gave his opinion on their application. Stressing the compactness of the set whose vital part he had produced Ritz explained how tanks blind and tactically useless at night could when fitted with infra red be enabled to "see in the dark" - this by means of an infra red receiver and an infra red searchlight (thelatter either fitted to the tank or vehicle - cf. Leigh Light - or independently operated from a flank cf. "Artificial moonlight".) Ritz gave the impression that this was the actual intention of the Wehrmacht by his eagerness to convince his hearers that with a little more time this might have been a weapon for which, used for example in a night attack at the start of the counter offensive, it would have been difficult to find an immediate antidote. He assumes that if it was never used in action the reason could only be that in order to take full advantage of the element of surprise the German Army had decided to delay its appearance until sufficient had been produced to equip a large number of vehicles. Discussing other applications Ritz mentioned the detection of aircraft and Naval gunnery control at night. The latter cases did not, however, seem to interest him so deeply and it is considered that he was not, so far as his knowledge goes, working on a set destined for use by the Navy.

Range of the set when relying on radiated heat as opposed to "recording" and image illuminated by an infra red lamp is given as 10-15 Kilometers under good conditions. Ritz expressing the hope that the benefits of his work fall into the hands of the Americans and not into those of the Russians, states that the sets must still be available at Greiz (sic)

Production figures he estimates roughly as being between 50-100. A.E.G. Berlin are; according to Ritz, the big infra red people. He recommends Dr. Meyer of Berlin as a man with most expert knowledge of the subject. Kugler the Berlin director, is more the organizer. The firm also has a factory at Freiburg in Schlesien.

Ritz also proudly stated that he had been engaged on research work connected with splitting the atom and hinted that this was far enough advanced for the Europeans to combine forces and develop this "terrific" potential energy for use in any future War with the Asiatics. The subject was not pursued owing to the complete lack of knowledge on the part of the interrogator.

Informant denied all knowledge of export of infra red to Japan. He did not consider it likely that the Germans would part with any new apparatus in this line though admitted that elementary material such as was used by the Italians may well have been sent without his knowledge.

I.O.'s note. Though now inclined to co-operate with British and Americans, Ritz cannot get rid of the idea that by giving us information which we might pass on to the Russians he is stabbing Europe and Civilization in the back. Professes however to have no love for the Japs, so this appears to be the line. Probably has an exaggerated idea of the importance of his work but it is strongly recommended that he be interrogated by an expert. He is at present in custody in the factory at Fuhlsbuttel. If released he will be available at short notice.

Dr. Schä/Me ~~Lu 949~~, den 16.6.43

Betreff

Der Stand der Neutronenanlage in Lu 949 Anfang Juni 1943 ist folgender :

Die Leistung unserer Neutronenanlage wurde an der Herstellung von künstlich radioaktivem Phosphor $^{32}_{15}P$ geprüft. Vorteilhaft benützt man hierzu folgenden Kernprozess :

$$^{32}_{16}S + ^{1}_{0}n = ^{32}_{15}P + ^{1}_{1}H$$

Für unsere Anlage empfiehlt sich eine Bestrahlung von Schwefel in Form von CS_2 mit den schnellen Neutronen der D - D Reaktion.

$$^{2}_{1}D + ^{2}_{1}D = ^{3}_{2}He + ^{1}_{0}n$$

Dieser Kernprozess wird in dem Neutronenrohr dadurch realisiert, dass man die in einer Kanalstrahlionenquelle erzeugten Deuteronen mit einer Spannung von einigen hundert Kilovolt nachbeschleunigt und den energiereichen, durch Fokussierung gebündelten Deuteronenstrahl auf eine deuteriumhaltige Substanz, in unserem Falle eine dünne Schicht von schwerem Eis, D_2O Target genannt, fallen lässt.

Die freiwerdenden schnellen Neutronen treten aus dem Neutronenrohr aus, treffen die S - Atome des CS_2 und der dabei gebildete, in unwägbarer Menge vorliegende aktive Phosphor kann von dem CS_2 durch bekannte Methoden abgetrennt werden. Die Stärke des gewonnenen aktiven Phosphorpräparates wird mit einem Geiger-Müller-Zählrohr+), das auf die beim radioaktiven Zerfall emittierten Elektronen anspricht, gemessen.

+) Nebenher wurde noch ein Zählrohrverstärker mit Netzanschluss und einem Thyratronkippkreis in der Endstufe gebaut. Die letztere empfahl sich, da das vorhandene mechanische Zählwerk von Willichowsky -Göttingen nur bei Jmpulsen gleicher Grösse einwandfrei arbeitet, was durch den Kippkreis erreicht wird.

Figure D.622: This document demonstrates that scientists in Germany had been routinely using deuterium + deuterium and lithium + deuterium fusion reactions (in high-voltage tubes) as neutron sources for experiments during the war. - 2 -

Beim ^{32}P geschieht der Zerfall mit einer Halbwertzeit von 14,3 Tagen.15 Zuverlässig messbare Bruchteile des angereicherten Präparates, das als Ammoniumphosphat vorlag, wurden auf Streifen Filtrierpapier gebracht und um den Zählrohrmantel gelegt. Die am Zählrohr in der Zeiteinheit gemessenen Ausschläge sind ein Mass für die Stärke des Präparates. Das Zählrohr gestattet Aktivitäten von etwa 5 Elektronen in der Minute noch nachzuweisen.

Bei 1 stündigem Betrieb der Anlage bei 200 KV an der Nachbeschleunigungsstrecke und 200 μA Deuteronenstrom, der, um eine bei elektrischer Messung des Stromes leicht auftretende Täuschung durch Sekundäreffekte zu vermeiden, kalorimetrisch bestimmt wurde, erhielten wir bei Bestrahlung von 0,5 Ltr CS$_2$ eine Präparatstärke des gebildeten aktiven Phosphors von ca 10^3 Elektronen/min. Durch Bestrahlung von grösseren Mengen CS$_2$ (5 - 10 Ltr.) könnte man bei 10 stündigem Betrieb Präparate von 10^5 Elektronen/min herstellen.

Es mag hier erwähnt werden, dass bei Verwendung der aktiven Phosphorpräparate als radioaktive Indikatoren manche Untersuchungen mit Präparaten von 10^4 Elektronen/min +) mit Erfolg durchgeführt werden können.

Bei Steigerung der Spannung auf 250 KV ist unter den gleichen sonstigen Bedingungen eine Steigerung der Neutronenausbeute und damit auch der Ausbeute an rad.Phosphor um 60% zu erwarten. Versuche ergaben aber vorläufig nur eine Zunahme von 30%. Dies ist darauf zurückzuführen, dass die mit flüssigem Stickstoff gekühlte D$_2$O - Schicht, die Belastung mit 50 Watt (250 KV,200 μA) nicht mehr aushält. Durch Verringerung der spezifischen Belastung, also eine Vergrösserung des Brennfleckes ist eine Steigerung der Gesamtbelastbarkeit zu erreichen. Sollte auch dann die Belastbarkeit eines D$_2$O - Targets nicht hinreichend sein, so empfielt sich die Verwendung eines Targets mit Lithiummetall, der sicher genügend belastbar ist, aber den Nachteil einer geringen Ausbeute bei den in Frage kommenden Spannungen gegenüber einem Target mit schwerem Eis hat. Beim Li-Target wird zur Neutronenerzeugung folgender Kernprozess benützt :

$${}^{7}_{3}\mathrm{Li} + {}^{2}_{1}\mathrm{D} = 2\,{}^{4}_{2}\mathrm{He} + {}^{1}_{0}\mathrm{n}$$

Das Neutronenrohr wurde auch mit 320 KV und 200 μA kurze Zeit betrieben, doch liegen noch keine Ausbeutemessungen vor. Es ist gegenüber 200 KV eine Steigerung der Neutronenausbeute bei einem D$_2$O - Target um 150% zu erwarten. Bei diesen hohen Spannungen treten infolge der entstehenden Sekundärelektronen harte Röntgenstrahlen in einem Masse auf, sodass ohne geeigneten Schutz gegen diese Strahlung, deren Intensität die Toleranzdosisleistung überschreitet, weitere Versuche bei hohen Spannungen nicht ausgeführt werden können. Daher müsste noch ein hinreichender Schutz in Form von 1 cm dicken Pb - Schirmen angebracht werden.

+) O.Meyerhof, P.Ohlmeyer, W.Gentner u.H.Maier,Leibnitz, Biochem.ZS. 298, 396-411, 1938 : Studium der Zwischenreaktionen der Glykolyse mit Hilfe von radioaktivem Phosphor.

Figure D.623: This document demonstrates that scientists in Germany had been routinely using deuterium + deuterium and lithium + deuterium fusion reactions (in high-voltage tubes) as neutron sources for experiments during the war. [Technical Oil Mission Microfilm 119 (BM-6—Ludwigshaven), Folder LU III-2. https://www.fischer-tropsch.org/Tom%20Reels/Linked/TOM%20119%20Partial/TOC_TOM-119.htm]

- 3 -

Da zu erwarten ist, dass die Spannung noch über 320 KV hinaus erhöht werden kann und da besonders auch anzunehmen ist, dass sich die Ergiebigkeit der Jonenquelle über 200 μA hinaus steigern lässt, so dürfte eine Steigerung der Leistung des Neutronengenerators um ein Mehrfaches gegenüber dem jetzt schon bei 200 KV und 200 μA erreichten Werten, die einem Rn + Be - Äquivalent von ca 3 Curie (~ 3 gr Radium) entsprechen, zu verwirklichen sein.

Fritz Houtermans. Letter to Werner Czulius. 28 November 1944. AMPG, I. Abt. Rep. 34, Nr. 53, Bl. 1–2 [Nagel 2012a, pp. 639–640].

[...] Das beste ist zweifellos möglichst weit hinaus zu messen und mit 0,105 oder 0,106 zu extrapolieren. Den Bakkerschen Wert halte ich für zu niedrig. Ich sprach auch mit Bothe kürzlich über die Frage, wie weit, sich der Abfall von $A_c r^2$ bei grossen Entfernungen durch eine Exponentialfunktion approximieren lässt, und er sagte mir, dass er durch Rechnung gefunden habe, dass sich bei komplexem Spektrum schliesslich ein Wert von B einstellt, der wohl durch die freie Weglänge der schnellsten Neutronen bedingt isst, aber nur sehr langsam, d.h. bei sehr grossen Entfernungen. Es ist eben wie immer bei mehreren Exponentialfunktionen, z.B. beim radioaktiven Zerfall von 2 Körpern mit kurzer und langer H.W. Zeit, nur meinte er, es gehe hier noch langsamer. Welchen Wert sie für die Fluoridquelle nehmen sollen, weiss ich nicht, denn ich habe mit einer solchen Quelle nicht gearbeitet. Wenn Sie es nicht selbst messen können, würde ich aus den Tuve-Hafsad-Werten künstlicher Quellen einen aussuchen der einem primären Neutronenspektrum mit ungefähr ähnlicher oberer Grenze (ich glaube D+D, nach vorne, käme ungefähr hin) entspricht bezw. extrapolieren. Für Li + D haben wir 1/B = 10,8 cm gefunden, auch nach vorne, also ziemlich dasselbe, wie für Ra+Be, woraus man sieht, dass die Energieabhangigkeit nicht sehr viel ausmacht. Man wird also sicher auch für CaF_2 mit einem geeigneten interpolierten Wert rechnen dürfen. [...]

[...] The best is undoubtedly to measure as far as possible and to extrapolate it with 0.105 or 0.106. Bakker's value I think is too low. I also talked with Bothe about the question of how far the decay of $A_c r^2$ can be approximated by an exponential function at great distances, and he told me that for a complex spectrum he had calculated a value of B, which is probably due to the free path of the fastest neutrons, but only very slowly, i. e. at very great distances. It is just as always with several exponential functions, e.g. in the radioactive decay of two bodies with short and long half lives, he just meant, it was slower. I do not know which value you should take for the source of fluoride, because I have not worked with such a source. If you cannot measure it yourself, I have chosen one from the Tuve-Hafsad values of artificial sources which extrapolating corresponds to a primary neutron spectrum with a similar upper limit (I believe D+D, forward, approximately). For Li + D, we have found 1/B = 10.8 cm, also forward, which is quite the same as for Ra+Be, which shows that the energy dependence does not matter very much. Thus, CaF_2 may also be expected to have a suitable interpolated value. [...]

[This document demonstrates that scientists in Germany had been routinely using deuterium + deuterium and lithium + deuterium fusion reactions (in high-voltage tubes) as neutron sources for experiments during the war; they are casually mentioned alongside a much more conventional radium+beryllium neutron source. For producing neutrons, the lithium reaction would have been lithium-7 + deuterium → neutron + 2 helium-4 (alpha) particles.

A high-voltage tube containing such fusion fuel would make a good neutron initiator in a fission bomb and is apparently described in Ilyichev's March 1945 intelligence report on a German fission implosion bomb design; see pp. 4485 and 5157.

From unclassified references on nuclear weapons designs, lithium deuteride makes excellent fusion fuel in H bombs or can be used at the center of a fission bomb to provide a fusion neutron boost to greatly increase the fission efficiency and explosive yield.]

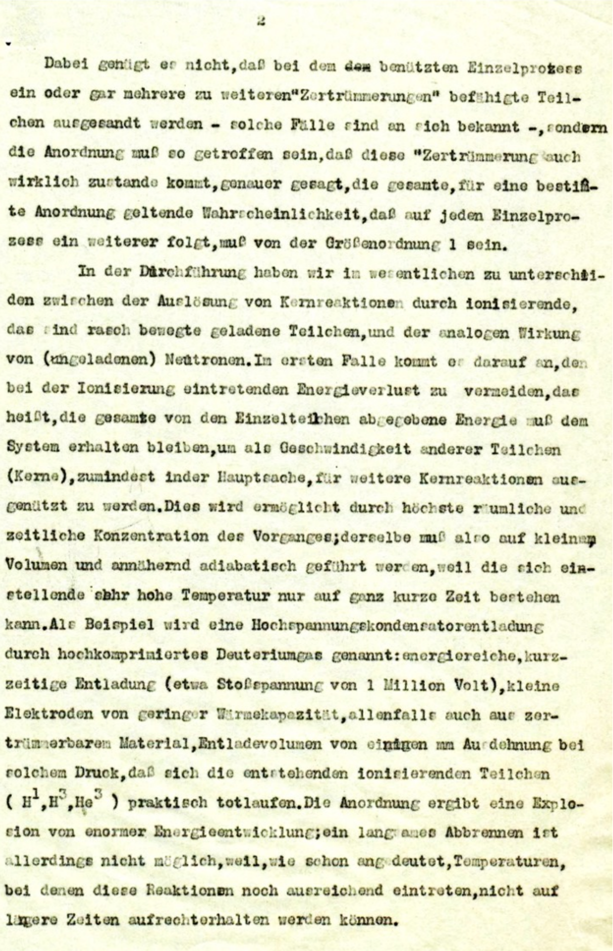
Technische Energiegewinnung mit Hilfe
von Kernreaktionen.

Die bei Kernprozessen,also Zertrümmerungen und Umwandlungen von Atomkernen,ungesetzten Energiebeträge sind,wie bekannt, meist um mehrere Zehnerpotenzen höher als bei gewöhnlichen chemischen Prozessen,bei denen nur die Atomhülle ins Spiel kommt.

Kernprozesse wurden jedoch bisher nur als Einzelereignisse beobachtet und benützt;auch bei Verwendung starker Strahlenquellen kann die Zahl der beteiligten Atomkerne noch als abzählbar gelten. Eine technische Anwendung,also etwa unter Umsetzung wägbarer Substanzmengen,erfolgte nicht,u.zw.aus folgendem Grunde:auch für hoch exotherme Prozesse ist zu ihrer Einleitung eine so hohe,bzw.so hochwertige Energie,z.B.in Form höchstbeschleunigter Kanalstrahlen, erforderlich und andererseits die Wahrscheinlichkeit,daß im Einzelfall die gewünschte Kernreaktion nun wirklich eintritt,so gering,daß das Verfahren damit höchst unökonomisch wird.

Der Grundgedanke der in dieser Patentschrift gegebenen Anweisungen ist nun der,den Ablauf so zu leiten,daß die bei dem Einzelprozess auftretenden Vorgänge selbst benützt werden,weitere, etwa die gleichen Prozesse,auszulösen,so daß die ursprünglich von außen zugeführte Energie nur ähnlich wie eine Initialzündung wirken braucht.

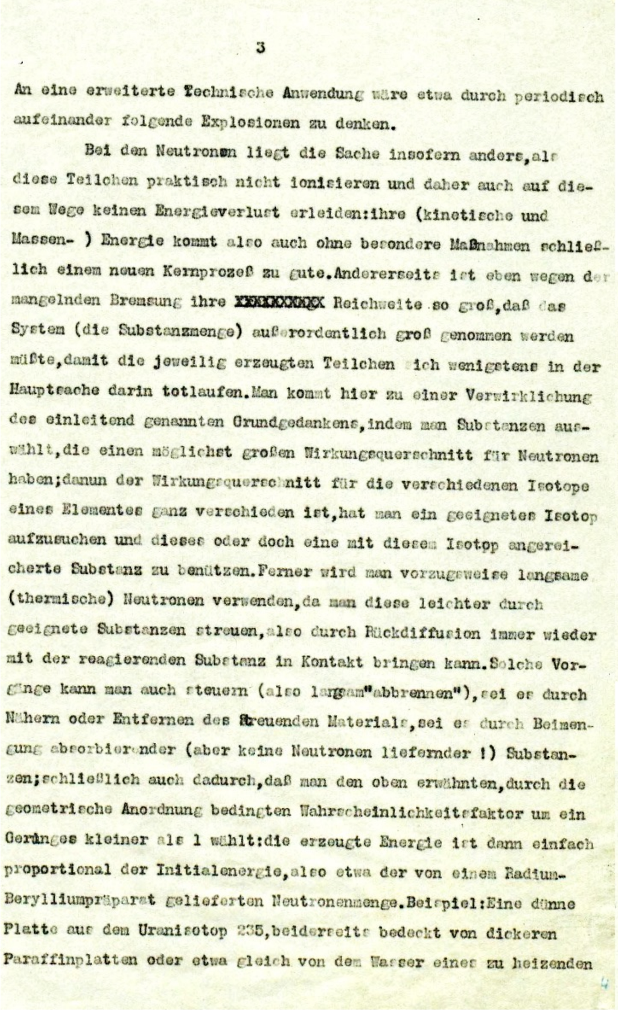


2

Dabei genügt es nicht,daß bei dem dem benützten Einzelprozess ein oder gar mehrere zu weiteren"Zertrümmerungen" befähigte Teilchen ausgesandt werden - solche Fälle sind an sich bekannt -,sondern die Anordnung muß so getroffen sein,daß diese "Zertrümmerung auch wirklich zustande kommt,genauer gesagt,die gesamte,für eine bestimmte Anordnung geltende Wahrscheinlichkeit,daß auf jeden Einzelprozess ein weiterer folgt,muß von der Größenordnung 1 sein.

In der Dürchführung haben wir im wesentlichen zu unterscheiden zwischen der Auslösung von Kernreaktionen durch ionisierende, das sind rasch bewegte geladene Teilchen,und der analogen Wirkung von (ungeladenen) Neutronen.Im ersten Falle kommt es darauf an,den bei der Ionisierung eintretenden Energieverlust zu vermeiden,das heißt,die gesamte von den Einzelteilchen abgegebene Energie muß dem System erhalten bleiben,um als Geschwindigkeit anderer Teilchen (Kerne),zumindest inder Hauptsache,für weitere Kernreaktionen ausgenützt zu werden.Dies wird ermöglicht durch höchste räumliche und zeitliche Konzentration des Vorganges;derselbe muß also auf kleinem Volumen und annähernd adiabatisch geführt werden,weil die sich einstellende sehr hohe Temperatur nur auf ganz kurze Zeit bestehen kann.Als Beispiel wird eine Hochspannungskondensatorentladung durch hochkomprimiertes Deuteriumgas genannt:energiereiche,kurzzeitige Entladung (etwa Stoßspannung von 1 Million Volt),kleine Elektroden von geringer Wärmekapazität,allenfalls auch aus zertrümmerbarem Material,Entladevolumen von einigen mm Ausdehnung bei solchem Druck,daß sich die entstehenden ionisierenden Teilchen (H^1,H^3,He^3) praktisch totlaufen.Die Anordnung ergibt eine Explosion von enormer Energieentwicklung;ein langsames Abbrennen ist allerdings nicht möglich,weil,wie schon angedeutet,Temperaturen, bei denen diese Reaktionen noch ausreichend eintreten,nicht auf längere Zeiten aufrechterhalten werden können.

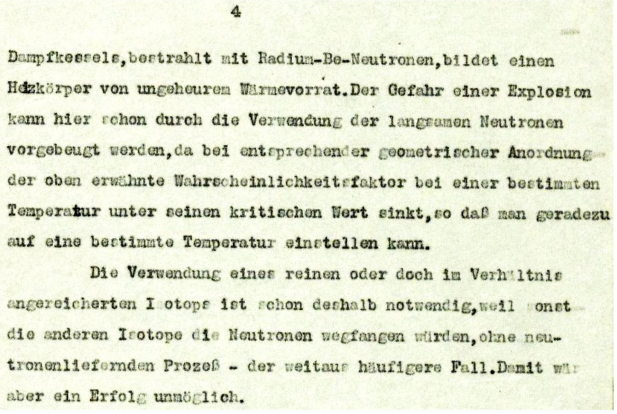
Figure D.628: G-378. Georg Stetter. Technische Energiegewinnung mit Hilfe von Kernreaktionen. FA 002/0762. Deutsches Museum Archive, Munich. https://digital.deutsches-museum.de/item/FA-002-762/



3

An eine erweiterte Technische Anwendung wäre etwa durch periodisch aufeinander folgende Explosionen zu denken.

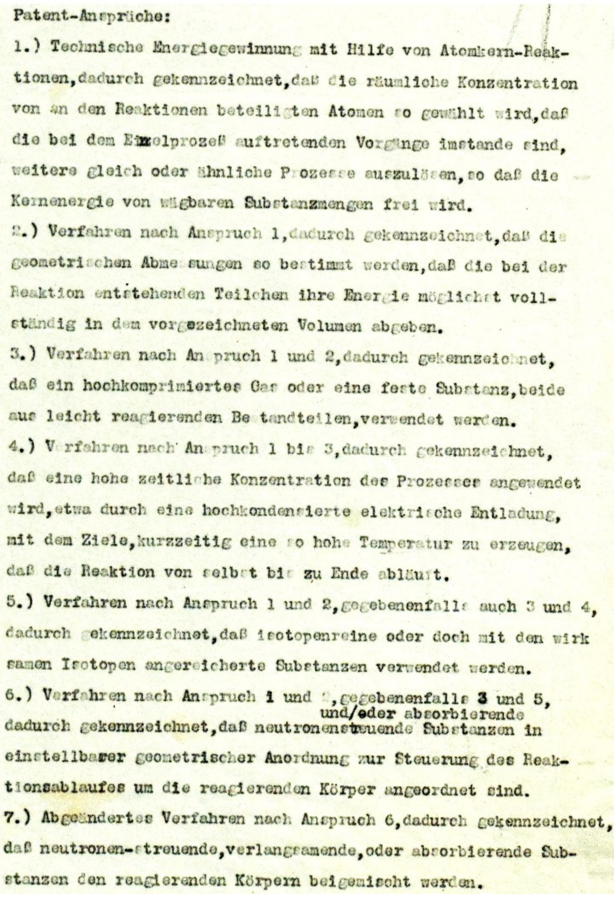
Bei den Neutronen liegt die Sache insofern anders, als diese Teilchen praktisch nicht ionisieren und daher auch auf diesem Wege keinen Energieverlust erleiden: ihre (kinetische und Massen-) Energie kommt also auch ohne besondere Maßnahmen schließlich einem neuen Kernprozeß zu gute. Andererseits ist eben wegen der mangelnden Bremsung ihre XXXXXXXXX Reichweite so groß, daß das System (die Substanzmenge) außerordentlich groß genommen werden müßte, damit die jeweilig erzeugten Teilchen sich wenigstens in der Hauptsache darin totlaufen. Man kommt hier zu einer Verwirklichung des einleitend genannten Grundgedankens, indem man Substanzen auswählt, die einen möglichst großen Wirkungsquerschnitt für Neutronen haben; danun der Wirkungsquerschnitt für die verschiedenen Isotope eines Elementes ganz verschieden ist, hat man ein geeignetes Isotop aufzusuchen und dieses oder doch eine mit diesem Isotop angereicherte Substanz zu benützen. Ferner wird man vorzugsweise langsame (thermische) Neutronen verwenden, da man diese leichter durch geeignete Substanzen streuen, also durch Rückdiffusion immer wieder mit der reagierenden Substanz in Kontakt bringen kann. Solche Vorgänge kann man auch steuern (also langsam "abbrennen"), sei es durch Nähern oder Entfernen des Streuenden Materials, sei es durch Beimengung absorbierender (aber keine Neutronen liefernder !) Substanzen; schließlich auch dadurch, daß man den oben erwähnten, durch die geometrische Anordnung bedingten Wahrscheinlichkeitsfaktor um ein Geringes kleiner als 1 wählt: die erzeugte Energie ist dann einfach proportional der Initialenergie, also etwa der von einem Radium-Berylliumpräparat gelieferten Neutronenmenge. Beispiel: Eine dünne Platte aus dem Uranisotop 235, beiderseits bedeckt von dickeren Paraffinplatten oder etwa gleich von dem Wasser eines zu heizenden



4

Dampfkessels, bestrahlt mit Radium-Be-Neutronen, bildet einen Heizkörper von ungeheuren Wärmevorrat. Der Gefahr einer Explosion kann hier schon durch die Verwendung der langsamen Neutronen vorgebeugt werden, da bei entsprechender geometrischer Anordnung der oben erwähnte Wahrscheinlichkeitsfaktor bei einer bestimmten Temperatur unter seinen kritischen Wert sinkt, so daß man geradezu auf eine bestimmte Temperatur einstellen kann.

Die Verwendung eines reinen oder doch im Verhältnis angereicherten Isotops ist schon deshalb notwendig, weil sonst die anderen Isotope die Neutronen wegfangen würden, ohne neutronenliefernden Prozeß - der weitaus häufigere Fall. Damit wär aber ein Erfolg unmöglich.



Patent-Ansprüche:

1.) Technische Energiegewinnung mit Hilfe von Atomkern-Reaktionen, dadurch gekennzeichnet, daß die räumliche Konzentration von an den Reaktionen beteiligten Atomen so gewählt wird, daß die bei dem Einzelprozeß auftretenden Vorgänge imstande sind, weitere gleich oder ähnliche Prozesse auszulösen, so daß die Kernenergie von wägbaren Substanzmengen frei wird.

2.) Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß die geometrischen Abmessungen so bestimmt werden, daß die bei der Reaktion entstehenden Teilchen ihre Energie möglichst vollständig in dem vorgezeichneten Volumen abgeben.

3.) Verfahren nach Anspruch 1 und 2, dadurch gekennzeichnet, daß ein hochkomprimiertes Gas oder eine feste Substanz, beide aus leicht reagierenden Bestandteilen, verwendet werden.

4.) Verfahren nach Anspruch 1 bis 3, dadurch gekennzeichnet, daß eine hohe zeitliche Konzentration des Prozesses angewendet wird, etwa durch eine hochkondensierte elektrische Entladung, mit dem Ziele, kurzzeitig eine so hohe Temperatur zu erzeugen, daß die Reaktion von selbst bis zu Ende abläuft.

5.) Verfahren nach Anspruch 1 und 2, gegebenenfalls auch 3 und 4, dadurch gekennzeichnet, daß isotopenreine oder doch mit den wirksamen Isotopen angereicherte Substanzen verwendet werden.

6.) Verfahren nach Anspruch 1 und 2, gegebenenfalls 3 und 5, dadurch gekennzeichnet, daß neutronenstreuende und/oder absorbierende Substanzen in einstellbarer geometrischer Anordnung zur Steuerung des Reaktionsablaufes um die reagierenden Körper angeordnet sind.

7.) Abgeändertes Verfahren nach Anspruch 6, dadurch gekennzeichnet, daß neutronen-streuende, verlangsamende, oder absorbierende Substanzen den reagierenden Körpern beigemischt werden.

Figure D.629: G-378. Georg Stetter. Technische Energiegewinnung mit Hilfe von Kernreaktionen. FA 002/0762. Deutsches Museum Archive, Munich. https://digital.deutsches-museum.de/item/FA-002-762/

G-378. Georg Stetter. Technische Energiegewinnung mit Hilfe von Kernreaktionen. FA 002/0762. Deutsches Museum Archive, Munich. https://digital.deutsches-museum.de/item/FA-002-762/ This early 1939 draft of a patent application covered both fusion and fission reactions. A key section on fusion is given below. In reviewing this patent draft, Karl Wirtz raised concerns that the fusion claims were too similar to Brasch and Lange's German Patent 662036 [AMPG 34/29]. The final patent application deleted the fusion claims and polished the fission claims (see p. 3372). Stetter and his fellow researchers were heavily involved in both the wartime fission and fusion programs (pp. 3372–3375, 4330–4345, 4788–4800, 4992). [See document photos on pp. 4328–4329.]

In der Durchführung haben wir im wesentlichen zu unterscheiden zwischen den Auslösung von Kernreaktionen durch ionisierende, das sind rasch bewegte geladene Teilchen, und der analogen Wirkung von (ungeladenen) Neutronen. Im ersten Falle kommt es darauf an, den bei der Ionisierung eintretenden Energieverlust zu vermeiden, das heißt, die gesamte von den Einzelteilchen abgegebene Energie muß dem System erhalten bleiben, um als Geschwindigkeit anderer Teilchen (Kerne), zumindest in der Hauptsache, für weitere Kernreaktionen ausgenützt zu werden. Dies wird ermöglicht durch höchste räumliche und zeitliche Konzentrationen des Vorganges; derselbe muß also auf kleinem Volumen und annähernd adiabatisch geführt werden, weil die sich einstellende sehr hohe Temperatur nur auf ganz kurze Zeit bestehen kann. Als Beispiel wird eine Hochspannungskondensatorentladung durch hochkomprimiertes Deuteriumgas genannt: energiereiche, kurzzeitige Entladung (etwa Stoßspannung von 1 Million Volt), kleine Elektroden von geringer Wärmekapazität, allenfalls auch aus zertrümmerbarem Material, Entladevolumen von einigen mm Ausdehnung bei solchem Druck, daß sich die entstehenden ionisierenden Teilchen (H^1, H^3, He^3) praktisch totlaufen. Die Anordnung ergibt eine Explosion von enormer Energieentwicklung; ein langsames Abbrennen ist allerdings nicht möglich, weil, wie schon angedeutet, Temperaturen, bei denen diese Reaktionen noch ausreichend eintreten, nicht auf längere Zeiten aufrechterhalten werden können.

An eine erweiterte technische Anwendung wäre etwa durch periodisch aufeinander folgende Explosionen zu denken.

In the main we have to differentiate between the induction of nuclear reactions by ionizing, that is rapidly moving charged particles, and the analogous effect of (uncharged) neutrons. In the first case, it is important to avoid the loss of energy occurring during ionization, that is, the total energy released by the individual particles must be retained by the system, as speed of other particles (nuclei), at least in the main, for further nuclear reactions to be exploited. This is made possible by highest spatial and temporal concentrations of the process; the same must therefore be performed on a small volume and approximately adiabatically, because the very high temperature condition can exist only for a very short time. As an example, a high-voltage capacitor discharge by highly compressed deuterium gas is considered: high-energy, short-term discharge (about 1 million volts surge), small electrodes of low heat capacity, if necessary also from fissile material, discharge volume of a few mm expansion at such pressure that the resulting ionizing particles (H^1, H^3, He^3) practically run into each other. The arrangement results in an explosion of tremendous energy development. However, a slow burning off is not possible because, as already indicated, temperatures at which these reactions still sufficiently occur cannot be maintained for longer periods of time.

An advanced technical application would be to think about successive periodical explosions.

Assistant Chief of Staff, G-2, Department of the Army, Washington, DC. Lintner, Karl Rudolf Josef. 6 April 1954. [NARA RG 330, Entry A1-1B, Box 103, Folder Lintner, Karl]

According to information received in Aug 1949 from an untested source, one Dr. Karl LINTNER was assistant to Prof Karl PRZIBAM at the Second Institute of Physics in Vienna. Source declared PRZIBAM to be pro-Russian and believed without being sure that he was in Moscow early 1949. PRZIBAM had been carrying out infra-red research for the Russians. During the war, the nuclear physicists of the Second Institute of Physics in Vienna engaged in a research project of releasing high amounts of energy through nuclear reactions of the lithium hydrite crystal *Li H*. The research was carried out mainly by Dr. Karl LINTNER under the supervision of Prof. Dr. Georg K. F. STETTER. The project failed because according to source, it was impossible to procure strong enough electrodes and equipment sufficiently resistant to heat.

[See document photo on p. 4333.

What lithium and hydrogen isotopes and what reactions did Stetter's group consider? Did they originate the "Jetter cycle" (see p. 4348)?]

Robert A. Snedeker, CIC Sub-Det "C" (Vienna). Agent Report. Dr. Georg Stetter's Patent Concerning Production of Atomic Energy, Technical Intelligence, Vienna. 29 September 1953. [NARA RG 319, Entry A1-134B, Box 749, Folder 23 Nov 95 Georg Stetter XA001081]

On 23 September 1953, Dr. Karl Lintner, Second Physical Institute of the University of Vienna, was interviewed by Informant 1063 and stated the following:

Source [Lintner] was Dr. Georg STETTER's assistant in the Second Physical Institute during World War II, when STETTER was working on the splitting of the lithium nucleus. STETTER intended to have certain processes patented, in connection with splitting nuclei, but Source is unaware of the result of this intention. All of STETTER's research material and notes fell into the hands of the Soviets in 1945 and to Source's knowledge STETTER has not concerned himself with nuclear research since that date. Source considers STETTER the best nuclear physicist in Austria. STETTER, before obtaining a position with the Second Physical Institute, University of Vienna, was affiliate with the United Austrian Iron and Steel Works and the Austrian Nitrogen Works.

[See document photo on p. 4333.

Note that Stetter applied or intended to apply for a patent on his fusion approaches. Was that just the deleted early 1939 patent sections on p. 4330, or did he write additional, more detailed patent drafts? Can any of his group's material be found in Russian archives?]

6. MOIC-S-4412, dated 11 May 1949, Subject: "Schintlmeister Josef Dr., Nuclear Scientists Currently in the USSR," indicated that SUBJECT collaborated with Prof. Georg Stetter on the problem of releasing the energy or accomplishing the atomic fission of the Lithium Hydrite (LiH) crystal. SUBJECT was listed as an assistant at the University of Vienna, Physics Institute II. His political orientation was uncertain. Information in this report was obtained from Prof. Stetter.

Figure D.631: Examples of postwar U.S. intelligence about wartime work on the German H-bomb [NARA RG 319, Entry A1-134B, Box 749, Folder 23 Nov 95 Georg Stetter XA001081. NARA RG 330, Entry A1-1B, Box 103, Folder Lintner, Karl.].

Russian Department of the Archives of the State Cooperation of Atomic Energy (OOFR), Österreich 2, pp. 302–304, Gutachten von Kokin zur Annotation einer Aussage von Dr. Rober [Kober], 21 August 1945.

Prof. Stetter aus Wien, der sich mit dem Zerfall des Kernes von Lithium-Hydrid [...] beschäftige, hat entdeckt, dass diese Reaktion nicht stabil ist, das heisst, dass sie sich nach dem Anfang automatisch weiter fortsetzt, dabei wird eine ausserordentlich grosse Energie des Kernes freigesetzt, und die ganze Versuchseinrichtung explodiert (Versuch auf dem Erprobungsgelände). Prof. Bethe schätzt diese Reaktion als Quelle der Sonnenenergie ein, außerdem bringt diese Reaktion eine Wende in der Technik der Sprengstoffe, weil die Stärke der Explosion 10^6-mal größer ist als bei Nitroglyzerin. Diese Reaktion wurde in vielen Instituten untersucht, unter Teilnahme der Professoren Gerlach und Tomaschek—in München. Prof. Stetter aus Wien hat eine Theorie entwickelt, dass diese Reaktion bei der Temperatur 10^6 ^{o}C beginnen soll. Falls diese Theorie richtig ist, ist eine Versuchsanlage, die diese Energie zum praktischen Zweck benutzen darf, leicht zu bauen. [...] Dr. Rober [Kober] bittet um Erlaubnis, such damit zu beschäftigen und wies darauf hin, dass AEG schon einige Patente in dieser Frage hat.

Prof. Stetter from Vienna, who is concerned with the disintegration of the nucleus of lithium hydride, has discovered that this reaction is not stable, that is, that it continues automatically after the beginning; exceptionally large energy of the nucleus is released, and the whole experimental facility explodes (experiment at the test site). Prof. Bethe regards this reaction as a source of solar energy. In addition, this reaction brings about a change in the technique of explosives because the strength of the explosion is 10^6 times greater than in the case of nitroglycerin. This reaction was studied in many institutes, with the participation of professors Gerlach and Tomaschek—in Munich. Prof. Stetter from Vienna has developed a theory that this reaction should begin at the temperature of 10^6 ^{o}C. If this theory is correct, a test facility that can use this energy for practical purposes is easy to build. [...] Dr. Rober [Kober] asks permission to do so, and pointed out that AEG has already patented this issue.

[Again, which specific isotopes and reactions were considered? The general description sounds like the autocatalytic Jetter cycle (p. 4348). What experiments were done? What were the “many institutes” that also participated in this research? What exactly did Walther Gerlach and Rudolf Tomaschek do? Kober was known as a radar expert—what if any involvement with nuclear research did he have before or after the war? The existing AEG patent was that of Brasch and Lange (p. 4282).]

If Josef Schintlmeister really produced and identified transuranic elements through element 104 during the war, that long predates the recognized historical achievement of that milestone in 1969 in the United States. What evidence is this based on, and can it still be found? If transuranic elements were produced, was that in a cyclotron, a fission reactor, or by other methods?]

Hans Thirring. 1946. *Die Geschichte der Atombombe.* Vienna: Neues Österreich. pp. 130–134, 138–139.

Es liegt deswegen die Idee nahe, ob man nicht die so schwer herstellbaren und deswegen immer nur in geringen Mengen zur Verfügung stehenden Stoffe U-235 and Plutonium in irgendeiner Weise "strecken" könnte, oder ob man nicht die bisherige Atombombe als eine Art "Zündpille" zur Einleitung weiterer Kernprozesse an anderen Stoffen verwenden könnte. [...]

Die Energie, die dem gestoßenen Deuteron verliehen wird, beträgt allerdings nur einen kleinen Bruchteil, höchstens etwa 1/25 der Energie des ursprünglichen Sprengstückes, aber diese Energie kann immerhin groß genug sein, damit das getroffene Deuteron, wenn es mit einem anderen Deuteron zusammenstößt, mit diesem die sogenannte d-d-Reaktion ausführt, die durch die Gleichung gegeben ist

The idea is therefore whether one might not be able in any way to "stretch" the substances U-235 and plutonium, which are so difficult to produce and therefore can only be produced in small quantities, or whether one might not be able to use the original atomic bomb as a kind of "sparkplug" to initiate further nuclear processes in other substances. [...]

The energy given to the destroyed deuteron is, however, only a small fraction, at most about 1/25 of the energy of the original explosive, but this energy can still be large enough for the deuteron to fuse when it collides with another deuteron, in the so-called d-d reaction, which is given by the equation

$$^{2}_{1}\mathrm{H}\,(d,n)\,^{3}_{2}\mathrm{He}$$

In Worten ausgedrückt: zwei Deuteronen stoßen zusammen (daher der Name d-d-Reaktion) und vereinigen sich zu dem Heliumisotop $^{3}_{2}$He, während gleichzeitig ein Neutron ausgestoßen wird. [...]

Eine andere Substanz, in der gegebenenfalls auch durch Zündung mittels einer Atombombe ein thermischer Kernkettenprozeß hervorgerufen werden könnte, ist das Lithiumhydrid (LiH), in dem sich bei einer Temperatur von Milliarden Graden der folgende Prozeß abspielen könnte

Expressed in words: two deuterons collide (hence the name d-d reaction) and fuse to form the helium isotope $^{3}_{2}$He, while a neutron is simultaneously emitted. [...]

Another substance, in which a thermal nuclear chain reaction could be induced by an atom bomb, is lithium hydride (LiH), in which the following process can take place at a temperature of billions of degrees

$$^{7}_{3}\mathrm{Li}\,(p,\alpha)\,^{4}_{2}\mathrm{He}$$

Die Gleichung bedeutet: Beim Aufprall eines Protons auf einen Lithiumkern $^{7}_{3}$Li entsteht ein Zwischenkern der Masse 8 und der Ladung 4, der in zwei mit großer Wucht auseinanderfliegende α-Teilchen zerfällt.

The equation means that when a proton collides with a lithium nucleus $^{7}_{3}$Li, an intermediate nucleus of mass 8 and charge 4 is formed, which breaks up into two alpha particles which separate with great energy.

[...] die Energie, die man durch Bildung von Helium aus LiH gewinnen kann, fast dreimal so groß wie die bei der Kernspaltung aus der gleichen Menge von U-235 erzeugte. Dabei ist nun Lithium ein gar nicht so seltenes Element, so daß man in einer "Superatombombe" ungefähr ebensoviel Tonnen Lithiumhydrid verwenden könnte, als man jetzt Kilogramm Plutonium verwendet, derart, daß sich eine Wirkung ergäbe, die wiederum einige tausendmal gegenüber der bisher bekannten gesteigert werden könnte. Gott gnade jenem Lande, über dem eine Sechstonnenbombe von Lithiumhydrid zur Explosion gebracht wird!

The energy which can be obtained by the formation of helium from LiH is almost three times as great as that produced by nuclear fission from the same quantity of U-235. In this case, lithium is not a rare element, so that in a "super atom bomb" it would be possible to use on the order of tons of lithium hydride compared to kilograms of plutonium [for fission], in such a way as to produce an effect several thousand times as large as before. God have mercy on the country over which a six-ton bomb of lithium hydride is made to explode!

Sofern die Idee überhaupt realisierbar ist, würde in solch einer Superatombombe die bisherige Uranbombe oder Plutoniumbombe nur die Rolle einer "Zündpille" spielen. [...]

If the idea is realizable at all, the former uranium bomb or plutonium bomb would only play the role of a sparkplug in such a super atom bomb. [...]

[Thirring was correct that lithium hydride would make an excellent solid fuel for a hydrogen bomb, and that such a bomb could be thousands of times more powerful than a fission bomb (megatons instead of kilotons of explosive yield). However, the specific isotopes and reaction that he proposed (^{7}Li + ^{1}H) are too difficult to use for fusion, because of the strong repulsion between the three positive charges in the lithium nucleus and the one positive charge in the hydrogen nucleus.

By using ^{6}Li, ^{2}H (deuterium), and two coupled nuclear reactions, the Jetter cycle (p. 4348) avoids that problem. Did scientists consider that possibility during the war?

Note that Thirring gave an extremely specific example of a fusion bomb: "a six-ton bomb of lithium hydride." Thirring was in direct contact with scientists who worked in the wartime German nuclear program. Why did he choose such a specific mass for a fusion bomb? Was there wartime work on a six-ton lithium hydride (lithium deuteride?) bomb? Immediately after the war, several other scientists and engineers mentioned wartime work on a mysterious six-ton bomb–see pp. 4350–4363 and 5343.]

[...] Man weiß seit fast einem Vierteljahrhundert, daß es α-strahlende Substanzen gibt, die etwas anderes sind als die bekannten α-Strahler der drei radioaktiven Familien. Sehr eingehende Messungen mit verfeinerten Appareten sind am Physikalischen Institut der Wiener Universität und am Wiener Radiuminstitut vorgenommen worden und ergaben, daß es eine ganze Gruppe von sieben neuen α-Strahlern mit verschiedener Reichweite gibt, die bisher keinem Isotop irgendeines der bekannten Elemente zwischen Nr. 1 und Nr. 92 zugeschrieben werden konnten. Es ist einer Wiener Forschergruppe, die aus den Herren Schintlmeister, Jentschke, Brukl, Hernegger und Frl. Hilbert besteht, gelungen, aus Zinkblende und aus anderen sulfidischen Erzen die α-Strahler anzureichern, aber die gewonnenen Mengen sind noch nicht groß genug, um mit Hilfe von Röntgen-spektralaufnahmen die chemische Natur festzustellen. Es wäre möglich, daß es sich um Transurane handelt, und zwar um andere und langlebigere als Neptunium und Plutonium, weil diese infolge ihrer Kurzlebigkeit schon längst nicht mehr im natürlichen Zustand auf der Erde vorkommen, sondern nur künstlich hergestellt werden können. Weil nun jedes Element mit einer Kernladung von 90 und darüber zur Kernspaltung neigt, ist mit Warscheinlichkeit anzunehmen, daß diese noch nicht identifizierten α-Strahler—falls sie wirklich Transurane sind—entweder selber Stoffe sind, in denen Kernkettenreaktionen eintreten können, oder als Ausgangsmaterial zur Heranzüchtung solcher Stoffe dienen können. Substanzen dieser Art würden dann sowohl für die Atomwaffe als auch für die reine Energiegewinnung das Uranmonopol brechen.

[...] It has been known for almost a quarter of a century that there are alpha-emitting substances that are different from the known alpha emitters of the three radioactive families. Very detailed measurements with refined equipment have been made at the Physics Institute of the University of Vienna and at the Vienna Radium Institute, and showed that there is a whole group of seven new alpha-emitters with different ranges which have hitherto not been associated with any isotope of any of the known elements between no. 1 and 92. It is a Viennese research group consisting of Schintlmeister, Jentschke, Brukl, Hernegger, and Frl. Hilbert, who succeeded in enriching the alpha emitters from zincblende and other sulphide ores, but the quantities obtained are not yet large enough to be combined with help of Roentgen spectral recordings to determine the chemical nature. It is possible that they are transuranics, and others are more durable than neptunium and plutonium, because, as a result of their short-livedness, they are no longer present in the natural state on the earth, but can be produced only in a manner which is artificial. Since every element with a nuclear charge of 90 or over tends to undergo nuclear fission, it is probable that these unidentified alpha-emitters, if they are really transuranics, are themselves substances in which nuclear chain reactions can occur, or as starting materials for the production of such substances. Substances of this kind would then break the uranium monopoly both for nuclear weapons and for pure energy production.

[Thirring provided more information about Schintlmeister's possible experiments with transuranic elements. Apparently Schintlmeister used the energies (range) of emitted alpha particles to try to identify the specific isotopes that emitted those alpha particles. If only isotopes from naturally occurring samples were analyzed, there should be no transuranic elements, and any results indicating that there were would presumably be spurious. Did the analyzed samples come from an artificial source, such as a cyclotron or fission reactor?]

Hans Thirring. Undated (circa 1971). In den nächsten zehn Jahren muss es zwischen den Supermächten USA, UdSSR, China, England und Frankreich zu einer allgemeinen Abrüstung kommen. Sondersammlung der Österreichischen Zentralbibliothek für Physik (ZBP), Universität Wien, Nachlass Broda, Box 24, File 55, Fiche 54.

Schon vor 25 Jahren wußte ich, daß man Wasserstoffbomben erzeugen wird, die eine zehntausendfache Sprengkraft der Hiroshima-Bombe haben würden. In den Jarhren 1951–1967 haben fünf Staaten an diesem Projekt gearbeitet und Megatonnenbomben erzeugt; es sind bereits genügend Bomben vorhanden, um die ganze Welt in einen chaotischen Zustand unvorstellbaren Ausmaßes bringen zu können. [...]

Im Juli 1946 diskutierte ich über das Problem der Entwicklung noch stärkerer Vernichtungswaffen mit meinem Kollegen Jentschke, einem jungen österreichischen Physiker, jetzt Generaldirektor des CERN in Genf. Jentschke war als reiner Physiker nicht so sehr von der Wichtigkeit der Kernvernschmelzung überzeugt; aber ich als Physiker und Politiker wußte, daß das Gelingen dieser Experimente (zur Herstellung der Wasserstoffbombe) leider von welthistorischer Bedeutung sein wird.

Im Herbst 1946 veröffentlichte ich mein Buch, “Die Geschichte der Atombombe”. [...]

Die meisten Leute fanden die darin beschriebene historische Entwicklung sehr interessant, aber über die Berechnungen der Lithiumhydrid-Reaktion lasen sie, als zu wissenschaftlich, einfach hinweg. [...]

Im Studienjahr 1946/47 war ich Dekan an der Universität Wien und sprach in einem Seminar, das ich damals hielt, über die Möglichkeit, daß nicht nur die Amerikaner sondern auch die Russen sehr bald über Wasserstoffbomben verfügen könnten.

25 years ago, I knew that hydrogen bombs, which could have ten thousand times the explosive force of the Hiroshima bomb, would be produced. In the years 1951–1967 five countries worked on this project and produced megaton bombs; there are already enough bombs to turn the whole world into a chaotic state of unimaginable proportions. [...]

In July 1946, I discussed the problem of the development of even more powerful weapons of destruction with my colleague Jentschke, a young Austrian physicist, now General Manager of CERN in Geneva. Jentschke, as a pure physicist, was not so much convinced of the importance of nuclear fusion; but as a physicist and politician I knew that the success of these experiments (for the production of the hydrogen bomb) would unfortunately be of historical importance.

In the autumn of 1946 I published my book, *The History of the Atomic Bomb.* [...]

Most people found the historical development described therein very interesting, but they simply ignored the calculations of the lithium hydride reaction as too scientific. [...]

In the academic year 1946/47, I was a dean at the University of Vienna, and I spoke in a seminar I held at the time about the possibility that not only the Americans, but also the Russians, could soon have hydrogen bombs.

[Thirring acknowledged that an important source for his book was Willibald Jentschke, who was a member of Georg Stetter's research group during the war.

Does the information in Thirring's book accurately convey what the Austrian nuclear scientists knew (or did not know) during the war, or were any important details omitted?

How much involvement did Thirring himself have with nuclear work during the war?

What other sources of information did he use for his book?]

Ehlert

An den

Bevollmächtigten des Reichsmarschalls für Kernphysik,
Herrn Professor Dr. W. Gerlach,

2683.45

Berlin-Dahlem
Boltzmannstr. 2o

Sehr verehrter Herr Professor Gerlach !

Da am 31.3.45 die vorgesehene Zeitspanne zur Durchführung meines Forschungsauftrages Nr. II.oo7.44 abläuft, möchte ich Ihnen mitteilen, wie weit die Arbeit seit meinem letzten Bericht an Sie vom 16.11.44 fortgeschritten ist.

Herr Dr. Hoernes und ich haben weiter zahlreiche Elektrolysen mit Schmelzen durchgeführt, wobei immer andere Versuchsbedingungen ausprobiert wurden. Von diesen Versuchen haben wir Lithium- und Bleiproben gewonnen. Zu einer Isotopen-Analyse der Proben ist es aber leider noch nicht gekommen. An unserm Institut ist Herr Dr.Hintenberger damit beschäftigt, sein Massenspektrometer für Lithium herzurichten. Wir werden Ihnen wohl bis Ende April das Ergebnis bei Lithium mitteilen können. Für die Untersuchungen des Bleis und anderer Metalle ausser Alkalien besteht an unserem Institut zurzeit wenig Aussicht, denn das Massenspektrometer von Dr. Hintenberger funktioniert vorläufig nur für Alkalien und mit dem Massenspektrographen von Dr.Ewald werden keine Häufigkeitsmessungen durchgeführt, sondern genaue Massenbestimmungen.

Herr Dr.Hoernes und ich bemühen uns inzwischen weiter, die jetzigen Bedingungen bei der Elektrolyse zu verbessern und damit bessere Proben der Metalle Lithium, Blei, Silber und Spezialmetalle zu gewinnen.

Sehr schade ist es, dass wir kein Thallium haben, von dem wir etwa 1 kg bräuchten. Wir haben schon mehrmals bei der Reichsstelle für Chemie darum angefragt, jedoch erhielten wir keine Antwort, obwohl mit gleichem Brief beantragtes Lithium bewilligt wurde. Das Thallium wäre für einen Versuch der Anreicherung von Spezialmetallen sehr wichtig.

Von den für meinen Forschungsauftrag bewilligten RM 3ooo.- habe ich bis jetzt ca. 12oo.- verbraucht. Die Abrechnungen darüber gehen Ihnen mit gleicher Post zu. Ich möchte Sie bitten, mir den Forschungsauftrag auf ein weiteres Jahr zu verlängern.

Da durch Feindeinwirkung die Geschäfte meines Vaters so geschädigt sind, dass ich von dieser Seite keine Zuschüsse mehr erhalten kann, bin ich jetzt darauf angewiesen, meine Familie, bestehend aus Frau und drei Kindern, selbst zu ernähren. Ich habe mir darum vom Institut angeben lassen, dass mir als Assistent im 9.Dienstjahr nach Hochschultarif 6oo.- RM monatlich zuständen. Ich möchte Sie daher bitten, mir ein Stipendium in dieser Höhe für das kommende Jahr zu bewilligen.

Mit vorzüglicher Hochachtung verbleibe ich

Ihr

Alfred Klemm

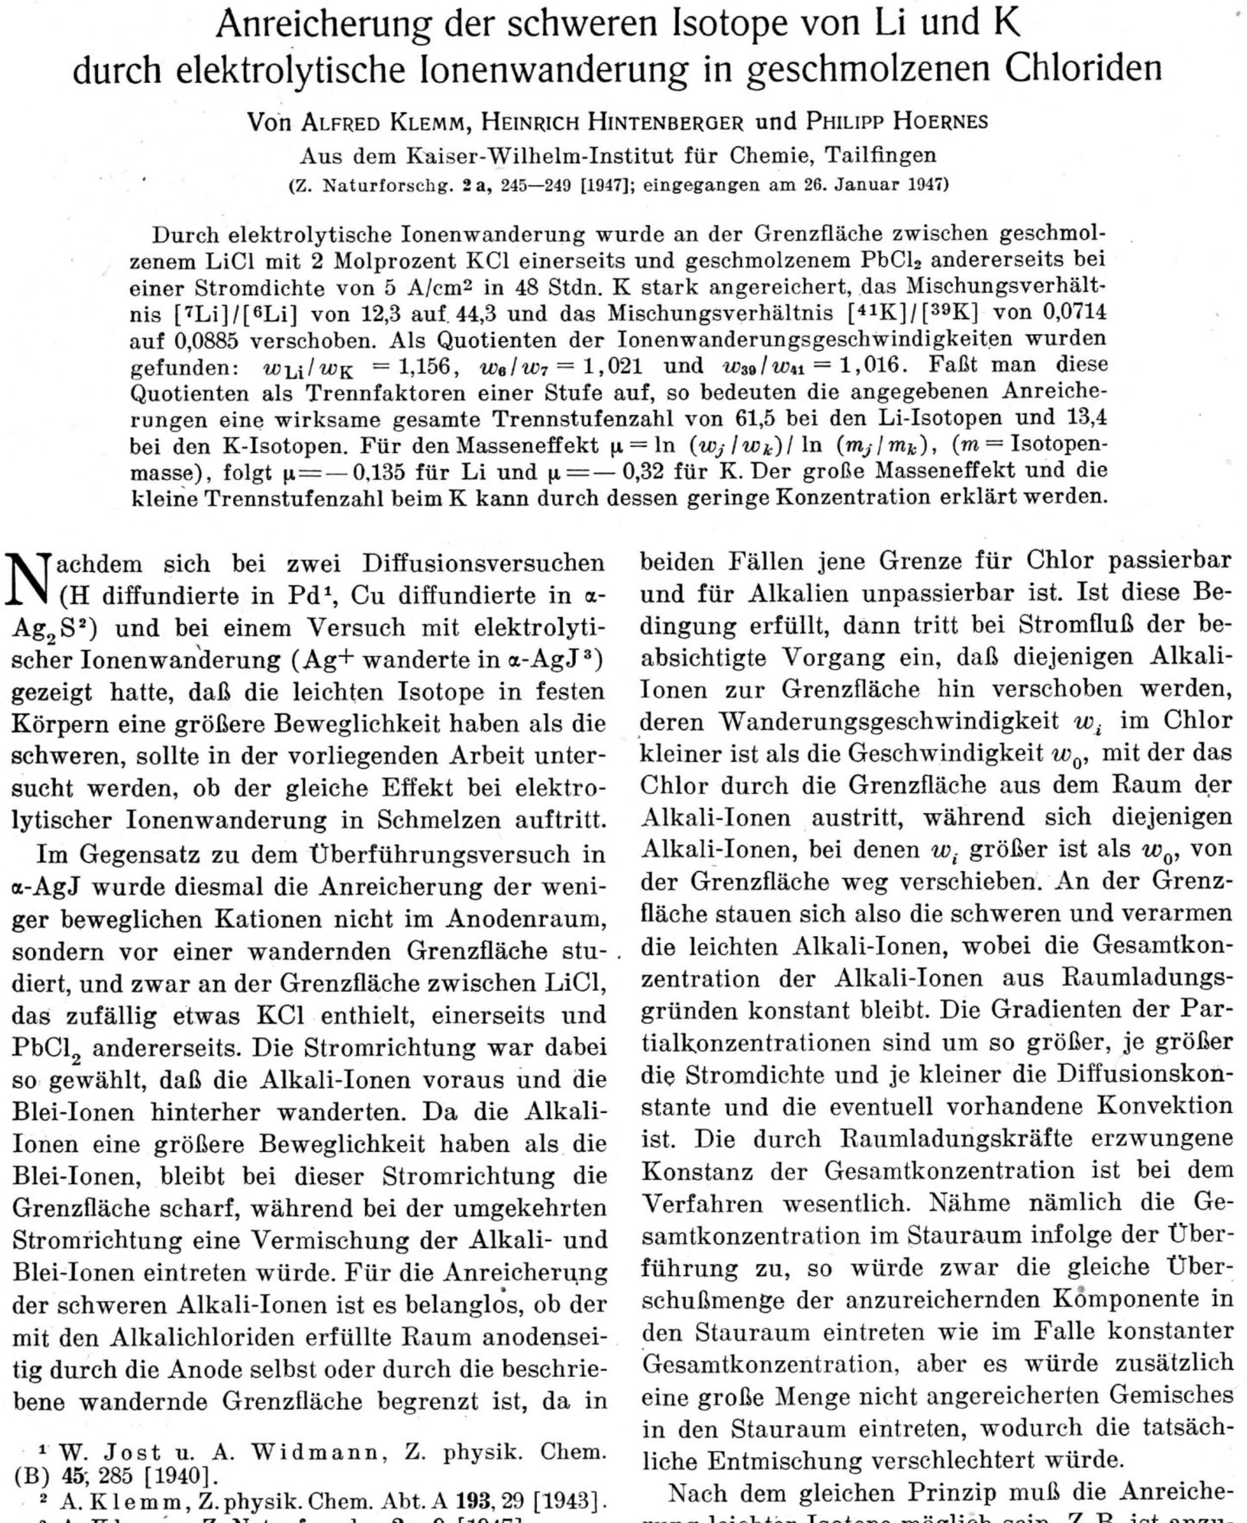
Figure D.633: 16 March 1945 letter from Alfred Klemm to Walther Gerlach reporting successful demonstrations of lithium isotope separation [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)].



Anreicherung der schweren Isotope von Li und K durch elektrolytische Ionenwanderung in geschmolzenen Chloriden

Von Alfred Klemm, Heinrich Hintenberger und Philipp Hoernes
Aus dem Kaiser-Wilhelm-Institut für Chemie, Tailfingen

(Z. Naturforschg. **2a**, 245—249 [1947]; eingegangen am 26. Januar 1947)

Durch elektrolytische Ionenwanderung wurde an der Grenzfläche zwischen geschmolzenem LiCl mit 2 Molprozent KCl einerseits und geschmolzenem $PbCl_2$ andererseits bei einer Stromdichte von 5 A/cm² in 48 Stdn. K stark angereichert, das Mischungsverhältnis $[^7Li]/[^6Li]$ von 12,3 auf 44,3 und das Mischungsverhältnis $[^{41}K]/[^{39}K]$ von 0,0714 auf 0,0885 verschoben. Als Quotienten der Ionenwanderungsgeschwindigkeiten wurden gefunden: $w_{\mathrm{Li}}/w_{\mathrm{K}} = 1{,}156$, $w_6/w_7 = 1{,}021$ und $w_{39}/w_{41} = 1{,}016$. Faßt man diese Quotienten als Trennfaktoren einer Stufe auf, so bedeuten die angegebenen Anreicherungen eine wirksame gesamte Trennstufenzahl von 61,5 bei den Li-Isotopen und 13,4 bei den K-Isotopen. Für den Masseneffekt $\mu = \ln (w_j/w_k)/\ln (m_j/m_k)$, ($m$ = Isotopenmasse), folgt $\mu = -0{,}135$ für Li und $\mu = -0{,}32$ für K. Der große Masseneffekt und die kleine Trennstufenzahl beim K kann durch dessen geringe Konzentration erklärt werden.

Nachdem sich bei zwei Diffusionsversuchen (H diffundierte in Pd[1], Cu diffundierte in α-Ag_2S[2]) und bei einem Versuch mit elektrolytischer Ionenwanderung (Ag^+ wanderte in α-AgJ[3]) gezeigt hatte, daß die leichten Isotope in festen Körpern eine größere Beweglichkeit haben als die schweren, sollte in der vorliegenden Arbeit untersucht werden, ob der gleiche Effekt bei elektrolytischer Ionenwanderung in Schmelzen auftritt.

Im Gegensatz zu dem Überführungsversuch in α-AgJ wurde diesmal die Anreicherung der weniger beweglichen Kationen nicht im Anodenraum, sondern vor einer wandernden Grenzfläche studiert, und zwar an der Grenzfläche zwischen LiCl, das zufällig etwas KCl enthielt, einerseits und $PbCl_2$ andererseits. Die Stromrichtung war dabei so gewählt, daß die Alkali-Ionen voraus und die Blei-Ionen hinterher wanderten. Da die Alkali-Ionen eine größere Beweglichkeit haben als die Blei-Ionen, bleibt bei dieser Stromrichtung die Grenzfläche scharf, während bei der umgekehrten Stromrichtung eine Vermischung der Alkali- und Blei-Ionen eintreten würde. Für die Anreicherung der schweren Alkali-Ionen ist es belanglos, ob der mit den Alkalichloriden erfüllte Raum anodenseitig durch die Anode selbst oder durch die beschriebene wandernde Grenzfläche begrenzt ist, da in beiden Fällen jene Grenze für Chlor passierbar und für Alkalien unpassierbar ist. Ist diese Bedingung erfüllt, dann tritt bei Stromfluß der beabsichtigte Vorgang ein, daß diejenigen Alkali-Ionen zur Grenzfläche hin verschoben werden, deren Wanderungsgeschwindigkeit w_i im Chlor kleiner ist als die Geschwindigkeit w_0, mit der das Chlor durch die Grenzfläche aus dem Raum der Alkali-Ionen austritt, während sich diejenigen Alkali-Ionen, bei denen w_i größer ist als w_0, von der Grenzfläche weg verschieben. An der Grenzfläche stauen sich also die schweren und verarmen die leichten Alkali-Ionen, wobei die Gesamtkonzentration der Alkali-Ionen aus Raumladungsgründen konstant bleibt. Die Gradienten der Partialkonzentrationen sind um so größer, je größer die Stromdichte und je kleiner die Diffusionskonstante und die eventuell vorhandene Konvektion ist. Die durch Raumladungskräfte erzwungene Konstanz der Gesamtkonzentration ist bei dem Verfahren wesentlich. Nähme nämlich die Gesamtkonzentration im Stauraum infolge der Überführung zu, so würde zwar die gleiche Überschußmenge der anzureichernden Komponente in den Stauraum eintreten wie im Falle konstanter Gesamtkonzentration, aber es würde zusätzlich eine große Menge nicht angereicherten Gemisches in den Stauraum eintreten, wodurch die tatsächliche Entmischung verschlechtert würde.

Nach dem gleichen Prinzip muß die Anreicherung leichter Isotope möglich sein. Z. B. ist anzu-

Anreicherung der schweren Isotope von Li und K durch elektrolytische Ionenwanderung in geschmolzenen Chloriden.

Durch elektrolytische Ionenwanderung wurde an der Grenzfläche zwischen geschmolzenem LiCl mit 2 Molprozent KCl einerseits und geschmolzenem $PbCl_2$ andererseits bei einer Stromdichte von 5 A/cm^2 in 48 Stdn. K stark angereichert, das Mischungsverhältnis [^{7}Li]/[^{6}Li] von 12,3 auf 44,3 und das Mischungsverhältnis [^{41}K]/[^{39}K] von 0,0714 auf 0,0885 verschoben. Als Quotienten der Ionenwanderungsgeschwindigkeiten wurden gefunden: $w_{\mathrm{Li}}/w_{\mathrm{K}}$ = 1,156, w_6/w_7 = 1,021 und w_{39}/w_{41} = 1,016. Faßt man diese Quotienten als Trennfaktoren einer Stufe auf, so bedeuten die angegebenen Anreicherungen eine wirksame gesamte Trennstufenzahl von 61,5 bei den Li-Isotopen und 13,4 bei den K-Isotopen. Für den Masseneffekt $\mu = \ln(w_j/w_k)/\ln(m_j/m_k)$, ($m$ = Isotopenmasse), folgt μ = -0,135 für Li und μ = -0,32 für K. Der große Masseneffekt und die kleine Trennstufenzahl beim K kann durch dessen geringe Konzentration erklärt werden.

[...] Der Trennversuch und die Auswertung der Analysenergebnisse wurde von A. Klemm, die massen-spektrometrische Analyse von H. Hintenberger und die chemische Arbeit von Ph. Hoernes durchgeführt. Hrn. Prof. J. Mattauch danken wir für die Förderung der Arbeit und den Assistentinnen H. und U. Scheid für ihre gewissenhafte Mitarbeit.

Enrichment of the heavy isotopes of Li [lithium] and K [potassium] by electrolytic ion migration in molten chlorides.

By electrolytic ion migration at the boundary between molten LiCl with 2 mole percent KCl, on the one hand, and molten $PbCl_2$, on the other hand, was strongly enriched in 48 hours of K at a current density of 5 A/cm^2, the mixing ratio [^{7}Li]/[^{6}Li] from 12.3 to 44.3 and the mixing ratio [^{41}K]/[^{39}K] from 0.0714 to 0.0885. As quotients of the ion migration rates were found: $w_{\mathrm{Li}}/w_{\mathrm{K}}$ = 1.156, w_6/w_7 = 1.021 and w_{39}/w_{41} = 1.016. If these quotients are taken as the separation factors of a step, the indicated enrichment means an effective total separation step number of 61.5 for the Li isotopes and 13.4 for the K isotopes. For the mass effect $\mu = \ln(w_j/w_k)/\ln(m_j/m_k)$, ($m$ = isotope mass), μ = -0.135 for Li and μ = -0.32 for K. The large mass effect and the small number of separation stages in the K can be explained by its low concentration.

[...] The separation experiment and the analysis of the results of the analysis were carried out by A. Klemm, the mass spectrometric analysis by H. Hintenberger, and the chemical work of Ph. Hoernes. We thank Prof. J. Mattauch for the support of the work and the assistants H. and U. Scheid for their conscientious cooperation.

[See document photo on p. 4344. This was a delayed publication of work that was done during the war; see for example p. 4343. Lithium has two naturally occurring isotopes: ^{6}Li (approximately 7.5% of natural lithium) and ^{7}Li (approximately 92.5% of natural lithium). Thus their naturally occurring ratio is [^{7}Li]/[^{6}Li] ≈ 92.5%/7.5% ≈ 12.3. Within 48 hours, Klemm's process enriched them to a ratio [^{7}Li]/[^{6}Li] ≈ 97.8%/2.2% ≈ 44.3. The isotopes are virtually identical chemically; the only major reason to separate them would be for nuclear reactions. What exactly was the purified ^{6}Li intended for?]

During the war, Josef Mattauch was head of the physics department at the Kaiser Wilhelm Institute for Chemistry in Tailfingen where Klemm worked. Prior to the war, Mattauch was at the University of Vienna for 26 years, and thus closely connected to Georg Stetter's research group. Was the purified ^{6}Li for the Stetter group's work on fusion? If so, that could suggest that they were working on the Jetter cycle, which requires ^{6}Li.]

Alfred Klemm. 1958. Lithium in der Kerntechnik. *Angewandte Chemie* 70:1:21–24.

Lithium kann in der modernen Kerntechnik auf vielfache Weise verwendet werden, so zur Herstellung von Tritium (etwa für thermonucleare Reaktionen), als Abschirmungsmittel, zum Nachweis thermischer Neutronen, als Reaktorkühlmittel, als Moderator oder in Form von geschmolzenem LiF als Lösungsmittel für Kernbrennstoffe. Zur Anreicherung der Lithium-Isotope 6 bzw. 7 sind die Ionenwanderung in geschmolzenem LiCl und das Lithium-Amalgam-Verfahren von besonderem Interesse.	Lithium can be widely used in modern nuclear engineering, for instance to produce tritium (for thermonuclear reactions), as a shielding agent, for detecting thermal neutrons, as a reactor coolant, as a moderator, or as a molten LiF as a solvent for nuclear fuels. The ion migration in molten LiCl and the lithium-amalgam process are of particular interest for the enrichment of the lithium isotopes 6 and 7, respectively.

[This postwar article by Klemm may suggest that his wartime work was indeed intended for nuclear purposes.]

Heiko Petermann, Discussion notes with Prof. Alfred Klemm, Mainz, Saarstr. 23, Max Planck Institut für Chemie. 5 March 2004. 06131-305-223 [courtesy of Heiko Petermann].

Klemm wirkte sehr nervös und wich meinen Fragen immer wieder aus. Er war bemüht, mich so schnell wie möglich wieder los zu werden.	Klemm looked very nervous and always gave up my questions. He tried to get rid of me as soon as possible.
Klemm hat sich während des Krieges ausschließlich mit Isotopentrennung beschäftigt und war sozusagen sein 'eigener Herr'. Das von ihm entwickelte Elektrolyt-Verfahren funktionierte bei Uranhexaflorid nicht.	During the war, Klemm concentrated exclusively on isotopic separation and was, so to speak, his own master. The electrolyte process he developed did not work with uranium hexafluoride.
Klemm hatte mit Hahns Truppe wenig zu tun, da er separat arbeitete, sich selbst als 'eigen' bezeichnet	Klemm had little to do with Hahn's group, since he worked separately, calling himself 'independent'
Klemm ging mit nach Tailfingen	Klemm also went to Tailfingen

Schwerpunkt der Arbeit war die Herstellung von Li6 durch Trennung von Li7. Dies gelang im elektrolytischen Verfahren sehr gut. Ab 1942–43. Klemm wies darauf hin, dass er wohl der erste war, dem die Trennung mittels Elektrolyse gelungen sei (wissenschaftliche Priorität, siehe auch Z. f. Naturforschung 2a, S. 245 ff, 1947, unter Mitarbeit v. H. Hintenberger u. P. Hoernes)

Über die Tritium-Problematik wusste er Bescheid, es war aber damals nicht seine Aufgabe. (wessen denn?)

Diskutiert wurde die Verwendung von metallischem Li7 als Reaktorkühlmittel

Klemm kannte die AEG-Hochspannungsanlage und meinte Flammersfeld hat dort mit Bestrahlung von Material gearbeitet
(Vorsicht bei dieser Aussage, sie passt zwar, doch es ist nicht klar ob Klemm da nicht einiges bezüglich der Hochspannungsanlage des KWI f. Chemie durcheinanderbringt, ich fasse brieflich nach—hp)

Klemms Vater gehörte die Dietrichsche Verlagsbuchhandlung. 1946 entstand dann als Ableger der Verlag der Zeitschrift für Naturforschung, die seitdem A. Klemm leitet.

Brieflich dürfte er präziser sein, denn der Besuch hat ihn in erheblichste Unruhe gestürzt.

Vielleicht lässt sich aus seinem Archiv noch ein Schätzchen heben.

Nachtrag: Mit Antwortschreiben v. 4.4.04 notierte er handschriftlich, daß er Li6 im Grammbereich produzierte. Gegen Kriegsende hat er es ‘weggeworfen’.

Er bestätigte weiterhin, daß die Tritiumproblematik (Zerfall Li6 in Tritium) bereits vor 1945 diskutiert wurde.

Main focus of the work was the production of Li6 by separation of Li7. This was achieved very well in the electrolytic process. From 1942–43. Klemm pointed out that he was probably the first to achieve the separation by means of electrolysis (scientific priority, see also Z. f. Naturforschung 2a, pp. 245 ff, 1947, with the collaboration of H. Hintenberger and P. Hoernes)

He knew about the tritium problem, but it was not his job at the time. (Whose then?)

The use of metallic Li7 as a reactor coolant was discussed

Klemm knew the AEG high voltage installation and said Flammersfeld worked there with irradiation of material
(Caution with this statement, it fits, but it is not clear whether Klemm was referring in part to the high-voltage plant of the KWI for Chemistry disagrees, I will get the correspondence after—hp)

Klemm’s father owned the book publisher Dietrich. In 1946, the publishing house of the Zeitschrift fúr Naturforschung (Journal of Natural Research), which has been headed by A. Klemm since then, was founded.

In correspondence he might be more precise, for the visit has plunged him into considerable disquiet.

Perhaps one can pick up a clue from his archive.

Addendum: With a reply from v. 4.4.04 he noted in handwriting that he produced Li6 in the gram range. He “threw it away” at the end of the war.

He also confirmed that the tritium problem (disintegration of Li6 into tritium) was already discussed before 1945.

[If Klemm's wartime work was for purely scientific reasons, why was he so nervous to discuss it 60 years later, and shortly before his death?

Klemm twice confirmed that scientists were working on tritium during the war. Who and where? Was his ^{6}Li bombarded with neutrons to produce tritium during the war? The knowledge of that reaction during the war, as shown by both Klemm and also Kallmann and Kuhn (p. 4298) may help demonstrate that the Jetter cycle (p. 4348) originated in the German-speaking world during the war.

An amount of ^{6}Li "in the gram range" (one gram? several grams?) would be extremely useful for fusion boosting of a fission bomb, or for producing a similar amount of tritium for the same purpose.

If Klemm's work was performed during 1942–1943, planning for fusion reactions must have begun early in the war. If Klemm's work was perfected at that time, was his ^{6}Li purification process transferred to other locations and scaled up later in the war?

If the gram-range amount of ^{6}Li was difficult to create and was produced for purely scientific reasons, why would Klemm "throw it away" at the end of the war? If he did throw it away, does that suggest that he knew its real purpose was much more serious? Or did he not throw it away—was it transferred to the German nuclear program, or seized by Allied forces, or hidden to protect it?]

Pavel V. Oleynikov. 2000. German Scientists in the Soviet Atomic Project. *Nonproliferation Review* 7:2:1–30.

After 1950, Hertz moved to Moscow where, together with Werner Schuetze, he started to work on analysis of lithium and purification of tritium.

Documents about German scientists who helped the Soviet Union develop an atomic bomb. 29 October 2019. [**https://www.mbs.news/2019/10/documents-about-german-scientists-who-helped-the-soviet-union-develop-an-atomic-bomb.html**]

Manfred von Ardenne, the scientific director of the A kurulan institute, established in another sanatorium in the USSR, was also awarded the Stalin Prize twice in 1947 for inventing the electronic microscope and in 1953 for obtaining the lithium 6 isotope necessary for the creation of nuclear warheads.

[After the war, Gustav Hertz, Werner Schuetze, and Manfred von Ardenne separated lithium isotopes and produced tritium for the Soviet hydrogen bomb project. Was their expertise in that area derived from work they did during the war to separate lithium isotopes and produce tritium for the German nuclear program?]

https://www.cia.gov/readingroom/docs/CIA-RDP82-00457R004500650007-8.pdf

Ulrich Jetter. 1950. Die sogenannte Superbombe. *Physikalische Blätter* (1950) 6:199-205.

Die beiden Reaktionen... “gehen” ungewöhnlich gut: das leichte Lithiumisotop hat einen sehr großen Wirkungsquerschnitt gegenüber der D-D-Reaktion eine tiefere Energieschwelle und bei gleicher Temperatur die rund hundertfache Ausbeute. Sofern also genügend Tritonen oder Neutronen zugegen sind, wird der Zyklus

$$\begin{tikzcd} \mathrm{n} + {}^{6}\mathrm{Li} \arrow[r] & {}^{4}\mathrm{He} + \mathrm{Tr} \arrow[d] \\ \mathrm{n} + {}^{4}\mathrm{He} \arrow[u] & \mathrm{D} + \mathrm{Tr} \arrow[l] \end{tikzcd} \tag{D.15}$$

die Hauptreaktion bilden.

The two reactions... “go” [together] unusually well: the light lithium isotope has a very large cross section over the DD reaction, a lower energy threshold and at the same temperature a hundredfold yield, so if sufficient tritons or neutrons are present, the cycle

$$\begin{tikzcd} \text{neutron} + \text{lithium-6} \arrow[r] & \text{helium-4} + \text{tritium} \arrow[d] \\ \text{neutron} + \text{helium-4} \arrow[u] & \text{deuterium} + \text{tritium} \arrow[l] \end{tikzcd} \tag{D.16}$$

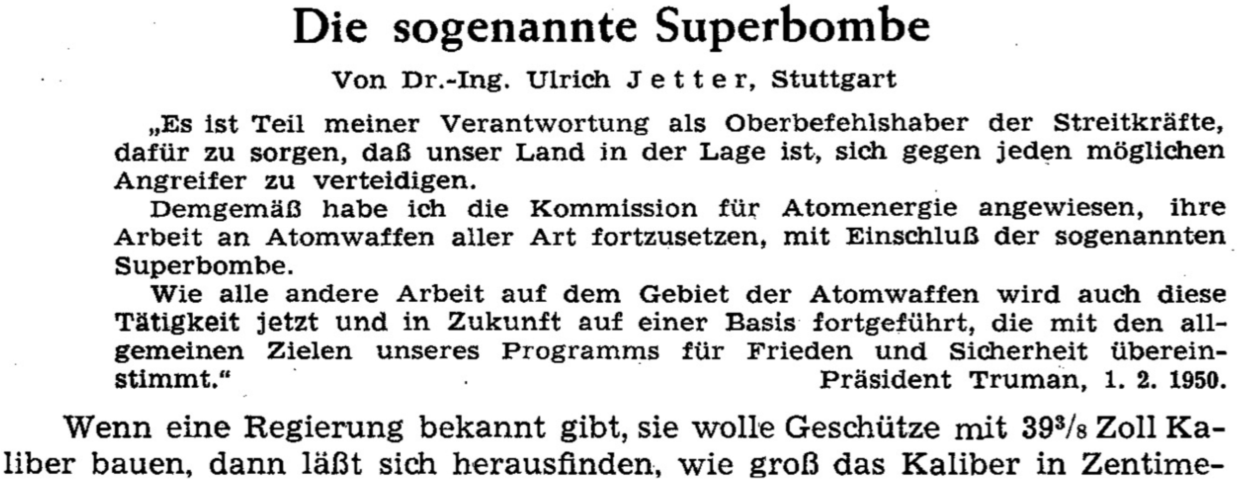
will become the main reaction.

[This reaction uses lithium-6 deuteride and is the main reaction in modern hydrogen bombs. It was not demonstrated by the United States and Soviet Union until the 1950s.

Due to Allied restrictions on research in Germany and Austria after the war, it seems likely that this paper was based on wartime research. Where and when was that research done, and by whom? Can this paper be connected to wartime research by Georg Stetter’s group or other groups on lithium-based fusion reactions? Ulrich Jetter (German, 1914–??) studied at the University of Stuttgart 1931–1941, worked at the Kaiser Wilhelm Institute for Metal Research 1941–1945, and served as an editor for *Physikalische Blätter* 1945–1951 [Jetter 1954]. Could Jetter’s 1950 article, 1952 book, and 1954 article (Fig. D.635) on the scientific details of H-bombs have been based on information he learned during the war? Did Jetter do nuclear research during the war, or did he interact with other scientists who did? Lithium is a metal; was lithium fusion research being done at the KWI for Metal Research during the war?

Alternatively, could Jetter’s article be based on wartime research that he learned about after the war in his capacity as an editor at the journal? Or does the paper truly demonstrate an insight that only came to Jetter, and only in 1950?

Note that Jetter was invited to Washington, D.C. as a “cultural exchange fellow” in 1951, before the U.S. produced and tested its first H-bombs.]



Die sogenannte Superbombe

Von Dr.-Ing. Ulrich Jetter, Stuttgart

> „Es ist Teil meiner Verantwortung als Oberbefehlshaber der Streitkräfte, dafür zu sorgen, daß unser Land in der Lage ist, sich gegen jeden möglichen Angreifer zu verteidigen.
>
> Demgemäß habe ich die Kommission für Atomenergie angewiesen, ihre Arbeit an Atomwaffen aller Art fortzusetzen, mit Einschluß der sogenannten Superbombe.
>
> Wie alle andere Arbeit auf dem Gebiet der Atomwaffen wird auch diese Tätigkeit jetzt und in Zukunft auf einer Basis fortgeführt, die mit den allgemeinen Zielen unseres Programms für Frieden und Sicherheit übereinstimmt.“

Die Zeitgenossen der Wasserstoffbombe

Denkbar jäh und unter wahrhaft dramatischen Umständen sind die Atomwaffen vor einem knappen Jahrzehnt der Öffentlichkeit bekannt ge-

Figure D.635: Ulrich Jetter worked on mysterious research programs for the German government during the war, published a book and articles on the scientific details of H-bombs after the war, and was invited to Washington, D.C. as a “cultural exchange fellow” before the U.S. produced and tested its first H-bombs [Jetter 1950, 1952, 1954].

Major Edmund Tilley to Lt. Col. P. M. Wilson. Secret Missiles. EPES/FIAT, Control Commission for Germany, British Element, 13 July 1946 [TNA FO 1031/57].

1. Lt. F.T. GUTMANN, of 2940th Engineer Technical Intelligence Team (R), U.S. Army, has just returned from Austria with three of SCHULZ-KAMPFHENKEL's assistants, all of the Forschungsstaffel.

2. Lt. GUTMANN went into the Russian Zone in Austria and saw a gendarme, Anton KÄSTNER, in EURATSFELD near AMSTETTEN, in Lower Austria. KÄSTNER told Lt. GUTMANN of a new radio-active bomb, weighing six tons. This bomb has no fins and is lowered by parachute. KÄSTNER himself claims to have been connected only with the fuze part of this new secret missile.

3. Colonel PETERSEN was said to have been in charge of this secret missile at OKW. KÄSTNER claimed that Colonel PETERSEN's papers and documents were left by him at Kloster ANDECHS in AMMERSEE, Upper Bavaria. Colonel PETERSEN is presumed to be in Spain.

4. A Hauptmann (Captain) SORG is said to have been Colonel PETERSEN's Chief Administrative Officer and also in charge of organization. SORG is still living at UTTING on the AMMERSEE.

5. Lt. GUTMANN believed that this new radio-active bomb may not be unconnected with the "Wärmesuchgerät" described by SCHULZ-KAMPFHENKEL. This must be a very secret instrument, for SCHULZ-KAMPFHENKEL did not tell any of the Americans about its existence and would not reveal it to us at OBERURSEL until a high pressure was exerted on him. He continues to call it "Wärmesuchgerät", which means heat searching or finding instrument, but he describes it as an aircraft instrument for measuring temperatures on the ground during the flight of the aircraft. If this were all, the instrument would be called "Wärmemessgerät" or "Temperaturmessgerät".

6. SCHMITTHÜSEN has been indicated as the man in the Forschungsstaffel who knows most about this "Wärmesuchgerät". I shall interrogate him with Lt. GUTMANN on Monday, 15th July. He is likely to prove stubborn for I saw him for a moment outside FIAT and asked him to prepare immediately a list of all hideouts for Top Secret documents. He did not know that we had found the boxes at HARBURG which he himself had dug into the ground. He was informed smilingly that 20 years behind barbed-wire were awaiting him if he continued to deny such well-known facts. He quickly agreed to let me have a complete list by Monday.

7. PILLEWIZER is the glacier expert of the Forschungsstaffel. He has written two reports for us at Lt. GUTMANN's request. The most significant sentence at the beginning of the second report, on the activities of the Forschungsstaffel in Lappland in 1944, reads as follows:

"In July 1944 a small group of the Forschungsstaffel was sent to Northern Finland in order to demonstrate, by practical experiment, the feasibility of quick map-making in the swamps and primeval forests of Lappland, i.e. to make maps quickly for topographical evaluation of hardly explored territory."

The rest of the report explains more fully the real purpose of this expedition for the work was started in VUOTSO and PARKKINA, both in the Arctic Circle, and was continued there after the Germans had evacuated all Southern Finland. Later they photographed the SAARENPAEAE area in West Lappland (ENONTOEKICE area). It is hardly likely that such an important and secret group of scientists could have been left in the Arctic Circle as late as November 1944. After completion of the work PILLEWIZER returned with his group, via NARWIK and OSLO, to Germany, where he arrived in mid-December 1944.

This expedition may have served the same purpose as other expeditions of SCHULZ-KAMPF-HENKEL, i.e. obtaining data of the effect of new deadly weapons or submitting data to enable the High Command to carry out such experiments with such missiles.

8. Lt. GUTMANN, who has not had much sleep for the last few days, will give me a copy of his report on this new missile on Monday and I shall show it to you before I go to DUSTBIN with Lt. GUTMANN.

[See document photos on pp. 4352–4353.

The six-ton bomb was specifically described as radioactive, which might mean a dirty bomb of conventional explosives releasing radioactive material, a fission bomb, or a hydrogen bomb. There was no apparent reason to make a six-ton dirty bomb—the same material could have been packaged into several smaller bombs that would have been much easier to deliver. There was also no apparent reason to make a six-ton fission bomb—the U.S. Gadget was approximately three tons without its fins or bomb casing, and the German fission bomb reported to have been tested in Thuringia in March 1945 was approximately two tons (p. 4485). In contrast, an early hydrogen bomb would be fairly much required by fundamental physical principles to be very large, since it would need to contain enough fission fuel, enough fusion fuel, enough conventional explosives to implode the fission fuel, and the structure necessary for the fission fuel to ignite the fusion fuel. Therefore the reported six-ton bomb seems to best match the description of a hydrogen bomb.

Note that Hans Thirring, who was in close contact with Austrian scientists who had worked on the wartime German nuclear program, specifically mentioned “a six-ton bomb of lithium hydride” (or perhaps lithium deuteride?); see p. 4338.

It sounds as if a German team was scouting locations in northern Finland in which to test the six-ton radioactive bomb. Seeking such a remote test location is further evidence that the bomb was a hydrogen bomb, with an explosive yield much higher than a fission bomb, making it too large to be safely or secretly tested closer to more populated regions.

The capabilities and intended functions of the “Wärmesuchgerät” are unclear from this document. It may have been a heat-seeking missile guidance system, an infrared vision system for night-time flying, or a semi-automated terrain mapping system, among other possibilities. Or since the “Wärmesuchgerät” seems to have been closely associated with the six-ton radioactive bomb and with the German team selecting a test site, perhaps the “Wärmesuchgerät” was intended to measure the explosive yield of the bomb from a safe distance in a remote territory without permanent emplacements of diagnostic instruments.

Can Lt. F. T. Gutmann’s more detailed report on the six-ton radioactive bomb be located in archives, declassified, and released?

For information on Edmund Tilley, see pp. 4894–4895.]

Control Commission for GERMANY (BE)
B.A.O.R.

13th July 1946

SUBJECT : Secret Missiles.

See EPES/447.

FROM : Major E. TILLEY.

TO : Lt.Col. P.M. WILSON.

1. Lt. F.T. GUTMANN, of 2940th Engineer Technical Intelligence Team (R), U.S. Army, has just returned from Austria with three of SCHULZ-KAMPFHENKEL's assistants, all of the Forschungsstaffel.

2. Lt. GUTMANN went into the Russian Zone in Austria and saw a gendarme, Anton KÄSTNER, in EURATSFELD near AMSTETTEN, in Lower Austria. KÄSTNER told Lt. GUTMANN of a new radio-active bomb, weighing six tons. This bomb has no fins and is lowered by parachute. KÄSTNER himself claims to have been connected only with the fuze part of this new secret missile.

3. Colonel PETERSEN was said to have been in charge of this secret missile at OKW. KÄSTNER claimed that Colonel PETERSEN's papers and documents were left by him at Kloster ANDECHS in AMMERSEE, Upper Bavaria. Colonel PETERSEN is presumed to be in Spain.

4. A Hauptmann(Captain) SORG is said to have been Colonel PETERSEN's Chief Administrative Officer and also in charge of organization. SORG is still living at UTTING on the AMMERSEE.

5. Lt. GUTMANN believed that this new radio-active bomb may not be unconnected with the "Wärmesuchgerät" described by SCHULZ-KAMPFHENKEL. This must be a very secret instrument, for SCHULZ-KAMPFHENKEL did not tell any of the Americans about its existence and would not reveal it to us at OBERURSEL until a high pressure was exerted on him. He continues to call it "Wärmesuchgerät" which means heat searching or finding instrument, but he describes it as an aircraft instrument for measuring temperatures on the ground during the flight of the aircraft. If this were all, the instrument would be called "Wärmemessgerät" or "Temperaturmessgerät".

6. SCHMITTHÜSEN has been indicated as the man in the Forschungsstaffel who knows most about this "Wärmesuchgerät". I shall interrogate him with Lt. GUTMANN on Monday, 15th July. He is likely to prove stubborn for I saw him for a moment outside FIAT and asked him to prepare immediately a list of all hide-outs for Top Secret documents. He did not know that we had found the boxes at HARBURG which he himself had dug into the ground. He was informed smilingly that 20 years behind barbed-wire were awaiting him if he continued to deny

such well-known facts. He quickly agreed to let me have a complete list by Monday.

7. PILLEWIZER is the glacier expert of the Forschungsstaffel. He has written two reports for us at Lt. GUTMANN's request. The most significant sentence at the beginning of the second report, on the activities of the Forschungsstaffel in Lappland in 1944, reads as follows :

"In July 1944 a small group of the Forschungsstaffel was sent to Northern Finland in order to demonstrate, by practical experiment, the feasibility of quick map-making in the swamps and primeval forests of Lappland, i.e. to make maps quickly for topographical evaluation of hardly explored territory."

The rest of the report explains more fully the real purpose of this expedition for the work was started in VUOTSO and PARKKINA, both in the Artic Circle, and was continued there after the Germans had evacuated all Southern Finland. Later they photographed the SAARENPAEAE area in West Lappland (ENONTOEKIOE area). It is hardly likely that such an important and secret group of scientists could have been left in the Artic Circle as late as November 1944. After completion of the work PILLEWIZER returned with his group, via NARWIK and OSLO, to Germany, where he arrived in mid-December 1944.

This expedition may have served the same purpose as other expeditions of SCHULZ-KAMPFHENKEL, i.e. obtaining data of the effect of new deadly weapons or submitting data to enable the High Command to carry out such experiments with such missiles.

8. Lt. GUTMANN, who has not had much sleep for the last few days, will give me a copy of his report on this new missile on Monday and I shall show it to you before I go to DUSTBIN with Lt. GUTMANN.

Figure D.637: 6-ton radioactive bomb that must be dropped with a parachute (∼megaton yield), and a planned test site in northern Finland. Edmund Tilley to P. M. Wilson. Secret Missiles. EPES/FIAT, Control Commission for Germany, British Element, 13 July 1946 [TNA (Kew) FO 1031/57].

Notes on an Interrogation of Edmund Sorg at Dustbin. 7 August 1946 [TNA FO 1031/112].

REGARDING SPECIES OF V-2s

[...] I have never seen any plans of the steps in development of the V-2. I had nothing to do with the V-2 either personally or officially. When I mentioned 10–12 types of V-2 it is only personal supposition.

REGARDING ATOM BOMBS

I have never heard of the existence of atom bombs in connection with the German Wehrmacht. I can thus give no information as to whether the V1 was to have an atomic charge.

REGARDING V-1s WITH POISON GAS, BIOLOGICAL or BACTERIOLOGICAL CHARGES

I have never heard of V-1s being loaded with poison gas, biological matters or bacteria.

REGARDING 6 TON BOMBS

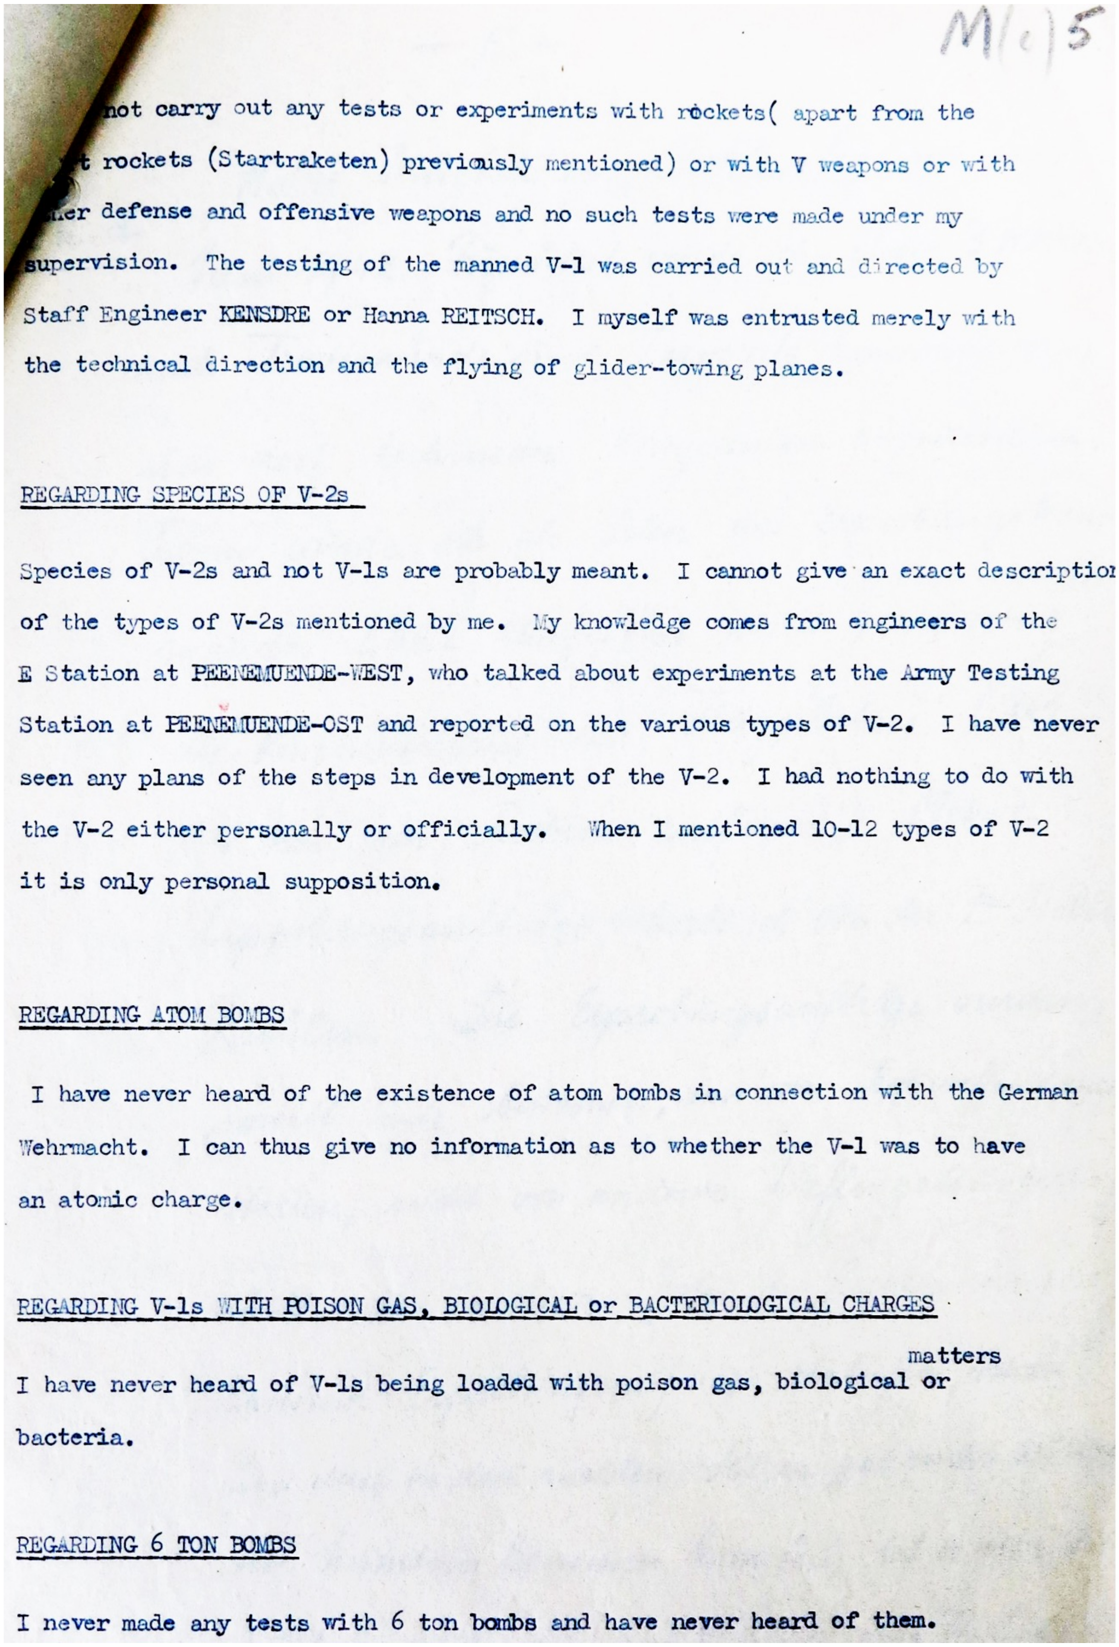
I never made any tests with 6 ton bombs and have never heard of them.

REGARDING USE OF POISON GAS, BIOLOGICAL MEANS and BACTERIA IN ROCKETS &c.

I have no knowledge of the use of poison gas, biological or bacteriological means in rockets, other missiles or in planes.

[Elsewhere in this file at The National Archive (UK), Major Tilley provided evidence that Sorg had detailed personal knowledge of many of the things he denied, such as V-2 rocket information. See p. 4896 for another example. Thus the fact that Sorg denied German atomic bombs, six-ton bombs, biological weapons, multiple types of large rockets, etc. is much less important than the fact that Sorg's Allied interrogators seemed convinced of the reality of those weapons, over a year after the war had ended. What other information did Allied officials have about those weapons from interrogations, captured documents, and/or capture hardware?]

TNA (Kew) FO 1031/112 Sorg V2



M(c)5

not carry out any tests or experiments with rockets(apart from the t rockets (Startraketen) previously mentioned) or with V weapons or with her defense and offensive weapons and no such tests were made under my supervision. The testing of the manned V-1 was carried out and directed by Staff Engineer KENSDRE or Hanna REITSCH. I myself was entrusted merely with the technical direction and the flying of glider-towing planes.

REGARDING SPECIES OF V-2s

Species of V-2s and not V-1s are probably meant. I cannot give an exact description of the types of V-2s mentioned by me. My knowledge comes from engineers of the E Station at PEENEMUENDE-WEST, who talked about experiments at the Army Testing Station at PEENEMUENDE-OST and reported on the various types of V-2. I have never seen any plans of the steps in development of the V-2. I had nothing to do with the V-2 either personally or officially. When I mentioned 10-12 types of V-2 it is only personal supposition.

REGARDING ATOM BOMBS

I have never heard of the existence of atom bombs in connection with the German Wehrmacht. I can thus give no information as to whether the V-1 was to have an atomic charge.

REGARDING V-1s WITH POISON GAS, BIOLOGICAL or BACTERIOLOGICAL CHARGES

I have never heard of V-1s being loaded with poison gas, biological matters or bacteria.

REGARDING 6 TON BOMBS

I never made any tests with 6 ton bombs and have never heard of them.

16 Aug. 1946

PROF. WAGNER - Tape ~~BAENDER~~ PARA~~S~~CHUTE (Bänderfallschirm) - 6 TON BOMB - NAMES & ADDRESSES

I never had anything to do with Prof. WAGNER. He is not known to me. I heard about the Me 323 accident in the course of a discussion with directors of depts. No precise details were given. A survivor of this aircraft accident in FRIEDRICHSHAFEN was present at the later tests carried out by Dept. E 5 with Me 323 in LAERZ. He mentioned nothing about a 6 ton bomb, however. Large Baenderfallschirm) parachute tests were probably carried out on Lake CONSTANCE. I do not know the name of the survivor. He spoke about the accident on the LAERZ airfield.

Experiments with Tape parachute (Baenderfallschirme) were then undertaken by Dept. E 5 in LAERZ. Three releases (Abwurfe) were carried out with heavy bodies (metal plates screwed together) with Me 323. The releases were carried out on the target field (Abwurfplatz) MIRÓW with Me 323 and exact measurements were made. I saw the experiment quite by chance on the LAERZ Flying Field, but did not participate. The body released from the aircraft reached a certain speed, then an auxiliary parachute opened by means of a time release and the opened in its turn the large (Baenderfallschirm). I can remember having heard that at least one of the releases went wrong and the parachute did not open. The purpose of the experiment, so far as I knew, was the testing of parachutes for heavy loads, probably for aircraft as emergency parachutes. I never heard of a 6 ton bomb in connection with this experiment. If there is any connection, the pilot of the Me 323 who made the flights, Staff Engineer (Stabsing.) MUELLER, I believe, must know about it. I do not know MUELLER's address. I myself had nothing to do with the entire experiment. Yet there must most certainly be details of the type of experiment, the execution and results, among the E-Station records in RECHLIN. I sorted the records in KAUFBEUREN in June 1945 at the Air Pool with Interrogation Unit, and noticed that weekly and monthly reports of every dept. of the E-Station in RECHLIN as well as of the other E-Stations over a period of 3 years were to be found in the records. The details of the experiment, mentioned above will be given in detail in the weekly reports.

Figure D.639: Edmund Sorg. 16 August 1946 [TNA FO 1031/112].

sons unknown to SORG, on 6 May 45. We may therefore assume the major was dealing with documents in the ANDECHS monastery nd possibly tried to escape . SORG exhumed the body of the major in March 46 on the grounds that he had to produce proof for the major's widow of her husbands death so that she could draw on her life insurance. This exhumation coincides with the return of Colonel PETERSEN from the United Kingdom where he had been interrogated. We may therefore assume that there was a discussion between Colonel PETERSEN and Captain SORG concerning the exact location of various documents and that the body was disinterred on the assumption that this valuable list of caches might still be in the clothing of the body of the major. Only months later SORG mentioned casually that the major's sergeant was shot with him and disinterred in March 46. Previously SORG had stated that only one person, aside from himself, knew all the hiding places of these documents, viz, the major.

Both SORG and Colonel PETERSEN claim to have revealed all their secrets to the Americans and British. Neither of them has admitted hiding documents in Kloster ANDECHS; therefore we may safely assume that both of them are still in possession of secrets which, for reasons best known to themselves, they are still withholding from us.

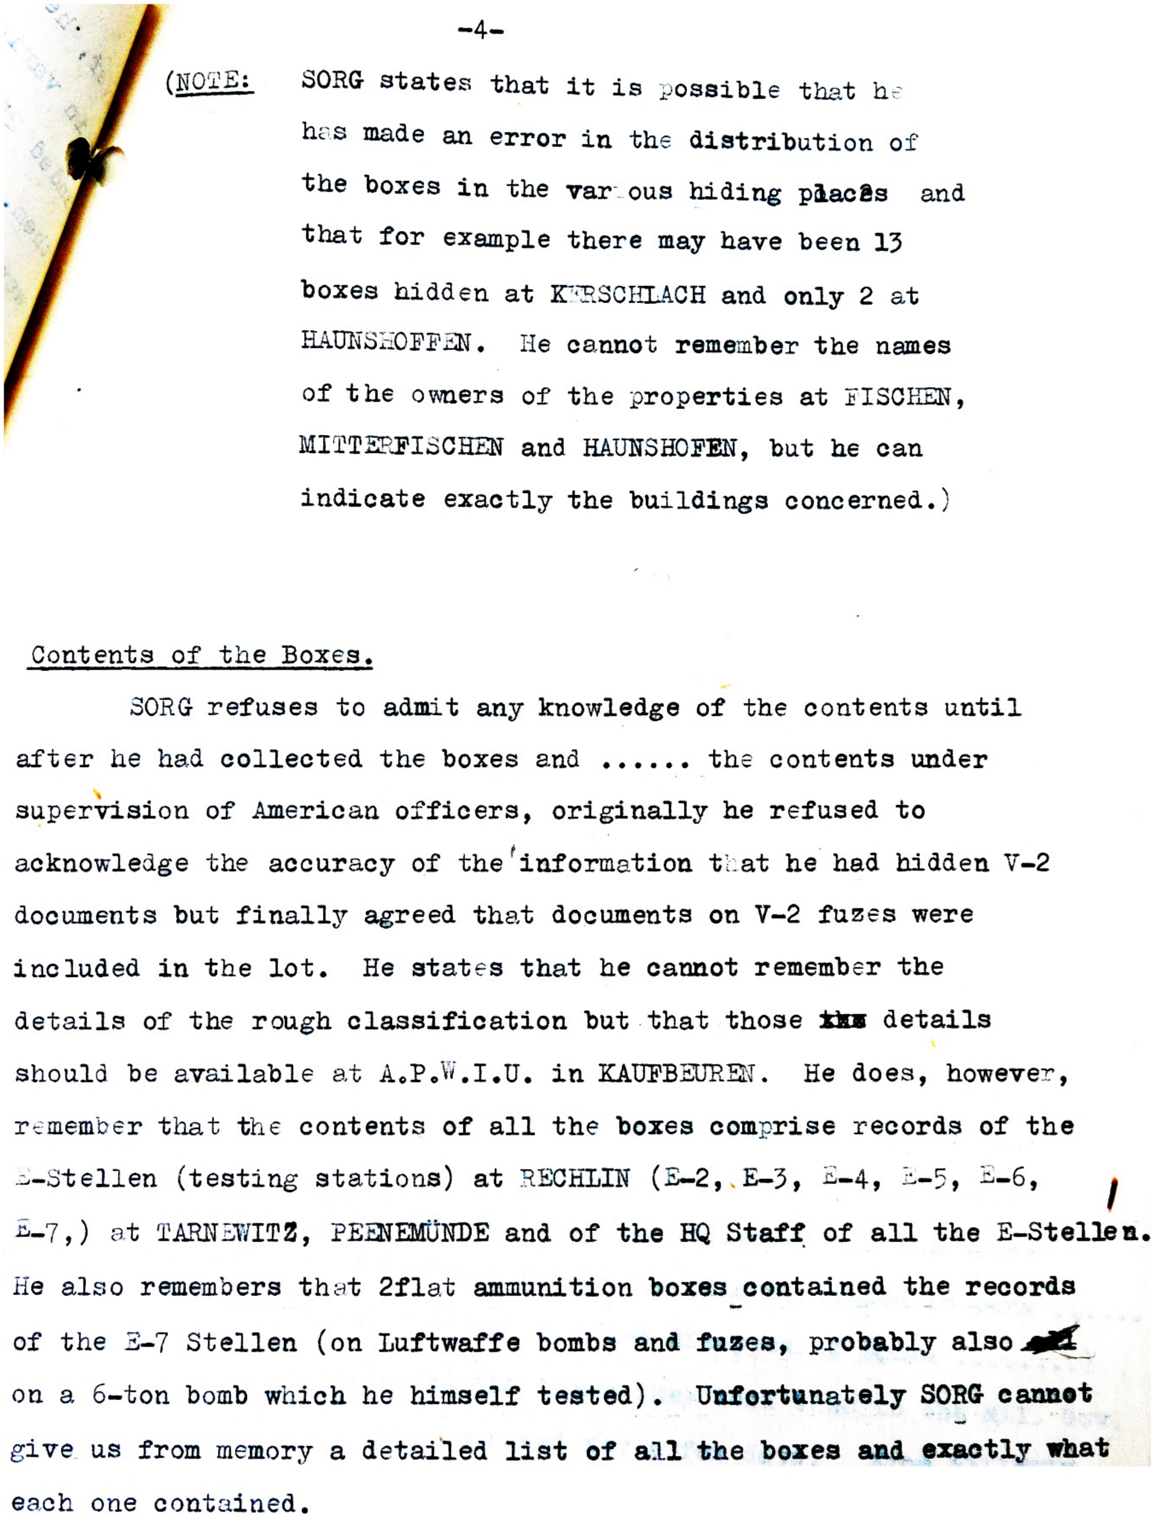
In the following paragraphs all particulars about the documents hidden by SORG in the Spring of 1945 are being presented. Any discrepancies between his original oral statements and his written statements will be put down.

Total of Boxes Hidden in Various Places.

According to SORG's written statement a total of 25 boxes were hidden by him in Southern Germany in February 1945 and were listed on the sheet which he entrusted to Major GROSSHOLZ la of Colonel PETERSEN. During his first interrogation at DUSTBIN,

TNA (Kew) FO 1031/112 Sorg V2

Figure D.640: Major Edmund Tilley to Lt. Col. P. M. Wilson. October 1946 [TNA FO 1031/112].



-4-

(NOTE: SORG states that it is possible that he has made an error in the distribution of the boxes in the various hiding places and that for example there may have been 13 boxes hidden at KERSCHLACH and only 2 at HAUNSHOFFEN. He cannot remember the names of the owners of the properties at FISCHEN, MITTERFISCHEN and HAUNSHOFEN, but he can indicate exactly the buildings concerned.)

Contents of the Boxes.

SORG refuses to admit any knowledge of the contents until after he had collected the boxes and ...... the contents under supervision of American officers, originally he refused to acknowledge the accuracy of the information that he had hidden V-2 documents but finally agreed that documents on V-2 fuzes were included in the lot. He states that he cannot remember the details of the rough classification but that those [illegible] details should be available at A.P.W.I.U. in KAUFBEUREN. He does, however, remember that the contents of all the boxes comprise records of the E-Stellen (testing stations) at RECHLIN (E-2, E-3, E-4, E-5, E-6, E-7,) at TARNEWITZ, PEENEMÜNDE and of the HQ Staff of all the E-Stellen. He also remembers that 2flat ammunition boxes contained the records of the E-7 Stellen (on Luftwaffe bombs and fuzes, probably also [illegible] on a 6-ton bomb which he himself tested). Unfortunately SORG cannot give us from memory a detailed list of all the boxes and exactly what each one contained.

TNA (Kew) FO 1031/112 Sorg V2

Figure D.641: Major Edmund Tilley to Lt. Col. P. M. Wilson. October 1946 [TNA FO 1031/112].

Major Edmund Tilley to Lt. Col. P. M. Wilson. October 1946 [TNA FO 1031/112].

The general background of this brief report on the hiding by SORG of documents of the E-Stellen (testing stations) at RECHLIN, TARNEWITZ, TRAVEMÜNDE, WERNEUCHEN, UDETFELD, PEENEMÜNDE, GOTENHAFEN (GYDNIA) was given in a memorandum by the undersigned to Lt-Col. P.M. Wilson on 6 Oct 46. Information was received in Austria late summer 46 that a Captain SORG had hidden V-2 documents in Kloster ANDECHS on the Ammersee in Spring 45 and that Captain SORG was the administrative officer of Colonel PETERSEN.

[...] the return of Colonel PETERSEN from the United Kingdom where he had been interrogated. [...] Both SORG and Colonel PETERSEN claim to have revealed all their secrets to the Americans and British. Neither of them has admitted hiding documents in Kloster ANDECHS; therefore we may safely assume that both of them are still in possession of secrets which, for reasons best known to themselves, they are still withholding from us. [...]

SORG refuses to admit any knowledge of the contents until after he had collected the boxes [...] He also remembers that 2 flat ammunition boxes contained the records of the E-7 Stellen (on Luftwaffe bombs and fuzes, probably also on a 6-ton bomb which he himself tested). Unfortunately SORG cannot give us from memory a detailed list of all the boxes and exactly what each one contained.

[Based on (still classified) evidence they had already seen, Allied interrogators were convinced that the six-ton radioactive bomb had reached the point of testing before the end of the war. Thus that weapon was much more than a paper design or a long-term project. This information is consistent with other reports that a German hydrogen bomb could have been deployed later in 1945 or in 1946 if the war had continued. For information on Edmund Tilley, see pp. 4894–4895.]

Allen Dulles. 14 March 1944. [Princeton University Library, Allen Dulles Papers, Series 4, Subseries 4K: Telegrams d'etat, 1942–1945, 1942–1943, MC019.09_c44.pdf, https://findingaids.princeton.edu/catalog/MC019-09_c44].

Source 840. (1) 600 technicians doing research on rocket direction in high frequency lab in Gatow near Berlin. 300 rockets said to be ready for use one month ago. Length 15 to 17 meters, weight of explosive 4 to 6 tons. Rocket consists of over 1000 parts including two batteries. Remaining difficulty is deviation up to 500 meters radius over 230 km.

[This OSS intelligence report came from someone involved in developing rocket guidance systems. That source stated they were working on rockets that were larger than a standard A-4 (V-2), 15–17 meters long instead of the standard 14 meters, and that were designed to accommodate a special explosive warhead weighing up to 6 tons instead of the standard 1-ton warhead.]

J. P. E. Peters. Interrogation of Dipl. Ing. Hermann Zumpe at F.I.A.T. (Main) on 7th November, 1946. [TNA AIR 40/2832]

[...] 2. On 22nd October, 1946, ZUMPE presented himself at the headquarters of F.I.A.T. (Forward) in Berlin with the request that passage be provided for himself and his family to the British Zone of Germany. It transpired that ZUMPE had been working for the Russians in the GEMA Buildings, Wendelschlossstrasse, 3, Berlin-Kopenick, but did not wish to move to Russia with that organisation.

3. ZUMPE was interrogated by the Intelligence Department, Air Division, CCG. (BE), and was then evacuated by air to F.I.A.T. (Main), where he is at present lodged in "Dustbin". [...]

14. ZUMPE also had in hand a new project for a rocket motor on the same principles as the new C2, but developing a thrust of 50 tons for use in a 26 ton rocket of the A4 type. This project was still in the early stages; the only decision made was that the maximum weight allowable for the motor, fuels, and shell was 20 tons, leaving 6 tons for the warhead. He claims that he can complete the calculations for this project in 4–6 weeks. [...]

16. ZUMPE states that it was impossible to gain access to departments other than the one in which he worked, as his pass was clearly marked with the department for which it was valid, and even the Russian officers on the unit were not allowed to enter buildings with which they were not directly concerned. [...]

[The Soviets apparently found plans for the German 6-ton bomb and conscripted German engineers to recreate methods (especially the rocket mentioned by Dulles above) to deliver it.]

Nazis Were Working On 100-Ton Rocket. *The Courier-Mail* (Brisbane, Australia). 5 December 1946 p. 1. [**https://trove.nla.gov.au/newspaper/article/49363386**]

NEW YORK, December 4.—When the war ended the Nazis were building a 100-ton rocket with which to strike at the United States.

This has been revealed by the brilliant German scientist, Wernher von Braun, who invented the V2 rocket.

Von Braun is now in the United States working with American experts on rocket experiments.

The super-rocket, he said, was on the drawing-board when Germany was over-run. It would have carried an explosive charge of six tons, and would have been capable of travelling thousands of miles.

He claimed that the V2 rocket failed in only about 5 per cent of its tests in Germany.

Von Braun and his associates from Germany are being kept at work under the utmost secrecy by the Army as they help to train American ordnance men, industrialists, and scientists from leading American universities in the secrets of rocket bombs.

U.S. Gain

An estimate that German and Austrian scientists had saved the United States more than £235 million in basic research in rockets alone was disclosed by the War Department in announcing that 730 additional experts were to be brought to the United States.

Former enemy brain-power, the department said, had advanced American research in several fields by from two to 10 years.

Already 270 former enemy scientists are at work in the United States. They include the former chief designer for the Messerschmitt aircraft works and the technical director of the Nazis' Peenemunde rocket proving ground. They came to the United States voluntarily.

The scientists are being paid on contract, the maximum being £975 annually, plus 37/ daily expense allowance. This is considerably less than the salaries paid to American civil service workers doing comparable work.

The work of the foreign scientists covers the fields of electronics, supersonics, guided missiles, jet propulsion, and fuels.

["100-ton rocket" was a name sometimes used by the Peenemünde engineers for the A-9/A-10. Usually the expected payload of the A-9/A-10 is given as 1 ton. That could be stretched to 2 tons without much trouble. A German rocket design capable of carrying a 6-ton payload is unknown in the official histories. Was this a different version of the A-9/A-10, or a different rocket entirely?

Because of the extreme difficulty of accommodating a 6-ton payload on a rocket, that would have been attempted only if the payload could not be made smaller. Conventional explosives, chemical weapons, biological weapons, or a radioactive dirty bomb could be made as small as desired, and delivered on multiple rockets if necessary. Even a fission bomb would only weigh 2–3 tons. This must have been a weapon whose physical constraints at that time required it to be no smaller than 6 tons—presumably a hydrogen bomb.]

Nazi Scientists Work On U.S. Rocket Experiment. *Newcastle Morning Herald and Miners' Advocate* (NSW, Australia). 5 December 1946 p. 3. [https://trove.nla.gov.au/newspaper/article/133178482]

NEW YORK, Dec. 4.—Before the war ended the Nazis were building a 100-ton rocket to strike the United States. This was revealed by the brilliant German scientist Wernher von Braun, who invented the V2 rocket, and who is now in the United States.

Von Braun is at present working with American experts on rocket experiments.

He said the Nazis' super-rocket was on the drawing board when Germany was overrun. It would have carried an explosive charge of six tons and be capable of travelling thousands of miles.

Von Braun claimed the V2 failed in only about five per cent of its tests in Germany.

Von Braun and his associates from Germany are being kept at work under the utmost secrecy by the army as they help to train American ordnance men, and industrialists and scientists from leading American Universities in the secrets of rocket bombs.

Saved U.S. Millions

A statement issued by the War Department in Washington said it was estimated that German and Austrian scientists had saved the United States more than 750 million dollars (£A234 1/2 millions) in basic research in rockets alone.

The department announced that about 730 additional experts would be brought to the United States.

The statement said that former enemy brainpower had advanced American research in several fields two to ten years. The number of experts put to work since September 1945 had grown to 270, and the total would be increased to about 1000 as soon as transportation arrangements were completed.

The scientists and technicians include the former Chief Designer for the Messerschmitt Aircraft Works and the Technical Director of the Nazis' Peenemunde rocket-proving ground. They came to the United States voluntarily.

Nazis Planned Rocket to Hit U.S. *New York Times.* 4 December 1946.

Wernher von Braun, 34-year-old German scientist who invented the deadly V-2 supersonic rocket, revealed today that before the war ended the Nazis were building a 100-ton rocket to strike at the United States.

Von Braun told reporters that the 100-ton rocket was on the drawing board when the Allies overran Europe. He said it would have carried a "pay-load" of six tons and would have traveled thousands of miles to strike the United States.

Eugen Sänger and Irene Bredt. 1944. *Über einen Raketenantrieb für Fernbomber.* UM 3538. Ainring: Deutsche Luftfahrtforschung. English translation 1952. *A Rocket Drive for Long Range Bombers.* CGD-32, C-84296. Technical Information Branch, Buaer Navy Department. pp. 148, 152.

As an example of area attack with single propulsion and full turn, we use the attack on New York at a range of 6500 km. For c=4000 m/sec, the bomb load is 6 tons, and the detailed attack runs as follows: the motor starts to work 36 seconds after the take-off at 12 km. distance from the take-off point, and consumes the total fuel supply of 84 tons in the next 336 sec. At the end of the climb process, the aircraft reaches a velocity of 6370 m/sec, an altitude of 91 km, a distance of 736 km. from the point of take-off, and a weight of 16 tons. Using only its store of potential and kinetic energy, the bomber flies on to the point of bomb release, 5550 km. from the take-off point, and 950 km. in front of the target. At this point, which is reached 1150 sec. after take-off, the velocity has decreased to 6000 m/sec, and the stationary altitude to 50 km. After the bomb release the weight is 10 tons. Then the aircraft goes into a turn and in 330 sec. goes through a turn-spiral 1000 km. in diameter until it has reached the direction for the return flight to the home base. During turning, the altitude is greatly decreased in order to develop the aerodynamic forces necessary for the turn. At the end of the turn path, the velocity is still 3700 m/sec. and the corresponding stationary altitude is 38 km. The supersonic glide-path in the direction of the home base goes over 5450 km. in 2600 sec. and ends 100 km. before the home base at an altitude of 20 km. and velocity 300 m/sec. Subsonic glide and landing are completed in customary fashion. The whole flight lasts 4755 sec.

[The Sänger-Bredt Silbervogel space plane was designed to bomb New York or other targets in the United States. Historians have dismissed the Silbervogel as merely a paper design that was never seriously considered or built. However:

- Eugen Sänger and Irene Bredt completed and submitted a 900-page proposal giving details of the Silbervogel design and development program to the German government in 1941 [Myhra 2002].
- Wind tunnel models of Silbervogel are known to have been constructed and tested (p. 5595).
- At least one photograph exists of a full-sized Silbervogel engine that had been constructed for testing no later than 1944 (p. 5596).
- In January 1946, five Canadian aerospace experts reported that while visiting a German research station, they viewed “a rocket motor 10 times larger than those used on V-2s.” That description could match either the Silbervogel motor or the A-10 booster rocket motor (p. 5470).
- Detailed orbital calculations were performed in 1944 to find the best trajectory for the Sänger-Bredt vehicle to reach New York (pp. 5597–5599).
- An article published in the 30 October 1944 *Daily Mail* reported that the Germans in occupied France had been constructing a “huge ramp” that was “intended as a launching place for flying

bombs, which... would wreck New York." The size of the ramp, the reference to flying bombs, and the claimed target of New York seem consistent with the Silbervogel launch catapult (p. 5600).

- U.S. Army Air Forces Colonel Donald Putt, in charge of overseeing all German rocket scientists and related equipment and information rounded up at the end of the war, reported in March 1946: "Test model was made that carried one man and had landing gear, although it is not known if this model ever flew; it is known, however, that test runs were made on its engine." Thus according to an authority with arguably the best access to the available information, the Silbervogel engine was constructed and tested, a Silbervogel vehicle complete with cockpit and landing gear was constructed, its engine was operational, and postwar U.S. officials were left wondering if flight tests of the Silbervogel may have even been conducted (p. 5601). What German witnesses and documents was this information based on? What became of the prototype Silbervogel vehicle—was it destroyed by the Germans, removed by the Americans, or removed by the Soviets?

- A lengthy and detailed October 1946 article in *Harper's Magazine* stated that the Silbervogel system "was never completed merely because of the war's quick ending" (p. 5490).

- A 1957 U.S. Air Force report stated: "The boost-glide concept was... partially tested by the Germans in the early 1940's" (p. 5603).

In the part of their 1944 report quoted on the previous page, Sänger and Bredt specifically discussed using the Silbervogel to deliver a six-ton bomb to New York. That agrees with several other independent sources that mentioned a special six-ton bomb (pp. 4338, 4350–4362, 5343). Six tons of conventional explosive would not do even remotely enough damage to justify the enormous amount of money, labor, materials, time, and energy involved in developing a systems such as Silbervogel to deliver the bomb to a U.S. target, especially under wartime conditions when all of those resources were critically needed and in short supply. The whole approach would have made sense only if the six-ton bomb was nuclear, and indeed some of the sources specifically stated that it was nuclear—in fact, apparently a full-fledged hydrogen bomb.

Moreover, some sources indicated that much of the work related to the six-ton or hydrogen bomb was conducted in Austria, and Sänger was Austrian. Between his professional connections and his payload delivery method, it seems quite reasonable that Sänger would have had some contact with the scientists who were working on the actual bomb.

While most wartime papers on Sänger's work were destroyed or were captured and remain inaccessible in archives, some of the letters he wrote to Hermann Oberth after the war confirm that he was quite interested in fusion reactions [Oberth 1984, Vol. 1, pp. 199–200, 213–216].]

G. Ward Price. Fly-bombs Were Meant for U.S.: Huge Ramp Found. *Daily Mail.* 30 October 1944.

Immense concrete works on top of a hill in Artois, near Saint Omer, were intended as a launching place for flying bombs, which, the Germans boasted, would wreck New York.

Thousands of workmen were employed in tunnelling and building a cylindrical cupola on top of the hill, 250ft. in diameter.

Lorries, and even trains, could drive right into the heart of the hill.

German engineers told local French people that when the vast machinery was installed and ready to fire, the district would have to be evacuated for six miles around.

Frequent attacks by the R.A.F. kept on delaying work until the Allied advance from Normandy obliged all the enemy engaged on it to pack up hurriedly.

Footnote.—A German U-boat commander recently told naval cadets at Esjberg, Denmark, that Germany was preparing a new secret weapon for use against America. He said that U-boat crews would play a decisive part in the use of the weapon.

[The six-mile radius suggests that the bomb would have had that blast radius. A 6-mile or 10-km blast radius corresponds to an explosive energy of at least $(10,000/85.5)^3 \approx$ 1,600,000 tons of TNT equivalent, or at least 1.6 megatons. This is well beyond the kiloton-ranges of fission bombs, as the German scientists knew from basic calculations of fission energies, and suggests that they were developing much more powerful hydrogen (H) or fusion bombs. Other sources from around the same time also mentioned the exact same 10-kilometer/6-mile blast radius (pp. 4366 and 4367).

This site sounds like a launching sled track for the Sänger-Bredt Silbervogel space plane, or possibly a slightly smaller launching track for the winged A-9 rocket. For more discussion on track-launched rockets, see Section E.3. Also see the article on p. 5011 that mentions development of a catapult-launched atomic bomb delivery system in Norway.]

Bruno Spampanato. 1974. *Contromemoriale.* Rome: Centro Editoriale Nazionale. pp. 917, 1116. [Spampanato (1902–1960) was a journalist and politician who was a longtime supporter of Mussolini and very well connected with high-ranking Italian officials. After the war, he wrote a multivolume memoir that preserved information from a huge number of sources that otherwise might have been lost or forgotten. Here he quoted two wartime sources that both appear to have been describing a nuclear weapon with a megaton-level yield. One of them even gave the exact same 10-kilometer/6-mile blast radius as other sources from that time (pp. 4365 and 4367).]

Qualche cosa del genere ci ha detto Goffredo Coppola ch'era stato in Germania a un congresso scientifico in rappresentanza del Governo: e tornava allora. Ci vediamo al Plaza con lui ed Enrico Santamaria. Coppola ci dice qualche cosa che rasenta i limiti della fantasia. Ma tutto si può sospettare di Coppola, Rettore Magnifico dell'università di Bologna, fuorché si occupi di fotomontaggi come Theil, o di altra propaganda razionale. Il prof. Coppola ci dice quanto gli hanno confidato degli scienziati che hanno fama mondiale per i loro studi.

Questo ci disse Coppola il 16 febbraio 1945: "I tedeschi hanno trovato il mezzo per disintegrare l'atomo. E una scoperta elettronica. La disintegrazione avviene a cicli successivi e prende aree vastissime di decine di chilometri. Nei laboratori si lavora in pieno". [...]

Tra gl'italiani il più a contatto coi più alti ambienti militari tedeschi era il Maresciallo [Rodolfo] Graziani. E proprio Graziani nella sua autodifesa dinanzi alle Assise Speciali di Roma [1948] depose: "Ognuno può dire quello che vuole sulla faccenda delle armi segrete; ma sta di fatto che le armi segrete in Germania c'erano: c'erano nel modo più assoluto e c'era un rinnovamento in tutta l'aviazione con apparecchi a reazione, e ne avevano già in gran numero, migliaia. Non sono riusciti a metterli in funzione perché in quel momento è cominciata a mancare la benzina, e in seguito ci sono stati i bombardamenti a tappeto fatti dagli anglo-americani sugli impianti delle industrie. Stavano per realizzare anche l'antiradar per le segnalazioni e avrebbero potuto ricominciare la guerre dei sommergibili. C'era la V-1 e c'era la V-2, ma si arrivava fino alla V-10 che distruggeva nel raggio di dieci chilometri ogni elemento di vita".

Something like this was said to us by Goffredo Coppola, who had been in Germany at a scientific congress representing the government and then came back. We met at the Plaza with him and Enrico Santamaria. Coppola told us something that borders on the limits of fantasy. But everything can be suspected of Coppola, the Magnificent Rector of the University of Bologna, except that he deals in fakes like Theil, or other intellectual propaganda. Prof. Coppola told us what he had been confidentially told by scientists who are world-renowned for their studies.

This Coppola told us on 16 February 1945: "The Germans have found the means to disintegrate the atom. And an electronic discovery. The disintegration occurs in successive cycles and covers vast areas of tens of [square] kilometers. In the laboratories work is at full capacity." [...]

Among the Italians the most in contact with the highest German military circles was Marshal [Rodolfo] Graziani. And it was Graziani himself in his self-defense before the Special Court in Rome [1948] who testified: "Everybody can say what they want about the matter of secret weapons; but the fact is that secret weapons in Germany were there: they were there in the most absolute way and there was a renewal in the whole aviation with jet aircraft, and they already had them in large numbers, thousands of them. They were not able to put them into operation because at that time there began to be a shortage of gasoline, and later there was the carpet bombing done by the Anglo-Americans on the plants of industries. They were also going to make anti-radar for signaling and they could have started the submarine wars again. There was the V-1 and there was the V-2, but it went all the way up to the V-10 which destroyed within a ten-kilometer radius every element of life."

Germans Timed Atom Bomb for October. *Evening Standard* (London). 7 August 1945.

The Germans had an atom bomb which would have been ready by October.

A colossal blast effect was claimed for the German bomb. It was said it would wipe out everything inside a radius of six miles, said B.U.P. today.

The German atomic plans were uncovered four months ago, when an Allied search party walked into a small silk factory at Celle, north of Hanover.

A laboratory of two rooms was buried away in the heart of the factory. A famous research scientist [Wilhelm Groth] was still at work. He was flown to Britain the same day.

This man, with others, had been working on the Atom bombs for months. The Nazi Government poured out money on it. Apparently they had not asked for immediate results.

Nazis Five Months from Completion of Atomic Bomb. *Pittsburgh Press.* 7 August 1945 p. 14.

21ST ARMY GROUP HEADQUARTERS, Germany, Aug. 7 (UP)—Germany was within five months of completing her own atom bomb when the European war ended.

A British task force four months ago discovered that German scientists almost had completed work on the bomb in a two-room laboratory in the heart of a small silk factory north of Hannover.

The bomb, it was calculated, would wipe out everything within a radius of six miles.

A famous German research scientist [Wilhelm Groth, in] charge of the experiments was flown immediately to Britain at the time. He estimated his work would have been completed by October.

He said the German Government had given him unlimited funds and equipment and had not demanded any immediate results.

[Also reported in:

6-Miles Radius Bomb. *Toronto Daily Star.* 7 August 1945. p. 1.

6-Miles Radius Bomb. *Madera Tribune* (Madera, California). 7 August 1945. p. 1.

Bomba de 10 Kilómetros. *ABC* (Madrid). 8 August 1945.

These articles all mentioned a bomb with a 6-mile blast radius. Completely independent sources from around the same time also gave the same 10-kilometer/6-mile blast radius (pp. 4365 and 4366). As already noted, a 10-kilometer/6-mile blast radius would correspond to at least a ∼1.6 megaton explosion, which would suggest a hydrogen bomb and not a simple fission bomb. Wilhelm Groth, a very talented physicist who along with Paul Harteck had played a major role in numerous aspects of the German nuclear program since early 1939, stated that Germany was five months away from completing such weapons. If true, that was a feat that the U.S. and U.S.S.R. did not actually accomplish until the 1950s.]

Air Intelligence Report No. 100-13/1-100, Significant Developments and Trends in Aircraft and Aircraft Engines, Antiaircraft Guided Missiles (15 June 1946). pp. 3, 90–93. [NARA RG 38, Entry 98C, Box 11, Folder TSC # 3001–3100]

[...] b. Russia is known to have acquired German technicians and V-weapon production and experimental sites. [...] In addition, German developments in the atomic energy field and the possibilities for use of this energy as a guided missile warhead are known to the Russians.

(3) Step rockets. This type of rocket had been considered by the Germans who anticipated ranges of 3,000 miles or more with successors of the V-2. Such a rocket would consist of a main body containing the demolition charge and control units and two or more detachable sections containing propulsion units. These sections would be dropped from the missile as they were exhausted in flight. Such a rocket in the hands of the Russians would make the transpolar routes probable tactical approaches. [...]

e. Russian Atomic Energy. The development of atomic weapons and guided rocket projectiles go hand in hand. It was the Germans who realized that the rocket was “the ideal vehicle for atomic warhead” and it has been established that they intended the A-4 (V-2) rocket to be such a vehicle. In the construction of a long-range rocket, space allotted to payload is of necessity reduced to a minimum by the increase in space allotted to fuel. Adaptability of the atomic warhead to such a missile can be fully appreciated because the ratio of destructive power to unit weight is far in excess of conventional explosives and a radical increase in the destructive power is not accompanied by a similar increase in volume of the warhead.

Little is known concerning the Russian activity with regard to atomic energy. [...]

g. Heavy Hydrogen Bomb. In Germany a letter was picked up by the American censors. It had been written by a German desirous of exchanging information for an opportunity to go to the United States. The writer professed knowledge of “heavy water” research in Germany and of an “even more deadly weapon than the atomic bomb”.

h. German Heavy Hydrogen Bomb. During 1943 the Germans were experimenting with the production of “heavy water” in Norway. Their installation at Rjukan, Norway was deemed important enough at that time to warrant a visit from the heavy bombers of the Eighth Air Force. It was evident that the Germans recognized the potentialities of “heavy water” as a source of Heavy Hydrogen and were taking advantage of the abundance of electric power available in Norway for the production of this substance.

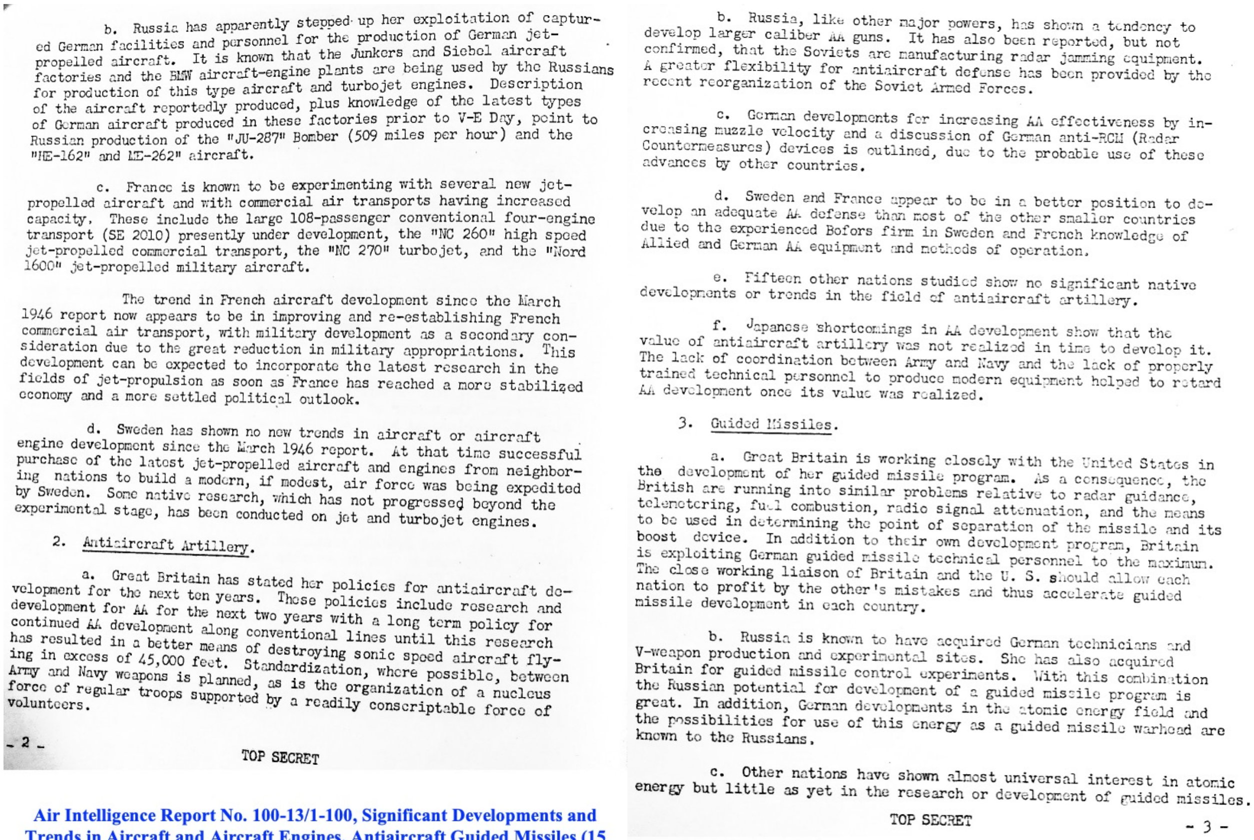
The war brought the German activity in connection with “heavy water” to a close but the question can now be posed, “Have the Russians obtained German personnel formerly employed in the project and if so will they exploit them in an effort to devise an atomic weapon which requires none of the radio active minerals so closely guarded throughout the world?” If the Russians are successful in this attempt, they will have within their grasp the new atomic weapon which is reported to have made the Uranium bomb obsolete. Research in the United States confirms the comparison of the Heavy Hydrogen bomb to the Uranium bomb.

[See document photos on pp. 4370–4371.

How exactly did U.S. intelligence know that Germany intended to build an atomic bomb, intended to deliver it via rocket, and made "developments" that fell into Russian hands?

No significant information about H-bombs was public until fall 1946 (pp. 4337–4341), so the German letter writer's knowledge apparently came directly from wartime work.

Can this letter be located now?]



b. Russia has apparently stepped up her exploitation of captured German facilities and personnel for the production of German jet-propelled aircraft. It is known that the Junkers and Siebel aircraft factories and the BMW aircraft-engine plants are being used by the Russians for production of this type aircraft and turbojet engines. Description of the aircraft reportedly produced, plus knowledge of the latest types of German aircraft produced in these factories prior to V-E Day, point to Russian production of the "JU-287" Bomber (509 miles per hour) and the "HE-162" and ME-262" aircraft.

c. France is known to be experimenting with several new jet-propelled aircraft and with commercial air transports having increased capacity. These include the large 108-passenger conventional four-engine transport (SE 2010) presently under development, the "NC 260" high speed jet-propelled commercial transport, the "NC 270" turbojet, and the "Nord 1600" jet-propelled military aircraft.

The trend in French aircraft development since the March 1946 report now appears to be in improving and re-establishing French commercial air transport, with military development as a secondary consideration due to the great reduction in military appropriations. This development can be expected to incorporate the latest research in the fields of jet-propulsion as soon as France has reached a more stabilized economy and a more settled political outlook.

d. Sweden has shown no new trends in aircraft or aircraft engine development since the March 1946 report. At that time successful purchase of the latest jet-propelled aircraft and engines from neighboring nations to build a modern, if modest, air force was being expedited by Sweden. Some native research, which has not progressed beyond the experimental stage, has been conducted on jet and turbojet engines.

2. Antiaircraft Artillery.

a. Great Britain has stated her policies for antiaircraft development for the next ten years. These policies include research and development for AA for the next two years with a long term policy for continued AA development along conventional lines until this research has resulted in a better means of destroying sonic speed aircraft flying in excess of 45,000 feet. Standardization, where possible, between Army and Navy weapons is planned, as is the organization of a nucleus force of regular troops supported by a readily conscriptable force of volunteers.

b. Russia, like other major powers, has shown a tendency to develop larger caliber AA guns. It has also been reported, but not confirmed, that the Soviets are manufacturing radar jamming equipment. A greater flexibility for antiaircraft defense has been provided by the recent reorganization of the Soviet Armed Forces.

c. German developments for increasing AA effectiveness by increasing muzzle velocity and a discussion of German anti-RCM (Radar Countermeasures) devices is outlined, due to the probable use of these advances by other countries.

d. Sweden and France appear to be in a better position to develop an adequate AA defense than most of the other smaller countries due to the experienced Bofors firm in Sweden and French knowledge of Allied and German AA equipment and methods of operation.

e. Fifteen other nations studied show no significant native developments or trends in the field of antiaircraft artillery.

f. Japanese shortcomings in AA development show that the value of antiaircraft artillery was not realized in time to develop it. The lack of coordination between Army and Navy and the lack of properly trained technical personnel to produce modern equipment helped to retard AA development once its value was realized.

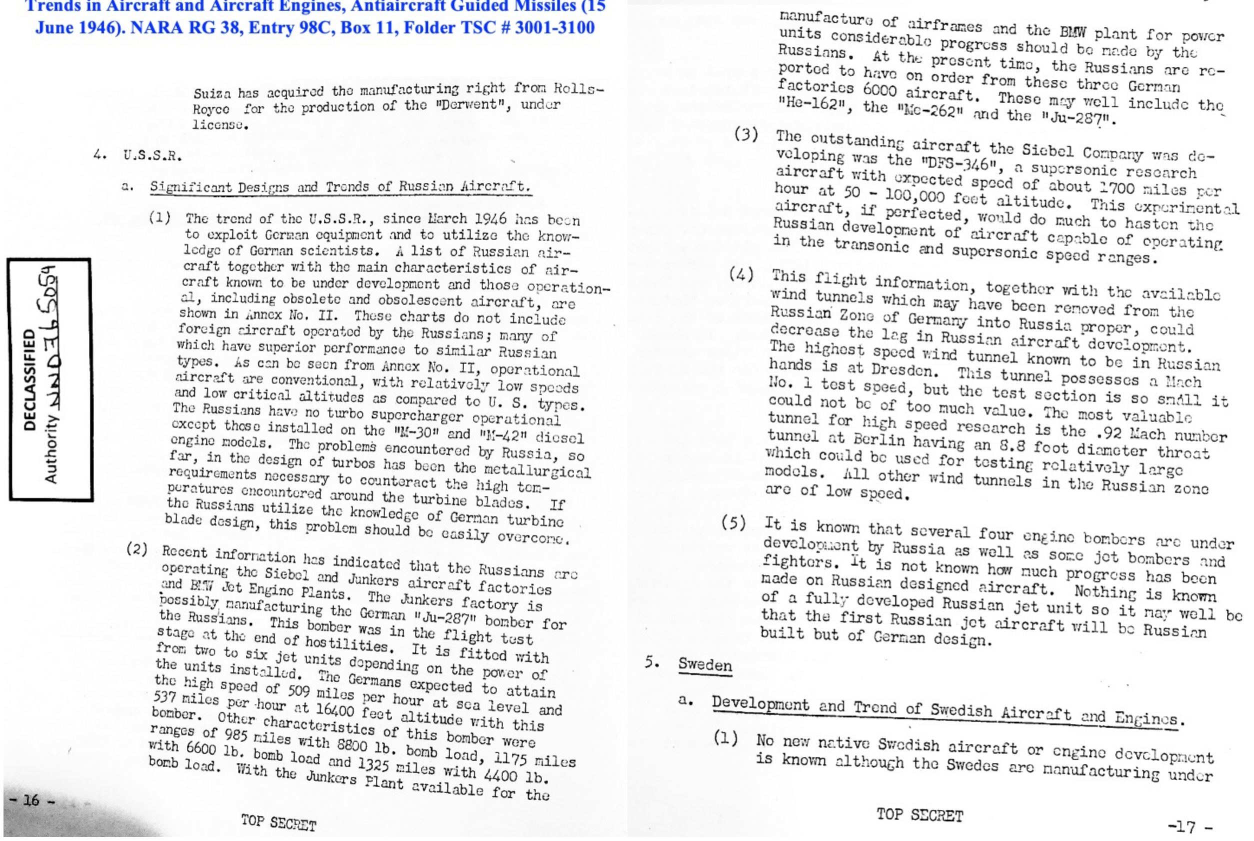
3. Guided Missiles.

a. Great Britain is working closely with the United States in the development of her guided missile program. As a consequence, the British are running into similar problems relative to radar guidance, telemetering, fuel combustion, radio signal attenuation, and the means to be used in determining the point of separation of the missile and its boost device. In addition to their own development program, Britain is exploiting German guided missile technical personnel to the maximum. The close working liaison of Britain and the U. S. should allow each nation to profit by the other's mistakes and thus accelerate guided missile development in each country.

b. Russia is known to have acquired German technicians and V-weapon production and experimental sites. She has also acquired Britain for guided missile control experiments. With this combination the Russian potential for development of a guided missile program is great. In addition, German developments in the atomic energy field and the possibilities for use of this energy as a guided missile warhead are known to the Russians.

c. Other nations have shown almost universal interest in atomic energy but little as yet in the research or development of guided missiles.

Air Intelligence Report No. 100-13/1-100, Significant Developments and Trends in Aircraft and Aircraft Engines, Antiaircraft Guided Missiles (15 June 1946). NARA RG 38, Entry 98C, Box 11, Folder TSC # 3001-3100



Suiza has acquired the manufacturing right from Rolls-Royce for the production of the "Derwent", under license.

4. U.S.S.R.

a. Significant Designs and Trends of Russian Aircraft.

(1) The trend of the U.S.S.R., since March 1946 has been to exploit German equipment and to utilize the knowledge of German scientists. A list of Russian aircraft together with the main characteristics of aircraft known to be under development and those operational, including obsolete and obsolescent aircraft, are shown in Annex No. II. These charts do not include foreign aircraft operated by the Russians; many of which have superior performance to similar Russian types. As can be seen from Annex No. II, operational aircraft are conventional, with relatively low speeds and low critical altitudes as compared to U. S. types. The Russians have no turbo supercharger operational except those installed on the "M-30" and "M-42" diesel engine models. The problems encountered by Russia, so far, in the design of turbos has been the metallurgical requirements necessary to counteract the high temperatures encountered around the turbine blades. If the Russians utilize the knowledge of German turbine blade design, this problem should be easily overcome.

(2) Recent information has indicated that the Russians are operating the Siebel and Junkers aircraft factories and BMW Jet Engine Plants. The Junkers factory is possibly manufacturing the German "Ju-287" bomber for the Russians. This bomber was in the flight test stage at the end of hostilities. It is fitted with from two to six jet units depending on the power of the units installed. The Germans expected to attain the high speed of 509 miles per hour at sea level and 537 miles per hour at 16400 feet altitude with this bomber. Other characteristics of this bomber were ranges of 985 miles with 8800 lb. bomb load, 1175 miles with 6600 lb. bomb load and 1325 miles with 4400 lb. bomb load. With the Junkers Plant available for the

DECLASSIFIED
Authority NND 765059

manufacture of airframes and the BMW plant for power units considerable progress should be made by the Russians. At the present time, the Russians are reported to have on order from these three German factories 6000 aircraft. These may well include the "He-162", the "Me-262" and the "Ju-287".

(3) The outstanding aircraft the Siebel Company was developing was the "DFS-346", a supersonic research aircraft with expected speed of about 1700 miles per hour at 50 - 100,000 feet altitude. This experimental aircraft, if perfected, would do much to hasten the Russian development of aircraft capable of operating in the transonic and supersonic speed ranges.

(4) This flight information, together with the available wind tunnels which may have been removed from the Russian Zone of Germany into Russia proper, could decrease the lag in Russian aircraft development. The highest speed wind tunnel known to be in Russian hands is at Dresden. This tunnel possesses a Mach No. 1 test speed, but the test section is so small it could not be of too much value. The most valuable tunnel for high speed research is the .92 Mach number tunnel at Berlin having an 8.8 foot diameter throat which could be used for testing relatively large models. All other wind tunnels in the Russian zone are of low speed.

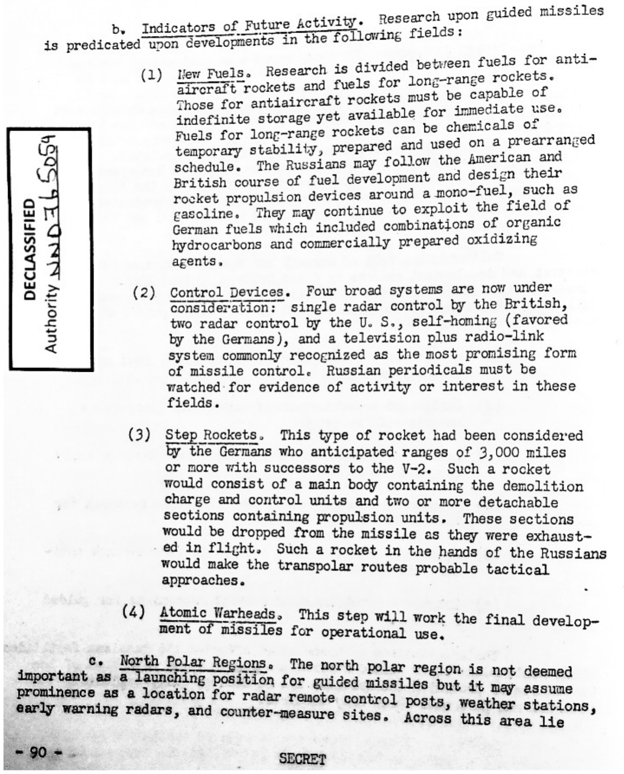
(5) It is known that several four engine bombers are under development by Russia as well as some jet bombers and fighters. It is not known how much progress has been made on Russian designed aircraft. Nothing is known of a fully developed Russian jet unit so it may well be that the first Russian jet aircraft will be Russian built but of German design.

5. Sweden

a. Development and Trend of Swedish Aircraft and Engines.

(1) No new native Swedish aircraft or engine development is known although the Swedes are manufacturing under

Figure D.642: Air Intelligence Report No. 100-13/1-100, Significant Developments and Trends in Aircraft and Aircraft Engines, Antiaircraft Guided Missiles (15 June 1946). [NARA RG 38, Entry 98C, Box 11, Folder TSC # 3001–3100]



DECLASSIFIED
Authority NND765059

b. Indicators of Future Activity. Research upon guided missiles is predicated upon developments in the following fields:

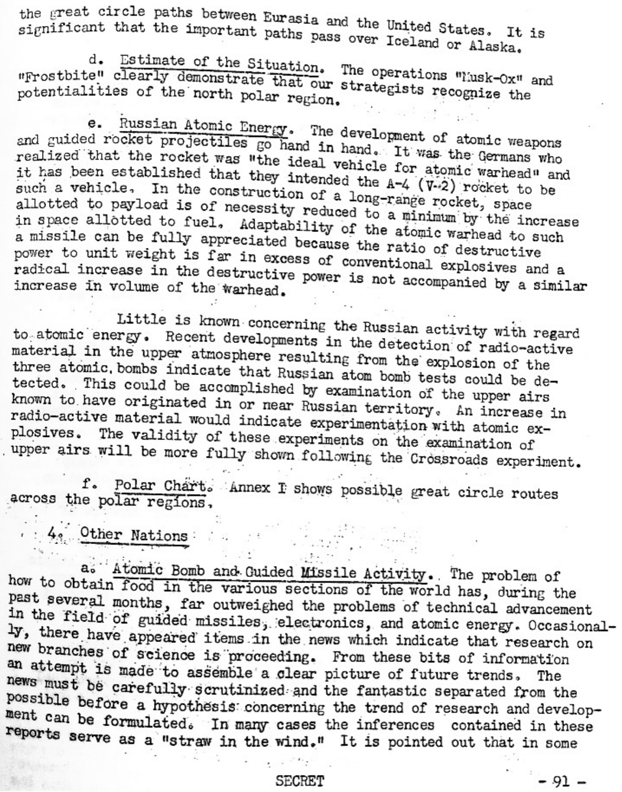
(1) New Fuels. Research is divided between fuels for antiaircraft rockets and fuels for long-range rockets. Those for antiaircraft rockets must be capable of indefinite storage yet available for immediate use. Fuels for long-range rockets can be chemicals of temporary stability, prepared and used on a prearranged schedule. The Russians may follow the American and British course of fuel development and design their rocket propulsion devices around a mono-fuel, such as gasoline. They may continue to exploit the field of German fuels which included combinations of organic hydrocarbons and commercially prepared oxidizing agents.

(2) Control Devices. Four broad systems are now under consideration: single radar control by the British, two radar control by the U. S., self-homing (favored by the Germans), and a television plus radio-link system commonly recognized as the most promising form of missile control. Russian periodicals must be watched for evidence of activity or interest in these fields.

(3) Step Rockets. This type of rocket had been considered by the Germans who anticipated ranges of 3,000 miles or more with successors to the V-2. Such a rocket would consist of a main body containing the demolition charge and control units and two or more detachable sections containing propulsion units. These sections would be dropped from the missile as they were exhausted in flight. Such a rocket in the hands of the Russians would make the transpolar routes probable tactical approaches.

(4) Atomic Warheads. This step will work the final development of missiles for operational use.

c. North Polar Regions. The north polar region is not deemed important as a launching position for guided missiles but it may assume prominence as a location for radar remote control posts, weather stations, early warning radars, and counter-measure sites. Across this area lie



the great circle paths between Eurasia and the United States. It is significant that the important paths pass over Iceland or Alaska.

d. Estimate of the Situation. The operations "Musk-Ox" and "Frostbite" clearly demonstrate that our strategists recognize the potentialities of the north polar region.

e. Russian Atomic Energy. The development of atomic weapons and guided rocket projectiles go hand in hand. It was the Germans who realized that the rocket was "the ideal vehicle for atomic warhead" and it has been established that they intended the A-4 (V-2) rocket to be such a vehicle. In the construction of a long-range rocket, space allotted to payload is of necessity reduced to a minimum by the increase in space allotted to fuel. Adaptability of the atomic warhead to such a missile can be fully appreciated because the ratio of destructive power to unit weight is far in excess of conventional explosives and a radical increase in the destructive power is not accompanied by a similar increase in volume of the warhead.

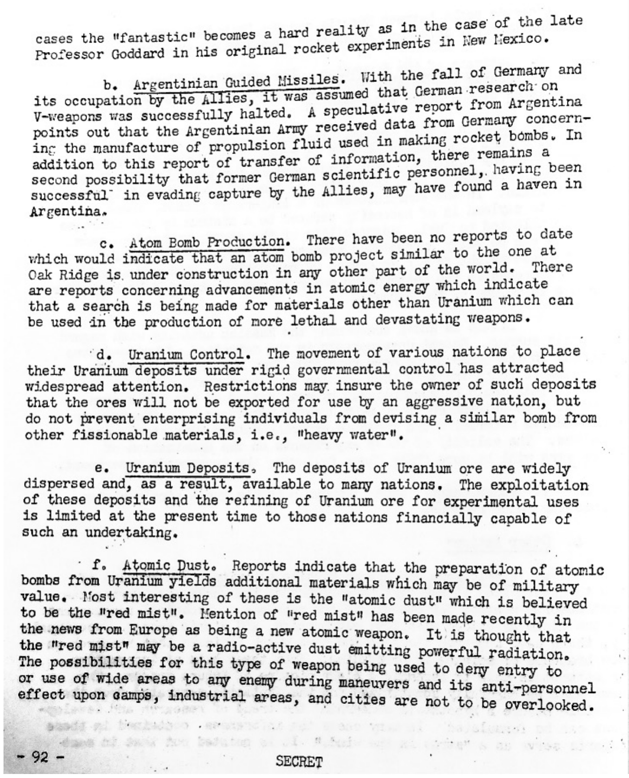
Little is known concerning the Russian activity with regard to atomic energy. Recent developments in the detection of radio-active material in the upper atmosphere resulting from the explosion of the three atomic bombs indicate that Russian atom bomb tests could be detected. This could be accomplished by examination of the upper airs known to have originated in or near Russian territory. An increase in radio-active material would indicate experimentation with atomic explosives. The validity of these experiments on the examination of upper airs will be more fully shown following the Crossroads experiment.

f. Polar Chart. Annex I shows possible great circle routes across the polar regions.

4. Other Nations

a. Atomic Bomb and Guided Missile Activity. The problem of how to obtain food in the various sections of the world has, during the past several months, far outweighed the problems of technical advancement in the field of guided missiles, electronics, and atomic energy. Occasionally, there have appeared items in the news which indicate that research on new branches of science is proceeding. From these bits of information an attempt is made to assemble a clear picture of future trends. The news must be carefully scrutinized and the fantastic separated from the possible before a hypothesis concerning the trend of research and development can be formulated. In many cases the inferences contained in these reports serve as a "straw in the wind." It is pointed out that in some

Air Intelligence Report No. 100-13/1-100, Significant Developments and Trends in Aircraft and Aircraft Engines, Antiaircraft Guided Missiles (15 June 1946). NARA RG 38, Entry 98C, Box 11, Folder TSC # 3001-3100



cases the "fantastic" becomes a hard reality as in the case of the late Professor Goddard in his original rocket experiments in New Mexico.

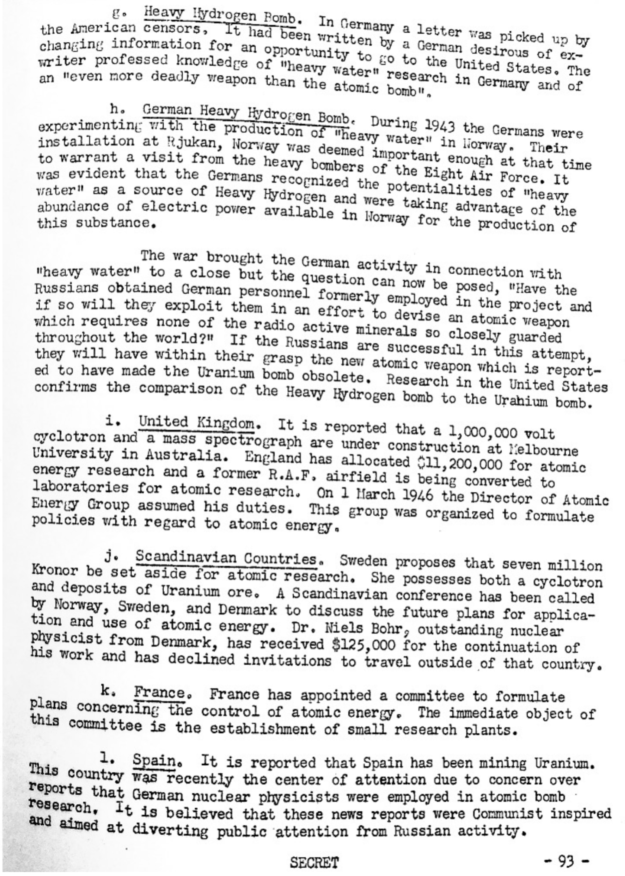
b. Argentinian Guided Missiles. With the fall of Germany and its occupation by the Allies, it was assumed that German research on V-weapons was successfully halted. A speculative report from Argentina points out that the Argentinian Army received data from Germany concerning the manufacture of propulsion fluid used in making rocket bombs. In addition to this report of transfer of information, there remains a second possibility that former German scientific personnel, having been successful in evading capture by the Allies, may have found a haven in Argentina.

c. Atom Bomb Production. There have been no reports to date which would indicate that an atom bomb project similar to the one at Oak Ridge is under construction in any other part of the world. There are reports concerning advancements in atomic energy which indicate that a search is being made for materials other than Uranium which can be used in the production of more lethal and devastating weapons.

d. Uranium Control. The movement of various nations to place their Uranium deposits under rigid governmental control has attracted widespread attention. Restrictions may insure the owner of such deposits that the ores will not be exported for use by an aggressive nation, but do not prevent enterprising individuals from devising a similar bomb from other fissionable materials, i.e., "heavy water".

e. Uranium Deposits. The deposits of Uranium ore are widely dispersed and, as a result, available to many nations. The exploitation of these deposits and the refining of Uranium ore for experimental uses is limited at the present time to those nations financially capable of such an undertaking.

f. Atomic Dust. Reports indicate that the preparation of atomic bombs from Uranium yields additional materials which may be of military value. Most interesting of these is the "atomic dust" which is believed to be the "red mist". Mention of "red mist" has been made recently in the news from Europe as being a new atomic weapon. It is thought that the "red mist" may be a radio-active dust emitting powerful radiation. The possibilities for this type of weapon being used to deny entry to or use of wide areas to any enemy during maneuvers and its anti-personnel effect upon camps, industrial areas, and cities are not to be overlooked.



g. Heavy Hydrogen Bomb. In Germany a letter was picked up by the American censors. It had been written by a German desirous of exchanging information for an opportunity to go to the United States. The writer professed knowledge of "heavy water" research in Germany and of an "even more deadly weapon than the atomic bomb".

h. German Heavy Hydrogen Bomb. During 1943 the Germans were experimenting with the production of "heavy water" in Norway. Their installation at Rjukan, Norway was deemed important enough at that time to warrant a visit from the heavy bombers of the Eight Air Force. It was evident that the Germans recognized the potentialities of "heavy water" as a source of Heavy Hydrogen and were taking advantage of the abundance of electric power available in Norway for the production of this substance.

The war brought the German activity in connection with "heavy water" to a close but the question can now be posed, "Have the Russians obtained German personnel formerly employed in the project and if so will they exploit them in an effort to devise an atomic weapon which requires none of the radio active minerals so closely guarded throughout the world?" If the Russians are successful in this attempt, they will have within their grasp the new atomic weapon which is reported to have made the Uranium bomb obsolete. Research in the United States confirms the comparison of the Heavy Hydrogen bomb to the Urahium bomb.

i. United Kingdom. It is reported that a 1,000,000 volt cyclotron and a mass spectrograph are under construction at Melbourne University in Australia. England has allocated $11,200,000 for atomic energy research and a former R.A.F. airfield is being converted to laboratories for atomic research. On 1 March 1946 the Director of Atomic Energy Group assumed his duties. This group was organized to formulate policies with regard to atomic energy.

j. Scandinavian Countries. Sweden proposes that seven million Kronor be set aside for atomic research. She possesses both a cyclotron and deposits of Uranium ore. A Scandinavian conference has been called by Norway, Sweden, and Denmark to discuss the future plans for application and use of atomic energy. Dr. Niels Bohr, outstanding nuclear physicist from Denmark, has received $125,000 for the continuation of his work and has declined invitations to travel outside of that country.

k. France. France has appointed a committee to formulate plans concerning the control of atomic energy. The immediate object of this committee is the establishment of small research plants.

l. Spain. It is reported that Spain has been mining Uranium. This country was recently the center of attention due to concern over reports that German nuclear physicists were employed in atomic bomb research. It is believed that these news reports were Communist inspired and aimed at diverting public attention from Russian activity.

Figure D.643: Air Intelligence Report No. 100-13/1-100, Significant Developments and Trends in Aircraft and Aircraft Engines, Antiaircraft Guided Missiles (15 June 1946). [NARA RG 38, Entry 98C, Box 11, Folder TSC # 3001–3100]

Kurt Diebner, 1962, *Kerntechnik* 4:3:89–93. Nuclear explosive design with numerous concentric spherical shells, likely based on wartime work.

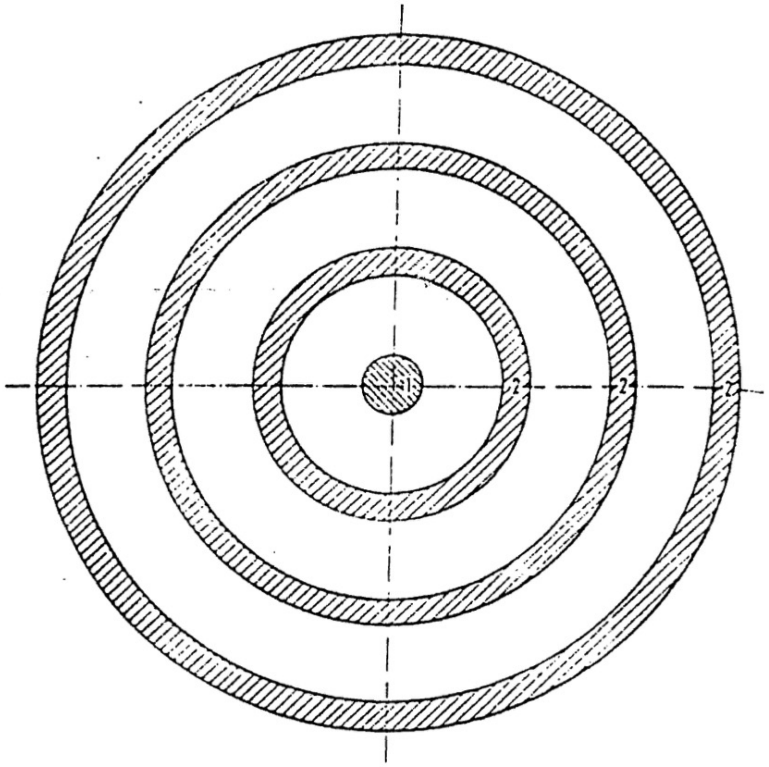


Abb. 3: Eine der Abb. 2 entsprechende schematische Anordnung mit einer Folge von ineinandergefügten Sprengstoffschalen (2) zur Verstärkung des Effektes; (1) bedeutet wieder den Fusionsreaktionsraum

Friedwardt Winterberg, 1981, *The Physical Principles of Thermonuclear Explosive Devices.* Winterberg worked very closely with Diebner after the war.

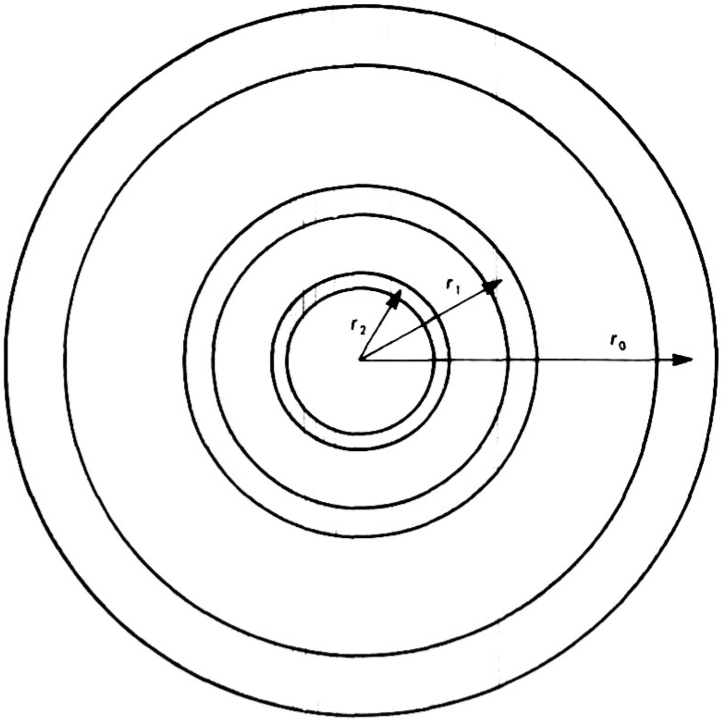

Figure 7. The implosion velocity can be raised through the subsequent collision of several concentric shells of decreasing mass.

Figure D.644: Top: Diagram from Kurt Diebner, likely based on wartime work [Diebner 1962]. Bottom: Diagram from Friedwardt Winterberg, who worked very closely with Diebner after the war [Winterberg 1981]. These diagrams illustrate nuclear explosive designs with a large number of concentric spherical shells to increase the implosion velocity, but they may also represent a key step toward a sloika H-bomb design that implodes alternating layers of fission and fusion fuel.

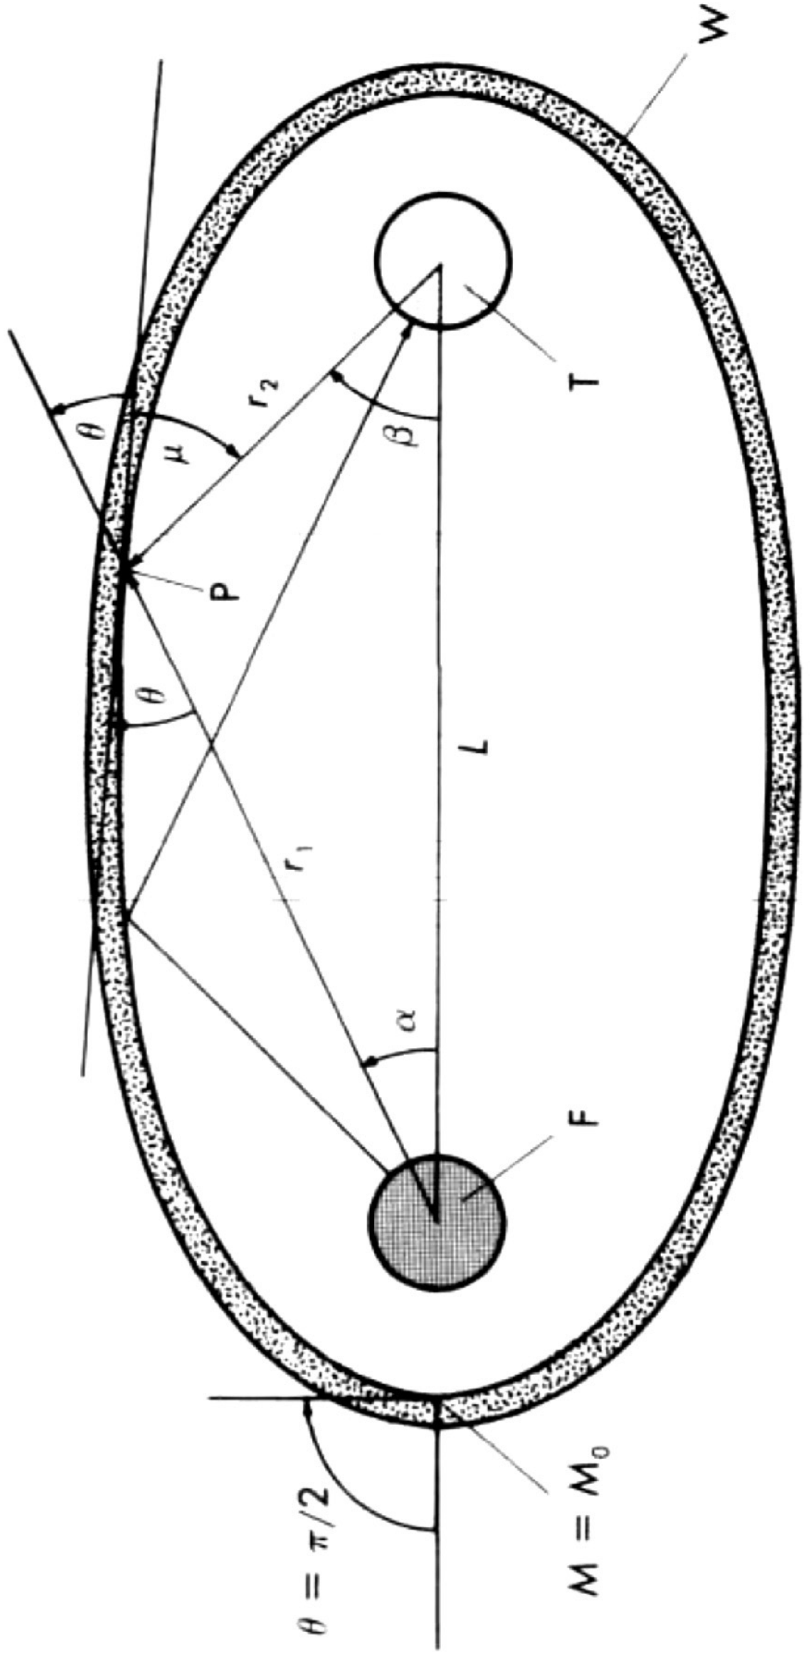

Figure 4. In the Prandtl-Meyer ellipsoid shock wave focusing principle, only one fission bomb F is used to induce a spherical implosion onto the thermonuclear explosive T by shock wave reflection from the wall inside the ellipsoidlike cavity. P is the point where the incoming wave intersects with the wall; M is the Mach number of the hypersonic flow associated with the diverging wave at P; θ is the angle between the wall slope and the incoming ray; r_1 and r_2 are the rays of the shock wave.

Figure D.645: Diagram from Friedwardt Winterberg, who worked very closely with Kurt Diebner after the war, showing a fission-fusion H-bomb design that appears to be deeply steeped in pre-war German hydrodynamic theory (Ludwig Prandtl, Theodor Meyer, Ernst Mach, etc.) and not derivative of the Teller-Ulam H-bomb design used in the United States [Winterberg 1981].

Friedwardt Winterberg. 1981. *The Physical Principles of Thermonuclear Explosive Devices.* New York: Fusion Energy Foundation.

[Friedwardt Winterberg (1929–) worked very closely with Kurt Diebner after the war. In 1981, Winterberg published a book of nuclear explosive designs that appear to have been heavily based on the wartime work of Diebner and others in the German nuclear program. In particular, Winterberg presented two diagrams that appear to be especially relevant for the history of H-bomb designs [Goncharov 1996a, 1996b; Chuck Hansen 1988, 2007; Rhodes 1995; Sublette 2019; Wellerstein and Geist 2017].

1. Page 4372 shows two similar versions of a nuclear explosive design with a large number of concentric spherical shells. The top version is from Diebner, quite likely based on wartime programs with which he was involved [Diebner 1962]. The bottom version is from Winterberg [Winterberg 1981]. In both of these postwar publications, Diebner and Winterberg made the point that such a design could be useful to increase the implosion velocity. However, using a large number of concentric spherical shells is also a critical feature of the sloika H-bomb approach, which implodes alternating layers of fission and fusion fuel. Thus these postwar diagrams might be clues that the wartime German H-bomb program was working toward a sloika design.

2. Page 4373 presents another diagram from Winterberg. The diagram depicts a fission-fusion H-bomb design that appears to be deeply steeped in prewar German hydrodynamic theory (Ludwig Prandtl, Theodor Meyer, Ernst Mach, etc.) and not directly derivative of the Teller-Ulam H-bomb design that was developed in the United States after the war [Winterberg 1981]. Yet like the Teller-Ulam design, the design shown by Winterberg was intended to function as a two-stage (fission explosion, then fusion explosion) thermonuclear bomb, or a three-stage (fission, fusion, fission) bomb if the outer casing were fissionable. For evidence that this ellipsoidal design originated in the wartime German program, see p. 4377.

Either a sloika multi-layered implosion design or an ellipsoidal two-stage design for an H-bomb could have used the lithium deuteride fusion fuel mentioned in other German documents (see pp. 4281–4349).

In principle, either design could have had a weight consistent with the 6-ton bomb mass reported in documents such as those on pp. 4338, 4350–4363, and 5343.

Likewise, if either a sloika or a two-stage design worked as intended, it could have had a megaton-level explosive yield, which would also be consistent with the 6-mile blast radius reported in documents such as those on pp. 4365–4367.]

Is either a large spherical sloika design or an ellipsoidal two-stage design what Werner Grothmann meant by “a third” German nuclear bomb design that was under development during the war, that was apparently quite different than the fission bombs with which Grothmann was more familiar, and that “must have looked like a swollen bomb” (see p. 4272)?

Charles Chamberlain. Germans Failed to Split Atom: Experiments With Heavy Water Futile. *Council Bluffs Nonpareil* (Council Bluffs, Iowa). 9 February 1946 p. 1. https://www.newspapers.com/article/the-daily-nonpareil/1957966/

Another atom scientist in the British occupation zone of Germany—Prof. Paul Harteck of the Kaiser Wilhelm institute of physics in Berlin—said that the light rays thrown out during the enormous explosion of an atomic bomb added greatly to the destructive force.

‘The splitting of the atom causes a temperature of more than 10,000,000 degrees and aerial allure which destroy everything,’ Harteck said.

This frees an amount of light which is beyond the visible spectrum. Only a few people know that the reflection of beams of light on solid bodies also exerts a mechanical pressure. This pressure is so small where our normal light is concerned that it is not noticed. The amount of light freed by an atomic bomb is so great it destroys walls.

[On the basis of his wartime work, Harteck was apparently describing the key to radiation implosion in H-bombs. Compare Harteck’s description above with the description below from Kenneth Ford, one of the American H-bomb scientists. Harteck was brought to the United States to work after the war (p. 4993).]

Kenneth W. Ford. 2015. *Building the H-Bomb: A Personal History.* World Scientific Publishing. pp. 67, 70.

Let me explain what was special about the radiation-implosion idea (the 1951 insight of Edward Teller and Stan Ulam that replaced the unattainable runaway Super with the successful equilibrium Super). [...]

The energy in a given volume of radiation goes as the fourth power of the temperature. [. . .] If you increase the radiation temperature by a factor of ten, the radiant energy increases by a factor of ten thousand (10 to the 4th power). [. . .] The energy of one cubic meter of radiation at a temperature of 30 million K is, in the units favored by weaponeers, 15 kilotons. And its pressure is correspondingly elevated, to 2 billion atmospheres. [. . .]

At ordinary temperature, radiation is like the pixie dust that was visible only to Tinker Bell and her band of fairies. At the temperatures characteristic of nuclear explosions, radiation is “stuff,” full of enormous energy and capable of pushing like a giant piston.

Walther Gerlach. Notebooks 1943/44 and 1944 [Deutsches Museum Archive NL 080/270-66 and NL 080/270-67].

[See document photo on p. 4377.

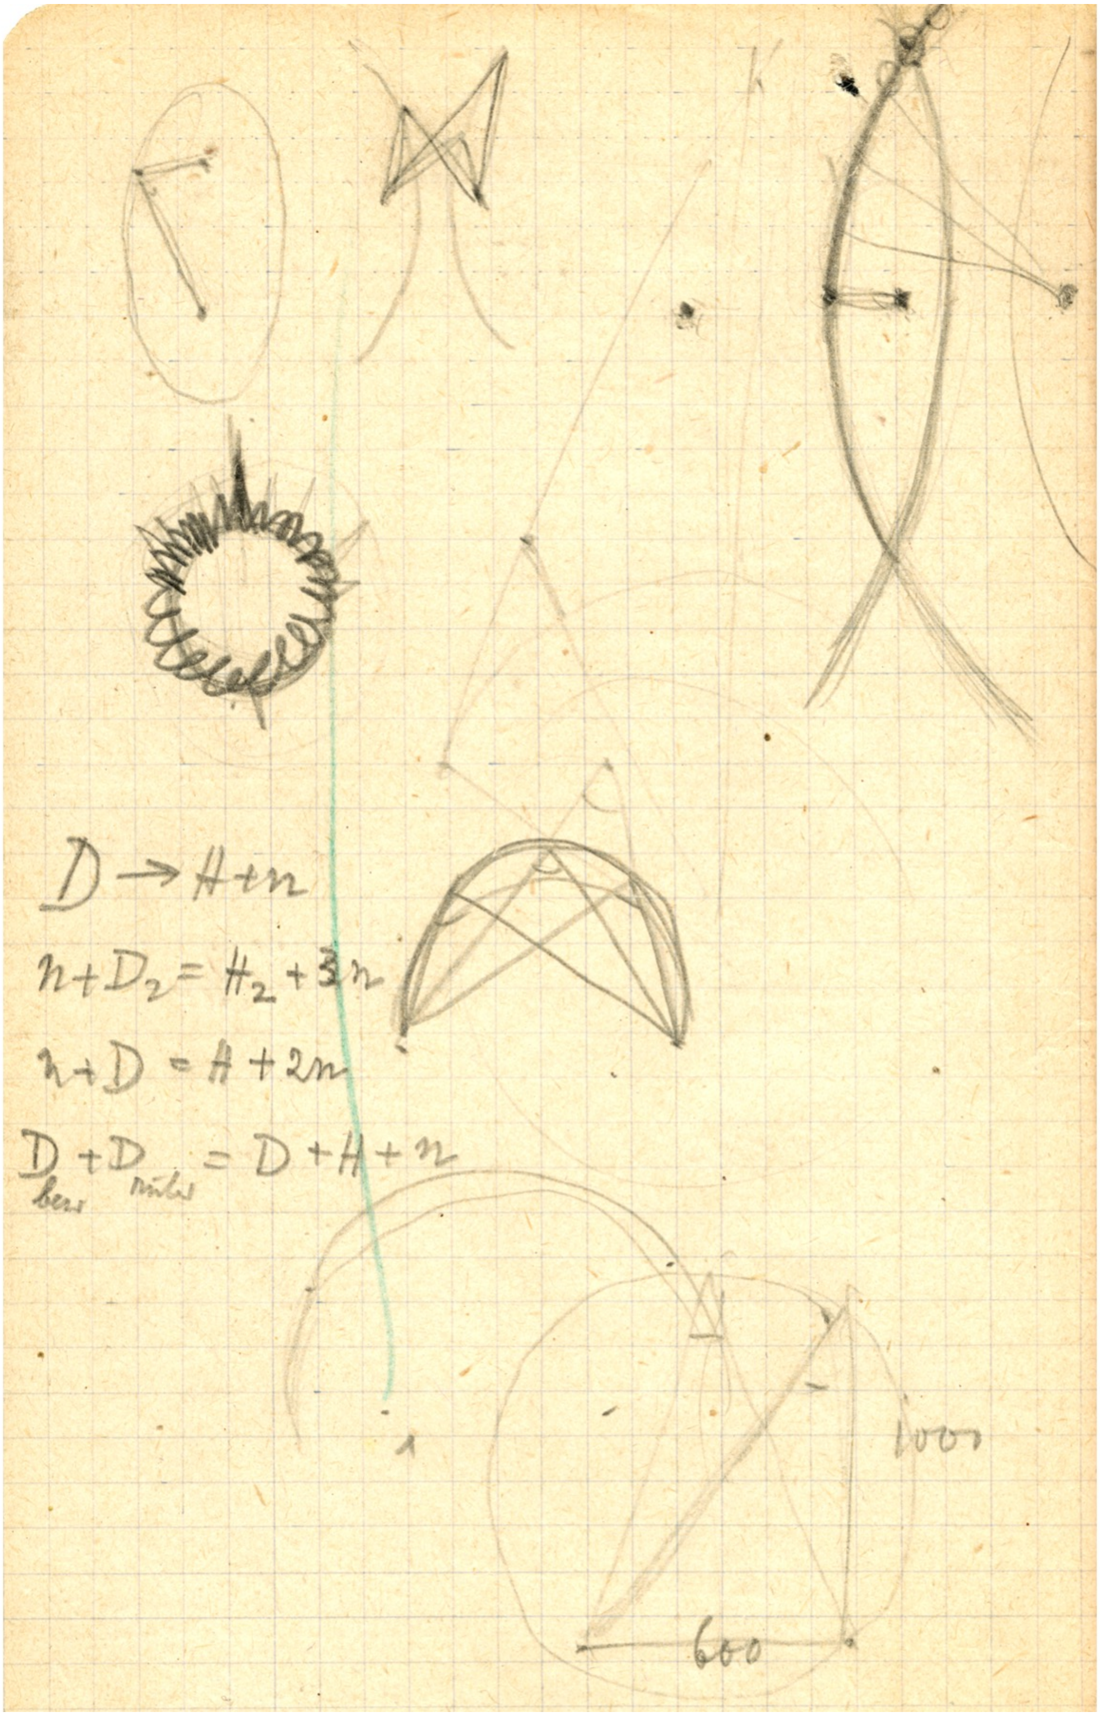
Walther Gerlach kept a series of small notebooks for scientific notes to himself. They are now in the Deutsches Museum Archive in Munich. Since these notebooks served simply as scientific reminders for Gerlach, they do not contain detailed explanations, as formal laboratory notebooks would. However, they also do not contain any random artistic doodles such as some people make during meetings. Everything in them appears to have had a specific scientific purpose for Gerlach.

Notizbuch 1943/44 [Deutsches Museum Archive NL 080/270-66] is a small orange notebook covering the period 10 November 1943 to March 1944. On the final page, Gerlach drew an ellipsoid remarkably similar to Friedwardt Winterberg's postwar diagram of a hydrogen bomb on p. 4373. On the same page, Gerlach also included nuclear reactions involving deuterium and sketches of converging shock waves [Karlsch 2005, pp. 205, 321, 333].

Notizbuch 1944 [Deutsches Museum Archive NL 080/270-67] is a small dark red notebook that apparently began in March 1944; it is not clear when the final entry was made, but that was likely sometime in 1944 or possibly early 1945. Entries in the notebook show that Gerlach had scientific discussions (although the notebook does not give the scientific details) with Kurt Diebner, Siegfried Flügge, Wilhelm Groth, Fritz Houtermans, and other scientists on nuclear topics, including specifically the use of lithium.

After the war, Kurt Diebner wrote about bombs employing fusion reactions (pp. 4260–4267) and worked closely with the young Friedwardt Winterberg. Edward Teller apparently tried to recruit Siegfried Flügge to help develop the U.S. hydrogen bomb (p. 4996). Wilhelm Groth was reported to have been working on a megaton-level bomb during the war, which is consistent with the physics of hydrogen bombs but not fission bombs (p. 4367). Fritz Houtermans was the first scientist to propose and analyze the fusion reactions in stars (p. 1542).

While these surviving notes from Gerlach are cryptic and certainly not conclusive, they do suggest the existence of a wartime program that was very active by March 1944 and that involved the use of deuterium, lithium, and both fusion and fission reactions in an ellipsoidal hydrogen bomb design highly similar to that on p. 4373. Any more detailed documents on such a program would have been either destroyed by the Germans at the end of the war or captured by Allied countries and still buried in their classified archives.]



$D \rightarrow H + n$
$n + D_2 = H_2 + 3n$
$n + D = H + 2n$
$D_{bew} + D_{ruh} = D + H + n$

Figure D.646: March 1944 diagram from Walther Gerlach showing an ellipsoid (upper left) in conjunction with nuclear reactions involving deuterium and converging shock waves. Compare it to Fig. D.645 [Karlsch 2005, pp. 205, 321, 333; Deutsches Museum Archive, NL 080/270-66].

Ronald Richter's 1951–1957 Paperclip file [NARA RG 330, Entry A1-1B, Box 134, Folder Richter, Ronald W. Dr.].

[Ronald Richter (Austrian, 1909–1991) conducted research in Germany during the war, but he is mainly remembered for the highly publicized failure of an experimental fusion reactor project he led for Argentinian president Juan Perón during the period 1949–1952. Scientists and historians have spent the decades since then debating whether Richter was a willful charlatan, a misunderstood genius, or something else entirely.[14]

After the failed project in Argentina, Richter applied for admission to the United States under the Paperclip program, was denied, and lived the rest of his life in obscurity.

Richter's Paperclip file is rather lengthy and includes many pages written by him, or written by U.S. government interviewers about him, regarding his then past, present, and intended future research projects. As illustrated by the excerpts on pp. 4380–4389, these documents list a large number of extremely advanced and insightful ideas in applied physics, including (but not limited to):

- Magnetic-confinement plasma fusion reactors.
- Non-Maxwellian plasma fusion systems not in thermodynamic equilibrium.
- Advanced "aneutronic" fusion reactions (proton + boron-11, proton + lithium-6, helium-3 + helium-3, etc.) that would produce fewer unwanted neutrons than the simplest fusion reactions (deuterium + deuterium and deuterium + tritium).
- Traveling-wave direct electric converters to extract the output energy from fusion reactors in the form of more efficient electromagnetic waves instead of less efficient heat.
- Advanced fission reactors.
- Nuclear propulsion systems for various types of vehicles.
- Supersonic combustion ramjets (scramjets).
- Dual-mode scramjet/rocket engines.
- Quantum vacuum energy or zero-point energy.
- Gravitational theories and grand unified theories.

---

[14] See for example: Ehrenberg 1958a, 1958b; Paul-Jürgen Hahn 2003; Karlsch and Petermann 2007; Nagel 2002; Richter 1991; Thirring 1955.

Upon hearing all of these ideas, the Director of the Office of International Affairs at the U.S. Atomic Energy Commission, John Hall, was "quite impressed with the knowledge, theories and work of Dr. Richter" and "stated that Dr. Richter is thinking in the year 1970" (i.e., at least 14 years in the future, p. 4380).

While all of the ideas listed by Richter were extremely clever and worthy of study, detailed theoretical and/or experimental physics investigations would have shown that some of them (such as advanced aneutronic fusion reactions and highly non-Maxwellian plasma fusion reactors [Rider 1995, 1997]) were not practical even under the best possible conditions. There is no evidence that Richter conducted competent theoretical or experimental investigations of the topics that he listed, or that he ever discovered the fundamental physical limitations on some of them. Richter's apparent inability to carry out proper theoretical or experimental physics work was likely one of the primary causes of the failure of the Argentinian fusion project.

Richter's Paperclip file also lists his job history. From his graduation in 1935 until his move to Argentina in 1948, Richter changed research jobs extremely frequently, often after only a few months at each. He worked in labs all over the German-speaking world on a wide variety of projects, and interacted with countless stellar German and Austrian scientists. From reading Richter's job history, one gets the strong impression that Richter was probably discovered to be scientifically incompetent at each job and was quickly dismissed, only to land at another job. Military research and development projects were often overstretched and eager for additional personnel in wartime Germany, so they may not have asked as many questions about Richter's previous employment as they should have before hiring him each time. Yet precisely because those projects were so eager for personnel, Richter must presumably have demonstrated great incompetence to be fired so swiftly by each project.

It is possible that Richter was gifted at thinking of new physics ideas even though he was incapable of properly pursuing them. However, that possibility seems remote, since even conceiving of such ideas requires physical insight and understanding that Richter apparently never demonstrated in his jobs.

Thus by far the most likely explanation is that Richter appropriated the many intriguing research ideas he listed from much more competent scientists with whom he interacted in wartime Germany. In the Paperclip documents, Richter himself listed interactions with or knowledge of the work of Manfred von Ardenne, Adolf Busemann, Abraham Esau, Siegfried Flügge, Josef Mattauch, Max Steenbeck, Kurt Tank, and others. Von Ardenne, Busemann, Esau, Flügge, Mattauch, and Steenbeck appear to have played roles in a program to develop an H-bomb, among other wartime projects.

Therefore, Richter's lists of ideas may offer a rare and valuable glimpse into otherwise quite mysterious wartime research projects. If that explanation is correct, scientists in wartime Germany conceived detailed ideas for research projects that still remained cutting-edge topics many decades after the war, and they may have even made significant progress on some of those topics. At the very least, Richter's documents demonstrate that historians need to do much more work to investigate the true extent and accomplishments of highly advanced research and development programs in wartime Germany.]

THE FOREIGN SERVICE
of the
UNITED STATES OF AMERICA
Office of the Air Attache
United States Embassy

Buenos Aires, Argentina
3 July 1956

175-R&D

(Uncl)
SUBJECT: Dr. Ronald Richter (See IR-76-56, 79-56, 80-56 and 145-56)

TO: Director of Intelligence
Headquarters, USAF
ATTN: Air Attache Branch
Washington 25, D. C.

1. A recent visit by a group of U. S. atomic energy scientists to Argentina, headed by Dr. John Hall, resulted in a conversation among Dr. Richter, Dr. Hall and two other scientists in the group. The undersigned officer attended a meeting with Dr. Hall subsequent to this conference and the following items of interest relative to Dr. Richter are being forwarded for information and whatever action is required:

a. Dr. Richter is considered by Dr. Hall to be "a mad genius". Along the same lines Dr. Hall stated that Dr. Richter is thinking in the year 1970. Dr. Hall was quite impressed with the knowledge, theories and work of Dr. Richter. He will attempt to send to Argentina an atomic scientist thoroughly familiar with Dr. Richter's field of work to further interrogate Dr. Richter and thus properly evaluate his capabilities. One of the visiting group who attended this conference was a medical doctor and has diagnosed Dr. Richter as being close to the verge of a complete breakdown.

b. Dr. Richter has visited the undersigned officer several times during the past four months. He has become increasingly concerned about his future inasmuch as he cannot secure employment in Argentina and has completely exhausted all his personal funds. Dr. Richter has repeatedly indicated his desire to work for the U.S. or for any country that is opposed to the Communists. It is known to this officer that Dr. Richter has been approached four times in the past six months by "pink" Germans residing in Buenos Aires and has been urged to visit the Russian attache who would completely solve all of his problems. His condition at present is such that the undersigned feels that unless he has some definite encouragement for obtaining employment in the U.S. or with a Western Bloc country, he will accept employment with the Communist Bloc.

AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency) Air Attache Buenos Aires, Argentina	REPORT NO. IR-76-56	PAGE 2 OF 8 PAGES

1. The following information was given to the Preparing Officer by Dr. RICHTER in a personal interview :

Curriculum Vitae

Name:	Ronald RICHTER, Dr.rer.nat.
Profession:	Physicist, industrialist
Born:	21 February 1909
Place of Birth:	Falkenau a.d. Eger, Bohemia, Austria (Czechoslovakia)
Citizenship:	Naturalized Argentine, naturalized in May, 1950
Status:	Married, one daughter of five years
Address:	Almt. Brown - Berassain, Monte Grande; Province of Buenos Aires, Argentine Republic

Childhood and early life were strongly influenced by the industrial environment in which I was growing up. My father and the father of my father, both were directors of coal mines and administrative bodies. Design problems, construction work, machinery, instruments, power stations, extremely busy engineers and general managers, a.s.o., formed consciously and subconsciously an essential part of my 'world'. My grandfather as an engineer and my father merely as an industrialist gave me first lessons in technical sciences and industrial thinking.

1928:	Entering the German University at Prague, studying physics, chemistry and geophysics.
1930:	Assistant on the Geophysical Institute of the University.
1931:	In charge ofthe Meteorological and Geophysical Observatory on the Donnersberg, Bohemia; solar physics and earth-magnetism.
1933/34:	Thesis: 'Untersuchungen an Sperrschichtphotozellen mit weichen Roentgenstrahlen', (Investigations on photo-voltaic cells by soft X-rays).
1935:	Graduated on March 2, Doctor of Natural Sciences.
1935/36:	Running a private research laboratory near Falkenau a.d. Eger, sponsored by industrial circles. Research on the activation of catalysts, catalyst-controlled high-pressure coal hydrogenation and coal cracking processes, development of an image-converter-like activity-contrast-microscope, based on scanning of hydrogen- or deuterium adsorbing border surfaces by protons, deuterons, or electrons; for the first time, it became possible to see and to photograph activity contrasts which cannot be made visible by light nor by electron microscopes. Activation ofcatalysts under continuously activity-controlled conditions. Research work and design studies on electric arc furnace systems, development of new types of arc plasma analyzing instruments and methods. In 1936, discovery of a plasma shock wave generating process, conception of a completely new type of industrial arc reactor system, based rather on plasma shock wave reactivity than on heat transfer. Development of a basis of operation for testing plasma shock wave conditions by means of plasma-collision-induced nuclear reactions.
1937/38:	In charge of a research laboratory, connected to the Berlin-Suhler-Waffen- und Fahrzeugwerke. Gustloff-Werke, Suhl, Thuringia, Germany. Research on the storage capacity of hydrogen-adsorbing highly activated materials; since a considerable amount of thermal energy has to be fed into the structure of a highly active adsorbing material to discharge its hydrogen content again, the aspects for adsorber-stored hydrogen as a fuel for rocket and jet engines are still under consideration.

AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency)	REPORT NO.	
Air Attache Buenos Aires, Argentina	IR-76-56	PAGE 3 OF 8 PAGES

Considerable improvement in the analysis and generation of plasma shock waves.
Due to a lack of counter sensitivity and owing to a very poor counter geometry (one cannot place the counter tubes near to the extremely hot arc plasma zone), still no correct nuclear raction data could be obtained when analyzing a shock-wave-controlled non-Maxwellian deuterium high pressure plasma, development of a tele-analyzing method, based on excitation-energy-discriminating ultra-violet-sensitive proportional counter tubes, the ultraviolet photons being excited by plasma-collision-induced nuclear reactions.

1939/41: At the outbreak of World War II, I joined the research staff of the Junkers Flugzeug-und Motorenwerke, A.G., Dessau, Germany, research work on the excitation of mechanical resonance (fluttering) oscillations near the critical speed of flight, series of test flights and nose dives mainly with the proto-type Ju-88, in 1941, under research contract of the German Air Ministry, Forschungsfuehrung des Reichsluftfahrtministeriums, Abteilung LC 1.
Head of an Air Ministry sponsored research laboratory at Darmstadt, Germany.
Development of methods and instruments for testing material strength under extreme mechanical and thermodynamic conditions, based on the excitation of photoelectrically analyzed mechanical resonance oscillations by means of sound and ultra-sound waves; analysis of structural damage by micro-vibrations and by corrosion.
The same analyzing device will considerably improve testing of structural stability on nuclear power reactor systems (corrosion and radiation damage).

In contact with Prof. Busemann and Prof. Dirksen, both were research directors at the Luftfahrtforschungsanstalt Hermann Goering near Braunschweig, Germany.
Research on jet operation analyzers, vibration problems near the sound barrier and in the supersonic range, development of supersonic wind-tunnel analyzers, analysis of structural stability of intensely heated up and extremely fast spinning jet turbine blades, a.s.o.
By this research contact, in the fall of 1942, Prof. Busemann invited me to transfer my research laboratory to the Luftfahrtforschungsanstalt, to work with him on rocket and supersonic projects.
At that time, by intervention of the Gestapo, I had to stop research work on secret projects.
(In August, 1937, when I had entered Germany to have discussions with an industrialist, the Gestapo took away my Czechoslovakian passport and issued me a Nansen passport, thus giving me the status of a stateless person by force; as a consequence of these strange events, all the time I have spent in Germany before and during World War II, I found myself being likewise sponsored and shadowed by the German authorities).

1942/43: In order to improve the detectability of shock-wave-induced nuclear reactions in the fall of 1942,- using nuclear mass data, just having been published by Mattauch and Fluegge, Kernphysikalische Tabellen, Springer Verlag, Berlin, 1942,- I developed nuclear reaction schemes, based on the chain-reacting consumption of the lithium and boron isotopes; the basic conception was to start a self-reproducing shock-wave-ignited reaction chain by jetting lithium or lithium-6-enriched lithium into a powerful non-Maxwellian, neutron-producing deuterium high pressure plasma.
Development of a reaction scheme, based on the combined chain-reacting consumption of the lithium and boron isotopes.

AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency)	REPORT NO.	PAGE	OF	PAGES
Air Attache Buenos Aires, Argentina	IR-76-56	4	8	

In 1943, nuclear data collecting experiments, using the Van de Graaff generator, available then at the nuclear research laboratory of Baron von Ardenne, Berlin-Lichterfelde-Ost, contact with Prof. A. Esau, then in charge of all the nuclear energy research projects, (Beauftragter des Reichsmarschalls fuer Kernphysikalische Forschung).
Later on in 1943, I have joined the research staff of the Deutsche Versuchsanstalt fuer Luftfahrt, Berlin-Adlershof, developing turbulence detectors and analyzers for wind-tunnels.

1944/45: Sponsored by the Reichsministerium Speer (Armament and Ammunition Ministry) and by the Reichsborschungsrat, I have signed a research and production contract with the AEG (Allgemeine Flektrizitaets-Gessellschaft), Berlin, dealing with the production of activated catalysts and activated light weight storage batteries; by this contract, a minimum of 1 million Reichsmark was granted as royalties.
At the same time, I became scientific and technical adviser of the Ruhrchemie Aktiengesellschaft, Muehlheim, in the field of highly activated catalysts; research contact with the chairman of this company, Prof. F. Martin.
Besides the experimental program fixed by the AEG contract, I was carrying out some decisive arc plasma experiments, using the large test installations available at the AEG transformer factories at Berlin-Oberschoeneweide.

1946/48: Visiting France, England and Holland, having discussions with scientific and industrial circles.
In London, I quite incidentally became acquainted with the chief-designer of the former Focke-Wulf-Flugzeugwerke, Prof. Kurt Tank, who showed himself particularly interested in the development of nuclear powered propulsion systems for aircraft, (still in 1947, Prof. Tank went to Argentina).

In December 1947, I was signing a contract with the French Petroleum Institute, Paris, dealing with research on activated catalysts and being scientific consultant in this field, an experimental program was progressing at the Ecole Polytechnique, and I became head of this research laboratory.
Unfortunately, this research contract, limited in time, was by no means a basis for a new position; therefore, despite of all the excellent scientific resonance which I always had found in the circles of my French colleagues, I had to look for another job in time.
In May 1948, I was invited, privately by Prof. Tank again and officially by the Argentine government, to join Tank in Argentina, in order to do some work in nuclear reactor development.
In August 1948, after fulfilling my contract, I went to Argentina, quite unaware of the political situation I would find there. Owing to an arrangement with the French Petroleum Institute, to continue research workin Paris for some months in 1949, I left France for Argentina without signing an Argentine contract.

One week after my arrival in Argentina, I had my first audience with President Peron.
He showed himself particularly interested inthe development of nuclear power reactors, but in 1948, there was no uranium available in Argentina; moreover, I was not interested in the development of nuclear fission reactor systems but anxious to develop a controllable thermonuclear reactor system; there was a certain probability that the chain-reacting schemes, developed in the fall of 1942, ignited by a shock-wave-controlled arc plasma might turn out to become a controllable reactor system.

AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency)	REPORT NO.		
Air Attache Buenos Aires, Argentina	IR-75-56	PAGE 5 OF 8 PAGES	

In October or November 1948, I have signed a five year contract with the Argentine authorities, became head of a thermo-nuclear reactor project, but never saw a copy of this contract in all the years to come.

1949/52: By June 1949, the reactor project at Huemul Island was starting from scratch.
During this period of construction, data were collected by means of an electronic reactor simulator.

On 16 February 1951 an exponential reactor system was ready for test. In the first test, the injection of lithium-6-enriched lithium into a shock-wave-controlled proton hydrogen plasma, for a short interval, produced series of primary and secondary reactions, the helium-3 helium 3 reaction giving proof for the existence of self-reproducing reaction chains. In a second test, by jetting lithium-6-enriched lithium into avalanche of neutron-reproducing reaction chains was monitored. In both tests, the self-reproducing reaction chains were analyzed by means of excitation-energy-discriminating ultraviolet sensitive proportional counter tubes.
At that time, a large-scale reactor system was under construction in which a self-sustaining chain reaction should have been realized; however, this reactor system has never been completed, probably for reasons fo sabotage.

Against my strict advice, President Peron announced these results with a great display of propaganda; from this time on, I found myself being mixed up with political affairs.
Still in 1951, President Peron offered to me the position of a National Director of Atomic Energy; I did not accept this offer to escape political interference with my scientific work.

On 26 October 1951, in a third decisive exponential reactor test, it has been proven that the avalanche of neutron-reproducing reaction chains, resulting from the injection of lithium into a shock-wave-controlled, neutron-producing deuterium plasma, can be kept going on by injecting boron.

Later on, the plasma-collision-induced isomerization of indium- and rhodium nuclei has been proven by monitoring the radioactive emission of gamma quantums; signal discrimination had to be provided against the shock-wave-induced bremsstrahlung background.

In order to shift the reactor project from the political and propaganda level to a more reasonable and profitable commercial level, in December 1951 I advised President Peron to accelerate reactor development by linking Argentina with a highly industrialized country like the United States. He showed himself extremely interested in this proposition and authorized me to arrange for preliminary industrial negotiations.
A few months later, in March 1952, the political situation in Argentina was obviously beginning to change; sabotage was increasing at Huemul Island.

On 2 September 1952, a commission of deputies and a group of experts arrived at Huemul Island.
The only purpose of this commission was to paralyze the reactor project; positive facts did not matter at all; the 'findings' of this commission were pre-set in Buenos Aires, weeks before the commission arrived at San Carlos de Bariloche in November 1952. I suddenly found myself expelled from the reactor project and had to stop work on nuclear reactor systems immediately.

experimental and applied physics,

analysis of stress and vibration under extreme thermodynamic and mechanical conditions (hypersonic flight conditions, radiation corrosion, a.s.o.),

development of new materials of construction for rocket and jet motors, nuclear propulsion systems, a.s.o., to be produced in shock-wave- and ultra-sound-controlled arc melting furnaces,

high-pressure plasma physics and plasma implosion analysis, shock-wave physics and chemistry, interested in rocket and jet plasma analysis, solar plasma physics,

analysis of nuclear reactions in chain-reacting fission and fusion plasma zones,

development and testing of plasma-type, pulsation-controlled fission and fusion reactor systems,

development and testing of propulsion reactor systems,

experimental approaches to new concepts,

development and testing of highly-turbulent, magnetic-field-controlled fission and fusion plasma systems,

experimental approach to solar flare conditions and to the explosion-tendency of the solar plasma, ultraviolet excess analysis,

excitation of space structure by pulsation-controlled plasma implosion, testing the limitations of quantum mechanics and quantum dynamics,

experimental approach to the unified field theory and to the velocity of propagation of gravity, a.s.o.

the substitution of the Lonardi government by the Aramburu government explains to some extent the hostile attitude of the Lonardi government against the 'Richter case',

in May, 1956, judge Dr. Botet was starting another investigations,

when being interrogated again and again, the investigation turned out to become a complete rehabilitation,

but there was no rehabilitation,

during the last interrogation about six months ago, Dr. Botet, despite of my loud and repeated protest, even confiscated the original of my doctor diploma, when I was offering a photocopy,

a few months ago, Dr. Botet, for some political reasons, lost his position as a judge; but I still cannot get a rehabilitation - and no job,

but it seems to be a matter of fact that I am now allowed to leave the country,

when entering exile in February, 1953, I immediately was beginning design work on shock-wave-controlled melting furnaces and chemical arc reactor systems,

still in 1953, I was developing an improved ram jet system, based on the shock-wave-controlled conversion of an intermittent ram jet system into a steady state ram jet system,

on the same basis, it was even possible to develop a propulsion system, interchanging continuously between rocket and ram jet phase, thus substituting turbo jet engines by a shock-wave-controlled combustion reactor system,

for the first time, the extraordinary feed-back loop between thrust and air-intake - which is an exclusive feature of a ram jet system - can be fully developed without the disadvantage of a minimum speed of flight,

these studies have derived from injection experiments and the characteristic curves of the penetrability of shock-wave-controlled plasma zones,

in the fall of 1953, and in 1954, much work was done for a better understanding of field-interaction-controlled fusion reactor systems; a workable basis for the development of a generalized theory of particle acceleration in highly-turbulent, magnetic-field-controlled fusion reactor systems was found,

during the same period, a nuclear fission plasma-type reactor system was analyzed theoretically,

first of all, there was the principle fission plasma experiment, controlled by excess reactivity, temperature coefficient, plasma turbulence, and magnetic-field-controlled plasma deformation,

improvement of the control of a fission plasma-type reactor system by critical-size (i.e. critical compression) - controlled plasma pulsation,

pulsation control was improved by the magnetic-field-controlled feed-back loop between shock-wave-induced plasma turbulence and plasma turbulence-induced promotion of shock-wave-generating plasma explosions, the shock-wave-generating plasma explosions initiated by the pulsation-controlled criticality of the chain-reacting fission plasma itself,

from these theoretical studies derives, that such a shock-wave-controlled pulsation-controlled fission (or fusion) plasma system must be an enormously powerful source of shock-wave-induced ultra-sound, (converting nuclear energy directly into ultra-sound energy),

theoretically, a chain-reacting controllable plasma reactor system (fission or fusion type) will be the only one which can produce nuclear power in the range of millions of kilowatts, when based on the controlled pulsation of supercritical chain-reacting zones; therefore, the optimal output of nuclear-power-induced ultra-sound will be determined and limited by the reactor structure demoloshing effects of the ultra-sound itself,

still in 1944, I have been using the coupling between plasma jets and a magnetic field as a means for analyzing non-Maxwellian plasma conditions; experimental research on a plasma-controlled, energy-converting system (converting nuclear energy directly into electrical energy by the induction effect) has been carried out on a preliminary non-nuclear basis in 1951 and 1952, (deriving from the analysis of plasma induction spectra),

in 1954, a push-pull plasma reactor system has been analyzed theoretically, based on two interconnected reactor vessels which become plasma-critical alternately,

only one vessel becomes critical at a time; when it goed plasma-critical, a plasma jet is firing through a magnetic field, producing electrical energy by the induction effect,

in the fall of 1951, when analyzing the induction spectrum of an extremely turbulent, shock-wave-superimposed plasma of ordinary proton hydrogen, a specific class if signals revealed the existence of sort of 'decaying structures', not resulting from eventual electron capture by protons, forming decaying neutrons,

another class of signals, characterized by extremely large amplitudes and very small pulse width was even indicating the existence of a certain exchange mechanism of energy, the source of the energy being still a mistery; sort of extremely irregular fluctuation spectrum was developing at the very moment of optimal plasma compression,

during the past four years of exile, much theoretical work has been done to clarify this matter; it has been found, at least, that an explanation can be given for the large-amplitude 'exchange signals', when we assume, that highly compressed electron gas becomes a detector for energy exchange with what we call zero point energy,

zero point energy derives from the exclusion principle,

the exclusion principle derives from empirical data,

in a shock-wave-superimposed, turbulence-feed-back-controlled plasma zone exists a high probability for cell-like super-pressure conditions,

zero point energy in balance with the mass energy of the electron gas represents an enormously high energy capacity for exchange processes,

about 10^{10} kwh per unit volume,

on the basis of exchange coupling, it seems to be possible to 'extract' a compression-proportional amount of zero point energy by means of a magnetic-field-controlled exchange fluctuation between the compressed electron gas and sort of cell structure in space (dimensions about 10^{-13} cm), representing the source of what we call zero point energy,

it seems even possible that the large-amplitude fluctuation signals derive from a mechanism of energy-conversion unknwon to us yet which becomes detectable only in highly compressed electron gas,

(it would be of interest to repeat these experiments not with a proton hydrogen plasma - proton spin and electron spin identical - but with a helium-4 plasma, the spin discrepancy supporting energy extraction,

it would also be worth-while to search for exchange signals in high-power pulsating fission plasma systems),

in case, all these interpretations are fully correct, plasma implosion analysis might turn out to become an approach to a completely new source of energy, probably superior to nuclear energy,

the present status of this matter can best be compared with the situation, when nuclear fission was discovered, but when the development of a chain-reacting fission reactor system was still depending on the realization of controllable neutron reproduction,

(the compression-induced 'decay signals' can be explained as resulting from wave-mechanical coupling of groups of electrons, the repulsive forces between the electrons becoming neutralized gradually by wave-mechanical coupling with increasing compression),

first, there was the discovery of the shock-wave-generating process in 1936, the discovery of a feed-back loop between shock-wave-induced plasma turbulence and plasma-turbulence-induced promotion of shock-wave-generating plasma explosions,

the concept of testing shock-wave conditions by means of plasma-collision-induced nuclear reactions,

the development of nuclear reaction schemes, based on the chain-reacting consumption of the lithium and boron isotopes in 1942,

the concept of a controllable fusion reactor system, ignited by a shock-wave-controlled deuterium high-pressure plasma,

then came the first series of exponential fusion experiments in February, 1951, and the second series of exponential fusion experiments in October, 1951, giving proof for the existence of self-reproducing reaction chains,

from these experiments derived the discovery of field-interaction-accelerated particles, initiating a completely new conce[illegible]reactor systems, and the discovery of two specific classes of fl[illegible]s, the 'decaying type', deriving from wave-mechanical coupling of electron groups, and the 'large-amplitude-type', deriving from a possible exchange

process with a new source of energy, probably the zero point energy,

from the development of super-plasma conditions derives fluctuating plasma implosion as a concept for fusion reactor systems, and as a probable approach to a new source of energy (in any case, as a method for exploring space structure physics),

from the development of a shock-wave-controlled arc melting furnace probably derive series of new materials of construction for rocket and jet engines, and for nuclear propulsion systems, under hypersonic flight conditions,

from the analysis of the penetrability of shock-wave-controlled plasma zones derives the concept for an improved ram jet propulsion system, which will allow to take full advantage of the feed-back loop existing between thrust and air-intake,

from the theoretical analysis of a pulsating fission plasma system derives the conception of a nuclear-energy into ultra-sound converting reactor system, the conception of a nuclear-energy into electrical energy converting reactor system, and the conception of a nuclear-energy into radiofrequency energy converting reactor system,

during the past four years of exile, much theoretical work has been done in space-time physics, and in unified field theory (having been interested in possible experimental approaches).

D.10 Possible October 1944 Test Explosion on the Baltic Coast

[There may have been a test explosion on the Baltic coast in October 1944, as reported by multiple sources:

- In August 1944, a German prisoner of war reported that "experiments are conducted on an estate in Pomerania [on the Baltic coast] and it is alleged that this explosive is capable of destroying everything in a radius of several kilometers." (p. 4396).
- On 20 October 1944, the U.S. physicist and intelligence analyst Philip Morrison mentioned "recent reports of Baltic explosions" that were being investigated by the Manhattan Project as possible tests of a German atomic bomb (p. 4398).
- A 21 October 1944 OSS intelligence report described the October test: "The Germans have completed a weapon which is founded on the principle of the disintegration of matter (Atomzertruemmerung). Experiments have been performed which have proved conclusive[...] The radius of action is supposed to be about three kilometers" (pp. 4400–4403).
- A 19 January 1945 U.S. military intelligence summary covering many areas of advanced German research included a subject heading for "ATOMIC BOMB," under which it mentioned "close surveillance of the area in which tests are alleged to have taken place" (p. 4404). While the report did not state a specific time or location for those alleged tests, it focused largely on the most recent work being conducted on the Baltic coast, suggesting that the tests occurred in late 1944 on the Baltic coast.
- In May 1945, German prisoner of war Friedrich Olmes said that there had been "experiments with the atom-splitting bomb" and that "practical experiments were conducted on the Baltic coast" (p. 4406).
- A 19 August 1945 U.S. Army Air Forces intelligence report entitled "Investigations, Research, Developments, and Practical Use of the German Atomic Bomb" presented testimony by Rudolf Zinsser, a German pilot captured by U.S. forces, that in October 1944 he flew near the massive explosion of a new German bomb on or near the Baltic coast, describing in detail a very large mushroom cloud and severe electrical disturbances (p. 4408). After further investigation, rather than dismissing Zinsser's report, the United States decided to upgrade it from Secret to Top Secret in October 1945 (p. 4422).
- In testimony in 1955, 1984, and 2005, Italian military correspondent Luigi Romersa stated that by a special arrangement between Benito Mussolini and Adolf Hitler, on 12 October 1944 he witnessed the massive explosion of a new German bomb on the Baltic coast (apparently Rügen island), had to wait in a bunker for many hours afterward for the site to become less dangerous (short radioactive half-lives?), and then had to wear a special protective suit when inspecting the leveled test site afterward (pp. 4427–4434).
- Werner Grothmann stated in 2000–2002 interviews that there was a successful atomic bomb test in October 1944 (p. 4436).
- In a 13 March 2005 television interview, Elisabeth Mestlin stated that she observed a massive explosion on Rügen from a neighboring island on 12 October 1944 (p. 4435).

Some of the major sources and details are summarized in Table D.4.]

Rügen island on the Baltic coast of Germany was used for the “most secret research” during the war.
In particular, the isolated Bug peninsula was used as a military base 1935–1945.
It may have been the location of a nuclear test in October 1944.

Figure D.659: Rügen island on the Baltic coast of Germany was used for the “most secret research” during the war (pp. 4393–4394). In particular, the isolated Bug peninsula was used as a military base 1935–1945. It may have been the location of a nuclear test in October 1944.

Baltimore Branch Office, Manhattan Engineer District. 4 August 1944 [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-2 GERMANY: US Wartime Positive Int. (July–Oct. 44)]

Subject: Positive Intelligence Secured from Prisoners of War at Camp Reynolds, Pa., Relative to "Secret Weapon"

Summary of Information:

The following information has been received from what is believed to be a reliable source relative to use by the Germans of a secret weapon.

"According to informant, the Germans are at present working on an extremely secret explosive. Informant knows very little about it and states that it has something to do with 'Heavy Water' (Schweres Wasser). Experiments are conducted on an estate in Pomerania and it is alleged that this explosive is capable of destroying everything in a radius of several kilometers."

Prisoner of war Schaeffer stated the following relative to a secret weapon.

"One of the weapons which the Germans are relying on has something to do with Heavy Water. It is a shell or an explosive and has the effect of collapsing the lungs of persons in a large area. Informant says he personally saw victims' mouths filled with blood, on the Russian front as a result of this weapon."

[See document photo on p. 4397. This report summarizes information from two different captured Germans. The unnamed first prisoner of war mentioned the production of "an extremely secret explosive" using "heavy water"—the production of plutonium for fission bombs. He also said such bombs should have a blast radius of several kilometers and were to be tested on the Baltic coast.

The second prisoner of war, Schaeffer, mentioned nuclear explosives whose production involved heavy water. He also mentioned fuel-air explosives that could be as small as artillery shells and would create a shock wave capable of destroying the lining of the lungs of people exposed to the blast. He said he had seen such fuel-air explosives actually employed on the Russian front. Schaeffer appeared to confuse nuclear explosives and fuel-air explosives (incorrectly connecting heavy water with fuel-air explosives), likely because of the extreme secrecy around both projects and the fact that both were intended to produce powerful explosions.

For more information fuel-air explosives, see pp. 538–557, 2615–2623.]

OSS London. 5 December 1944. Report T-2805-a. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-3 GERMANY: US Wartime Positive Int. (Nov. 44–June 45)]

GERMANY : ATOMIC PHYSICS

Heavy Water Experimental Station.

Heavy water experiments are being carried out at the Dräger Werke, Lübeck, which is reported to be the largest gas factory in Germany. The plant's experimental station is connected with the experimental station at Peenemünde.

Figure D.660: Baltimore Branch Office, Manhattan Engineer District. 4 August 1944. Subject: Positive Intelligence Secured from Prisoners of War at Camp Reynolds, Pa., Relative to "Secret Weapon" [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-2 GERMANY: US Wartime Positive Int. (July–Oct. 44)].

Philip Morrison to Joseph Volpe, 20 October 1944, Loose Ends [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)]

There are a number of things to be done by the Washington office which have not yet been done.

1. We need a final report on the installation at Watten. This is such an extraordinary enterprise that we must be sure that it was not designed for something in our field.

2. The questions for Mr. Baker should be answered.

3. The recent reports of Baltic explosions should be covered by Major Calvert as usual.

4. The de Boer matter is still open. Has Alsos contacted J. H. de Boer at Eindhoven? This should be done if it is still possible.

[See document photo on p. 4399.

Dr. Philip Morrison (U.S., 1915–2005), a Manhattan Project physicist, was stationed in the United States but specifically tasked with analyzing Allied intelligence data on the German nuclear program. Morrison's publicly available documents indicate that up through 1945, he believed the German nuclear program was much more advanced and dangerous than better-known investigators such as Samuel Goudsmit and Boris Pash seemed to.

Regarding the specific points in the memo above:

1. Even months after the Allied invasion of France, Morrison and other Allied officials were both awed ("extraordinary") by the rocket-launching installation at Watten and worried that some of its features seemed to indicate it involved nuclear payloads for the rockets.

2. "Mr. Baker" was Niels Bohr, who was famously quite concerned about the progress of the wartime German nuclear program.

3. In October 1944, there were "recent reports of Baltic explosions" that were being investigated by the Manhattan Project as possible tests of a German atomic bomb. That information agrees well with the other sources in this section that reported the apparent test of an atomic bomb on the Baltic coast in October 1944. Morrison's comment also makes it clear that Allied officials thought the German nuclear program could be sufficiently advanced to test an atomic bomb, and that U.S. Army Major Horace Calvert had a "usual" procedure for collecting and analyzing such data. Can the relevant Allied intelligence reports be located and declassified now?

4. Manhattan Project intelligence analysts were actively seeking information on the German nuclear program from the Dutch intelligence network, and Samuel Goudsmit was involved in at least some of those contacts, including with the physical chemist Dr. Jan Hendrik de Boer (Dutch, 1899–1971). See pp. 4832–4853.]

NO. 1 OF 3 COPIES, SERIES A

20 October 1944

Subject: Loose Ends.

To: Mr. Joseph Volpe

From: Dr. P. Morrison

There a number of things to be done by the Washington office which have not yet been done.

1. We need a final report on the installation at Watten. This is such an extraordinary enterprise that we must be sure that it was not designed for something in our field.

2. The questions for Mr. Baker should be answered.

3. The recent reports of Baltic explosions should be covered by Major Calvert as usual.

4. The deBoer matter is still open. Has Alsos contacted J. H. de Boer at Eindhoven? This should be done if it is still possible.

P. Morrison

SECRET

Figure D.661: Philip Morrison to Joseph Volpe. 20 October 1944. Subject: Loose Ends [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)].

OSS Report No. FF-83. 21 October 1944. Atom Smashing Secret Weapon. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-2 GERMANY: US Wartime Positive Int. (July–Oct. 44).]

1. The Germans have completed a weapon which is founded on the principle of the disintegration of matter (Atomzertruemmerung). Experiments have been performed which have proved conclusive. The effect of this weapon is like that of a thunderbolt, naturally much magnified.

2. It would be possible to direct the effect of this weapon in any given direction. Possibly it is a question of a sort of projectile rather than of a weapon properly so-called. The radius of action is supposed to be about three kilometers. The devastation produced by this weapon is said to be such that Hitler plans to use it only in the air, against planes, for example. Nevertheless, the Germans say that in case of necessity they will not hesitate to use it on the ground as well. This weapon seems to be ready, in fact, for use upon the battlefield, but it still exists only in the form of a model. Germany needs—and this appears to be absolutely certain—a delay of at least three months. Practically speaking, it seems that only within five months could the weapon be ready for use.

3. Different conversations which have taken place with industrial leaders in charge of concentration of production of German war material give the impression that Germany has unlimited confidence in the use of this weapon, which is to bring them certain victory.

4. Herr Schneider, one of the directors of the German factories called Deutsche Waffen u. Munitionsfabrik (a combine representing some fifteen factories and 250,000 workers) declared with a smile: "We shall gain the victory by new weapons, we are absolutely sure of that. Just now it is simply a case of gaining time, because the new arms will not be ready before three or four months. Bombing cannot keep us from building them. Our important factories where the assembly is carried out are all subterranean. An immense quantity of accessories is made in small lots everywhere throughout the country, so that bombing cannot interrupt the production. Our troops may retire within our frontiers. That does not matter, for nothing will be able to stand up for any length of time against these new weapons and we shall resume our overwhelming advance."

5. Directors of certain other factories have shown the same inveterate optimism, aroused by the confidence which they have in the effects of these new weapons.

6. Names of certain industrialists with whom the interviews took place:

> Herr [Adolf] Schneider—Director of the Deutsche Waffen und Munitions-Fabrik. His German title is Wehrwirtschaftsbeauftragter (Superintendent of Armament Production) in the region of the Duchy of Baden and Wurtemberg. He has charge of the plants of the Karlsruhe region.
>
> Director Dr. Buesse, who directs the DWM factories at Karlsruhe.
>
> Dr. Quandt, Administrator of a part of the DWM combine of factories.

[See document photos on pp. 4402–4403.

Deutsche Waffen- und Munitionsfabriken (DWM) was a massive German company (founded in the nineteenth century) that produced explosives, weapons, and other equipment. It had enormous amounts of support and funding from the German government and political contacts at the highest levels [https://zkm.de/en/from-the-munitions-factory-to-a-culture-factory]. During the war, it made extensive use of slave labor and underground facilities. As noted in this OSS report, it had fifteen factories and 250,000 workers.

Adolf Schneider (German, 1899–1979, https://historisches-lexikon.li/Schneider,_Adolf) was a senior manager of DWM during the war and a leading industrialist before, during, and after the war.

“Dr. Buesse” was another senior manager of DWM and may have been a member of the Busse family of weapons makers.

“Dr. Quandt” would have been either Günther Quandt (German, 1881–1954, https://www.deutsche-biographie.de/gnd124997821.html), who was the owner of DWM during the war, or his son Herbert Quandt (1910–1982, https://www.deutsche-biographie.de/sfz103954.html).

“Directors of certain other factories” were also interviewed but not explicitly named here.

According to all of these very well-informed and highly placed individuals, Germany had developed a secret weapon that used atomic disintegration (fission) to create an explosion with a blast radius of three kilometers and effects like a thunderbolt but much magnified—i.e., blinding light, intense heat, and a shock wave extending out to that radius. As of the final report date of 21 October 1944, a prototype of the weapon had been successfully tested.

More nuclear weapons were expected to be ready within five months, or by March 1945. Adolf Schneider, who was in charge of so many facilities and people and therefore in a position to know, explained how German nuclear weapons were being mass-produced: “Our important factories where the assembly is carried out are all subterranean. An immense quantity of accessories is made in small lots everywhere throughout the country, so that bombing cannot interrupt the production.”

What OSS source(s) had access to all of these important individuals and could get them to speak so candidly?

Where are the transcripts and reports on postwar Allied interrogations of Günther Quandt, Herbert Quandt, Adolf Schneider, “Dr. Buesse,” and the other factory directors regarding the German nuclear weapons program and other advanced programs?

Where are the reports on postwar Allied inspections of the many underground facilities manufacturing components for nuclear weapons, as described in this wartime OSS report?]

Figure D.663: OSS Report No. FF-83. 21 October 1944. Atom Smashing Secret Weapon [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-2 GERMANY: US Wartime Positive Int. (July–Oct. 44)].

Headquarters, United States Strategic Air Forces in Europe, Office of the Director of Intelligence, An Evaluation of German Capabilities in 1945. The Commanders Intelligence Digest. 19 January 1945. [AFHRA folder 519.635 1945 Intelligence Digest; AFHRA A5729 electronic version pp. 255 onward and 561 onward; NARA RG 319, Entry UD-1041, Box 27, Folder 925497]].

1. In the following paragraphs are listed the actual or potential weapons which the Germans may use against USSTAF operations in 1945. For the most part they include the so-called V weapons. No consideration is given to those for which there is lacking evidence of possible use for some time to come. [...]

2. V-2:

[...] The V-2, or rocket projectile, with a warhead of approximately one ton, and a current range of 225 miles, is being fired at London at the rate of 180/250 per month, and against Continental ports at the rate of approximately 300 per month.

[...] Larger rockets (68 feet in length as against 45 feet) are known to exist, and may appear in small quantities during the year. They would have a considerably larger warhead. [...]

7. ATOMIC BOMB: Close check of every report, and close surveillance of the area in which tests are alleged to have taken place lead to the conclusion that such bombs are not a likelihood in 1945.

[See document photos on pp. 5338–5340.

Point 1 suggests that there was significant evidence for each of the weapons listed thereafter.

Point 2 proves that rockets 50% longer than the V-2 (21 m vs. 14 m), and with a warhead “considerably larger” than one ton (suitable for an atomic bomb?), were “known to exist.”

Point 7 suggests U.S. knowledge of multiple alleged German atomic bomb tests prior to January 1945, in a particular area or areas under close Allied surveillance. This likely means the Baltic coast (which was being closely monitored for activities at Peenemünde and other locations), and might therefore include the October 1944 test. It might also refer to a failed test in the North Sea in autumn 1943 (pp. 4436, 5011, 5034).]

Theodor Soucek. 2001. *Mein Richter, mein Henker.* Malmö, Sweden: Bright Rainbow.

[Soucek (1919–20??) was born in Graz, Austria and served throughout the war as an officer. After the war he returned to Austria and helped run one of the “ratlines” for people fleeing Austria and Germany; in that context he sheltered and became well acquainted with Armin Dadieu, a scientist and former senior official from Graz. Soucek’s memoirs were written near the end of his life and mix what he had actually seen with what he had heard or believed, so one must be quite cautious in using them, but they contain several intriguing passages that align well with independent sources. For more information, see pp. 4613–4624.]

In diesem Zusammenhang erzählte ich Dadieu von einer außerordentlichen Begegnung mit einem hochrangigen ungarischen General, als ich mich—noch verwundet—im gleichen Zugabteil auf der Bahnfahrt von Berlin nach Wien Mitte Januar 1945 befand. [...]

Mir gegenüber hatte ein älterer, weißhaariger Herr Platz genommen, der sich mir im Laufe der Reise nach vertraulichem und angeregtestem Gespräch als hochrangiger ungarischer General vorstellte.

Nach mehr als einer Stunde Bahnfahrt wandte sich der General überraschend und vertraulich zu mir:

“Schauen Sie, lieber junger Freund, Sie sind für mich ein frontbewährter Offizier und offenbar bedingungslos Ihrer Nation und der Verteidigung Europas verschworen, dazu noch Schriftsteller von höchstem Verantwortungsbewußtsein zur Rettung vor dem Kommunismus. So kann ich Ihnen von meinem Besuch als Vertreter der ungarischen Regierung in Berlin erzählen, weil man uns mit anderen verbündeten Regierungsvertretern der Achsenmächte in den letzten Tagen die jüngsten Entwicklungen der deutschen Geheimwaffen vorführte.

Wir wurden an der Ostsee in ein Sperrgebiet der Wehrmacht geflogen und es geschah folgendes: Als Zielgebiet zeigte man uns eine vielleicht 20–25 km entfernte kleine Insel und beschoß diese mit einer neuartigen Bombe, aus einem Flugzeug abgeworfen. Diese Bombe wirkte so beispiellos, daß von der Insel nichts mehr zu sehen war, sie war im Wasser verschwunden![4]

Mit dieser neuen Waffe werden Sie den Krieg gewinnen, Deutschlands Sieg ist nicht mehr aufzuhalten. Ich gratuliere Ihnen!”

Das waren seine Worte.

4 [...] Der “Schwedische Beobachter” bericht vom Verschwinden einer Insel nach Beschuß durch eine deutsche Sonderwaffe.

In this context, I told Dadieu about an extraordinary encounter with a high-ranking Hungarian general when I was—still wounded—in the same train compartment on the train ride from Berlin to Vienna in mid-January 1945. [...]

An elderly, white-haired gentleman had taken a seat opposite me, who introduced himself to me as a high-ranking Hungarian general during the course of the journey after a confidential and animated conversation.

After more than an hour’s train ride, the general turned to me surprisingly and confidentially:

“Look, dear young friend, you are for me a front-line officer and obviously unconditionally sworn to your nation and the defense of Europe, in addition to being a writer of the highest sense of responsibility to save us from communism. So I can tell you about my visit to Berlin as a representative of the Hungarian government, because in the last few days we were shown the latest developments in German secret weapons together with other allied government representatives of the Axis powers.

We were flown to a Wehrmacht restricted area on the Baltic Sea and the following happened: We were shown a small island perhaps 20–25 km away as a target area and bombarded it with a new type of bomb, dropped from an airplane. This bomb had such an unprecedented effect that nothing could be seen of the island, it had disappeared into the water![4]

With this new weapon you will win the war, Germany’s victory can no longer be stopped. I congratulate you!”

Those were his words.

4 [...] The “Swedish Observer” reports on the disappearance of an island after bombing by a German special weapon.

Harry K. Lennon. 23 May 1945. SUBJECT: Addition to Preliminary Report on OLMES, Friedrich. [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)]

The following information was given by OLMES, after he had recovered his notebook buried in the LUENEBURGER HEIDE. [...]

2. The experiments with the atom-splitting bomb had almost been brought to conclusion. The proven effect of a one kilogram bomb is to cause a crater of 18 miles wide. Only 8–10 more weeks work would have been required to put the bomb into the operational stage.

3. Laboratory experiments were conducted in DANZIG and BERLIN. Practical experiments were conducted on the Baltic coast. [...]

[See document photo on p. 4407.

Olmes stated that “practical experiments” with an “atom-splitting bomb” “were conducted on the Baltic coast,” corroborating information from the other sources in this section.

Intriguingly, he apparently obtained that information from documents, people, or personal experience he had found in the Lüneburger Heide, an area just south of Hamburg that several other independent sources said contained factories producing atomic bombs or major components for them (pp. 4176–4182).]

SUBJECT: Addition to Preliminary Report on OLMES, Friedrich.

TO : Chief CIB, G-2 Section, HQ 12 Army Group, APO 655, US Army.

The following information was given by OLMES, after he had recovered his notebook buried in the LUENEBURGER HEIDE.

1. German Development of Atom-splitting bomb.

1. The following German scientists were instrumental in the development of an atom-splitting bomb:
   a. Prof. HEISENBERG, recipient of the 1932 NOBEL prize in physics. BERLIN-DAHLEM, Kaiser Wilhelm Institut for Physik, the "brains" of the project .
   b. Prof. PASQUAL JORDAN, physics lecturer at the BERLIN university.
   c. Prof. HAHN, Director of the Kaiser Wilhelm Institut fuer physikalische Chemie, BERLIN.
   d. Dr. STRASSNER, assistant to Prof. HAHN.
   e. Prof. KOSSEL, lecturer at the Technische Hochschule in DANZIG. X-ray and electronics specialist.
   f. Prof. GERTHSEN, BERLIN University. Developed the German super microscope.
   g. Baron MANFRED von ARDENNE, BERLIN LICHTERFELDE. Amateur scientist. No scientific tng, but considered a genius.
   h. Dr. ULRICH NEUBERT, Luftfahrts Forschungs Insitiut, BRAUNSCHWEIG: Private address: 1 Saarstrasse, BRAUNSCHWEIG. Specialist in cumbustion engines.

2. The experiments with the atom-splitting bomb had almost been brought to conclusion. The proven effect of a one kilogram bomb is to cause a crater of 18 miles wide. Only 8-10 more weeks work would have been required to put the bomb into the operational stage.

3. Laboratory experiments were conducted in DANZIG and BERLIN. Practical experiments were conducted on the Baltic coast.

4. OLMES knows all the above named scientists personally. He claims to know the principle of the atom-splitting bomb fairly well and would be able to explain it to an expert.

5. HITLER was very impatient for the experiments to come to a conclusion. He had BORMANN call up Prof. HEISENBERG daily to inquire about the progress.

6. The above named scientists were afraid of the responsibility of putting into operation a wpn of such horrifying proportions. They deliberately stalled and had false reports given to HITLER. Some of their assistants were involved in the plot of 20 Jul 1944.

7. Through scientist friends in SWITZERLAND and SWEDEN the German scientists were fairly well informed about atom-splitting experiments in other countries, including the USA. They know that the other countries were far behind GERMANY in that respect.

8. The germans thought that the Russians were particularly eager to find out about the atom-splitting bomb. Orders were given that under no circumstances any plans should fall in Russian hands.

9. Although plans for the escape of some atom-splitting specialists to JAPAN had been vaguely mentioned, OLMES thinks that all of the scientists were opposed to such a project.

Interrogation of Zinsser, Rudolph G. Papers attached: Memo of 17 July 1945, 609th CIC Detachment [AFHRA C5094 frames 1546–1552].

Re: Subject & 1 incl. thereto; Miscellaneous Interviews, Abstract: Contains Biographical Information on Rudolph G. Zinsser

[...] 1. SUMMARY

Subject was investigated because of his appearance under suspicious circumstances at the Signal Intelligence Section project which is being conducted at Bad Kissingen. Interrogation of subject revealed that he was formerly the director of a German research project, Code Name DERNA, whose purpose was the development of a fully automatic, self-steering anti-aircraft rocket. Subject stated that he is willing to develop this device for the American authorities.

2. INVESTIGATION

Subject ZINSSER, Rudolph G. was born 6/9/13 in Vienna of Austrian parents. Subject became an engineer at the Technische Hochschule in Darmstadt in 1933–1935 and later took his doctorate degree at University J. W. Goethe in Frankfurt 1935–1939.

In 1939 subject entered the Luftwaffe and served in Norway, France, Italy and Africa. Subject was discharged from the Luftwaffe late in 1944 because of wounds received in combat. Highest rank attained was Oberleutnant. [...]

Previous to his discharge from the Luftwaffe subject stated that he was granted space at the Luftkriegs Academy, Berlin/Gatov, to work on above mentioned rocket-steering device. He left the academy in September 1944 having secured financial backing from the Flugzeugwerk Siebl in Halle and opened his own laboratory at Jibka in the Sudeten. [...]

On the 26 April subject stated that the factory was evacuated to the vicinity of Bad Aussee and that at the present time he does not know what happened to his equipment or personnel. [...]

[See document photos on pp. 4409–4410.]

17 July 1945

MEMORANDUM TO THE OFFICER IN CHARGE

Subject: Investigation of ZINSSER, Rudolph G.

1. SUMMARY

Subject was investigated because of his appearance under suspicious circumstances at the Signal Intelligence Section project which is being conducted at Bad Kissingen. Interrogation of subject revealed that he was formerly the director of a German research project, Code Name DERNA, whose purpose was the development of a fully automatic, self - steering anti - aircraft rocket. Subject stated that he is willing to develop this device for the American authorities.

2. INVESTIGATION

Subject ZINSSER, Rudolph G. was born 6/9/13 in Vienna of Austrian parents. Subject became an engineer at the Technische Hochschule in Darmstadt in 1933 - 1935 and later took his doctorate degree at University J.W.Goethe in Frankfurt 1935 - 1939.

In 1939 subject entered the Luftwaffe and served in Norway, France, Italy and Africa. Subject was discharged from the Luftwaffe late in 1944 because of wounds received in combat. Highest rank attained was Oberleutnant.

Subject stated that while in Africa he was ordered by his commanding officer to return to Erding, near Munich, and develop a special bomb-sight for use against fast moving ground targets. Subject stated that this work was completed in September 1942 and that the bomb-sight was successfully used. Production of the bomb-sight was by Ziess Jena and Ziess Ikon factories and fifty-three (53) were completed.

Previous to his discharge from the Luftwaffe subject stated that he was granted space at the Luftkriegs Academy, Berlin/Gatov, to work on above mentioned rocket-steering device. He left the academy in September 1944 having secured financial backing from the Flugzeugwerk Siebl in Halle and opened his own laboratory at Jibka in the Sudeten. Here he financed his work through the sale of small radio transmitters to the Wehrmacht. Subject stated that during this time he and his assistants developed some working models of the rocket steering device.

On the 26 April subject stated that the factory was evacuated to the vicinity of Bad Aussee and that at the present time he does not know what happened to his equipment or personnel. Orders were left by him to destroy the test models of the steering device. At this time Zinsser stated that he returned to Roding, near Nurnberg, and attempted to contact the American authorities. Subject stated that he feels certain that the report turned in to the authorities at Roding did not accurately describe his project since no one there spoke German.

3. Zinsser was advised to return to Roding and to remain there pending further developments.

4. AGENTS NOTE

Since a project of this type is of such a highly technical nature it is not possible for this agent to make any evaluation of possible value of the project. Suggest that a further investigation of this project be conducted by appropriate technical authorities.

Enclosed is a brief description of the project as outlined by Zinsser.

A.P.W.I.U. [Air Force Prisoner of War Interrogation Unit] (Ninth Air Force) 96/1945. 19 August 1945. Investigations, Research, Developments, and Practical Use of the German Atomic Bomb. [NARA RG 38, Entry 98C, Box 9, Folder TSC # 2601–2700; NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946); AFHRA B-5737 electronic version pp. 340–345]

2. Dr. EDSE, well known chemist, wrote:
At the Institute for Physical Chemistry of the Hamburg University I worked on problems concerning nuclear physics under the direction of Prof. Dr. P. HARTECK, and engaged in investigations of behavior and properties of the so-called trans-uraniums, already mentioned by HAHN and STRASSMANN in Berlin, and by JOLIOT-CURIE in Paris. [...]

9. Furthermore the improvement and application of ultra-centrifuge, thermo-diffusion, and distillation had its effect on the success of these experiments. For this reaction the material to be split must have the form of a liquid, a gas, or a solution; UF_6 was used which will melt at 69.2^o C. under light over-pressure. This is advantageous as Fluor (UF_6) has not isotope. In this manner only the uranium isotopes are separated. [...]

14. When Germany was at this stage of the game, the war broke out in Europe. At first investigations on this disintegration of $^{235}_{92}U$ were somewhat neglected because a practical application seemed too far off. Later, however, this research continued, especially in finding methods of separating isotopes. Needless to say that the center of gravity of Germany's war effort at that time lay on other tasks.

15. Nevertheless the atomic bomb was expected to be ready toward the end of 1944, if it had not been for the effective air attacks on laboratories engaged in this uranium research, especially on the one at Rjuken in Norway, where heavy water was produced. It is mainly for this reason that Germany did not succeed in using the atomic bomb during the war. [...]

17. [...] The disintegration of one kg $^{235}_{92}U$ delivers an amount of energy of $\frac{1000}{235} \cdot 160 \cdot 23 \cdot 10^6$ kg cal $= 1.6 \cdot 10^{10}$ kg cal, whereas one kg of TNT only delivers 1000 kg cal when detonating. Out of this follows that an atomic bomb of 3 lbs $^{235}_{92}U$ has the same effect as a bomb of 20,000 tons of TNT. [...]

47. A man named ZINSSER, a Flak rocket expert, mentioned what he noticed one day: In the beginning of Oct. 1944 I flew from Ludwigslust (south of Lubeck), about 12 to 15 km from an atomic bomb test station, when I noticed a strong, bright illumination of the whole atmosphere, lasting about 2 seconds.

48. The clearly visible pressure wave escaped the approaching and following cloud formed by the explosion. This wave had a diameter of about 1 km when it became visible and the color of the cloud changed frequently. It became dotted after a short period of darkness with all sorts of light spots, which were, in contrast to normal explosions, of a pale blue color.

49. After about 10 seconds the sharp outlines of the explosion cloud disappeared, then the cloud began to take on a lighter color against the sky covered with a gray overcast. The diameter of the

still visible pressure wave was at least 9000 meters while remaining visible for at least 15 seconds.

50. Personal observations of the colors of the explosion cloud found an almost blue-violet shade. During this manifestation reddish-colored rims were to be seen, changing to a dirty-like shade in very rapid succession.

51. The combustion was lightly felt from my observation plane in the form of pulling and pushing. The appearance of atmospheric disturbance lasted about 10 seconds without noticeable climax.

52. About one hour later I started with an He 111 from the A/D [aerodrome] at Ludwigslust and flew in an easterly direction. Shortly after the start I passed through the almost complete overcast (between 3000 and 4000 meter altitude). A cloud shaped like a mushroom with turbulent, billowing sections (at about 7000 meter altitude) stood, without any seeming connections, over the spot where the explosion took place. Strong electrical disturbances and the impossibility to continue radio communication as by lightning, turned up.

53. Because of the P-38s operating in the area Wittenberg-Merseburg I had to turn to the north but observed a better visibility at the bottom of the cloud where the explosion occurred. Note [by U.S. Captain Freiberger]: It does not seem very clear to me why these experiments took place in such crowded areas.

[See document photos on pp. 4414–4419.

Paragraph 15 clearly states that the German nuclear weapons program was so advanced that the bomb would have been ready for use by the end of 1944, and that timetable was only slowed by Allied attacks. For independent sources that confirmed that fact, see pp. 5022, 5031, and 5073.

Rudolf Edse's calculation in paragraph 17 agrees well with modern calculations of the amount of U-235 required per ton of explosive yield (p. 5144). Of the roughly 180 MeV of energy released by each uranium fission, Edse appears to have assumed that approximately l60 MeV would be deposited within a short enough distance to directly contribute to the explosion, which would have been a very plausible assumption for him to make. How much did Edse actually know about nuclear weapons? What exactly did he work on, both during and after the war?

Rudolf Zinsser said he took off from Ludwigslust, flew toward the east, and turned to the north (to avoid Allied aircraft going to/from Berlin). That suggests he was somewhere along the Baltic coast, likely in the vicinity of Rügen, when he observed the test. If that was the case, Zinsser took off from a "crowded area" (Ludwigslust) but observed the test site in a much less populated area on the Baltic coast, which is well known to have been filled with test areas for everything from rockets to biological agents. His U.S. interrogator does not seem to have understood that initially, judging by the appended final note from Captain Helenes Freiberger.

Although Zinsser did not admit it, he had most likely been ordered to make multiple flights over the test area in order to make visual observations of the atomic bomb test, and quite possibly to carry cameras or measuring equipment. One flight at the right place and time might have simply been an extraordinary coincidence (and quite improbable, considering that it would have been a high-security area), but two flights shows deliberate intent to observe the test, especially coupled with his highly detailed description.

Zinsser provided many details about the nuclear explosion—such as the strong electromagnetic disturbances, the behavior of the blast wave and the debris cloud over time, and the colors of the cloud—that are scientifically correct and would not have been known to the public (or even many specialists), even after the bombings of Hiroshima and Nagasaki. Moreover, Zinsser had been in custody and under interrogation going back to at least 17 July 1945, well before Hiroshima and Nagasaki. Thus all the details that Zinsser described regarding the explosion strongly support the veracity of his story and the conclusion that what he observed was a nuclear test and not the test of some other sort of weapon. See especially p. 4421.

After two months of further Allied interrogation of Zinsser and investigation of any corroborating evidence, Zinsser's claims were not dismissed. Rather, they were actually upgraded to Top Secret—see p. 4422. Allied officials must have found their postwar investigation of German nuclear weapons tests to be very convincing indeed. Where are the follow-on reports about Zinsser, the other evidence, and the tests? Can they be located and declassified?]

INVESTIGATIONS, RESEARCH, DEVELOPMENTS, AND PRACTICAL USE OF THE GERMAN ATOMIC BOMB

THE FOLLOWINGINFORMATION WAS OBTAINED FROM FOUR GERMAN SCIENTISTS: A CHEMIST, TWO PHYSICAL CHEMISTS, AND A ROCKET SPECIALIST. ALL FOUR MEN CONTRIBUTED A SHORT STORY AS TO WHAT THEY KNEW OF THE ATOMIC BOMB DEVELOPMENT.

1. After the first atomic bomb was released over Hiroshima recently, several Germans began talking about whatever little they knew in this field of German research. Out of the many stories received, the following were selected.

2. Dr. EDSE, well known chemist, wrote:
At the Institute for Physical Chemistry of the Hamburg University I worked on problems concerning nuclear physics under the direction of Prof. Dr. P. HARTECK, and engaged in investigations of behavior and properties of the so-called trans-uraniums, already mentioned by HAHN and STRASSMANN in Berlin, and by JOLIOT - CURIE in Paris.

3. These new elements originated from uranium bombarded by slow neutrons. As the experimental results exhibited some incorrectness and because there were symptoms leading to the disintegration of the nucleus of the uranium, we began making theoretical calculations to investigate the possible disintegration as a whole.

4. Before we were able to report theoretical investigations, U.S. physicists confirmed the reality of the disintegration of the nucleus of uranium when bombarded by neutrons, andffound that the disintegration of one atom delivered an energy of 160 Million Volts. Another result of these investigations was that the disintegration of a piece of uranium, containing only the nucleus ${}^{235}_{92}$U, produces an explosive of enormous powers.

5. This disintegration delivers besides the lighter atoms like Strotium (Sr) and Xenon (X) neutrons to which in turn hits another nucleus and forces it to disintegrate. This process, which is termed "chain reaction", is very quick and delivers an enormous quantity of energy.

6. However, the theory could not be proved for no experiments couldbbe made, because the ordinary uranium does not produce this explosion, but, like the theory predicted, only the isotope with the number 235 posses this quality.

7. Uranium has three isotopes and is composed of:

0.006% : ${}^{234}_{92}$U; 0.720% : ${}^{235}_{92}$U; 99.274% ; ${}^{238}_{92}$U.

The uranium isotope ${}^{235}_{92}$U is separated from ordinary uranium when the chain reaction, the uranium explosion, takes place.

8. This is a difficult problem and requires effective methods of adsorption and desorption to separate the isotopes. I developed in particular the method of desorption and adsorption, while afterwards adding to it the chromatography method, which turned out to be very effective, as indicated by several experiments.

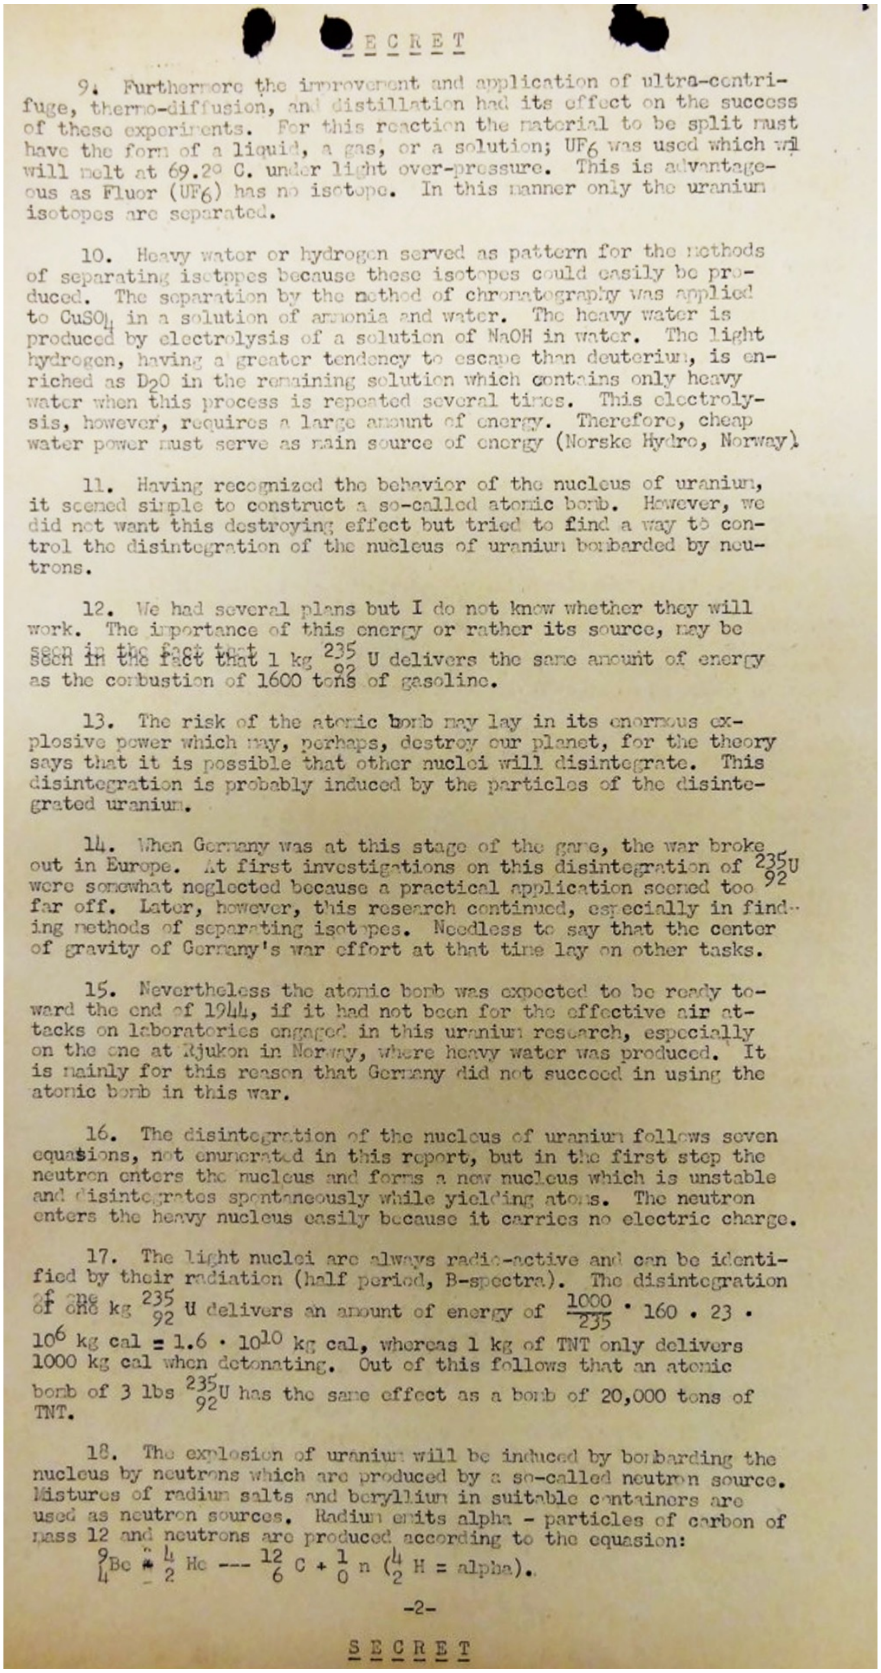
AFHRA Folder 533.619-5 1945



S E C R E T

9. Furthermore the improvement and application of ultra-centrifuge, thermo-diffusion, and distillation had its effect on the success of these experiments. For this reaction the material to be split must have the form of a liquid, a gas, or a solution; UF_6 was used which wil will melt at 69.2° C. under light over-pressure. This is advantageous as Fluor (UF_6) has no isotope. In this manner only the uranium isotopes are separated.

10. Heavy water or hydrogen served as pattern for the methods of separating isotopes because these isotopes could easily be produced. The separation by the method of chromatography was applied to $CuSO_4$ in a solution of ammonia and water. The heavy water is produced by electrolysis of a solution of NaOH in water. The light hydrogen, having a greater tendency to escape than deuterium, is enriched as D_2O in the remaining solution which contains only heavy water when this process is repeated several times. This electrolysis, however, requires a large amount of energy. Therefore, cheap water power must serve as main source of energy (Norske Hydro, Norway)

11. Having recognized the behavior of the nucleus of uranium, it seemed simple to construct a so-called atomic bomb. However, we did not want this destroying effect but tried to find a way to control the disintegration of the nucleus of uranium bombarded by neutrons.

12. We had several plans but I do not know whether they will work. The importance of this energy or rather its source, may be seen in the fact that 1 kg $^{235}_{92}$U delivers the same amount of energy as the combustion of 1600 tons of gasoline.

13. The risk of the atomic bomb may lay in its enormous explosive power which may, perhaps, destroy our planet, for the theory says that it is possible that other nuclei will disintegrate. This disintegration is probably induced by the particles of the disintegrated uranium.

14. When Germany was at this stage of the game, the war broke out in Europe. At first investigations on this disintegration of $^{235}_{92}$U were somewhat neglected because a practical application seemed too far off. Later, however, this research continued, especially in finding methods of separating isotopes. Needless to say that the center of gravity of Germany's war effort at that time lay on other tasks.

15. Nevertheless the atomic bomb was expected to be ready toward the end of 1944, if it had not been for the effective air attacks on laboratories engaged in this uranium research, especially on the one at Rjukon in Norway, where heavy water was produced. It is mainly for this reason that Germany did not succeed in using the atomic bomb in this war.

16. The disintegration of the nucleus of uranium follows seven equations, not enumerated in this report, but in the first step the neutron enters the nucleus and forms a new nucleus which is unstable and disintegrates spontaneously while yielding atoms. The neutron enters the heavy nucleus easily because it carries no electric charge.

17. The light nuclei are always radio-active and can be identified by their radiation (half period, B-spectra). The disintegration of one kg $^{235}_{92}$U delivers an amount of energy of $\frac{1000}{235} \cdot 160 \cdot 23 \cdot 10^6$ kg cal $= 1.6 \cdot 10^{10}$ kg cal, whereas 1 kg of TNT only delivers 1000 kg cal when detonating. Out of this follows that an atomic bomb of 3 lbs $^{235}_{92}$U has the same effect as a bomb of 20,000 tons of TNT.

18. The explosion of uranium will be induced by bombarding the nucleus by neutrons which are produced by a so-called neutron source. Mistures of radium salts and beryllium in suitable containers are used as neutron sources. Radium emits alpha - particles of carbon of mass 12 and neutrons are produced according to the equasion:

$$^{9}_{4}Be + ^{4}_{2}He \text{ --- } ^{12}_{6}C + ^{1}_{0}n \quad (^{4}_{2}H = \text{alpha}).$$

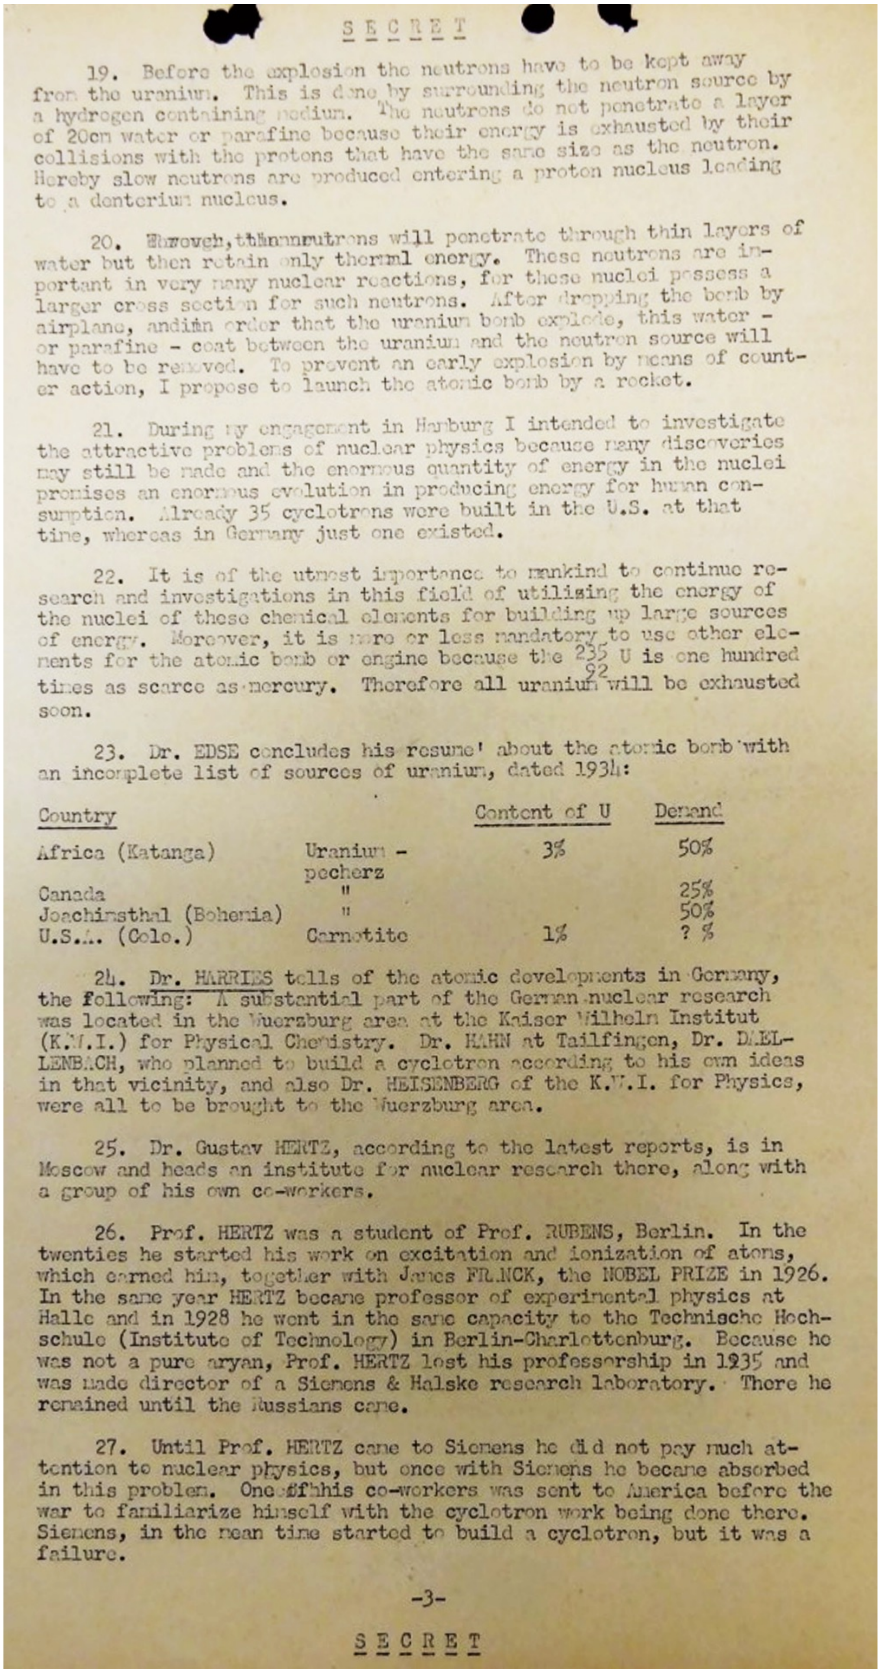
AFHRA Folder 533.619-5 1945



S E C R E T

19. Before the explosion the neutrons have to be kept away from the uranium. This is done by surrounding the neutron source by a hydrogen containing medium. The neutrons do not penetrate a layer of 20cm water or parafine because their energy is exhausted by their collisions with the protons that have the same size as the neutron. Hereby slow neutrons are produced entering a proton nucleus leading to a denterium nucleus.

20. Through, the neutrons will penetrate through thin layers of water but then retain only thermal energy. These neutrons are important in very many nuclear reactions, for these nuclei possess a larger cross section for such neutrons. After dropping the bomb by airplane, and in order that the uranium bomb explode, this water - or parafine - coat between the uranium and the neutron source will have to be removed. To prevent an early explosion by means of counter action, I propose to launch the atomic bomb by a rocket.

21. During my engagement in Hamburg I intended to investigate the attractive problems of nuclear physics because many discoveries may still be made and the enormous quantity of energy in the nuclei promises an enormous evolution in producing energy for human consumption. Already 35 cyclotrons were built in the U.S. at that time, whereas in Germany just one existed.

22. It is of the utmost importance to mankind to continue research and investigations in this field of utilising the energy of the nuclei of these chemical elements for building up large sources of energy. Moreover, it is more or less mandatory to use other elements for the atomic bomb or engine because the $^{235}_{92}U$ is one hundred times as scarce as mercury. Therefore all uranium will be exhausted soon.

23. Dr. EDSE concludes his resume' about the atomic bomb with an incomplete list of sources of uranium, dated 1934:

Country		Content of U	Demand
Africa (Katanga)	Uranium - pecherz	3%	50%
Canada	"		25%
Joachimsthal (Bohemia)	"		50%
U.S.A. (Colo.)	Carnotite	1%	? %

24. Dr. HARRIES tells of the atomic developments in Germany, the following: A substantial part of the German nuclear research was located in the Wuerzburg area at the Kaiser Wilhelm Institut (K.W.I.) for Physical Chemistry. Dr. HAHN at Tailfingen, Dr. DAELLENBACH, who planned to build a cyclotron according to his own ideas in that vicinity, and also Dr. HEISENBERG of the K.W.I. for Physics, were all to be brought to the Wuerzburg area.

25. Dr. Gustav HERTZ, according to the latest reports, is in Moscow and heads an institute for nuclear research there, along with a group of his own co-workers.

26. Prof. HERTZ was a student of Prof. RUBENS, Berlin. In the twenties he started his work on excitation and ionization of atoms, which earned him, together with James FRANCK, the NOBEL PRIZE in 1926. In the same year HERTZ became professor of experimental physics at Halle and in 1928 he went in the same capacity to the Technische Hochschule (Institute of Technology) in Berlin-Charlottenburg. Because he was not a pure aryan, Prof. HERTZ lost his professorship in 1935 and was made director of a Siemens & Halske research laboratory. There he remained until the Russians came.

27. Until Prof. HERTZ came to Siemens he did not pay much attention to nuclear physics, but once with Siemens he became absorbed in this problem. One of his co-workers was sent to America before the war to familiarize himself with the cyclotron work being done there. Siemens, in the mean time started to build a cyclotron, but it was a failure.

28. Since his days at Halle, HERTZ had been interested in the question of separation of isotopes and did quite a bit of pioneering in the field of nuclear research.

29. Dr. HARRIES, a physical chemist himself, believes that quite a bit of the basic research in nuclear physics, with a view toward the construction of an atomic bomb, has already been completed. There still remains much to be done to perfect our methods of production of isotopes in pure form.

30. Dr. LIEB, also a physical chemist and head of the Patent Office in the Speer Ministry, relates some inside stories related to the atom bomb, under the heading:

The Handling Of The Problem Of Nuclear Physics By The Ministry Of Armament And War Production.

31. Because of its set-up and pre-occupation with other tasks this ministry had little time for, or interest in, purely theoretical research. When I entered the ministry in 1941 I immediately told Mr. TODT that this situation was deplorable and that it would cause us great concern and trouble in the future. No change was made because the head of the technical office was a good organisor and a man of actual practice and therefore not interested in matters which could not show practical application quickly.

32. The problem of nuclear physics with its chief aim the utilization of atomic energy was being worked on only by Army Ordnance Research Dept. (Brig. Gen. Dr. SCHUMANN) and by a small Navy group. In view of the importance of the problem this military interest was much too small, as I often pointed out at that time.

33. Early in 1943, with the help of various scientists, we finally succeeded in calling a meeting under the chairmanship of Mr. SPEER himself, where the problem of nuclear physics was disdussed. The meeting was held in Harnack-Haus, K.W.I., Berlin-Dahlem, and was attended by about 50 people.

34. Aside from the Ministry authorities the following named persons were present:

a. Min. Dir. Brig. Gen. Dr. SCHUMANN with his staff.
b. From the Air Force
   Gen. MILCH with staff and research staff members.
c. From the Navy
   Adm. RHEIN, leader of the section "Research, Develppment, Patents".
d. Scientists
   A group of leading physicists and chemists, including: Prof. HEISENBERG, Prof. HAHN, Prof. STRASSMANN, Prof. HARTECK (Hamburg), Prof. JENSEN (Hamburg), Dr. W. GROTH (Hamburg), Prof. BOTHE (Heidelberg), Prof. CLUSIUS (Munich), Prof. SOMMERFELD (Munich), Prof. JOOS (Jena), Dr. ARDENNE (Berlin), and many others.

35. Various lectures were given which covered a survey of the state of research in Germany and, as far as was known, in foreign countries. The nature of these discussions resulted in acquainting the government leaders with the importance of this problem. Minister SPEER promised to give this problem a place in the armament program in accordance with its importance and to aid it financially, and furnish housing, provide materials and personnel.

36. It was generally felt that the results of this research could not materially effect the course of the war. Some people pointed out, however, that the possession of a weapon like the atom bomb would assure to the country having it undisputed superiority for a long time and that the smashing of the atom would be a source of energy for technical development in the post war period.

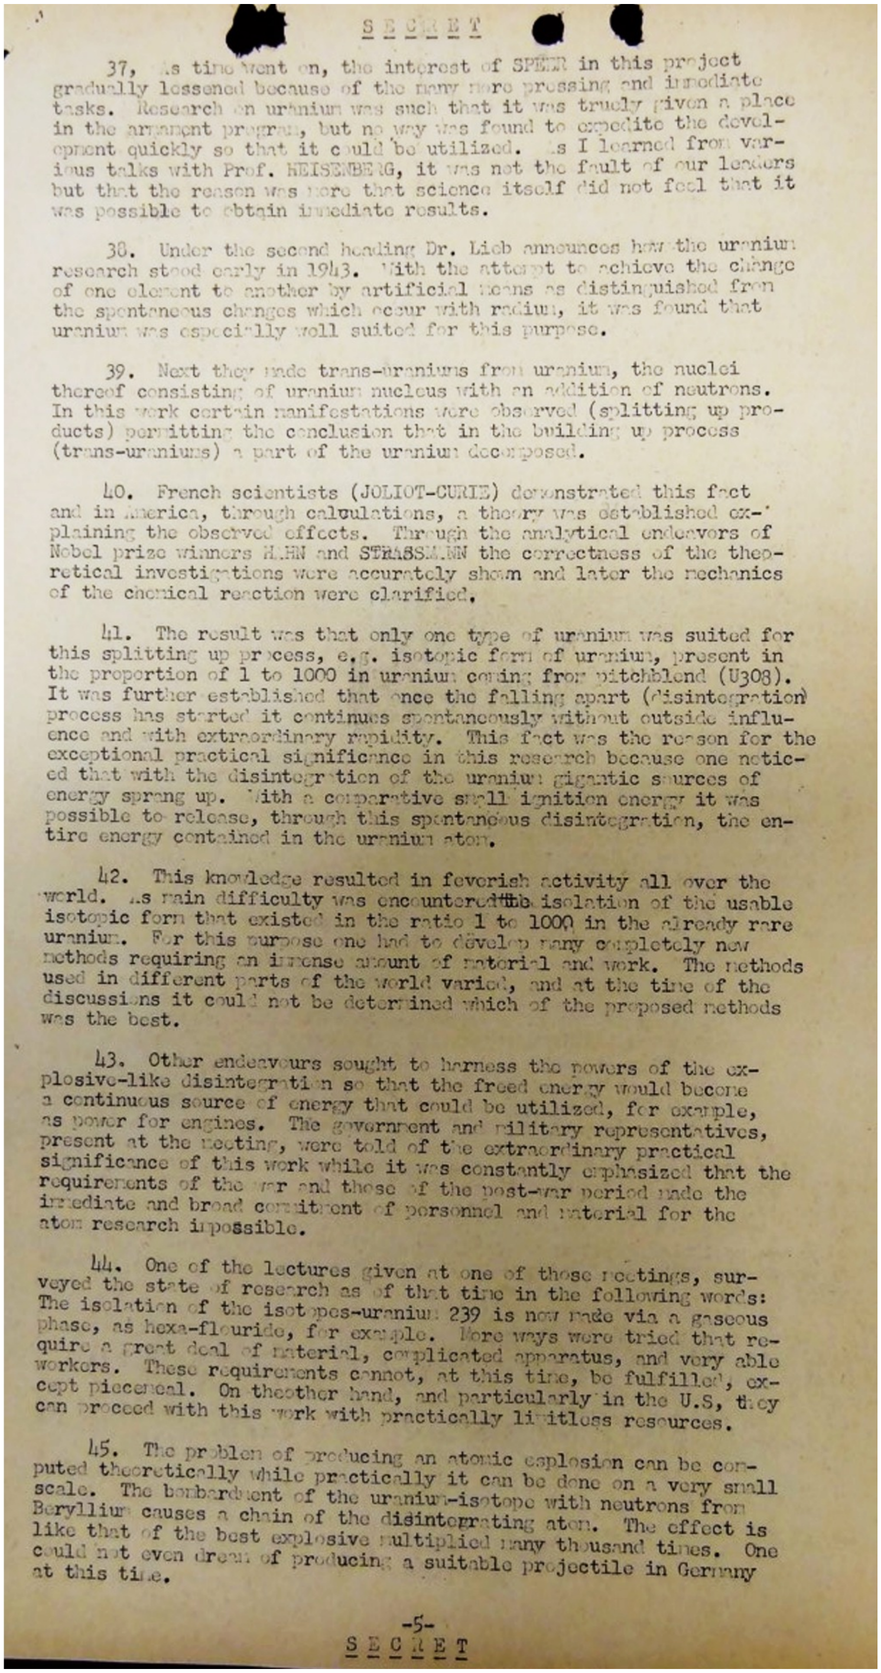
AFHRA Folder 533.619-5 1945



SECRET

37, As time went on, the interest of SPEER in this project gradually lessened because of the many more pressing and immediate tasks. Research on uranium was such that it was truely given a place in the armament program, but no way was found to expedite the development quickly so that it could be utilized. As I learned from various talks with Prof. HEISENBERG, it was not the fault of our leaders but that the reason was more that science itself did not feel that it was possible to obtain immediate results.

38. Under the second heading Dr. Lieb announces how the uranium research stood early in 1943. With the attempt to achieve the change of one element to another by artificial means as distinguished from the spontaneous changes which occur with radium, it was found that uranium was especially well suited for this purpose.

39. Next they made trans-uraniums from uranium, the nuclei thereof consisting of uranium nucleus with an addition of neutrons. In this work certain manifestations were observed (splitting up products) permitting the conclusion that in the building up process (trans-uraniums) a part of the uranium decomposed.

40. French scientists (JOLIOT-CURIE) demonstrated this fact and in America, through calculations, a theory was established explaining the observed effects. Through the analytical endeavors of Nobel prize winners HAHN and STRASSMANN the correctness of the theoretical investigations were accurately shown and later the mechanics of the chemical reaction were clarified.

41. The result was that only one type of uranium was suited for this splitting up process, e.g. isotopic form of uranium, present in the proportion of 1 to 1000 in uranium coming from pitchblend (U308). It was further established that once the falling apart (disintegration) process has started it continues spontaneously without outside influence and with extraordinary rapidity. This fact was the reason for the exceptional practical significance in this research because one noticed that with the disintegration of the uranium gigantic sources of energy sprang up. With a comparative small ignition energy it was possible to release, through this spontaneous disintegration, the entire energy contained in the uranium atom.

42. This knowledge resulted in feverish activity all over the world. As main difficulty was encountered the isolation of the usable isotopic form that existed in the ratio 1 to 1000 in the already rare uranium. For this purpose one had to develop many completely new methods requiring an immense amount of material and work. The methods used in different parts of the world varied, and at the time of the discussions it could not be determined which of the proposed methods was the best.

43. Other endeavours sought to harness the powers of the explosive-like disintegration so that the freed energy would become a continuous source of energy that could be utilized, for example, as power for engines. The government and military representatives, present at the meeting, were told of the extraordinary practical significance of this work while it was constantly emphasized that the requirements of the war and those of the post-war period made the immediate and broad commitment of personnel and material for the atom research impossible.

44. One of the lectures given at one of those meetings, surveyed the state of research as of that time in the following words: The isolation of the isotopes-uranium 239 is now made via a gaseous phase, as hexa-flouride, for example. More ways were tried that require a great deal of material, complicated apparatus, and very able workers. These requirements cannot, at this time, be fulfilled, except piecemeal. On theother hand, and particularly in the U.S, they can proceed with this work with practically limitless resources.

45. The problem of producing an atomic explosion can be computed theoretically while practically it can be done on a very small scale. The bombardment of the uranium-isotope with neutrons from Beryllium causes a chain of the disintegrating atom. The effect is like that of the best explosive multiplied many thousand times. One could not even dream of producing a suitable projectile in Germany at this time.

SECRET

46. The problem of harnessing the released energy in the sense of using it as power for engines, factory machines, transportation (ground, water, air), has not been practically solved as yet. This side of uranium research is clearly a post war problem.

47. A man named ZINSSER, a Flak rocket expert, mentioned what he noticed one day: In the beginning of Oct. 1944 I flew from Ludwigslust (South of Luebeck), about 12 to 15 km from an atomic bomb test station, when I noticed a strong, bright illumination of the whole atmosphere, lasting about 2 seconds.

48. The clearly visible pressure wave escaped the approaching and following cloud formed by the explosion. This wave had a diameter of about 1 km when it became visible and the color of the cloud changed frequently. It became dotted after a short period of darkness with all sorts of light spots, which were, in contrast to normal explosions, of a pale blue color.

49. After about 10 seconds the sharp outlines of the explosion cloud disappeared, then the cloud began to take on a lighter color against the sky covered with a gray overcast. The diameter of the s still visible pressure wave was at least 9000 meters while remaining visible for at least 15 seconds.

50. Personal observations of the colors of the explosion cloud found an almost blue-violet shade. During this manifestation feddish-colored rims were to be seen, changing to a dirty-like shade in very rapid succession.

51. The combustion was lightly felt from my observation plane in the form of pulling and pushing. The appearance of atmospheric disturbance lasted about 10 seconds without noticeable climax.

R. J. Ritter, ed. Inside the Mushroom Cloud. *Newsletter for America's Atomic Veterans.* July 2013, pp. 3–10. National Association of Atomic Veterans. https://naav.com/archives/2013_07_NAAV_Newsletter.pdf

At the instant of the initial nuclear detonation, the fission process generates & emits Alpha (a) & Beta (b) particles, Gamma (g) & X-rays (x), and Electro-Magnetic Pulse (EMP), from within the boiling fireball, after which cooler air is drawn into the center of the rising "toroidal" formation, which itself begins to cool into the familiar mushroom-cloud shape & appearance as it begins to rise to higher altitudes. EMP is the root cause of electronic instrumentation and communication device failures, shortly thereafter, and in close proximity, to the nuclear weapon detonation event. [...]

The distribution of radiation in the mushroom cloud varies with the total yield of the explosion, the type of weapon, the fusion/fission ratio, the burst altitude, the terrain type, and the prevailing weather patterns. Generally it can be said that lower-yield (Kiloton-range) explosions have about 90% of radioactivity in the mushroom head and 10% in the (heat-chute) stem, while Megaton-range detonations tend to have most of the radioactivity in the lower third of the mushroom cloud.

At the instant of detonation, the (fission process) fireball is formed, and the ascending, roughly spherical, mass of hot incandescent gases changes shape due to atmospheric friction and cools its surface by energy radiation, thus turning from a sphere to a violently swirling annular vortex. A (*Rayleigh-Taylor*) instability is formed at the boundary between the hot fireball and the surrounding cooler air. This will then cause turbulence and forms a vortex, which sucks air into its center, creating after-winds and thus cooling itself. As it begins to cool, the speed of its swirling motion begins to slow down, and may stop entirely during later phases. The vaporized parts of the weapon, and other materials, then condense into visible dust (and water vapor mist) forming the cloud; while the white-hot vortex core becomes yellow, then red, then loses any visible incandescence. [...]

The initial colors of some radioactive clouds can be red, or reddish brown, due to the presence of nitrogen dioxide and nitric acids, which are formed from the combination of nitrogen, oxygen, and atmospheric moisture. In the high temperature, high radiation environment of the blast, ozone is also formed. It is estimated that each Megaton of yield produces about 5,000 tons of nitrogen oxides...

Yellow and orange hues are also described. And a reddish hue is later obscured by the white color of water vapor (condensing in the fast flowing air as the fireball begins to cool) and the dark color of smoke and debris that is sucked into the strong updraft. The ozone will give the blast its characteristic corona & discharge like smell. [...]

The intense radiation in the first seconds after a nuclear blast may cause an observable aura of fluorescence, that emits an eerie blue-violet-purple glow of ionized oxygen and nitrogen at some distance from the fireball, surrounding the rapidly forming radioactive cloud. The light is best visible during the night or just before daylight, or just after sundown. The brightness then decreases rapidly, becoming barely visible in 20 to 45 seconds.

S. D. Felkin. 9 October 1945. [NARA RG 38, Entry 98C, Box 9, Folder TSC # 2601–2700]

SECRET.

A.P./W.I.U. (9th. AIR FORCE) REPORT NO. 96/1945.

Will all recipients of the above report please note that it has now been upgraded to TOP SECRET.

S. D. Felkin
Group Captain

[By spring 1945, the U.S. Alsos Mission concluded that Germany never even made a serious attempt to develop an atomic bomb during the war, yet Zinsser's testimony about an apparently successful October 1944 German atomic bomb test was given wide circulation and credence in U.S. military intelligence circles several months later, in August 1945. That fact suggests that U.S. intelligence officials had good reasons to doubt the conclusions of the Alsos Mission.

Moreover, the fact that the Zinsser report was then **upgraded** from Secret to Top Secret in October 1945 suggests that intelligence about German atomic bomb tests became more credible, not less credible, with further time and investigation. What new information did U.S. intelligence learn about the German atomic bomb program and/or Zinsser between August and October 1945 that prompted them to increase the classification level of Zinsser's report?]

Loose memo with no title, date, or signature [NARA RG 38, Entry 98C, Box 9, Folder TSC # 2601–2700]

The Enclosure to this report previously obtained from MIS and incorporated in report on the atomic bomb. A copy of the previous enclosure in Mr. Alberti's file. This report filed without further action or distribution.

[MIS was the Military Intelligence Service. This note appears to have originally been attached to a report, but what report and what enclosure does it reference?

"Mr. Alberti" would have meant Jack H. Alberti, a Naval Intelligence investigator who was one of the first to board the U-234 submarine in May 1945, who conducted many of the interrogations of its passengers and crew, and who was in charge of cataloging and processing its cargo. Alberti also performed the same functions for other captured German submarines (pp. 4866–4881). Does this loose memo suggest that Alberti obtained information from U-234 (or other German submarines) that was related to the Zinsser report about the German atomic bomb program? If so, what information?

Edse, Rudolf. Foreign Scientist Case File. [NARA RG 330, Entry A1-1B, Box 35, Folder Edse, Rudolf]

DATE: 9 May 1946

The following information in the case of Dr. Rudolf Edse is submitted in accordance with letter, Headquarters, Army Air Forces [...]

a. [...] Department head of Chemical Research Branch at LFA, specialist for nuclear physics, chemical basic research, powdered rockets, and thermodynamics.

b. [...] Has written report on possibilities of atomic research at Wright Field.

c. [...] Because of his work on the production of isotopes related to atomic research, he might be employed along similar lines in this country. [...]

Deputy Commanding General
Intelligence (T-2)

Date 26 September 45 [...]

BASIC PERSONNEL RECORD

Arrived: 20 Sept. 1945

I. Name: EDSE, Rudolf [...]

XV. Remarks: Worked on atomic bomb (see attached report)

[The same 19 August 1945 report that included Rudolf Zinsser's description of an October 1944 German atomic bomb test also included information from Rudolf Edse, who said that he had worked on the German nuclear program, and that it had had the goal of having an atomic bomb ready by late 1944 (p. 4411).

The Foreign Scientist Case File ("Paperclip" file) for Rudolf Edse reaffirms that he did work on the German atomic bomb. It also indicates that he gave detailed descriptions of his work for Germany and how he could do similar work for the United States, although those details are not in the files. Edse was brought to the United States in 1945 (much sooner than many other Paperclip scientists) and given lifetime employment in the United States. He does not appear to have ever again mentioned the German nuclear work.

See document photos on pp. 4425–4426.]

HEADQUARTERS
AIR MATERIEL COMMAND
WRIGHT FIELD, DAYTON, OHIO

DATE: 9 May 1946

The following information in the case of Dr. Rudolf Edse
s submitted in accordance with letter, Headquarters, Army Air Forces, ubj: "Exploitation of German and Austrian Scientists", dated 30 April 46 and Joint Intelligence Objectives Agency "Memorandum of Request" .I.O.A. 1/2/M - 26 April 1946).

1. Specialist's potential contribution of interest to the national security of the U.S.

a. Field of fields in which prominent prior to arrival in the U.S. Department head of Chemical Research Branch at LFA, specialist for nuclear physics, chemical basic research, powdered rockets, and thermodynamics.

b. Field or fields in which active since arrival in the U.S. Has designed test stand for powdered and liquid rockets. Has written report on possibilities of atomic research at Wright Field.

c. Field or fields in which the specialist's services are of interest to the U.S. for exploitation.
Chemical research in industries or universities, possibly in collaboration with government projects. Because of his work for the production of isotopes related to atomic research, he might be employed along similar lines in this country.

2. Present location of specialist.
Analysis Division, Intelligence, T-2, AMC, Wright Field, Dayton, Ohio

3. If specialist is to continue under direct supervision of an armed service, the specific office within that service and station at which he will be located.
Analysis Division, Intelligence, T-2, AMC, Wright Field, Dayton, Ohio

4. If specialist is to work in a non-service establishment or a project under contract to an armed service, the nature of the project, and the name and location of the establishment.
Immediate employment to continue at Wright Field. It is anticipated that the scientist will be assigned to a contractor's facility engaged in a research and developement project in the field for which the scientist is best qualified in the near future.

5. The length and terms of the proposed contract or arrangement for employment of the specialist.
Present contract for employee's duty at Wright Field to be extended for three (3) months pending decision on long range exploitation. In any event, the contract must cover the period of time the scientist would be required to work for the government before he can be employed by industry.

6. Type of visa desired by scientist.

Regular immigration visa

7. Type of visa recommended by this headquarters.

Regular immigration visa

8. If immigration visa is desired and recommended, the following information is submitted.

a. Is admission of members of immediate family desired?

yes

b. Names, ages, relationship and present location of immediate members whose entrance is desired.

EDSE,	Ilsedore, Maria,	Wife,	27 years old
	Claus Peter,	Son,	5 " "
	Frances,	Daughter,	3 " "

Present Residence: Hotel Wittelsbach, Bad Kissingen, Bavaria, Germany.

As far as is known to the requesting agency the background of neither the specialist nor any member of his family recommended for entry contains features rendering his entrance and presence in the United States objectionable.

Figure D.676: Edse, Rudolf. Foreign Scientist Case File. [NARA RG 330, Entry A1-1B, Box 35, Folder Edse, Rudolf]

[Luigi Romersa (1917–2007), shown in Fig. D.677, was an Italian military and aerospace journalist who had a long and distinguished career both during and after the war. According to him (and supported by documents such as those below and others [Karlsch 2005]), Benito Mussolini sent him to Germany in October 1944 as his special representative to observe the latest German secret weapons tests and to report back to Mussolini to strengthen his flagging confidence that Germany could win the war. Along with a long list of now well known advanced German rockets, missiles, and jets, Romersa said he was also briefed about V-3 and V-4 rockets and an atomic bomb.

The calendar of Mussolini's appointments has been published, and it shows that Mussolini met with Romersa on 1 October 1944 (before Romersa's trip to Germany) and 30 October 1944 (after his trip), and that Mussolini had met with Romersa on several earlier occasions as well [Guerrazzi 2020, pp. 219, 241, 250, 257–258, 279–280]. This independent information supports Romersa's account.]

29 October 1944 memo for Mussolini to meet with Luigi Romersa [Archivo Centrale dello Stato, Rome, SPD CO RSI B 65, File 5680]

Telefona il Tenente Romersa per informare che è rientrato dal suo viaggio in Germania e per chiedere di essere ricevuto dal DUCE, possibilmente in giornata.	Lieutenant Romersa called to report that he has returned from his trip to Germany and to ask to be received by the DUCE, possibly within the day.

Comunicato

29 October 1944 memo for Romersa to meet Mussolini to report on his trip to Germany

Figure D.677: Luigi Romersa reported observing an apparent atomic bomb test near the Baltic coast in October 1944.

Luigi Romersa. May-June 1955. Le armi segrete di Hitler [Hitler's Secret Weapons]. ***Civiltà delle Macchine.***

Il dottor Schaeffer, referente per la stampa italiana presso il ministero della propaganda tedesco, mi combinò il primo incontro col sottosegretario [Werner] Naumann, braccio destro di Goebbels. Il 6 ottobre 1944, Schaeffer mi comunicò all'albergo che Neumann mi avrebbe ricevuto alle quattordici al Propaganda Ministerium, nel suo ufficio. [...]

Si raccolse per un istante poi scandendo le parole riprese: "Abbiamo raggiunto la disgregazione dell'atomo. Abbiamo la bomba disgregatrice i cui effetti vanno al di là di ogni umana immaginazione..." [...]

Alla fine del suo lungo monologo, Naumann venne a parlare delle "V 2", "V 3" e "V 4" precisando che gli ultimi due tipi, ai quali ne dovevano seguire altri tre, erano radiocomandati e perciò infallibili. Ottenni anche la promessa di una visita alle fabbriche sotterranee e del suo interessamento, presso Goebbels, per assistere a un esperimento di bomba disgregatrice che doveva aver luogo in quei giorni in un'isola del Baltico. [...]

Il 10 ottobre 1944 fui avvertito di tenermi pronto a partire per il nord.

Lasciai Berlino nella notte dell'11 in automobile; mi accompagnavano due ufficiali, uno mi disse che al ritorno sarei stato ricevuto da Goebbels.

Dr. Schaeffer, contact person for the Italian press at the German propaganda ministry, arranged for me to meet first with Undersecretary [Werner] Naumann, Goebbels' right-hand man [p. 4650]. On 6 October 1944, Schaeffer informed me at the hotel that Naumann would receive me at 2:00 p.m. in his office at the Propaganda Ministerium. [...]

He [Naumann] collected himself for a moment, then emphasizing the words resumed: "We have achieved the disintegration of the atom. We have the disintegration bomb whose effects are beyond all human imagination..." [...]

At the end of his long monologue, Naumann came to talk about the "V-2," "V-3," and "V-4," pointing out that the last two types, to be followed by three more, were radio-controlled and therefore precise. I also obtained the promise of a visit to the underground factories and his support, with Goebbels, that I could witness a test of the disintegration bomb which was to take place within days on an island in the Baltic. [...]

On 10 October 1944, I was warned to be ready to leave for the north.

I left Berlin on the night of the 11th by car; two officers accompanied me, one of whom told me that on my return I would be received by Goebbels.

Avevo passato quasi tutta la serata nel rifugio dell'albergo Adlon. Mi era rimasta negli orecchi la voce di un altoparlante che nel corso del bombardamento diceva ai berlinesi dove erano cadute le bombe, il numero degli apparecchi incursori e le località in cui si erano sviluppati incendi. Molti, ancora prima di lasciare il rifugio, sapevano che all'uscita non avrebbero più trovato la casa. Viaggiammo per diverse ore nel buio umido che s'incollava ai vetri come nebbia. Pareva che sui vetri della macchina invece di nebbia colasse buio. Solo alla fine del viaggio seppi che mi trovavo nei pressi di Stralsund, davanti all'isola di Rugen che raggiungemmo con un motoscafo della marina militare.

Rügen era un centro d'esperimenti dove venivano collaudate le nuove armi germaniche. Speciali reparti di truppe d'assalto proteggevano l'isola e ne impedivano l'accesso a chiunque. Per recarsi a Rugen occorreva un salvacondotto a firma del capo dello stato maggiore della Wehrmacht. Ci recammo subito in una zona folta di alberi dove trovammo altri ufficiali e alcuni tecnici. Nel bosco erano stati costruiti rifugi in cemento e piccole case in mattoni. Entrammo in una torretta blindata, semisepolta, attraverso una porticina metallica che venne richiusa con ogni cura. Dentro eravamo in quattro: i due ufficiali che mi avevano accompagnato, un altro uomo vestito di una tuta e io. Aspettavo mezzogiorno col cuore in gola. A mezzogiorno, secondo quanto aveva detto l'uomo in tuta, ci sarebbe stato l'esperimento della "bomba disgregatrice".

La bomba doveva scoppiare a terra, a due chilometri circa dal nostro osservatorio blindato.

I had spent most of the evening in the bomb shelter of the Adlon Hotel. In my ears remained the voice of a loudspeaker, telling Berliners during the bombing where the bombs had fallen, the number of bomber formations, and the locations where fires had broken out. Many people, even before they left the shelter, knew that they would never see their homes again. We traveled for several hours in the damp darkness that stuck to the windows like fog. It seemed that instead of fog, darkness was dripping onto the car windows. Only at the end of the trip did I learn that I was near Stralsund, in front of the island of Rügen, which we reached by a navy speedboat.

Rügen was an experimental center where the new German weapons were tested. Special units of assault troops protected the island and restricted access. To travel to [part of] Rügen required a safe-conduct pass signed by the Wehrmacht's chief of staff. We immediately went to an area thick with trees where we found other officers and some technicians. Concrete shelters and small brick buildings had been built in the woods. We entered an armored, half-buried turret through a small metal door that was closed with every precaution. Inside there were four of us: the two officers who had accompanied me, another man dressed in a suit, and me. I waited for noon with my heart in my throat. At noon, according to what the man in the suit had said, there would be the test of the "disintegration bomb."

The bomb was to explode on the ground, about two kilometers from our armored observatory.

Il tempo non passava mai; i minuti erano ore. Aveva ripreso a piovere e una fumana densa saliva dal sottobosco. La terra, davanti a noi, era marcia e scura, color del saio dei monaci. Squillò un telefono nell'interno del bunker. Avvertirono che l'esperimento era stato anticipato alle 11,45. Mancavano perciò cinque minuti. Feci appena in tempo a consultare l'orologio che sentii un boato tremendo. Il pavimento mi dondolò sotto i piedi e per un istante mi parve che le pareti del rifugio si chiudessero. Davanti non vedevo che fumo, un fumo biancastro, lanoso, che ribolliva come la melma vomitata da una fogna. Si sentirono altri scoppi seguiti da lampi accecanti. Il cielo, tetro e chiuso, era stracciato da lampi bianchissimi. Mi passai una mano sulla faccia, sudavo. Nessuno aprì bocca. Al boato di poc'anzi seguì un silenzio che metteva i brividi. Fu l'uomo in tuta che parlò per primo. Era un colonnello dell'"Heereswaffenamt", l'organo addetto alla preparazione degli armamenti. "Quello che vedremo oggi—disse—è di capitale importanza. Quando potremo lanciare la nostra bomba sulle truppe d'invasione o su una città nemica gli angloamericani saranno costretti a meditare se valga la pena di continuare la guerra o di finirla ragionevolmente. Sono anni che studiamo. Siamo finalmente arrivati in porto". Le sue parole caddero nel silenzio. Lo ascoltavamo tutti con gli occhi.

Time did not pass; the minutes were hours. It had started raining again and a dense fog was rising from the undergrowth. The ground in front of us was rotten and dark, the color of monks' robes. A telephone rang inside the bunker. They warned that the test had been brought forward to 11:45 a.m. It was therefore five minutes away. I barely had time to consult the clock when I heard a tremendous roar. The floor rocked under my feet, and for an instant it seemed to me as if the walls of the shelter were falling in. In front I could see nothing but smoke, a whitish, woolly smoke that bubbled up like slime spewed from a sewer. More bursts were heard followed by blinding flashes. The sky, bleak and closed, was ripped apart by the whitest flashes of lightning. I ran a hand over my face; I was sweating. No one opened their mouth. The roar just then was followed by a chilling silence. It was the man in the suit who spoke first. He was a colonel in the "Heereswaffenamt" [Army Ordnance Office], the body in charge of developing weapons. "What we witness today—he said—is of paramount importance. When we can drop our bomb on invading troops or on an enemy city, the Anglo-Americans will be forced to decide whether it is worth continuing the war or ending it reasonably. We have been working for years. We have finally achieved our objective." His words fell into silence. We all listened to him with our eyes.

Uscimmo dal bunker verso la diciassette, dopo che erano arrivati alcuni uomini vestiti di una tuta mostruosa; in testa portavano uno scafandro del tipo di quello dei palombari, soltanto che era floscio e non aveva viti. Anche noi indossammo uno strano camiciotto di stoffa ruvida, bianchiccia e pantaloni dello stesso tessuto. Camminammo preceduti dai soldati. A mano a mano che avanzavamo la terra ci appariva sconvolta, arata, straziata da paurose voragini. Faceva freddo eppure tutto era arso come se fosse passata sull'isola una ventata di fuoco. Gli alberi non avevano più chioma nè rami; erano ridotti a tronconi abbrustoliti. Col piede urtai qualcosa; mi abbassai e vidi una capra carbonizzata. Si capiva che era una capra perché sulla carne strinata si vedevano ciuffi di peli; aveva la testa schiacciata, come pestata col martello. Le casette di pietra, erano mucchi di calcinacci. Solo le torrette in cemento armato avevano resistito. Qualche capra moribonda belava in maniera disperata; pareva il lamento di un uomo.

In nottata rientrai a Berlino. Alla fine di ottobre vidi Goebbels. Passai una serata nella sua casa e seppi la lui altre cose che Neumann non mi aveva detto. Seppi che esistevano altri due tipi di razzi, l'"A 4" e l'"A 9", uno di dieci tonnellate e l'altro di quindici, muniti di cariche atomiche, dotati di un'autonomia fantastica. Goebbels parlò di alcune migliaia di chilometri e aggiunse che con quei missili la Germania avrebbe bombardato anche l'America. Per il piccolo, claudicante ministro della propaganda che fu l'anima della Germania in guerra, occorrevano sei o sette mesi prima che il suo paese fosse in grado di sferrare un'offensiva che lui stesso, allora, definì infernale.

[...] Nel 1936 gli stessi tecnici, Walter Dornberger, Thiel e Wernher von Braun, inventore della "V 2", ora in America, impiantarono il centro di Peenemünde da cui uscirono tutte le bombe volanti, compreso l'"Aggregat 10", un razzo del peso di 65 tonnellate capace di volare per 5000 chilometri con il quale il Führer si riprometteva di martellare gli Stati Uniti.

We left the bunker around 5:00 p.m., after some men dressed in monstrous suits had arrived; on their heads they wore a helmet like that of a diving suit, only it was floppy and had no screws. We, too, wore a strange smock of rough, off-white cloth and pants of the same fabric. We walked ahead of the soldiers. As we advanced, the land appeared to have been shocked, plowed, torn apart by fearful chasms. It was cold and yet everything was scorched as if a blast of fire had passed over the island. The trees no longer had foliage or branches; they were reduced to burnt trunks. My foot bumped into something; I bent down and saw a charred goat. You could tell it was a goat because tufts of hair could be seen on the streaked flesh; its head was crushed, as if it had been pounded with a hammer. The little stone buildings were piles of rubble. Only the concrete bunkers had been resistant. A few dying goats bleated desperately; it sounded like a man's lament.

During the night I returned to Berlin. At the end of October I saw Goebbels. I spent an evening at his house and from him learned other things that Naumann had not told me. I learned that there were two types of rockets, the "A-4" and the "A-9," one of ten tons and the other of fifteen, equipped with atomic warheads, with a fantastic range. Goebbels spoke of several thousand kilometers and added that with those missiles Germany would also bomb America. According to the little, limping propaganda minister who was the soul of Germany at war, it would take six or seven months before his country would be able to launch an offensive that he himself then defined as hellish.

[...] In 1936 the same technicians, Walter Dornberger, Thiel, and Wernher von Braun, inventor of the "V-2," now in America, established the Peenemünde center, from which came all the flying bombs, including the "Aggregat 10," a rocket weighing 65 tons capable of flying 5,000 kilometers, with which the Führer vowed to hammer the United States.

[Romersa misspelled the name of Goebbels' undersecretary Werner Naumann as "Neumann." I have corrected the spelling here.

A French translation of Romersa's *Civiltà delle Macchine* article was published as:

> Luigi Romersa. J'ai Vu Exploser La Bombe Atomique de Hitler!
> *Paris-Presse L'Intransigeant*. 19 November 1955 p. 14.

In 1984, Romersa repeated his claims in a Spanish article:

> Luigi Romersa. August-September 1984. Las "Armas Secretas" de Hitler,
> algo más que fantasía. *Defensa* No. 76–77.

He continued to make the same claims for the rest of his life, as shown by:

> Luigi Romersa. 2005. *Le Armi Segrete di Hitler*. Milan: Mursia.

and the following article.]

John Hooper. 30 September 2005. Author fuels row over Hitler's bomb. *The Guardian.* [https://www.theguardian.com/world/2005/sep/30/books.italy]

Mr Romersa [...] lives today in an elegant flat in the Parioli district of Rome. His study walls are covered with photographs from a career during which he interviewed many of the major figures of the 20th century, from Chiang Kai-shek to Lyndon Johnson. Though he suffers from some ill-health these days, he is still lucid and articulate.

He told the *Guardian* how, in September 1944, Italy's wartime dictator, Benito Mussolini, had summoned him to the town of Salo to entrust him with a special mission. Mussolini was then leader of the Nazi-installed government of northern Italy and Mr Romersa was a 27 year-old war correspondent for *Corriere della Sera.*

Mr Romersa said that when Mussolini had met Hitler earlier in the conflict, the Nazi dictator had alluded to Germany's development of weapons capable of reversing the course of the war. "Mussolini said to me: 'I want to know more about these weapons. I asked Hitler but he was unforthcoming'."

Mussolini provided him with letters of introduction to both Josef Goebbels, the Nazi propaganda chief, and Hitler himself. After meeting both men in Germany, he was shown around the Nazis' top-secret weapons plant at Peenemünde and then, on the morning of October 12 1944, taken to what is now the holiday island of Rügen, just off the German coast, where he watched the detonation of what his hosts called a "disintegration bomb".

"They took me to a concrete bunker with an aperture of exceptionally thick glass. At a certain moment, the news came through that detonation was imminent," he said. "There was a slight tremor in the bunker; a sudden, blinding flash, and then a thick cloud of smoke. It took the shape of a column and then that of a big flower.

"The officials there told me we had to remain in the bunker for several hours because of the effects of the bomb. When we eventually left, they made us put on a sort of coat and trousers which seemed to me to be made of asbestos and we went to the scene of the explosion, which was about one and a half kilometres away.

"The effects were tragic. The trees around had been turned to carbon. No leaves. Nothing alive. There were some animals—sheep—in the area and they too had been burnt to cinders."

On his return to Italy, Mr Romersa briefed Mussolini on his visit. In the 1950s, he published a fuller account of his experiences in the magazine *Oggi.* But, he said, "everyone said I was mad".

2004 testimony of Elisabeth Mestlin, as described by Wolfgang Ebsen [Karlsch and Petermann 2007, p. 163]

Sie erinnerte sich aufgrund glaubwürdiger Umstände genau an das außergewöhnliche Ereignis. Frau Mestlin fuhr nach der Bombardierung von Stralsund am 6. Oktober 1944 zu ihren Kindern nach Vitte auf der Insel Hiddensee. Auf der Insel Hiddensee hörte sie am 12. Oktober 1944 eine heftige Explosion und sah eine große Staubwolke an der Südspitze der Halbinsel Bug.	She remembered the extraordinary event because of credible circumstances. After the bombardment of Stralsund on 6 October 1944, Ms. Mestlin went to see her children in Vitte on the island of Hiddensee. On the island of Hiddensee on 12 October 1944, she heard a violent explosion and saw a large cloud of dust on the southern tip of the Bug peninsula.
Interview mit Elisabeth Mestlin vom 5.10.2004, aufgezeichnet von Lutz Riemann, ausgestrahlt vom NDR am 13.3.2005.	Interview with Elisabeth Mestlin from 5 October 2004, recorded by Lutz Riemann, broadcast by NDR on 13 March 2005.

[In some sources, Elisabeth Mestlin's name is given as Ilse Menslin.

Bug is a peninsula on the northwestern side of Rügen island. During the war, it was used as a German naval base. It is geographically rather isolated from the rest of Rügen and from the Baltic coastline of Germany. Because of its relative isolation and its highly secure military status, it would have been a good location for atomic bomb development and/or testing. It is known that new types of bombs were tested in that area [e.g., Stüwe 1999, pp. 451, 461]. Advanced scientific testing was conducted at other locations on the Baltic coast of Germany—virology at Riems island, rockets and jets at Peenemünde, radar on the German-occupied Danish island of Bornholm off the coast, etc.

Vitte is the main village on Hiddensee island. It is approximately 3 km west of the southern tip of the Bug peninsula. It would be reasonable to expect a large explosion on Bug to be audible and visible from the eastern ocean side of Vitte.]

Heinrich Himmler's chief adjutant Werner Grothmann on test explosions [Krotzky 2002]. For a discussion of the background and reliability of this source, see pp. 3396–3397.

[S. 31] Also, es ist so: Mir ist bekannt, dass es vier Atomversuche gab. Der erste noch 1943 im Herbst in der Nordsee, der ist gescheitert. Dann zwei 1944 im Herbst und im Spätherbst. Einer davon am Boden, also auf einem niedrigen Gestell, der spätere in der Atmosphäre am Fallschirm. Der im Winter 1944 in der Luft war brisant und die Ladung war auch größer. Das könnte im November gewesen sein. Der letzte Versuch war dann wieder mit kleiner Ladung im März 1945. Wo die Versuche waren, möchte ich jetzt noch nicht sagen, weil sich sonst die Bevölkerung unnötig aufregen würde.

[p. 31] Well, it is so: It is known to me that there were four atomic tests. The first still in 1943 in the autumn in the North Sea, which failed. Then two in 1944 in the autumn and the late autumn. One of them on the ground, that is on a small stand, the later one in the atmosphere on a parachute. That one in winter 1944 in the air was highly explosive and the charge [fuel] was also larger. That could have been in November. The last test was then again with a small charge in March 1945. Where the tests were I would like to not say now, because otherwise the population would be unnecessarily upset.

[S. 32] Ich kann aber mit Bestimmtheit erklären, dass mir von sechs Atombomben berichtet wurde, die aus drei verschiedenen Forschungsanlagen stammten. Alle waren Prototypen. Darüber hinaus gab es einige Kleinstkörper, die für die Laborversuche vorgesehen waren. Für den Versuch im Winter 1944 ist allerdings eine größere Ladung verwendet worden, wie ich ja schon sagte.

[p. 32] I can definitely declare that I was told of six atomic bombs that came from three different research installations. All were prototypes. In addition, there were some very small devices that were intended for laboratory experiments. For the experiment in the winter of 1944, a larger charge was indeed used, as I already told you.

[S. 13] Als im Oktober 1944 klar war, dass die Theorie zur Atombombe grundsätzlich stimmt, ist in verschiedenen Kreisen natürlich auch darüber nachgedacht worden, was man dann machen sollte, um den Krieg schnellsten zu beenden.

[p. 13] When, in October 1944, it was clear that the theory of the atomic bomb was in principle correct, various circles had, of course, also been thinking about what should be done to end the war as quickly as possible.

[S. 17] Ich möchte aber mal etwas zu dem Hintergrund sagen, warum Himmler nicht zu dem Atombombentest am vierten März nach Thüringen gekommen ist.

[p. 17] But I would like to say something about the background, why Himmler did not come to Thuringia for the atomic bomb test on the fourth of March.

[S. 40] Dieser Versuch sollte den Beweis bringen, dass das Zündsystem stabil arbeitet und der Vorbereitung eines entsprechenden Angriffs dienen, der mit einer Rakete geflogen werden sollte.

[p. 40] This test was to provide proof that the ignition system worked stably and to serve as preparation for a corresponding attack that was supposed to be flown with a rocket.

[S. 40] Das sind aber alles Projekte gewesen, wo die Industrie auf die eine oder andere Weise beteiligt war. Ob die Facharbeiter stellten, oder ihre spezielle technische Kompetenz. Natürlich lieferten die auch Einzelstücke oder Bauteile für Prototypen oder für die Versuche. Das war ja kein Problem, weil man einem Metallstück ja nicht ansieht, für welchen Zweck es gebraucht wird. Sehen Sie, das ging soweit, dass das Gestell für unseren Atomversuch in Thüringen von einer Schlosserei aus Thüringen hergestellt wurde. Ich weiß es deshalb, weil, als man sich dort traf, Diebner auf die Frage von jemandem, ob den unsere Leute gebaut hätten erklärte, der wäre von einer Schlosserei aus der Gegend. Die hätten ja nicht erfahren, wofür der gedacht war.

Der Versuch ist gerade dort durchgeführt worden, obwohl das ja in bewohntem Gebiet liegt, weil wir durch den Kriegsverlauf nicht mehr viel Auswahl hatten und natürlich, weil ja auch die Zeit drängte. Also sind wir gleich dort geblieben, wo auch das erforderliche Material erzeugt und auch gelagert worden war. Außerdem hatten hier unsere Leute und die von Diebners anderer Gruppe ihre Labors und die Entwicklungsabteilung. Und hier in der Nähe war ja auch die Serienproduktion der Uran-Bombe geplant gewesen. Außerdem sollte Anfang Januar die Zünderfertigung oder zumindest die Entwicklung eines für die Uran-Bombe vorgesehenen Zündsystems nach meiner Erinnerung ebenfalls hierher verlagert werden. Das war aber in einem aufgelassenen Bergwerk untergebracht, nicht in einer der Anlagen vor Ort. Diebner hatte angeblich, versichert, die Sprengwirkung wäre bei der geringen Menge, die der Versuch kosten würde, ganz gering. Leider hat sich seine Vorhersage aber nicht bestätigt. Das was da geschehen ist, war scheußlich. Außerdem hat es in der Umgebung noch Folgen gegeben, wobei ich nur hörte, dass Ärzte, die bei uns unter Vertrag standen, dort eingesetzt werden mussten.

[p. 40] But these were all projects where industry was involved in one way or another. Whether the skilled workers were placed, or their special technical competence. Of course, they also supplied individual pieces or components for prototypes or for the tests. That was not a problem, because one cannot tell from a piece of metal for what purpose it is needed. You see, that went so far that the stand for our atom test in Thuringia was manufactured by a metalworking shop in Thuringia. I know it because when meeting there, Diebner explained, in response to someone's question about whether our people had built it, it was from a metalworking shop from the area. They would not have known what it was meant for.

The test was carried out directly there, even though that was in an inhabited area, because due to the course of the war we did not have a lot of choice and, of course, because time was also critical. So we just stayed where the necessary material was produced and stored. In addition, our people and those of Diebner's other group had their laboratories and the development department. And here close by, too, the mass production of uranium bombs had been planned. In addition, at the beginning of January, the ignition [system] production or at least the development of an ignition system intended for the uranium bomb was likewise supposed to be relocated here, according to my memory. But this was placed in an abandoned mine, not in one of the facilities on site. Diebner allegedly assured that the explosive effect would be quite small for the small amount [of fuel] that the test would require. Unfortunately his prediction was not confirmed. What happened there was horrible. In addition, there were other consequences in the surrounding area, of which I only heard, that doctors, who were under contract with us, had to be deployed there.

[S. 13] Nach dem dritten Versuch, also das war dann der vom März in Thüringen, ist Hitler informiert worden. [...] Es war doch so, als der Versuch in Thüringen gelang, sind nach meiner Kenntnis unbeabsichtigt Arbeitskräfte aus einem Lager ums Leben gekommen. Die Leute, die bei dem Versuch dabei waren, hatten zum Teil größte Bedenken, ob man die Waffe einsetzen sollte, also ich meine, es war ja klar, dass im Einsatz nicht mit einem Testkörper operiert werden würde.

[p. 13] After the third attempt, which was the one from March in Thuringia, Hitler was informed. [...] It was like this: when the test in Thuringia succeeded, according to my understanding, workers from a camp died accidentally. The people involved in the test had some of the biggest concerns about using the weapon, I mean, it was clear that deployment would not involve an experimental device.

[S. 43] Was bleibt, sind die drei gelungenen Atomwaffenversuche, darunter ein größerer, ein Fehlschlag und ein Unfall.

[p. 43] What remains are the three successful atomic weapons tests, including a big one, a failure, and an accident.

[According to Grothmann, at least six prototype atomic bombs were produced at at least three different facilities. Of those, at least four were detonated in test explosions:

1. A test in autumn 1943 in the North Sea that failed. Grothmann provided no other details, and little information is available from other public sources. (For some possibly related sources, see pp. 4404, 5011, 5034.) Elsewhere, Grothmann stated that fission fuel was very scarce even in 1944–1945 and that the implosion system was not perfected until 1944. Although it is very surprising that a test would even be attempted in 1943, either or both of those problems could have easily caused the failure.

2. A test in the first half of October 1944 at a location that Grothmann refused to name for fear of public reaction. The bomb was on a low stand or holder, and its explosion successfully demonstrated the principles of the device. This information is consistent with statements from Rudolf Zinsser (p. 4408), Luigi Romersa (pp. 4427–4434), Elisabeth Mestlin (p. 4435), and other sources, who described a test explosion on the Baltic coast, possibly on Rügen island, on approximately 12 October 1944. That area of the Baltic coast has long been a popular tourist destination for people from all of Germany and beyond, which may explain Grothmann's reluctance to name the location.

3. A test during or around November 1944 at another location that Grothmann refused to name for fear of public reaction. That bomb was suspended from a parachute (presumably after having been dropped by a large aircraft), contained more fission fuel, and had a larger explosive yield. This information is consistent with statements from Robert Jackson (p. 4458), Felix Kersten (p. 4470), Wilhelm Wulff (p. 4471), and other sources, who described a test explosion near Auschwitz, which was said to have occurred over a specially constructed concentration camp and its inmates. If that is true, both that specific war crime and the larger issue of war crimes at Auschwitz and elsewhere in Poland could explain why Grothmann would not name the location.

4. A test on 4 March 1945 in Thuringia. Although Grothmann did not name the specific location, he said the test occurred very close to the research installation, and he separately said the research installation was located at or adjacent to the Ohrdruf Truppenübungsplatz military base. According to Grothmann, the bomb was mounted on a test stand, used a smaller amount of fission fuel, and had a smaller explosive yield, but was intended to test an improved implosion system that would be light enough to be carried on a rocket. Nonetheless, the explosive yield was still larger than had been expected, killed a number of workers, contaminated the area, and necessitated the use of special doctors to treat local people who were affected by the “horrible” event. This description closely matches those given by Ivan Ilyichev (pp. 4481–4485), Oscar Koch (p. 4566), Cläre Werner (p. 4551), Heinz Wachsmut (p. 4557), and other sources.

Assuming that Grothmann did not overlook any tests or failures and that there were at least six bombs as he stated, at least two bombs remained at the end of the war. Grothmann reported that the United States captured at least one bomb (p. 5042).]

D.11 Possible ~November 1944 Test Explosion in Poland

[There may have been a test explosion in Poland in approximately November 1944, as reported by multiple sources:

- As already mentioned, a Top Secret U.S. cable from March 1946 stated that a "capable young engineer" in Poland knew that atomic bomb casings included a layer of cadmium, which was true for the implosion bomb designs described by both Ilyichev and Schumann (p. 4255). The Polish engineer's knowledge suggests that German-run industry in wartime Poland was involved in developing and/or testing an atomic bomb.
- Robert Jackson, chief U.S. prosecutor at the Nuremberg trials, stated on 21 June 1946 that he had received evidence that a new bomb design producing very intense heat had killed 20,000 Jewish prisoners in a specially constructed test village near Auschwitz (p. 4458).
- In August 1946, a FIAT intelligence document mentioned that there had been a number of unconfirmed reports that "about Christmas 1944, successful experiments were conducted in Pomerania with V-1 and atomic warheads, radio directed. The ensuing crater was 2 km in diameter" (p. 4460). There was also an August 1944 report of nuclear weapons development work in Pomerania (p. 4396).
- In December 1946, Otto Hahn said that there had been rumors that "atom bomb tests had been carried out in Poland during the last year of the war which were supposed to have had an effect similar to the first atom bomb dropped on Hiroshima though on a considerably smaller scale" (p. 4460).
- Gezo Mansfeldt, a survivor of Auschwitz, reported in December 1946 that he was frequently interrogated by Soviet officials about high-security wartime production work at Auschwitz and that he "learned of the atomic bomb tests" (p. 4463).
- A 1947 U.S. intelligence report stated that the Germans built a heavy water production plant near Auschwitz and that it was removed by the Soviets (p. 4463). Heavy water would only be useful for nuclear work, and the production of heavy water near Auschwitz suggests the presence of other nuclear work in Poland.
- Another 1947 intelligence report discussed wartime nuclear weapons work at Tucheler Heide in Poland, including the production of ^{235}U and ^{239}Pu and apparently even 1–5 kg fission pits for atomic bombs (p. 4902).
- In 1947, Heinrich Himmler's physical therapist, Felix Kersten, stated that Franz Göring, a senior SS security official, had told him that a new bomb design producing several thousand degrees of heat had killed 20,000 Jewish prisoners in a specially constructed test village near Auschwitz (p. 4470).
- Heinrich Himmler's personal astrologer, Wilhelm Wulff, confirmed that Franz Göring had stated that a new bomb design producing several thousand degrees of heat had killed 20,000 Jewish prisoners in a specially constructed test village near Auschwitz (p. 4471).
- Werner Grothmann stated that there was a successful atomic bomb test in or around November 1944 (p. 4436).

Some of the major sources and details are summarized in Table D.5.]

		Primary sources for ~November 1944 test							
		Polish engineer March 1946	**Jackson June 1946**	**Rumor cited by Hahn Dec. 1946**	**Mansfeldt Dec. 1946**	**Edmund Tilley August 1947**	**Kersten 1947**	**Wulff 1973**	**Grothmann 2000-2002**

PW INTELLIGENCE BULLETIN No. 2/25

21. Bunawerke MONOWITZ nr AUSCHWITZ

See ANNEXES I and II.

Preamble. PW, a Slovak, was drafted into the Slovakian labor service 15 April 43 and sent to a guard coy in AUSCHWITZ. After three days black SS uniforms were issued the coy. PW remained there until July 44.

Location. The factory, commonly known as Bunawerke MONOWITZ, houses the two firms BUNA and IG FARBEN. Completely underground, it can nevertheless be located easily by six large wooden barracks, used as quarters for foremen and head mechanics, and situated atop a hill.

Personnel. Employed in the factory are appr 30,000 workers, all political prisoners whose work is supervised by SS guards. The workers—Poles, Russians, Czechs, and Jews—march to and from the factory from the nearby concentration camp at AUSCHWITZ, where a total of 680,000 prisoners are detained. There are two shifts, 0600 to 1800 and 1800 to 0600.

Products. Synthetic rubber products and Flak guns are turned out in the BUNA section. Although never inside the factory, PW has seen tanks (believed to be Tiger IIs) being taken from the factory grounds by rail.

PW does not know what is manufactured by the IG FARBEN section of the factory, but he saw the name on some of the barracks and on papers.

Guards. A total of 37 guard towers are situated at irregular intervals around the area. Every second tower has one machine gun. Encircling the area is electrically-charged wire fencing four meters high, run in 2 rows three meters apart. The area is flood-lighted at night.

Rubber Plants. There are appr 35 sq km of fields covered with rubber plants brought from RUSSIA. The fields and plants are maintained entirely by Russian civilians. The plants are used in the manufacture of rubber product.

LEGEND FOR ANNEX I (ITEM 21)

1. DAW uniform factory.
2. AUSCHWITZ concentration camp, containing 30,000 prisoners.
3. GUSTLO shell factory (connected with BUNA), employing 1,500.
4. BUNA underground factory (See ANNEX II).
5. Supply and ordnance depot.

6. "REISKO" Jail for women, with 275 prisoners.
7. BUNA synthetic rubber laboratory.
8. Same as 7.
9. Shed for storage of plants used for rubber production.
10. Concentration Camp BIRKENAU I. 150,000 prisoners, Jews of all nationalities.
11. Salvage dump for planes. [...]
12. Barracks for RR police.
13. Power distribution plant.
14. Flour mill.

    [...] 15. PW believes a new plant was under construction here. Circles indicate reservoir-like concrete pits 8 m in diameter.

    16. Incomplete concrete foundations 6-7 m in diameter.

LEGEND FOR ANNEX II

1. Main entrance to area, with iron gate.
2. Second entrance.
3. Section of guard towers (37 encircle the factory area. Every other one contains LMG. Dimension: 2 m x 2 m x 10 m).
4. Air-raid shelters.
5. Entrance guard booth.
6. Cistern. (PW is not sure of contents, probably liquid rubber (?)).
7. Three ventillation towers, appr. 10 m high and 1 m in diameter.
8. Tower appr 7 m high and 4 m in diameter. Has been observed emitting steam.
9. Tower appr 8 m high and 1 m wide. Has been observed emitting smoke.
10. Coal shed, 20 m x 30 m x 1 m.
11. Wooden barracks appr 30 m x 20 m x 5 m. Roofs camouflaged with paint and walls painted green. Windows in the roofs only. Barracks rest on cement foundations. Under each of these barracks is a subterranean hall housing the factory proper.
12. Electrified fence.

[...] Note: The factory grounds are completely grassed. There are heavy Flak installations throughout the area. Over the whole area are barrage balloons. PW does not know where the entrances to the actual underground factory are located.

Summary of Information

Germany: Silesian Synthetic and Power Plants.

1. A synthetic petrol plant has been built at Blechhammer. A power station of 100-250,000 KW is under construction.

2. A power station of about 260,000 KW is being built for the I.G. plant at Oswiecim. A 110 KV H.T. transmission line has been erected between Chorzow Malobadz and Jaworzno. Under construction there is a 110 kW line from Laziska to Oswiecim and from Jaworzno to Oswiecim.

3. The Schaffgott'che Oderthal power station had an output of 17 million k Wh in February. A total of 310 million kWh passed through Oderthal transformers for EWAG in 1942. From this the PE v received 105 million kWh. In February the EWAG received 31.5 million kWh of which 11.4 were OE v.

4. A new 40,000 kW turbo-generator has been mounted in Chorzow.

5. Four turbo-generators of 50,000 kW combined capacity have been installed in the Tarnow district, probably at Roxnow.

The information concerning the power lines to Oswiecim is confirmed by a recent report that the I.G. plant there was to be supplied with power from the Oberlasisk power station.

The extra power requirements in the Chorzow and Tarnow districts may be partly explaines by the new nitrogen plants there.

For purposes of comparison the power plants of other synthetic oil plants are estimated as follows:

Germany: Blechammer (Censorship)

In early November there was a big explosion in the works which killed several people.

Germany: Blechammer (British P/W)

Informant had worked at I. G. Heydebreck until November 1942. He only did odd jobs in the Siemens section of the factory which made gas producer generators. The main factory made synthetic petrol and 15-20 tank wagons left the factory daily.

Germany: Reported Synthetic Oil Plant at Urdinger (Air Rec)

"The only significant new construction visible on available photographs of Krefelt/Urdingen, is the Plant near the I.G.F. works. The purpose of this plant is at present unknown and the plant itself appears quite unlike an oil plant. The surrounding district has also been examined, but no possible synthetic oil plant is present.

There may be a plant two or three miles distant from Krefeld/Urdingen, which has not been covered by photographs. If so the name will be misleading. It might however refer to an office address for a plant outside of town."

H. W. Dix to Francis Smith. Subject: Heavy Water. 26 December 1944. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-3 GERMANY: US Wartime Positive Int. (Nov. 44–June 45)]

This office has received the following comments from our Swedish people and it is dated 22 November 1944 and has a B-2 rating.

> Heavy water is manufactured primarily in Norway by I. G. at Norsk Hydro. However, manufacture in Germany at the Bayrische Stickstoffwerke in Piesteritz or Auschwitz is certainly a possibility.
>
> I have heard nothing about experiments with heavy water as an explosive. After all, that would be a case of splitting the atom!

Monthly Intelligence Summary. II Information on Possible TA Sites. January 1945. [NARA RG 77, Entry UD-22A, Box 168, Folder 202.3-1 LONDON OFFICE: Combined Intell Rpts.]

Report received from OSS Stockholm mentions the possibility that heavy water is being made in Germany at Piesteritz or Auschwitz at The Bayrische Stickstoffwerke, but the same source said he has heard nothing about heavy water in connection with an explosive. While coverage of these two towns has been requested, Auschwitz is in that part of Germany which is now in Russian hands.

U.S. Embassy, Warsaw. 12 August 1947. Report No. R-107-47, MIS-390731. Subject: Plants producing heavy water. [NARA RG 319, Entry 85A, Box 2534, Folder 390731–390740] [See document photo on p. 4454.]

1. It is believed that no plants designed specially for the production of heavy water exist in Poland. It is reliably reported that the Germans built one such plant near OSWIECIM (Auschwitz) but that it was destroyed or moved out by the SOVIETS in 1945.

2. A definite potentiality exists for the production of heavy hydrogen as a by-product of coal hydrogenation. There is believed to be small likelihood of the realization of this potential, since the Polish government insists on the complete orientation of industry toward the physical reconstruction of the country. [...]

[Heavy water would be of little use for anything other than nuclear work, specifically as a moderator for fission reactors. Because it was "reliably reported" that the Germans had built a heavy water production plant near Auschwitz and that the Soviets had removed, and that heavy water manufacturing was given such a high priority amid all the other war-related materials that urgently needed to be produced, these documents appear to confirm that the I.G. Farben and/or other installations at Auschwitz were (at least in part) manufacturing materials for a nuclear weapons program.]

BIOS 562. ***The German Phosphorus Industry at Bitterfeld & Piesteritz.*** **p. 41.**

[Piesteritz]

The plant was well laid out and in excellent condition but at the time of inspection was partially dismantled. The whole of the dearsenicating equipment had been removed.

BIOS 889. ***Manufacture of Nitric Acid, Ammonium Nitrate and Fertilizers at Bitterfeld, Wolfen and Piesteritz.*** **p. 1.**

Little information however was obtained from Piesteritz. The plant for making nitric acid and ammonium phosphate had already been completely dismantled, for transfer to Russia. It is believed that information on these plants had been obtained earlier by American investigators.

[If there was any nuclear-related work (such as heavy water production) at Piesteritz, the Russians would have removed all evidence of that before other countries ever had a chance to see it.]

Sub-source (1): Polish DP, native of Bydgoszcz, editor of DP paper in Salzburg, known and trusted informant.

Sub-source (2): Russian officer, deserter from Polish Army, who left Poland in late November 1945.

1. According to sub-source (1), the Germans constructed a dynamite plant in 1940 in a forest along the Bydgoszcz canal between Bydgoszcz and the river Wisle; the distance between the two points is approximately 8 kilometers. The forest covers about nine square kilometers. Some units of the plant extend two stories below ground. Sub-source obtained this information from reliable friends living in the area.

2. Sub-source (2) was in the vicinity of this plant with his unit clearing mine fields during the last week of October 1945. He noted barbed wire fences enclosing the entire area, a strong guard of NKVD soldiers, and heavy Russian traffic, stringently controlled, moving in and out of the area. His men were not permitted to approach the perimeter of the fence in their search for mines. From conversations with natives living nearby, Sub-source (2) learned that immediately after Russian occupation of the area, fences were thrown around the forest, strong guards were posted, and about 3,000 Russian soldiers were brought in and housed within the grounds. The natives told Sub-source that German scientists had been brought to live and work there.

[See document photo on p. 4455.

From the details provided, it sounds as if this plant was manufacturing something far more secret, more complex, and more valuable than dynamite. It could have been enriching uranium-235, or breeding and/or purifying plutonium-239 or uranium-233. Apparently General Leslie Groves and intelligence officers of the U.S. Manhattan Project thought so too, which is why they included this report in their foreign intelligence files.

With intelligence reports of apparent nuclear-related work at Auschwitz, Bydgoszcz, and possibly Posen (see p. 3245), there are indications that the wartime German nuclear program may have involved extensive production work at a number of sites in Poland. All of those sites were taken over by the Russians, while the western Allies only received fragmentary reports about them.]

Top Secret Cable from Warsaw to Secretary of State. 7 March 1946 [NARA RG 77, Entry UD-22A, Box 160, Folder 205.2 Cables Incoming, Top Secret]

From: Warsaw

To: Secretary of State

Nr: 300 7 March 1946

Nr 300. Signed Lane.

Information has been given this Embassy by a capable young engineer working in the zinc industry, that one of the best if not the only material for atomic bomb containers is cadmium. According to the informant the cadmium output of Poland in 1945 amounted to 49.15 tons, and in January of 1946 to 10.9 tons. In 1945 there was exported to Russia the total Polish cadmium output.

End

ACTION: General Groves

INFO: General Spaatz, General Hull, General Vandenberg

[See document photo on p. 4256.]

From Capt. Volpe to Colonel Shuler. Subject: Cable to Secretary of State from Warsaw. 12 March 1946. [NARA RG 77, Entry UD-22A, Box 173, Folder 57.70 Poland Misc]

1. I discussed the attached cable with Marks. The State Department is cabling Warsaw that subject matter is of interest and all pertinent information should be forwarded.

2. Perhaps Lt. Rugg might look into the question of the relative importance of the quantities specified in the cable. It might also be useful to determine if possible normal industrial uses of cadmium. This information might serve to explain the Russian demand for the Polish output.

[A detailed description from March 1945 of the German atomic bomb said that the bomb casing design included a very important layer of cadmium—see p. 4486. The above highly specific, early 1946 statement by the "capable young engineer" in Poland suggests that he in particular, and wartime German industry in Poland in general, had been involved in developing atomic bombs. The capable young engineer's supreme confidence in the suitability of cadmium for the bomb design may also suggest that he knew the bomb had been successfully tested, perhaps in Poland.

When the United States followed up with the capable young engineer, what else did they find out? Where are those documents?]

Robert Jackson, chief U.S. prosecutor at the Nuremberg trials. Cross-examination of Albert Speer. 21 June 1946. [https://avalon.law.yale.edu/imt/06-21-46.asp and http://law2.umkc.edu/faculty/projects/ftrials/nuremberg/speer.html]

MR. JUSTICE JACKSON: And certain experiments were also conducted and certain researches conducted in atomic energy, were they not? [...] Now, I have certain information, which was placed in my hands, of an experiment which was carried out near Auschwitz and I would like to ask you if you heard about it or knew about it. The purpose of the experiment was to find a quick and complete way of destroying people without the delay and trouble of shooting and gassing and burning, as it had been carried out, and this is the experiment, as I am advised. A village, a small village was provisionally erected, with temporary structures, and in it approximately 20,000 Jews were put. By means of this newly invented weapon of destruction, these 20,000 people were eradicated almost instantaneously, and in such a way that there was no trace left of them; that it developed, the explosive developed, temperatures of from 400 to 500 [4000 to 5000?] centigrade and destroyed them without leaving any trace at all. Do you know about that experiment?

SPEER: No, and I consider it utterly improbable. If we had had such a weapon under preparation, I should have known about it. But we did not have such a weapon. It is clear that in chemical warfare attempts were made on both sides to carry out research on all the weapons one could think of, because one did not know which party would start chemical warfare first.

MR. JUSTICE JACKSON: The reports, then, of a new and secret weapon were exaggerated for the purpose of keeping the German people in the war?

SPEER: That was the case mostly during the last phase of the war.

[What information about atomic energy experiments or weapons tests near Auschwitz was "placed in" Jackson's "hands"? Has that information been preserved in archives?

It is interesting that Speer answered a question about atomic energy experiments and an alleged atomic weapons test by immediately deflecting the discussion to talk about chemical warfare planning instead.]

Robert H. Jackson
(1892–1954)

Felix Kersten
(1898–1960)

Figure D.688: Robert Jackson and Felix Kersten both mentioned an atomic bomb test that killed concentration camp inmates in Poland.

DI 092.-76 FIAT. Subject: Periodic Intelligence Report 1. 2 August 1946 [TNA FO 1031/59]

[...] Completely unreliable source described the following: ARDENNE made experiments with an atom gun (Atomkanone). About Christmas 1944, successful experiments were conducted in Pomerania with V-1 and atomic warheads, radio directed. The ensuing crater was 2 km in diameter. Because the time for developments was too short nothing more came of it. Source has heard this from a man who participated in experiments but inconsiderately died in winter of 1945. It has not been possible to verify this statement from any other source although rumours to this effect, although with different names, have been persistent. [...]

[See document photos on pp. 3610–3615.]

R. W. Shaw to L. E. Seeman, 5 December 1946, Transmittal of Item from DAILY DIGEST OF WORLD BROADCASTS AND RADIO TELEGRAPH SERVICES [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)]

[...] Hahn said that a rumour which went the rounds in Germany about six months before the capitulation was equally untrue. According to this rumour, atom bomb tests had been carried out in Poland during the last year of the war which were supposed to have had an effect similar to the first atom bomb dropped on Hiroshima though on a considerably smaller scale. [...]

[See document photo on p. 4461.

The rumor reported by Hahn seems to agree very well with other reports of an atomic bomb test in Poland in October–December 1944.

Hahn does not appear to have been involved in the German nuclear weapons program, only basic nuclear physics experiments. It is unclear how much he knew or had been informed about the nuclear weapons program.

Note also that from April 1945 until January 1946, Hahn had been imprisoned (mostly at Farm Hall) and eavesdropped upon by the U.K. and U.S. military. After he was released, his public statements were still closely monitored and controlled by Allied officers. Even if Hahn knew that the rumor of an atomic bomb test in Poland was true, he would undoubtedly have been aware that it would be extremely unwise personally and politically to admit that information publicly.]

RESTRICTED

Manhattan Engineer District
Office of the Military Attache
American Embassy, London
5 December 1946

SUBJECT: Transmittal of Item from DAILY DIGEST OF WORLD BROADCASTS AND RADIO TELEGRAPH SERVICES

TO: Colonel L. E. Seeman, P.O. Box 2610, Washington 25, D. C.

The following item which appeared in DAILY DIGEST OF WORLD BROADCASTS AND RADIO TELEGRAPH SERVICES, dated 5 December 1946, is thought to be of interest to your office:

"21.10 ATOMIC RESEARCH IN GERMANY: PROF. OTTO HAHN (As DPD 12.05, 3.12.46, Digest No. 2, 692, add:) Hahn said that a rumour which went the rounds in Germany about six months before the capitulation was equally untrue. According to this rumour, atom bomb tests had been carried out in Poland during the last year of the war which were supposed to have had an effect similar to the first atom bomb dropped on Hiroshima though on a considerably smaller scale.

"Hahn stated that during the war various tests had been made to increase the German war potential by processes based on the splitting of the uranium atom. The object of this work, however, had not been to create a new weapon but to open up new sources of energy. In these tests the "heavy water" frequently mentioned in connection with the atom bomb had been used.

"Hahn then spoke of the first scientific experiments with atomic energy which he had undertaken. 'The first step towards atomic energy was made through our work and we realised at the time - sometime before the outbreak of war - that the splitting of the uranium nucleus would release large quantities of energy. If Hitler had prevented publication of the results of our research then, in all likelihood it would have been impossible for the USA to have developed their atom bomb." Publication took place at the beginning of 1939, and shortly before the war - either in May or in June - he had lectured in London on his scientific work and had also given scientific lectures during the war in Oslo, Stockholm and Copenhagen with the permission of the Reich Government. Hahn then referred to insinuations made against him all over the world, the most persistent of which was that he had given the Americans the secret of atomic bomb production and that the Nobel Prize had been his Judas's reward for treason. This was wrong for the production of atomic bombs had been impossible in Germany.

"Speaking on his activities after the war, Hahn stated that he had been invited on 25th April 1945, when living in a small Wuerttemberg town, to which the Kaiser Wilhelm Institute Department of Chemistry had been evacuated since February 1944, to go to England via France and Belgium. Some time ago he had returned to Germany to work in Goettingen as president of the Kaiser Wilhelm Institute for the development of sciences and to continue with his scientific work. If this society were dissolved by the Control Council, Prof. Hahn hoped to be able to create in the British zone a society for the development of scientific work within the framework of the Control Council regulations, obtaining at the same time the benevolent permission of the British Control Commission. He regarded it as his duty to continue the pure scientific research work in Germany in the tradition of the Kaiser Wilhelm Institute, which had never been a National Socialist institution.

"Prof. Hahn answered various questions about the use to which cosmic rays could be put. Russia was also working on cosmic ray research, but the importance which is ascribed to cosmic rays in Russia may be propaganda. He did not believe that cosmic rays could provide energy which would be of any importance in war. Only small quantities of energy could be obtained which could not compare with the atom bomb."

R. W. SHAW
Captain, C.E.

Figure D.689: R. W. Shaw to L. E. Seeman, 5 December 1946, Transmittal of Item from DAILY DIGEST OF WORLD BROADCASTS AND RADIO TELEGRAPH SERVICES [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)].

Germany took over Tucheler Heide in September 1939 and used it as a proving ground (Truppenübungsplatz Westpreußen) for rockets, nuclear work, and other experiments until January 1945. It or one of the other Polish proving grounds may have been the location of a nuclear test around November 1944.

Figure D.690: The German military took over Tucheler Heide in September 1939 (upper photo) and used it as a proving ground (Truppenübungsplatz Westpreußen or Heidekraut) for rockets [Dornberger 1958, pp. 227–229], nuclear work (pp. 4902–4903), and other experiments until January 1945. It or one of the other Polish proving grounds (p. 2096) may have been the location of a nuclear test around November 1944.

Letter of Prof. Dr. Gezo Mansfeldt, Professor of Physiological Institute of the University of Budapest (former inmate of the Rajsko camp) to Dr. Hans Münch (during the war at the SS-Hygiene Institute in Rajsko). 5 December 1946. US Holocaust Memorial Museum. RG-15.169M (1998.A.0247) microfilm reel 8.

Der nachste Tag verlief ereignislos und am 27. Januar 4 Uhr Nachmittag marschierte die erste russische Vorhut durch das Lager Auschwitz. So wurden wir etwa 3000 Mann–Aerzte, Pfleger und Kranke—frei. [...] Ich war der einzig lebende Zeuge, der über das Hygiene-Institut Bescheid wusste und so wurde ich mindestens 2–3 mal wöchentlich einem Verhör unterzogen und musste freilich einigemal, aber jetzt schon im feinen Auto nach Raisko fahren, um dort alles zu zeigen. Die verschiedenen wissenschaftlichen Kommissionen waren nur schwer davon zu überzeugen, dass dort nicht giftiges Gas und dergleichen fabriziert wurde und was man eigentlich vermutete wurde mir erst viel später klar, als ich von den Atombombenversuchen erfuhr.

The next day was uneventful, and on January 27th [1945], 4:00 in the afternoon the first Russian vanguard marched through the Auschwitz camp. Thus we approximately 3,000 men—physicians, nurses, and patients—were free. [...] I was the only living witness who knew about the Hygiene Institute information and so I was at least 2–3 times weekly interviewed and had to drive to Raisko several times, but now in the fine car, and show everything there. The various scientific commissions were difficult to convince that poison gas and the like was not produced there, and what was actually suspected was clear to me only much later, when I learned of the atomic bomb tests.

[See document photos on pp. 4464–4469.

Mansfeldt's testimony suggests that something of great scientific interest to the Soviets was produced at Auschwitz during the war, and that this was connected to multiple German atomic bomb tests that had occurred during the war. It is not clear if he means that one or more of those tests occurred near Auschwitz, as reported by Robert Jackson, Felix Kersten, and Wilhelm Wulf. Apparently his Soviet interrogators were keenly interested in an atomic bomb test that had already occurred by the time Soviet forces took control of Auschwitz in January 1945. That would put an Auschwitz-associated test in late 1944, consistent with Grothmann's testimony of a test during or around November 1944.

I.G. Farben Auschwitz was a very large and very expensive facility whose products are not well documented. The following documents provided additional evidence to support the ideas mentioned by Mansfeldt that at least part of I.G. Farben Auschwitz produced materials related to nuclear and/or chemical weapons of mass destruction.]

Mein lieber Herr Kollege Münch!

Eine unsagbare Freude hatte ich mit der Abschrift Ihres an Paul Reichl geschriebenen Briefes, aus dem ich erfahre, dass Sie alles glücklich überlebt haben und in absehbarer Zeit auch wieder Ihre Freiheit erlangen werden, was vielleicht inzwischen schon geschehen ist. Auf jeden Fall lege ich diesem Brief ein Zeugnis bei, dass Ihnen vielleicht nützlich sein kann. Seit einem Jahr hatte ich alle möglichen Wege versucht um von Ihnen Nachricht zu bekommen bzw. zu erfahren, ob Sie am Leben sind, aber ganz ohne Erfolg. Mein Schwiegersohn /ein Schweitzer/ war vor kurzem 3 Wochen mit dem Auto dienstlich in Deutschland, suchte in München das botanische Institut auf, um Ihren Herrn Vater zu finden, aber erhielt auch dort keine Auskunft über Sie. Nun freue ich mich aufrichtig mit Ihnen die Verbindung aufnehmen zu können und will Ihnen kurz über mein Schicksal berichten, von dem Tage an, da Sie zum letzten Mal bei meinem Krankenbett standen und die Absicht äusserten mit dem kleinen Karren mich mit dem Transport mitzuschicken. Glücklicherweise scheiterte dieser Plan, denn am Abend desselben Tages, als der grösste Teil des Krankenbaus wegmarschierte und ich um jeden Preis mitgehen wollte, verhinderten mich daran einige wohlwollende Kollegen mit der Versicherung, dass ich höchstens 5 km. mitkommen würde. So blieb ich denn in der sicheren Erwartung dort, dass wir vor dem Abmarsch der Wachmannschaft hingerichtet werden. Dies war am 18. Januar. Am 21. Januar als wir zu unserer grössten Überraschung immer noch am Leben waren, geschah etwas, das wir Häftlinge eigentlich vom ersten Tag unserer Haft ersehnten: die Wachtürme wurden leer, die SS. verschwand. Wir richteten uns bald auf Selbstständigkeit ein, wir wählten Torwache, Küchenpersonal, ich übernahm die Apotheke auf Block 28. und

empfanden das schon seit langer Zeit vermisste Glücksgefühl der Freihei
Am 24.Januar geschah etwas,das nur Sie aufklaren könnten. Vom Tor kam
Laufschrift ein Häftling zu mir mit Ihrer Nachricht,ich möchte sofort
Tor kommen,Sie hätten noch einen Weg zu machen,würden aber gleich zur
kommen,ich soll auf Sie wa~~r~~ten.Dies tat ich natürlich sofort,sass etwa
1 1/2 Stunden in der ausgeräumten Blockführerstube vor dem Tor,bis mir
schon das Knochenmark zu frieren begann,Sie kamen aber nicht wieder un
weiss bis heutigen Tag nicht was Ihre Absicht mit mir war.Am nächsten
am 25.Januar wurde ich aus meinem Nachmittagsschläfchen aufgeweckt mit
dem Gebrüll "Alles antreten!". Erst dachte ich es sei ein Scherz,erfuhr
aber bald die bittere Wahrheit,dass ein sog.Totenkommando zurückgekom
sei,um die zurückgebliebenen umzubringen.Wir wurden am Hof aufgestellt
umgeben von Maschinengewehren,dann die übliche rassenmässige Sichtung,
dass selbst die grössten Optimisten auch die letzte Hoffnung auf ein
leben aufgeben mussten.So standen wir etwa eine 1/4 Stunde,als plötzli
das Kommando hörbar wurde: "Alles zurück in die Blöcke!". Das Totenko
doz verschwand so rasch als es kam und als Erklärung erfuhren wir näch
sten Tag,dass der russische Vormarsch die Eisenbahnlinie gefährdete,
dass ein plötzlicher Rückzug notwendig wurde,sonst hätten sie sich nic
mehr retten können.Der nächste Tag verlief ereignislos und am 27.Janua
4 Uhr Nachmittag marschierte die erste russische Vorhut durch das Lage
Auschwitz.So wurden wir etwa 3000 Mann - Aerzte,Pfleger und Kranke -
frei.In den nächsten Tagen richteten die Russen auch in den anderen
Blöcken Krankenhäuser ein ,so dass die Kranken und Aerzte aus der Umg
bung Birkenau usw.zu uns kamen. So lebte ich als besonders bevorzugter
/die Russen schätzen die Wissenschaft sehr hoch/ bis 5.April, denn ich
musste mit einigen Ordinarien /Prof.Limousin aus Clairemont-Ferrand,
Prof.Epstein aus Prag,sowie einigen Universitätsdozenten/ versprechen
so lange dort zu bleiben,bis die Kommission zur Untersuchung der deut-
schen Greueltaten ihre Arbeit beendet hat.Ich war der einzig lebende

Zeuge, der über das Hygiene-Institut Bescheid wusste und so wurde ich mindestens 2-3mal wöchentlich einem Verhör unterzogen und musste freilich einigemal, aber jetzt schon im feinen Auto nach Raisko fahren, um dort alles zu zeigen. Die verschiedenen wissenschaftlichen Kommissionen waren nur schwer davon zu überzeugen, dass dort nicht giftiges Gas und dergleichen fabriziert wurde und was man eigentlich vermutete wurde mir erst viel später klar, als ich von den Atombombenversuchen erfuhr. Auch sonst war ich für die Untersuchungskommission eine ziemliche Enttäuschung, denn wenn man ein ganzes Leben in der Naturforschung verbringt, kann man eben nicht anders als objektiv sein und mein Aussagen, dass es auch wahre Menschen unter den SS. gab, erregte Missfallen. Am 5. April kam aus Krakau eine Regierungskommission mit dem Justitzminister an der Spitze und lud uns 4-5 Prominente ein nach Krakau als Gäste der polnischen Regierung zu kommen und ebenfalls Teil zu nehmen an ähnlichen Untersuchungsarbeiten. Auch da hatte ich nicht viel Erfolg, aber ich lebte 3 Wochen im besten Hotel Krakaus /Zimmer mit Badezimmer!/ und hatte glänzende Verpflegung. Ende April konnte ich dann mit einem Transport nach Ungarn fahren, wo ich freilich mit allen Ehren empfangen wurde, aber weder von meiner armen Frau - deren Tod Sie ja schon lange wussten - noch von meiner ebenfalls deportierten älteren Tochter etwas zu wissen. Erst im Juli erfuhr ich, dass meine Tochter am Leben ist und bald danach kam sie G.s.D. vollkommen gesund und in ihrer fröhlichen Stimmung zurück, was mich natürlich über die fürchterliche Katastrophe, die mir dann bald bewusst wurde, - wenn auch nicht tröstete - aber jedenfalls hinweghalf. Ein weiteres Narkoticum fand ich in meinem wieder gefundenen, vollkommen unversehrt gebliebenen schönen Institut, das von meinen treuen Mitarbeitern so bewahrt wurde, dass selbst die Bleistifte und die kleinsten Aufzeichnungen auf meinem Schreibtisch lagen, wie an jenem fürchterlichen Tag, da ich von der GESTAPO verhaftet wurde. Ich stürzte mich natürlich gleich

in die Arbeit, begann mit den Vorlesungen, wurde zum Dekan gewählt, dies alles nützte aber nicht sehr viel, denn die fürchterlichen Magenschmerzen, die Sie ja in Raisko mit angesehen haben und die Sie auch immer zu lindern versuchten, wurden immer schlimmer, so dass ich mich im Dezember entschloss zu einem längeren Urlaub nach Genf zu fahren, wo meine jüngere Tochter verheiratet lebt. So fuhren wir mit meiner älteren Tochter die ja seit vielen Jahren meine chemische Mitarbeiterin ist, mit einem Autokonvoy in die Schweiz, wo ich wieder ein Heim vorfand und 10 Monate dort blieb. Ich lebte dort nicht ganz untätig, denn ich hatte in Genf, Basel und Bern Vorträge zu halten und wurde sehr geehrt und zu allerlei Handbuchbeiträgen, Monographien verpflichtet und meine Monographie "Über die Hormone der Schilddrüse und ihrex Wirkungen" die in 1943. in Basel erschien, wurde von einem englischen Verlag gekauft und wird demnächst in London erscheinen. Im vergangenen September kam ich dann wieder zurück, aber ohne meiner Tochter, die auch jetzt noch am Genfer Biochemischen Institut arbeitet. Meine Rückkehr war deshalb notwendig geworden, da ich inzwischen an den Lehrstuhl der Physiologie der Universität Budapest berufen wurde und gleichzeitig wählte man mich zum Klassenpräsidenten der Ungarischen Akademie der Wissenschaften, so dass es höchste Zeit und Pflicht war wieder zum Wohl des Vaterlands etwas beizutragen. Das Wesentliche ist, dass ich von meinem Magengeschwür, das nun endlich röntgenologisch an der kleinen Kurvatur unweit von der Cardia festgestellt wurde, geheilt bin und wieder meine volle Arbeitslust und Arbeitskraft wiederfand.

Was unsere gemeinsame Arbeit betrifft muss ich Ihnen Folgendes mitteilen: Als ich zum erstenmal mit einer russischen Kommission von Auschwitz nach Raisko fuhr fand ich das Hygiene-Institut in einem fürchterlichen Zustand. Es müssen dort sehr heftige Kämpfe gewesen sein, es lagen viel Tote im Hof, vor dem Hauptgebäude ein zerschossener deutscher Tank, sämmtliche Fensterscheiben zertrümmert, an den Wänden

grosse Löcher. In den Laboratorien war natürlich alles kaputt gegangen und als ich in die "Histologie" eintrat wollte ich kaum meinen Augen glauben, denn mein kleiner Schreibtisch an dem ich arbeitete blieb unversehrt und in seiner Schublade fand ich alle Protokolle und Aufzeichnungen vor und hinter dem einen Schrank die Kurven, die ich nach den Versuchsergebnissen zeichnete. Ich habe natürlich alles mitgebracht, so dass ich einen grossen Teil der Versuchsergebnisse besitze, nämlich jene, an denen ich bis 16. Dezember 44. mitarbeitete, als ich dann die Magenblutung bekam. Seitdem habe ich an dem ganzen Problem noch weitergearbeitet und bin gerade dabei die letzten Versuche fertigzustellen, die ich bezüglich der Immunitätsfrage als das Experimentum crucis ansehe. Ich habe die Absicht sämmtliche diesbezüglichen Arbeiten in einer Monographie: "Neue Wege der Infektions- und Immunitätslehre" herauszubringen. Es würde mich natürlich sehr freuen, wenn ich auch jene Versuchsergebnisse bekommen könnte, die Sie in Ihrem Brief erwähnen und wäre sehr froh, wenn Sie mir Ihre Zustimmung geben würden, dass ich die Versuche, - die wir in Auschwitz zusammen ausführten - als gemeinsame Arbeit veröffentliche.

Ich versuche diesen Brief bzw. seine Abschriften auf verschiedenem Wegen Ihnen zuzuschicken und hoffe, dass wenigstens einer Sie erreichen wird. Wie ich erfahre kann man aus Deutschland nach Ungarn unmittelbar Briefe und dergleichen schicken, dagegen aus Ungarn nach Deutschland noch nicht. Ich versuche also teils über die UNRA. teils über die Schweiz Sie zu erreichen oder bitte ich jemanden diesen Brief nach Wien mitzunehmen und dort aufzugeben. Ihre Antwort, falls es noch nicht möglich wäre sie unmittelbar nach Budapest zu schicken, könnten Sie an meine Genfer Adresse senden, wo ich zu Weihnachten bis zum 10. Januar meine Ferien verbringen werde. Diese lautet:

Prof. G. Mansfeld c/o. Olivier Béguin, 28. Avenue de Champel, Genève.

Ich wäre sehr froh sobald als möglich zu erfahren, ob Sie bereits sich der Freiheit erfreuen und möchte Sie sehr gerne bald wiedersehen. Was ich Ihnen zu danken habe wissen Sie ja sehr gut, ich bin überzeugt davon, dass ich ohne Sie nicht am Leben geblieben wäre. Ob es sehr wichtig war weiss ich nicht, aber das ändert nichts an Ihrer guten Absicht, für die ich Ihnen immer dankbar sein werde. Oft habe ich mich gefragt, ob Ihr kleines Töchterchen den kleinen weissen Pelzmantel zu Weihnachten bekommen hat, der zwei blutenden Magengeschwüren seine Existenz verdankte. Auch an Herren und Frau Delmotte denke ich viel, sie waren beide sehr gut zu mir. Es würde mir sehr leid tun sie nicht mehr unter den Lebenden zu wissen. Vom Chef werden Sie schon durch Reichl erfahren haben, dass er vor kurzem in Frankfurt verhaftet wurde. Ohne ihm Schlechts zu wünschen glaube ich, dass bessere Menschen zugrunde gingen. Es ist doch ein grosses Glück, dass man mit der Zeit alles Schlechte vergisst und nur das Gute als Erinnerung übrigbleibt und so wenn ich an die schreckliche Zeit meiner Haft denke, so denke ich immer weniger an Gaskammer und Krematorium und immer mehr an meinen lieben und verehrten Mitarbeiter Dr. Münch.

Seien Sie herzlichst gegrüsst von Ihrem stets dankbaren

G. Mansfeld

Edmund Tilley. Brief Operational Report on [censored] and Other Germans and Italians Connected with Project Abstract. 19 August 1947. [NARA RG 319, Entry A1-134A, Box 29, Folder Operation Oberjoch]

[See p. 4902 for this document. In this 19 August 1947 intelligence report that is still heavily censored, Edmund Tilley discussed wartime nuclear weapons work at Tucheler Heide in Poland, including the production of ^{235}U and ^{239}Pu and apparently even 1–5 kg fission pits for atomic bombs. According to Tilley, one of the German scientists most directly responsible for that work, "Dr. Niels" (Walter Nielsch?), had already been taken to the United States for interrogation and/or work. For more information on Project Abstract, see Mills and Johanson 2019.]

Heinrich Himmler's physical therapist, Felix Kersten [Kersten 1947, pp. 252–253, 256–258].

When I returned to Himmler's headquarters in December [1944] I found him singularly optimistic. Once again he was prophesying a German victory! [...] Himmler saw my bewilderment and said: "Very soon we shall put our last secret weapon into use. And that will change the war situation entirely!" [...]

Early in March 1945 I paid one of my last visits to Himmler's headquarters... He was more optimistic than ever before! In his conversations with me he returned to the subject of the mysterious *secret weapon*. He made some strange assertions, and I kept a careful record of these. "Most people," he said, "think we have lost the war, and I cannot deny that apparently they have reason. But we have not yet used our last secret weapon. V-1 and V-2 bombs are effective secret weapons, but the secret weapon we still have up our sleeves will have an effect no one can even imagine. One or two shots and cities like New York or London will simply vanish from the earth! Allied aviation has destroyed many essential factories for its manufacture. That is why we are behind in our schedule. But in a month or two you will read all about it in the papers. Then you will realize that I know what I am talking about." [...]

This talk aroused my curiosity. I began giving heed to some very wild rumors–or so I had thought them–which seemed to be in line with Himmler's veiled disclosures. And when Kriminalrat Obersturmfuehrer Goering, a trustworthy man (unlike his homonym) told me something about the "secret weapon" I believed him. He said that a village had been built near Auschwitz for experimental purposes. They wanted to "try out" the new weapon. For the purpose, twenty thousand Jewish men, women, and children had been brought to live in this village. A single shell had been fired on the settlement. It had caused six thousand degrees of heat, and the whole village–houses, human beings, and animals included–was burnt to ashes.

Obviously, as I see it now in retrospect, the Germans had nearly completed their atomic bomb and were almost ready to use it on the enemy when the encirclement of Berlin was complete.

Heinrich Himmler's personal astrologer, Wilhelm Wulff [Wulff 1973, pp. 147, 160–161].

On March 10, Kersten, who had returned from Hohenlychen, came to my room and said that Himmler wished me to report to him the next day for a consultation. [...]

There were also reports of other secret weapons that were ready for mass production, all of which tended to contribute to Himmler's vacillation.

He [Himmler] went on to talk about a quite different missile, one of incredible power. Cities like New York and London, he said, could be wiped off the face of the earth with the help of this new weapon. This particular report was not entirely unfounded but meant little now that the Allies had already crossed the Rhine and the Russians had reached Küstrin, Stettin, and the Oder River and were threatening to occupy the whole of the Brandenburg region.

I had already heard about these new missiles and their enormous destructive power from Franz Göring in February, 1944. What he had told me was basically true, for work was already being done on the German atom bomb at the time.

Franz Göring also told me that the new missiles had been tested. According to him, a large town was especially built near Auschwitz concentration camp and some 20,000 Jews, mostly women and children, were sent to live in it. A single missile was then fired into the settlement. In the ensuing explosion, which developed a heat output of 6,000^{o} C at its center, the whole town and the entire population were burned to cinders in a flash. Stories such as this also reached Himmler's ears. Was it surprising, then, that he pinned his hopes on the effect of such weapons? Was it surprising that he hesitated to depose Hitler?

[Did Wulff mean that Franz Göring told him about the weapons test near Auschwitz in February 1944? Or did he mean that Franz Göring first told him about the new weapon in February 1944, and then at some later date told him that the weapon had been tested near Auschwitz? The second meaning would allow a much wider range of dates for when the Auschwitz test might have occurred. A successful nuclear weapons test in late 1944 seems much more probable than a successful test in early 1944.

Note that the alleged nuclear test on a village near Auschwitz does not appear to be simply a garbled account of the 27 January 1945 burning of the Fürstengrube concentration camp (30 km from Auschwitz) and several hundred of its inmates by the SS just before Soviet troops arrived. Although the date of the test to which sources refer remains vague, the sources seem to place the test as having occurred sometime prior to late January 1945.]

Heinrich Himmler's chief adjutant Werner Grothmann [Krotzky 2002]

[For testimony from Werner Grothmann apparently about the ∼November 1944 test, see p. 4436.]

Buna IV
Mineral Oil Construction Company Limited
Berlin SW 61, Belle-Alliance Stresse 7-10

To Direktor Ambros
I. G. Farbenindustrie A. G.
Ludwigshafen/Rhein

Our reference Si/Th/Kb
Berlin SW 61
11 January 1941

Dear Sir,

With reference to yesterday's discussion, I am enclosing excerpts from the report of the conference of 10 December 1940 concerning the site for 2 new hydrogenation plants. [...]

When inspecting the third building site (east of Auschwitz) it was noticed that there is an excellent site of about 5 square kilometers which offers still better possibilities for expansion. In addition, the water situation is very favourable because the draining works can be placed below the confluence of the Weichsel [Vistula], Przemsza, and Sola Rivers and sufficient water will be available, even with minimum outflow. Exact outflow data will be obtained from the Katowice *Water Office*.

Coal can be procured from 3 sides; to wit, the Cracow district, the central district, and the coal deposits southwest of the building site, where the new Brzeszcze and Jawiszowitz shafts of the Hermann Goering Werke are located, and from the Silesia Shaft, near Dzieditz, which is supposed to be the property of Elektroindustrie/Berlin. The distance from the central and Cracow districts is about 25 kilometers by rail, and from the southwestern district about 9-10 kilometers by rail. It would be preferable to get supplies from the southwestern district because a private works railroad could be built for that purpose. [...]

Since it may be expected that the greater part of the inhabitants will be evacuated when construction begins, in view of the population policy, there would be suitable quarters available to accommodate building workers and later on factory staff.

In addition, the site is very favorably located from the point of view of possible air pollution, so that, taking everything into account, it can be said that this building site would in every respect satisfy the requirements.

The Reichfuehrer SS and Chief of the German Police SS Economic and Administrative Main Office Group D-Concentration Camps

Ref. No. D II/114/16 So. Hue.
Oranienburg near Berlin, 31 July 1943
Enclosure to letter, Dy [Dyhernfurth] dated 27 August 1943
Re: Use of Inmates

To firm, Max Haaf, Certified Engineer,
Local Construction Management
Attention: Regierungsbaumeister Wuerz
Falkenhagen via Fuerstenwalde/Spree

As a consequence of the conference between the SS Lt. General and General of the Waffen SS Pohl and Dr. Ambros, the site in Falkenhagen near Fuerstenwalde was inspected by Dr. Schaefer, Certified Engineer Weirich, and Regierungsbaumeister Wuerz together with SS 1st Lt. Grimm on 20 July 1943. [...]

Chief of Office D II
[Signed] BAUER
SS Lt. Colonel

Reichsfuehrer SS and Chief of German Police,
D ill SS Economic and Administrative Main Office
Copies to: Dr. Schaefer, I. G. Farbenindustrie, Berlin, with request for transmittal to your office Breslau No. 56551.

[p. 1243:] *Ambros* was manager of the following plants: Schkopau (buna I), 1935–45; Ludwigshafen-Oppau (organic, intermediates and dyestuffs plants and laboratories), 1938–45; Huels (buna II), 1938–45; Ludwigshafen (buna III), 1941–45; Auschwitz (buna IV), 1941–45; Gendorf (inorganic), 1941–45; Dyhernfurt, 1941–45; Falkenhagen, 1942–45; which produced synthetic rubber, inorganics and nitrogen, organic intermediates, solvents, plasticisers, methanol, plastics, accelerators, dyestuffs, dyeing and printing auxiliaries, detergent raw materials, poisonous gas and intermediates. [...]

Kuehne was plant leader of Leverkusen, 1933–43, which produced inorganics, organic intermediates, buna, plastics, pharmaceuticals, insecticides, acetylcellulose, synthetic fibres.

[p. 1361:] AMBROS, OTTO (def.)—Professor of chemistry; member of Vorstand, Technical Committee, and Chemicals Committee of I. G. Farben, 1938–45; chairman of three Farben committees in the chemical field; plant leader of eight of the most important Farben plants, including Buna-Auschwitz; member of control bodies in several Farben enterprises, including Francolor; member of Nazi Party and German Labor Front; Military Economy Leader; chief of Special Committee "C" (Chemical Warfare) of the Main Committee Powder and Explosives, Reich Ministry of Armaments and War Production; chief of a number of units in the Economic Group Chemical Industry.

[pp. 1363–1364:] FAUST, MAX—Engineer; entered employment of Badische Anilin und Sodafabrik as construction engineer in 1922; until 1929, plant engineer at the Oppau plant of Farben; construction engineer at Ludwigshafen plant, 1929–36; in charge of construction of Farben's Rattwitz and Dyhernfurth plants, 1940–41; Farben Prokurist, 1941–45; construction chief of Auschwitz plant, 1941–45.

[For additional details, including the long series of I.G. Farben's payments for the Auschwitz facility, see Final Brief of the Prosecution Part IV. 1 June 1948. Especially pp. 54–56. [http://www.profit-over-life.org/rolls.php?roll=95]

The requirements for the I.G. Farben Auschwitz facility seem greatly excessive for a routine buna plant, but highly consistent with a facility that was intended (at least in part) to produce materials for a nuclear and/or chemical weapons program:

- Immediate proximity to not just one but three rivers.
- Proximity to a number of different coal deposits, to provide very large amounts of electricity.
- Proximity to not just one but several rail lines, with more to be built.
- The inhabitants of the region were removed.
- The site was quite remote to alleviate concerns about possible "pollution."
- Work at the facility was directly managed by Otto Ambros, a brilliant chemist who was one of the key figures in the highly secretive and very advanced German chemical weapons program, and who had conducted revolutionary research in other areas as well. Such expertise would not be required to manufacture buna, a routine process in Germany by the 1940s.
- The facility was built and operated by Max Faust and a large number of other people who had been involved in building and operating chemical weapons development facilities such as Dyhernfurt (tabun and sarin production), Falkenhagen (sarin production), and Gendorf (mustard gas production). Those other facilities featured extremely high levels of military security, chemical confinement, and technological sophistication. They were also given benign-sounding descriptions (production of detergents, insecticides, etc.) in wartime German documents and even in postwar Allied documents. Were these same things also true for the Auschwitz facility?]

Joseph Borkin. 1978. *The Crime and Punishment of I. G. Farben: The Unholy Alliance Between Hitler and the Great Chemical Combine.* New York: Free Press. pp. 3, 116, 127.

Drawn by the almost limitless reservoir of death camp labor, I.G. chose to build a great industrial complex at Auschwitz for the production of synthetic rubber and oil. So enormous was this installation that it used as much electricity as did the entire city of Berlin. More than 25,000 camp inmates paid with their lives to construct it. [...]

Rather than let the German government finance the building of the installations, the I.G. directors voted to put up the funds to make I.G. Auschwitz a privately owned I.G. enterprise and to assume the entire risk. With almost no opposition, they committed more than 900 million Reichsmarks, over $250 million, to the building of the single largest project in the I.G. system. With such an enormous risk, officials of I.G. carefully watched over their huge investment. [...]

From the bare records available, 300,000 [30,000?] concentration camp workers passed through I.G. Auschwitz of whom at least 25,000 were worked to death. The plants when completed were so enormous that they used more electricity than the entire city of Berlin. But in the final tally, I.G. Auschwitz was a miserable failure. Despite the investment of almost 900 million Reichsmarks and thousands of lives, only a modest stream of fuel and not a single pound of Buna rubber was ever produced.

[Borkin was in charge of investigating and prosecuting I.G. Farben on behalf of the United States after the war, so his statements should be considered authoritative.]

Peter Hayes. 1996. The European Strategies of IG Farben, 1925–45. In: Volker R. Berghahn, ed. 1996. *Quest for Economic Empire: European Strategies of German Big Business in the Twentieth Century.* Providence, Rhode Island: Berghahn Books. p. 63.

IG took some 30,000 camp prisoners between 1941 and 1944, 90 percent of whom died there or in the gas chambers when they could no longer work, yet only one installation was ever completed. No buna had been produced on the site by the time IG's managers evacuated it in January 1945.

Peter Hayes. 2001. *Industry and Ideology: I.G. Farben in the Nazi Era.* 2nd ed. Cambridge, UK: Cambridge University Press. pp. 367–368.

Throughout 1944, then, the Auschwitz project continued on its gruesome course, more impeded by continuing labor shortages than by the Allied air strikes that hit the plants on August 20, September 13, and December 18 and 26. No rubber had flowed by the time the SS ordered evacuation of the site on January 19, 1945. While some nine thousand inmates of Monowitz marched west toward Gleiwitz, were the war had begun, IG's employees began dismantling or destroying the factories. Eight hundred and fifty ill inmates remained behind to receive the Russians. Two hundred died in the week before the arrival of the Red Army, but the survivors escaped at least the final horror visited on the sick at Fürstengrube, who were burned in their huts. Having descended to the very depths of complicity with Nazism, IG Farben came away from Auschwitz still showing a net loss on its books for the development of buna.

Diarmuid Jeffreys. 2008. *Hell's Cartel: IG Farben and the Making of Hitler's War Machine.* New York: Bloomsbury. pp. 290–291.

The IG, meanwhile, had pulled its people home. The last of them left Auschwitz in the second week of January 1945 on two special trains reserved for the town's remaining civilian male Reich Germans (German women and children had been evacuated in October 1944). In the days before their departure, Walter Dürrfeld and Max Faust had toured the Buna-Werke, supervising the dismantling of key equipment and the destruction of documents that hadn't been sent back to Frankfurt and Berlin. Despite their efforts (and a last brief Allied raid after their departure on 19 January), most of the factory's infrastructure remained intact. But it mattered not; IG Auschwitz had been an almost total failure. Around 150,000 people (Reich Germans, foreign labourers, POWs and Auschwitz prisoners) had been engaged at different times on the plant's construction, at a cost of over 900 million reichsmarks and—estimated conservatively—some 35,000 human lives. This number rises to over 40,000 if the death toll at the IG's Fürstengrube and Janina mines is taken into account. Some Nuremberg prosecutors put the figures much higher, concluding that some 200,000 people had died while working for IG Auschwitz, either on-site or as a consequence of being dispatched from the IG's employ to the gas chambers at Birkenau—but this was almost certainly an overestimate based on the incomplete information available at the time. Whichever figure is correct, one thing is clear: although some explosive-grade methanol was produced, not a single pound of buna or one litre of synthetic gasoline ever emerged from the Buna-Werke's gates. After nearly four years of intense activity, all that IG Farben really had to show for its efforts was a reputation stained forever with the blood of those murdered in the Holocaust. Now, as the Red Army drew near, the huge Buna-Werke stood silent and waiting, a bomb-scarred monument to the ambition, greed and folly of a once mighty company.

[Carter Hydrick was apparently the first person to propose that the characteristics of the I.G. Farben Auschwitz facility were highly inconsistent with those of a synthetic rubber (buna) plant, but highly consistent with those of a nuclear production facility [Hydrick 1998, 2016]:

- The facility never produced any buna (or gasoline).
- Construction of the facility began in January 1941, and the facility operated until January 1945. Comparable plants were built and manufacturing final products within a matter of months [e.g., Hydrick 2016, pp. 76–77].
- The facility cost over 900 million Reichsmarks, or over 250 million wartime U.S. dollars. That appears to be over 25 times the cost of other typical buna plants [Hydrick 2016, p. 74]. For contemporary comparisons, the construction of the massive and highly advanced Peenemünde rocket facility cost approximately 300 million Reichsmarks [Neufeld 1995, p. 273], and the construction of the U.S. Oak Ridge electromagnetic uranium enrichment facility cost 304 million U.S. dollars [Groves 1962, p. 97].
- The facility consumed more electricity than the city of Berlin (which at the time was the eighth largest city in the world), vastly more than would be required for a buna plant [Hydrick 2016, p. 73]. However, the electricity consumption is consistent with uranium enrichment methods such as electromagnetic separation and gaseous diffusion, which are very energy-intensive.
- The facility employed around 150,000 people at various points during its four-year history. While that is far more than would be expected for a buna plant, it is consistent with a nuclear production facility. Even Oak Ridge only employed around 22,000 people at its wartime peak.

The Auschwitz facility was also producing heavy water; see p. 4463. Heavy water is not required for uranium-235 enrichment, but would be very helpful to operate a fission reactor and produce plutonium-239 (or uranium-233). On the other hand, production of plutonium-239 would not require enormous amounts of electricity. Could the Auschwitz facility have contained both a uranium-235 enrichment program and a plutonium-239 production program? Both programs would have required significant quantities of uranium as an input material. Furthermore, a uranium-235 enrichment program could have provided enriched uranium to accelerate a plutonium-239 production program.

Whereas the United States showed little interest in Manfred von Ardenne and Gustav Hertz and merely stated that they had played insignificant roles in the German nuclear program, as soon as the war ended, the Soviet Union immediately sought out both von Ardenne and Hertz and made them very lavish offers (by Soviet standards). Was that because Soviet forces sweeping through formerly German-held areas such as Auschwitz discovered technologies or documents that demonstrated that von Ardenne (an expert on electromagnetic separation) and/or Hertz (an expert on gaseous diffusion) had designed nuclear-related production plants that were in operation at Auschwitz or elsewhere in the east?

As shown in the document on pp. 4472–4473, Otto Ambros was the scientific manager of the I.G. Farben Auschwitz facility for its entire history. He is documented to have been deeply involved in the German chemical weapons program, and quite likely he was equally involved in the nuclear weapons program. After the war, Ambros was variously interrogated, imprisoned, and employed by the United States. Where are the transcripts of his interrogations and scientific reports to the United States? Did he reveal the scientific details about nuclear-related or other work at Auschwitz?]

D.12 Possible March 1945 Test Explosion in Thuringia

[There may have been a test explosion in Thuringia in March 1945, as reported by multiple sources:

- A 15 November 1944 letter from General Ivan Ilyichev, chief of intelligence for the Soviet army, to Joseph Stalin reported that the Germans in Thuringia were preparing under hurried but very high security conditions to test a new "bomb of unusual construction" with a "large destructive power" that might be an atomic bomb (p. 4481).

- A 23 March 1945 letter from General Ilyichev to Joseph Stalin reported that the Germans in Thuringia had recently conducted two very high-security test explosions of a new bomb design, described in considerable detail as a 2-ton, 1.3-meter-diameter spherical implosion device with multiple concentric layers and a uranium-235 core that created a "massive radioactive effect," incinerated or burned nearby prisoners of war (POWs), and destroyed buildings and trees within a radius of 500–600 meters (p. 4485).

- In a 30 March 1945 letter from Igor Kurchatov to General Ilyichev, Kurchatov analyzed the details reported in the 23 March 1945 letter, said it gave a "very believable description of the construction of the bomb," and requested further information (p. 4496).

- 21 and 29 May 1945 letters from Georgy Flerov to Igor Kurchatov reported that Flerov was currently in Dresden and en route to study the alleged German atomic test site using Geiger counters, and requested that former POWs returning from Germany to the Soviet Union should be interviewed to learn if any of them knew anything about the test (p. 4503).

- An October 1945 report from Soviet Marshal Georgy Zhukov to Stalin stated: "Based on the collected materials, it can be concluded that the German scientists in the field of theoretical and practical research and application of atomic energy have achieved good results up to the creation of the atomic bomb" (p. 4523).

- A 1946 Russian interrogation summary reported that Robert Döpel stated that there was an atomic bomb test on a German military base before the end of the war (p. 4530).

- It seems there is or at least was considerably more information about the apparent German nuclear tests in Russian government archives, including even a captured German film entitled "Film of the Launch of a V-2 and the Explosion of an Atomic Bomb" (p. 4533). At a bare minimum, there are presumably documents identifying the Soviet spy who provided the information given in Ilyichev's two reports, documents reporting the suspected test site location to Flerov (which he seemed to know, but which was not in Ilyichev's two reports), documents reporting what (if anything) Flerov ultimately found, and documents describing the "collected materials" to which Zhukov referred.

- 21 March 1945 and 9 June 1945 U.S. aerial reconnaissance photos of the Ohrdruf military base appeared to show a large circular area of possible blast damage, as well as surrounding buildings that may have been affected by blast and/or radioactive fallout, whereas a 12 August 1944 aerial reconnaissance photo did not show those features (pp. 4541–4545).

- In what appears to be a transcript of her testimony before an East German government inquiry on 16 May 1962, Cläre Werner, a wartime lookout at the Veste Wachsenburg castle near the Ohrdruf Truppenübungsplatz military base, reported watching a large nearby test explosion on 4 March and another one on 12 March 1945, as well as being informed of the historic nature of the explosions by visiting military and SS officials. She reported that she and other local residents suffered from symptoms that sound like radiation sickness. Although there are unresolved questions about the nature and the chain of custody of the 1962 transcript, Cläre Werner confirmed the key points of her testimony in several interviews conducted between 1998 and 2003 (p. 4551).

- In a transcript of his apparent testimony before the same East German government inquiry on 16 May 1962, Heinz Wachsmut reported being conscripted into a unique work assignment for the afternoon and evening of 5 March 1945 in Thuringia. He reported encountering large numbers of living, dying, and dead people suffering from what sounds like radiation sickness and burns in the aftermath of what the SS told him was a history-making test explosion. Under the close supervision of the SS, he was instructed to wear protective gear, and he burned approximately 450 bodies on woodpiles and saw a total of approximately 700 bodies being burned. (It is not clear if all of those were victims of the test explosion, or if some were victims of the daily harsh treatment of POWs.) Afterward his protective gear and clothing were burned, he was instructed to wash himself thoroughly, and he was unable to eat for days afterward possibly due to radiation sickness. While there are again unresolved questions about the 1962 transcript, the family of Heinz Wachsmut confirmed that he had described the same events and details to them (p. 4557).

- In transcripts of his testimony before East German government inquiries in 1966, Erich Rundnagel, a plumber who had worked for Kurt Diebner's nuclear research group in Thuringia during the war, reported that the scientists had told him they had two eight-kilogram atomic bombs (most likely fission pits for atomic bombs) in their safe (p. 4564).

- Colonel Oscar Koch, who was a high-ranking intelligence officer working with General George Patton, stated that a German prisoner of war described the massive explosion of a new bomb type in Thuringia in March 1945 (p. 4566).

- Werner Grothmann stated in 2000–2002 interviews that there was an atomic bomb test in Thuringia on 4 March 1945 (p. 4436).

Some of the major sources and details are summarized in Table D.6.]

	Primary sources for March 1945 test									
Details	**Ilyichev 11/1944**	**Ilyichev 3/1945**	**Kurchatov 3/1945**	**Flerov 5/1945**	**Döpel 1946**	**Werner 1962**	**Wachsmut 1962**	**Rundnagel 1966**	**Koch 1960s**	**Grothmann 2000-2002**
Test date	Preparations at fastest pace	Two in ~March 1945	~March 1945	Recent months	Prior to end of war	Evenings of 4 & 12 March 1945	4 March 1945	Work from 1944 to end of war	Early March 1945	4 March 1945
Test location	Thuringia Wooded area Very remote	Thuringia Wooded area Very remote	Remote area (implied)	Wooded area Very remote	Truppenübungsplatz military base	Behind Röhrensee from Wachsenburg	Near Ringhofen estate	Thuringia near Diebner lab, possibly other installations	Thuringia Wooded area Near research installation	Thuringia near Ohrdruf base, SS lab, Diebner lab, bomb production
People who were involved	SS	SS			SS (implied) scientists (implied)	SS, Post Office, Research Council	SS, Kammler, Post Office, Research Council, special doctors	Diebner's scientists, SS (implied)	SS (implied), scientists (implied)	SS, Himmler, Kammler, Gerlach, Post Office, Diebner, Flügge, special doctors
Blast	Large destructive power	High temp., large blast, buildings/trees in 500-600 m radius	Several hundred meter radius		Atomic bomb test	Bright flash and strong wind from kilometers away	Stinging flame to edge of forest		Far larger than normal bomb, destroyed test site, knocked down trees	Deployed: ≥ 3 kt Tested: ≥ 0.13 kt but $<< 3$ kt, larger than expected
Radio-activity	Probably atomic	Massive radioactive effect	Probably atomic	Test for residual radioactivity	Atomic bomb test	Radiation sickness in surrounding towns	Protective gear, decon., radiation sickness			On-site production Horrible test effects Doctors had to help surrounding areas
Casu-alties	Rapid SS construction → many POWs likely present	Many POWs vaporized, killed, and burned		POWs present		Many bodies to be collected	~450-700 POWs killed or burned; more than expected		People in the area would have been killed	Many workers at test site killed, doctors had to help surrounding areas
Device design	Probably atomic, 1.5 m diameter, several nested hollow spheres	1.3 m dia. 2 tons Al case U-235 fuel Ignition by neutrons Detailed implosion design Designed for rocket Used LOX to reduce weight	Spherical U-235 fuel Ignition by neutrons Implosion design Designed for rocket Used LOX to reduce weight	Probably atomic bomb	Uranium bomb	Something new that will make world history	Something new of which the whole world will speak	Atomic bomb capable of killing >100,000 people. At least two bombs. 8 kg fuel each, small enough to store in safe.	New and unusual weapon	> 1 m dia. sphere Very heavy Aluminum case A little U for test More U-235 for deployment Ignition by special system Designed for rocket Integrated design to minimize weight Tested on a stand

Table D.6: Details about possible March 1945 test explosion(s) from primary sources. The provenance of the 1962 Werner and Wachsmut sources is unknown and open to question (p. 4551).

[The following wartime Russian intelligence reports on the German nuclear program are part of a large archive, of which some selected documents were published in Riabev 2002a. These intelligence reports were first analyzed in Karlsch 2005 and Karlsch and Petermann 2007. See also Uhl 2024.]

General Ivan Ilyichev. 15 November 1944. Intelligence report to General Antonov and Joseph Stalin. Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 37. [See document photos on pp. 4482–4483.]

Peoples' Commissariat of Defense of the USSR
Chief Intelligence Department of the Red Army
15 November 1944
Moscow

To the Head of the Red Army General HQ
General of the Army, Comrade Antonov

Report:

Our trustworthy source in Germany reports:

"The Germans are preparing to conduct tests of a new secret weapon, which has a large destructive power. The test explosion of a bomb of unusual construction is being prepared under highest secrecy in Thuringia. For the preparations of the tests the local residents are supposed to be transported away by an SS detail; the whole operation is reported to be undertaken in strictest secrecy.

The explosions are supposed to take place in a wooded area. For that, special roads to the presumptive test site are being created. The bomb to be tested has a diameter of one and a half meters. It consists of several hollow spheres that nest inside each other. It will be brought to the explosion place with a transporter specially constructed for it. It is still unclear when the test is supposed to take place, but the preparations are going at the maximum fastest pace.

CONCLUSION.

In the last months our source has reported more and more often about the feverish efforts of the Germans to test ever more powerful weapons and their means of delivery. Probably these experiments lead directly to an attempt of the Germans to actually carry out tests of atom bombs, about whose existence we have only incomplete, scanty information."

ЗАКЛЮЧЕНИЕ.

За последние два месяца наши источники все чаще сообщают нам о лихорадочных попытках немцев испытать все более мощное оружие и средства его транспортировки к целям. Возможно именно эти опыты являются попыткой немцев произвести реальные испытания атомной бомбы о существовании которой у нас пока существуют не полные, отрывочные сведения".

Peoples' Commissariat of Defense of the USSR
Chief Intelligence Department of the Red Army
[2]3 March 1945
Moscow

To the Head of the Red Army General HQ
General of the Army, Comrade Antonov

Report:

Our trustworthy source from Germany reports:

"The Germans have in recent times carried out two large-capacity bomb explosions in Thuringia. The explosions took place in a forest area, under conditions of strictest secrecy. Trees fell at a distance of 500–600 meters from the center of the explosion. Buildings and fortifications specially constructed for the tests have been destroyed.

Prisoners of war who were near the epicenter of the explosion died, often without leaving a trace. Prisoners of war who were in the area beyond the center of the explosion have burns on their face and body, the strength of which depends on their position in relation to the epicenter of the explosion. The tests were carried out in a remote deserted area. The regime of secrecy at the test site was at maximum level. Entrance and exit from the territory are by special pass only. SS soldiers have surrounded the area of tests and interrogated any person approaching the area.

The bomb, supposedly filled with uranium 235 and weighing approximately two tons, was brought to the test site on a specially constructed truck. Dewars of liquid oxygen were delivered together with it. The bomb was permanently guarded by 20 guards with dogs. The bomb explosion was accompanied by a large explosive wave and high temperature. In addition, a massive radioactive effect was observed. The bomb is a sphere with a diameter of 130 cm.

The bomb consists of:

1. High-voltage discharge tube, which is charged by special generators
2. A sphere made of metal uranium 235
3. A delay mechanism
4. Protective casing
5. Explosive substance
6. Detonating mechanism
7. Steel casing

All parts of the bomb fit inside each other.

Initiator or bomb fuse.

Consists of a special tube, which creates fast neutrons. It is charged by special generators, which create high voltage inside the tube. As a result, fast neutrons attack active material.

Active bomb material.

Active bomb material is uranium 235. It represents a sphere with an opening into which an initiator is inserted. Once this is done, the opening is sealed by a cork made of uranium 235.

Protective casing.

The uranium sphere is encased in a protective aluminum casing, which is covered by a layer of cadmium. This significantly impedes thermal neutrons emanating from uranium 235, which can cause premature detonation.

Explosive matter.

After the layer of cadmium it is placed inside explosives that consist of porous TNT saturated with liquid oxygen; TNT is made up of bars of a specially chosen shape. The inner surface of the bars has a spherical curvature, which is the same as that of the external surface of the cadmium layer. Each of the bars is supplied with one detonator or two electrical fuses.

Casing.

TNT is covered by a protective layer made of a light aluminum alloy. A blasting mechanism is attached on top of this casing.

Exterior casing.

An exterior casing of armored steel is installed above the blasting mechanism.

Fairing.

A fairing made of a light alloy can be installed on top of the armored casing for future installation on a rocket of the V-type.

Bomb assembly.

The sphere, which consists of metal uranium, is placed inside a protective casing, which consists of aluminum, covered in a layer of cadmium, so that the opening in the sphere coinciding with the opening is sealed off by a uranium cork. After this the aluminum sphere, covered in cadmium, is sealed off by a cork, on top of which the last bar of TNT is placed. Next, liquid oxygen is pumped through the opening inside a protective casing, which covers the TNT. After this the bomb is ready for deployment.

Bomb ignition.

The bomb ignition is carried out with the help of a high-voltage discharge tube. It forms a flow of neutrons, which attack the active material. When the flow of neutrons impacts upon uranium, element 93 fissions, which speeds up the creation of a chain reaction. Next, the detonating mechanism detonates the explosive matter, after which a shock from the explosion of the external layer of TNT mixed with liquid oxygen takes place, which is directed toward the center. This allows the uranium to reach a critical mass.

Ahead of this, before the explosion, the uranium sphere is irradiated with gamma-rays, the energy of which does not exceed 6 million electron volts, which many times increases its explosive qualities.

CONCLUSION.

Without doubt, the Germans are carrying out tests of a bomb of high destructive force. In the event of their successful conclusion and production of such bombs in sufficient quantities, they will have weapons capable of slowing down our advance.

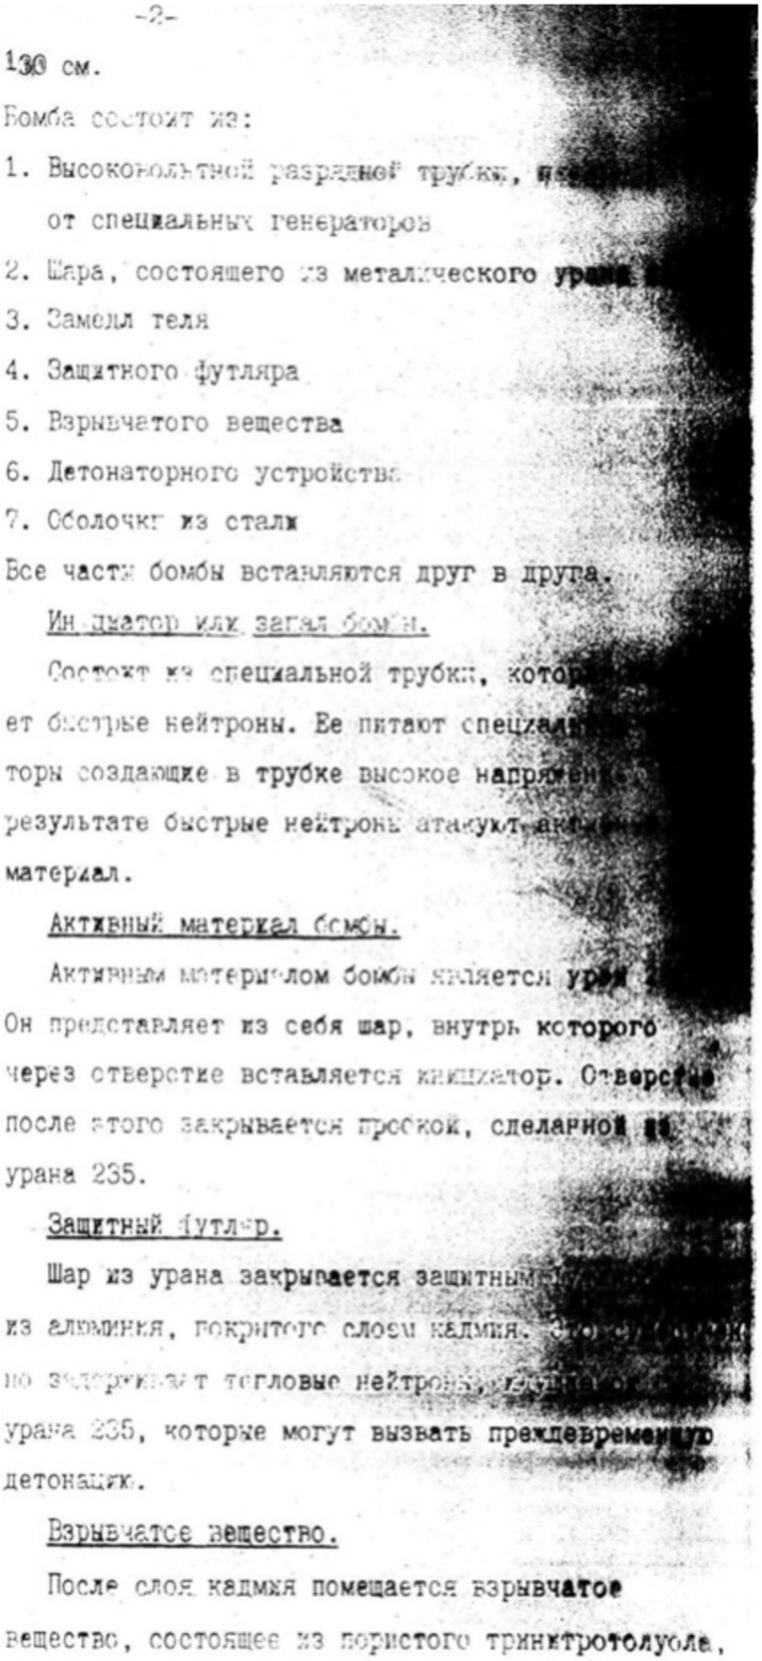
Докладываю:

Наш достоверный источник из Германии сообщает:

"Немцы в последнее время произвели два взрыва бомб большой мощности в Тюрингии. Взрывы проводились в лесной местности в обстановке строжайшей секретности. От центра взрыва деревья повалены на расстоянии 500-600 метров. Уничтожены специально построенные для опытов укрепления и сооружения. Находящиеся в центре взрыва военнопленные пог[illegible], причем зачастую от них не осталось следов. Военно[illegible]пленные, находящиеся за центром взрыва, имеют о[illegible] лица и тела, сила которых зависит от расстояния [illegible] от центра взрыва. Испытания проводились в максимально глухом районе. На объектах испытания режим секретности максимальный. Въезды и выезды разрешены только по особому удостоверению. Команды СС оцепили район испытаний и опрашивали каждого приближающегося к этому району человека. Бомба предположительно снаряженная ураном 235 массой около двух тонн была привезена в место взрыва на специально [illegible] платформе. Вместе с ней были доставлены цистерны с жидким кислородом. При бомбе постоянно находились 20 человек охраны с собаками. Взрыв бомбы сопровождался образованием взрывной волны большой мощности, развитием высокой температуры. Кроме этого наблюдался мощный радиоактивный эффект. Бомба представляет из себя шар диаметром

Figure D.700: General Ivan Ilyichev. 23 March 1945. Intelligence report to General Antonov and Joseph Stalin, p. 1 [Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 37, courtesy of Rainer Karlsch].



-2-

130 см.

Бомба состоит из:

1. Высоковольтной разрядной трубки,
от специальных генераторов
2. Шара, состоящего из металлического ура
3. Замедлителя
4. Защитного футляра
5. Взрывчатого вещества
6. Детонаторного устройства
7. Оболочки из стали

Все части бомбы вставляются друг в друга.

Инициатор или запал бомбы.

Состоит из специальной трубки, кото
ет быстрые нейтроны. Ее питают специал
торы создающие в трубке высокое напряжени
результате быстрые нейтроны атакуют акти
материал.

Активный материал бомбы.

Активным материалом бомбы является ура
Он представляет из себя шар, внутрь которого
через отверстие вставляется инициатор. Отверстие
после этого закрывается пробкой, сделанной из
урана 235.

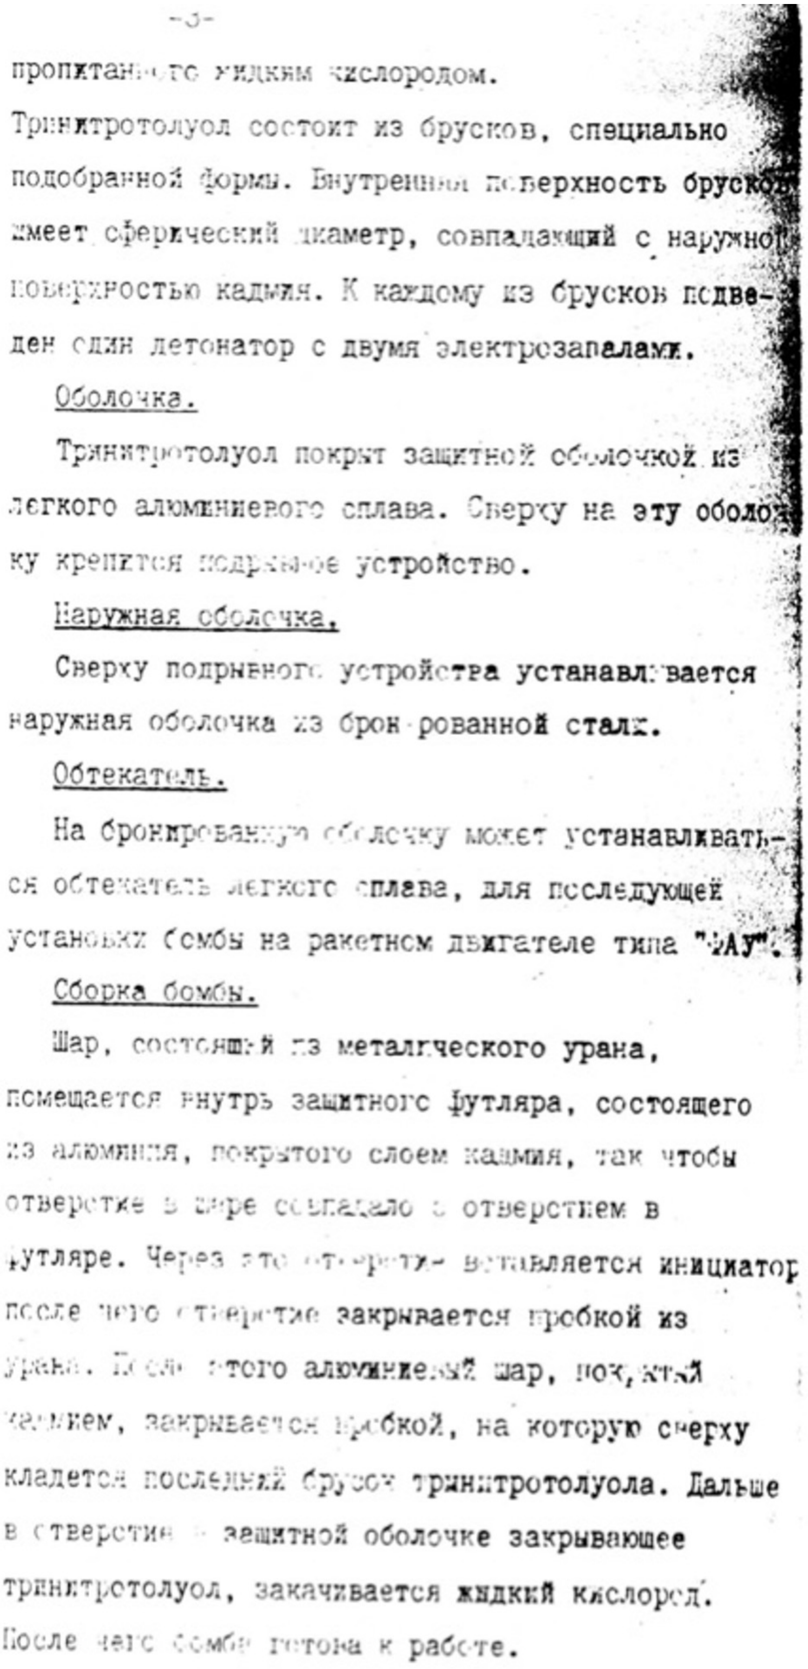
Защитный футляр.

Шар из урана закрывается защитным
из алюминия, покрытого слоем кадмия.
но задерживает тепловые нейтроны,
урана 235, которые могут вызвать преждевременную
детонацию.

Взрывчатое вещество.

После слоя кадмия помещается взрывчатое
вещество, состоящее из пористого тринитротолуола,

Figure D.701: General Ivan Ilyichev. 23 March 1945. Intelligence report to General Antonov and Joseph Stalin, p. 2 [Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 37, courtesy of Rainer Karlsch].



-3-

пропитанного жидким кислородом.

Тринитротолуол состоит из брусков, специально подобранной формы. Внутренняя поверхность брусков имеет сферический диаметр, совпадающий с наружной поверхностью кадмия. К каждому из брусков подведен один детонатор с двумя электрозапалами.

Оболочка.

Тринитротолуол покрыт защитной оболочкой из легкого алюминиевого сплава. Сверху на эту оболочку крепится подрывное устройство.

Наружная оболочка.

Сверху подрывного устройства устанавливается наружная оболочка из бронированной стали.

Обтекатель.

На бронированную оболочку может устанавливаться обтекатель легкого сплава, для последующей установки бомбы на ракетном двигателе типа "ФАУ".

Сборка бомбы.

Шар, состоящий из металического урана, помещается внутрь защитного футляра, состоящего из алюминия, покрытого слоем кадмия, так чтобы отверстие в шаре совпадало с отверстием в футляре. Через это отверстие вставляется инициатор после чего отверстие закрывается пробкой из урана. После этого алюминиевый шар, покрытый кадмием, закрывается пробкой, на которую сверху кладется последний брусок тринитротолуола. Дальше в отверстие в защитной оболочке закрывающее тринитротолуол, закачивается жидкий кислород. После чего бомба готова к работе.

Figure D.703: General Ivan Ilyichev. 23 March 1945. Intelligence report to General Antonov and Joseph Stalin, p. 4 [Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 37, courtesy of Rainer Karlsch].

[Ivan Ilyichev was the Head of the Main Intelligence Directorate (GRU, military foreign intelligence) of the Soviet Union from August 1942 until July 1945.

Compare the description in Ilyichev's report with other descriptions of the German fission bomb design (p. 4157), especially Erich Schumann's design for a two-ton spherical implosion bomb (p. 4244).

As discussed on p. 5154, Ilyichev's report gives a highly detailed and scientifically very plausible design for a fission implosion bomb, especially considering that the original design has been passed through several nonscientific hands, translated from German to Russian, and compressed into a Russian spy's succinct long-distance report. A few points deserve clarification:

"3. A delay mechanism" presumably refers to the heavy tamper, which has a large inertia that "delays" the expansion of the exploding fission fuel, and which is located between the fission fuel (item 2 in Ilyichev's list) and the aluminum pusher/casing (item 4). This component is mentioned in the numbered list but not in the more detailed descriptions that follow that list. The best tamper would be natural uranium, so the spy may have simply lumped the uranium fission fuel and the uranium tamper together in the more detailed descriptions.

Two different neutron initiators are apparently described, perhaps to be used together (for redundancy in case one fails during the implosion, or to maximize the number of initial neutrons and therefore the amount of fission chain reactions that occur before the fission fuel blows apart) or perhaps to be used in two different versions of the bomb:

- There are three similar descriptions: (a) "1. High-voltage discharge tube, which is charged by special generators." (b) "Consists of a special tube, which creates fast neutrons. It is charged by special generators, which create high voltage inside the tube." (c) "The bomb ignition is carried out with the help of a high-voltage discharge tube. It forms a flow of neutrons, which attack the active material. When the flow of neutrons impacts upon uranium, element 93 fissions, which speeds up the creation of a chain reaction." These three descriptions seem to refer to a high-voltage tube that is filled with fusion fuel (deuterium, tritium, and/or lithium) that produces high-energy fast neutrons when a high voltage is applied to the tube. Those neutrons initiate fission reactions in the uranium, releasing more neutrons and starting the fission chain reaction. Such tubes were known to exist in wartime Germany. The term "Element 93" was widely and scientifically loosely used in the German nuclear program to mean uranium that had absorbed a neutron, sometimes meaning neptunium and sometimes plutonium. Here it simply seems to mean the excited uranium compound nucleus, just after it has absorbed a high-energy fusion neutron and just before it fissions.

- A completely different description is also included under "Bomb ignition": "Ahead of this, before the explosion, the uranium sphere is irradiated with gamma-rays, the energy of which does not exceed 6 million electron volts [MeV], which many times increases its explosive qualities."[15] Gamma rays in that energy range can cause photofission of uranium, again releasing neutrons and starting the fission chain reaction. Gamma rays with energies up to

---

[15] An alternative possible interpretation (suggested by Michael Haupt) of this somewhat ambiguous statement is that long before bomb assembly, natural uranium may have been bombarded by particle accelerators to breed plutonium-239 and/or neptunium-237 fuel, which could have been purified and then included in the fission pit of the bomb.

> 6 MeV in the uranium could be produced in the early stages of the implosion process by bombarding the uranium with a beam of electrons with energies of at least 6 MeV from a compact betatron; absorption of the high-energy electrons would produce the high-energy gamma rays. Such compact betatrons were known to exist in wartime Germany; see p. 3089 for one weighing 272 kg, and lighter versions may have been constructed too. By maximizing the number of initial neutrons and hence the number of resulting chain reactions, the gamma irradiation would indeed "many times increase" the "explosive qualities" of the uranium, just as Ilyichev reported. The betatron would also need "special generators, which create high voltage," so that part of Ilyichev's description could apply to either or both neutron initiators.

Note that Igor Kurchatov, the scientific head of the Soviet nuclear program, was puzzled by these statements and did not know how to correctly interpret them; see p. 4496.

The two Ilyichev reports were addressed to Aleksei Antonov but also sent to Joseph Stalin and Vyacheslav Molotov, with one copy for records:

1. The fact that the reports were sent directly to Stalin demonstrates both how important and how reliable Ilyichev believed them to be.

2. General Aleksei Antonov was Deputy Chief of Staff of the Soviet military December 1942–February 1945 but was commonly considered the acting Chief in Moscow (where Ilyichev's reports were sent), since the official Chief of Staff Aleksandr Vasilevsky was usually directing operations on the front lines as the Soviet military advanced westward. Antonov became the official Chief of Staff in February 1945. By addressing his letters to Antonov, Ilyichev was reporting to the highest military official in Moscow. (See also pp. 5028–5029.)

3. Vyacheslav Molotov was the Soviet Minister of Foreign Affairs 1939–1949, but he also handled the logistics of the Soviet nuclear program (along with Lavrentiy Beria) during the war and after the war until at least 1946. By sending a copy of his letters to Molotov, Ilyichev was keeping this top official of the Soviet nuclear program in the loop on intelligence about the German nuclear program.

4. The fact that only four copies of the reports were made (apart from a fifth copy that was apparently forwarded to Igor Kurchatov in late March 1945) again demonstrates how important Ilyichev and the others considered them to be.

The authenticity of the two Ilyichev reports appears beyond doubt [Uhl 2024]:

- The Ilyichev reports are part of an extended paper trail that includes published responses by Kurchatov and Georgy Flerov [Riabev, ed. 2002], so they cannot be more recent fabrications. All of the details in Kurchatov's published response agree quite well with the details in these Ilyichev reports that he referenced (pp. 4496–4497).

- Since these documents cast grave doubt on the Soviet Union's claim to be the second nuclear nation or to have achieved that status by its own scientific strength, there appears to be no incentive for Russians of any time period to have forged or embellished them.

- These reports do not appear to have been a wartime German attempt to bluff the Russians into believing that the Germans possessed a weapon that they did not actually have. A bluff would surely have claimed that the test explosion was much larger, and would not have handed the Russians a highly detailed and presumably quite effective design for a fission bomb.

Of course, despite the authenticity of these documents, how accurate or inaccurate they may be depends on the competence of the unnamed Soviet spy who transmitted the details from Germany. That raises an obvious question—who was the "trustworthy source from Germany" who provided all the information to Ilyichev for the short 15 November 1944 report and the long 23 March 1945 report?

Within the U.S. nuclear program, there were Russian spies from Los Alamos to Oak Ridge transmitting every last technical detail to the Russians. Klaus Fuchs is the most famous, but he was only one of many. Therefore there may well have been multiple Russian spies within the German nuclear program. Because there are so few surviving German records of the program, we may have never even heard of the people who were the key Russian spies within the German program. Those names are probably still in Russian records, but unfortunately historians will probably not be allowed to view more of those records for a long time.

A different approach is to try to think about the types of source people who could have created these reports, just as some scholars divide up books of the Bible into multiple hypothetical sources. Taking that approach, there appear to be at least three possible sources within these reports, which could all be the same single person, or could be two, three, or more people providing information for the reports:

Source 1 was able to write long, detailed reports and transmit them to Russia without being detected by the Germans. Considering how tight German security for the nuclear weapons program was, and how viciously the SS treated anyone even suspected of disloyalty, that was a major accomplishment. Source 1 was also well known by and highly valued by the highest levels of the Russian military/intelligence system/government, apparently due to previous reports that we do not currently have.

Source(s) 2 was one or more people with detailed knowledge of the bomb design. Source 2 could have been a scientist or engineer who worked on the design or the practical assembly, or could have simply been someone who could observe and describe details accurately and who spent enough time with the bomb plans, with the bomb components as they were being assembled, and/or with the scientists who designed or assembled the bomb. Source 2's knowledge covers virtually every major component of the bomb, so this was a person who had comprehensive access, not just someone familiar with only some parts of the bomb. Moreover, source 2's information on all of those bomb components is highly accurate in all cases yet intriguingly is generally not described in very scientific language, which is why it puzzled Kurchatov. Collectively, that evidence suggests that source 2 had unfettered access to the complete bomb and/or complete bomb plans but quite possibly was not a formally educated scientist.

Source(s) 3 was one or more people very familiar with the SS security situation on the ground in Thuringia. That source was likely in the SS in Thuringia, or at least had access to detailed SS reports going to and from Thuringia (maybe in Berlin, or at one of Hans Kammler's other research installations that was closely coordinating with Thuringia). Source 3 knew about all SS security aspects in Thuringia from advanced preparations for the test, to setup of the test, to the effects of the test.

This same combination of sources 1–3 appears in both the short 15 November 1944 report and the long 23 March 1945 report. The identity of the one unified source, or the composition of the team of sources, did not change noticeably during that time period.

As already mentioned, sources 1–3 could have been several different people, or they could have all been the same person. If it was all the same single person, the most plausible profiles (which may or may not be correct) for that person might be:

A. An SS member in Thuringia, who was directly involved in helping to assemble the bomb and prepare for the tests, but probably was not a trained scientist or one of the designers of the bomb.

   or

B. Someone in an SS headquarters office in Berlin, Austria, or Czech territory with unrestricted access to both bomb plans and also SS security reports sent to and from Thuringia. That person could have been anyone from a highly trusted courier or secretary to a high-ranking SS officer, but likely was not a trained scientist.

Someone in the position of profile A above would have been in a far less populated area and perhaps better able to occasionally escape security to send messages to Russia. On the other hand, someone in the position of profile B above would have been surrounded by far more people and communications infrastructure that could potentially be used to send messages to Russia.]

Letter from Igor Kurchatov to General Ilyichev. 30 March 1945. Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 24–25. Published in L. D. Riabev, ed. 2002. *Atomnii Projekt SSR [Soviet Atomic Project] 1938–1945.* Vol. 1, Part 2. Moscow. pp. 260–261. [See document photos on pp. 4498–4501.]

Opinion of I. V. Kurchatov on the document "About a German atomic bomb" that was received by the head office of the General Staff of the Red Army, March 30, 1945

"Secret classified information" (strictly confidential)

The material is extremely interesting. It contains a description of the construction of a German atomic bomb, which is intended to be transported by a carrier rocket of the type "V."

The bringing together of uranium-235 over the critical mass that is required for the achievement of a nuclear chain reaction is caused by the described construction, the explosion of the mixture of granulated trinitrotoluene and liquid oxygen surrounding the U235. The ignition of the uranium is carried out by fast neutrons, which are generated by means of a high-voltage gas discharge tube fed by special generators.

To protect against thermal neutrons, the uranium container is surrounded by a cadmium layer. All of these design details are very credible ~~and agree overall with those according to us that underlie the project of an atomic bomb~~.

It should be noted that I am not totally convinced on the basis of the reviewed material that the Germans have actually made experiments with an atomic bomb.

The level of destruction of a nuclear bomb would be greater than stated, and spread over several kilometers and not just a few hundred meters. The events mentioned in the documents may be preparatory tests with nuclear weapon designs, but conducted without U235 explosive.

It would be desirable to obtain additional information about the course of the experiments, in order to get a more precise location and to obtain a sample of the uranium 235.

Some aspects that, judging from the description, very convincingly demonstrate the effect of a bomb, remain unclear to me.

These include: 1) the preliminary irradiation of uranium with gamma rays, whose energy potential does not exceed 6 million electron volts; 2) the indication that the radioactive element 93, which is obtained from uranium by neutron irradiation, acts extremely positively on the decay of the uranium-235.

It is hard to imagine that some kind of exposure to gamma rays or neutrons could change the explosion characteristics of U235 crucially. Only by the strong intensity of this radiation from utilizing a fission reactor can one change the properties of uranium-235 significantly. Here the wording of specific details at the beginning of the explosion process is rather based on some sort of new physical factors on exposure of the atomic nucleus of uranium to neutrons.

It would be extremely important to obtain detailed and accurate information on these issues.

Even more important would be to learn more details about the process of extracting uranium-235 from natural uranium.

I must note that it would be extremely important for our physicists to have a conversation with the person who gave the information reviewed here.

30 March 1945

I. Kurchatov
Single copy
(Note:) Copy sent to Gen. Ilyichev with No. 3GVS-s distribution. A. Vasin

[As shown in the table below, the details of Kurchatov's well-known and officially published 30 March 1945 letter agree essentially perfectly with the details of Ilyichev's 23 March 1945 letter that he was referencing, further confirming the authenticity of the archival documents from Ilyichev.

Information	**Ilyichev**	**Kurchatov**
Bomb design	Spherical implosion	(Implied spherical) implosion
Neutron initiator (1)	High-voltage [fusion] tube produces fast neutrons	High-voltage [fusion] tube produces fast neutrons
Neutron initiator (2)	$\leq$ 6 MeV gamma rays [from 6 MeV betatron]	$\leq$ 6 MeV gamma rays [from 6 MeV betatron]
Fission pit	Hollow sphere of uranium-235	(Implied spherical) uranium-235
Tamper and pusher	(Implied U) "delay mechanism" and aluminum shell	(Implied spherical) "uranium container"
Neutron absorber	Spherical cadmium layer	(Implied spherical) cadmium layer
Conventional explosive	Spherical shell of TNT and liquid oxygen	(Implied spherical) shell of TNT and liquid oxygen
Delivery system	V-type rocket	V-type rocket
Development status	Reportedly tested recently	Reportedly tested recently
Blast radius in tests	500–600 meters	Hundreds of meters

Table D.7: Comparison of details from Ilyichev's 23 March 1945 letter and Kurchatov's 30 March 1945 letter.]

(особой важности)
Отзыв о материале под заглавием
„О немецкой атомной бомбе".

Материал исключительно интересен.
Он содержит описание конструкции немецкой
атомной бомбы, предназначенной к транспорти-
ровке на ракетном двигателе типа „Фау".

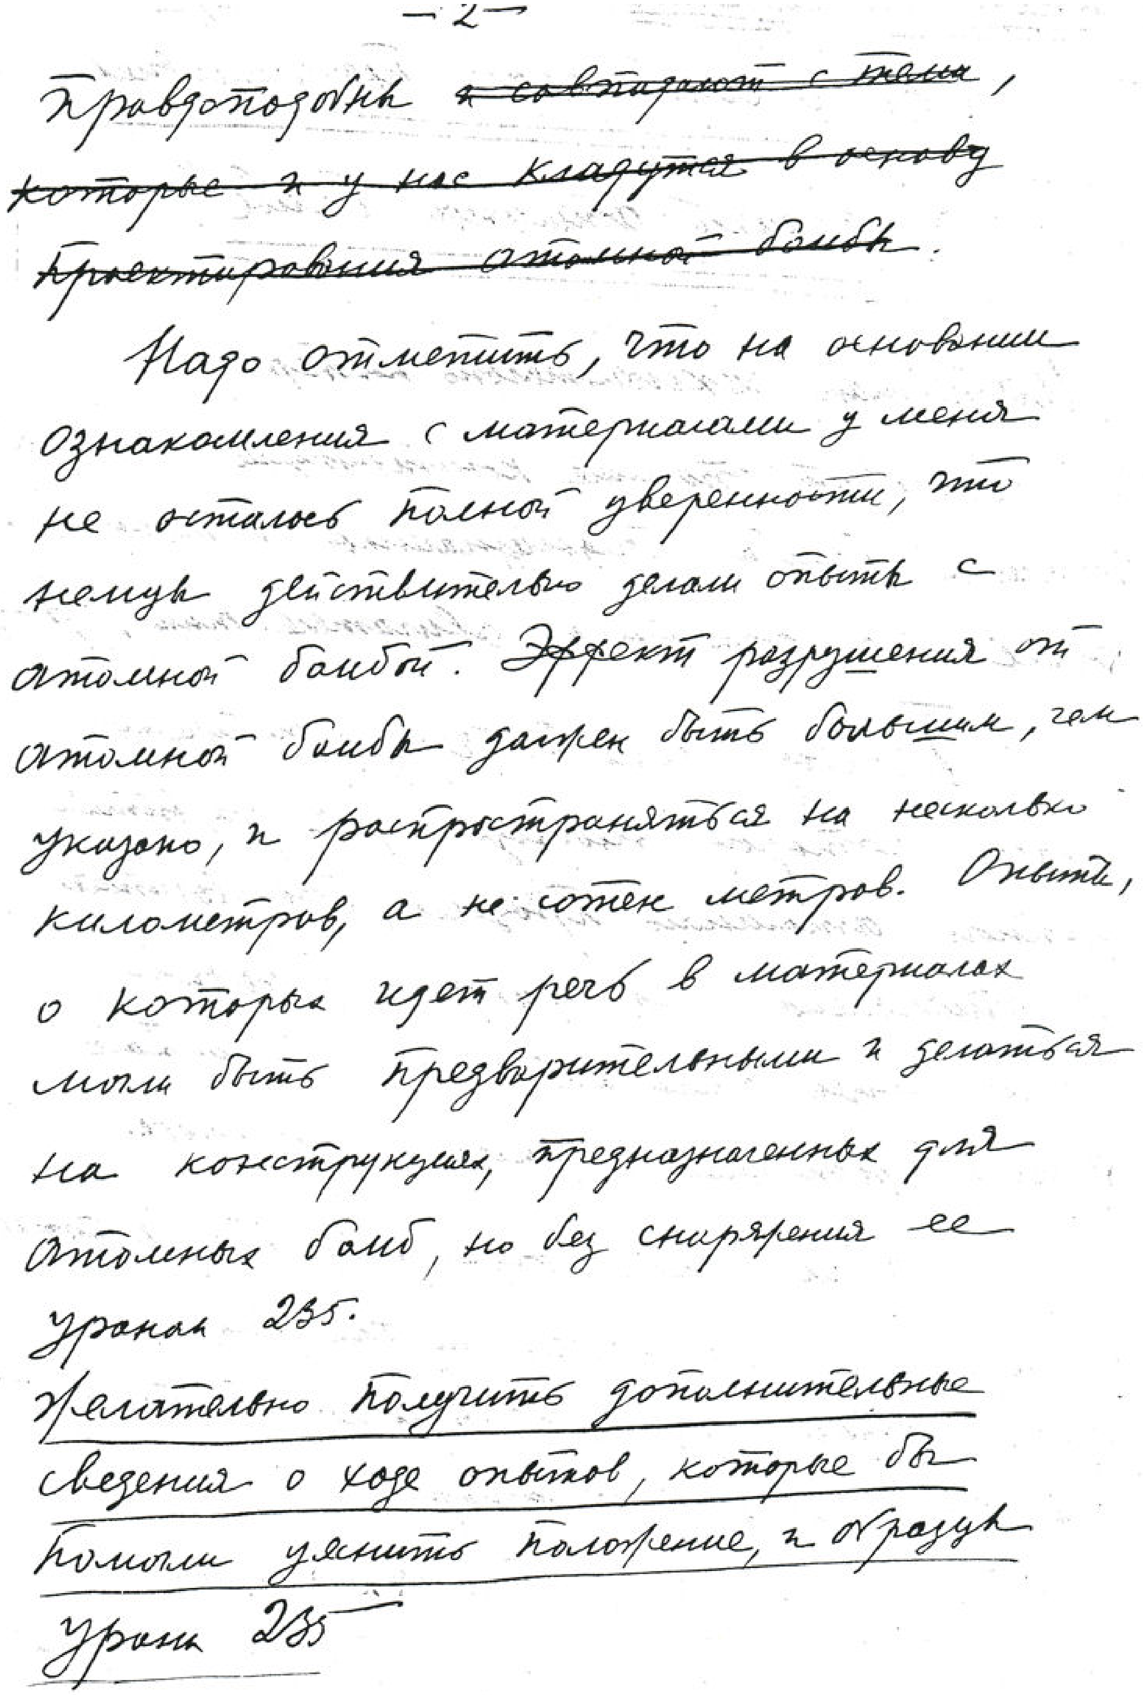
Перевод урана 235 через критическую
массу, который необходим для развития
цепного атомного процесса, производится
в описываемой конструкции взрывом,
окружающей уран 235, смеси тринитротолуола
тринитротолуола и жидкого кислорода.

Запал урана осуществляется быстрыми
нейтронами, генерируемыми при помощи
высоковольтной разрядной трубки, питаемой
от специальных генераторов.

Для защиты от тепловых нейтронов
футляр с ураном окружается слоем кадмия.

Все эти детали конструкции вполне

Figure D.704: Igor Kurchatov. 30 March 1945. Letter to General Ilyichev, p. 1 [Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 24–25, courtesy of Rainer Karlsch and Heiko Petermann].



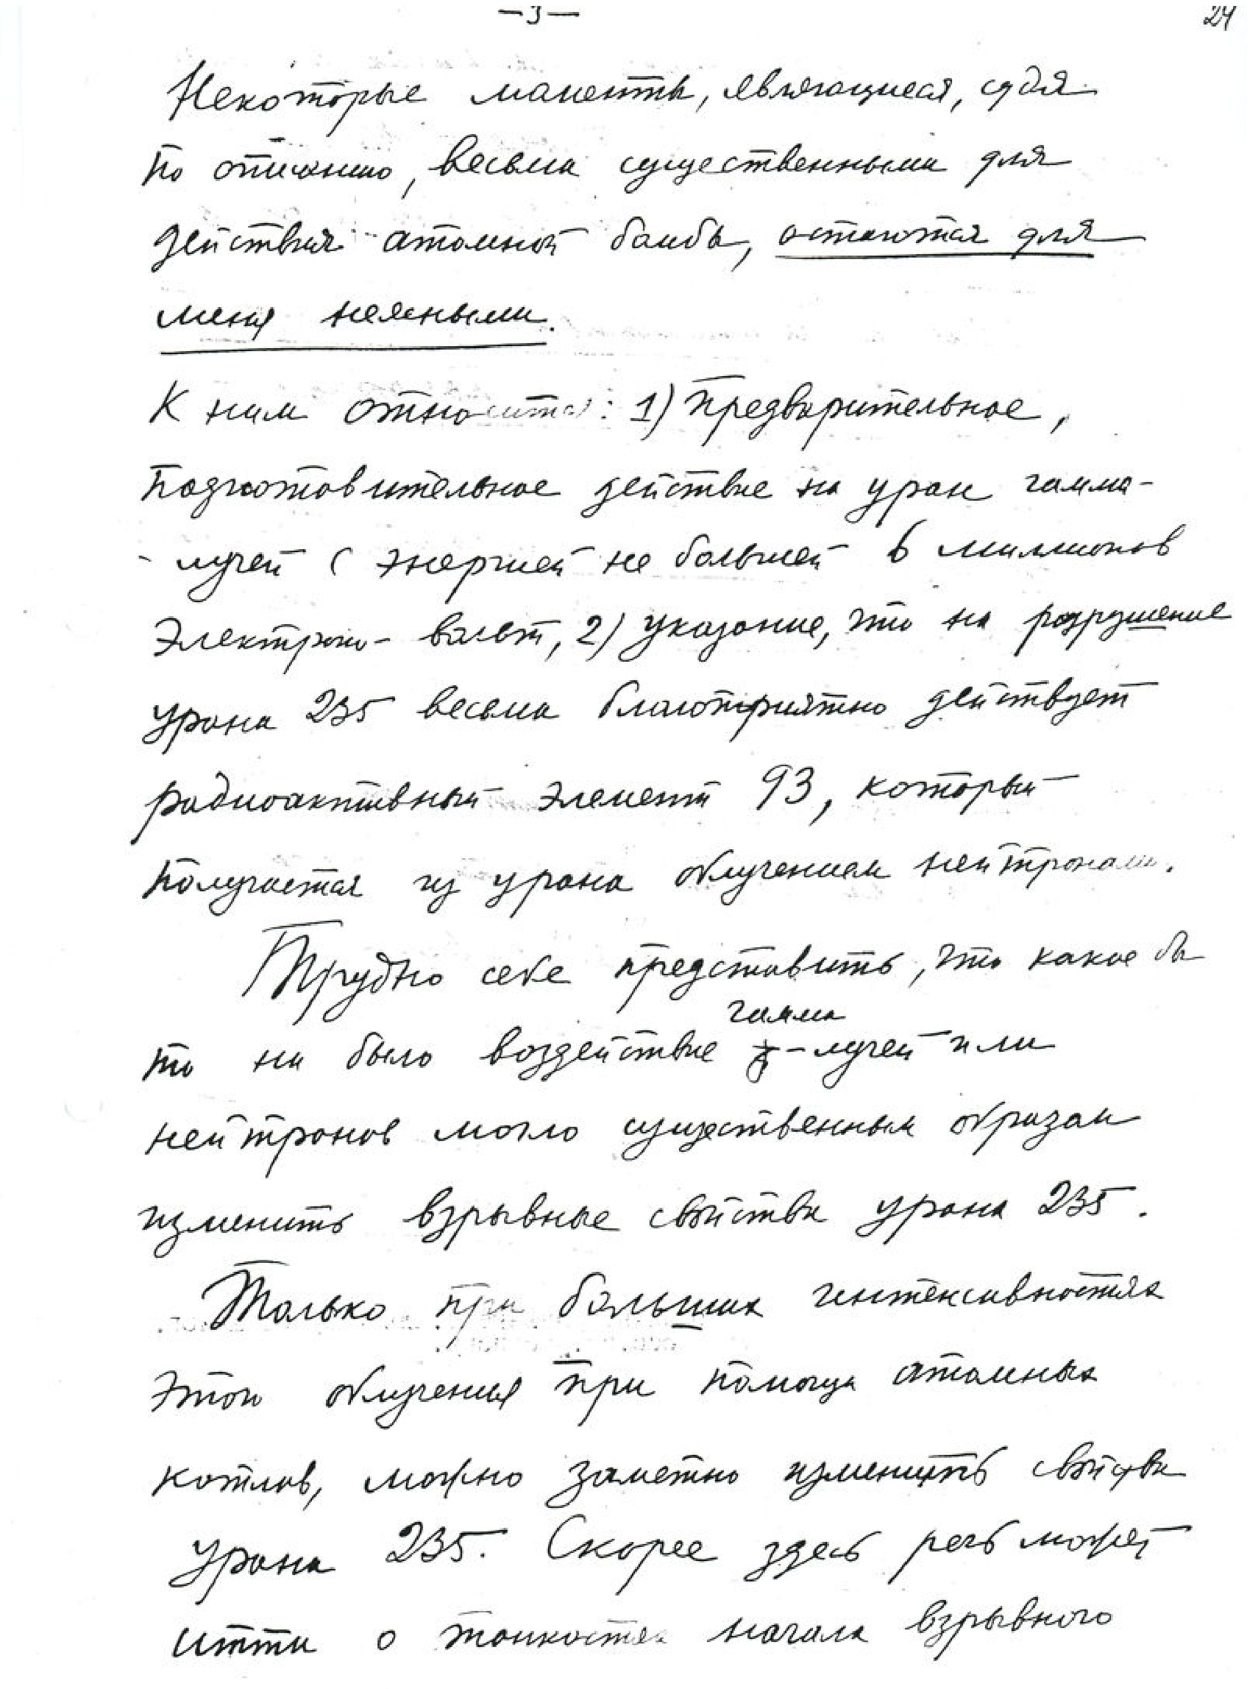
– 2 –

правдоподобны ~~и совпадают с теми, которые и у нас кладутся в основу проектирования атомной бомбы~~.

Надо отметить, что на основании ознакомления с материалами у меня не осталось полной уверенности, что немцы действительно делали опыты с атомной бомбой. Эффект разрушения от атомной бомбы должен быть большим, чем указано, и распространяться на несколько километров, а не сотен метров. Опыты, о которых идет речь в материалах, могли быть предварительными и делаться на конструкциях, предназначенных для атомных бомб, но без снаряжения ее ураном 235.

Желательно получить дополнительные сведения о ходе опытов, которые бы помогли уяснить положение, и образцы урана 235

Figure D.705: Igor Kurchatov. 30 March 1945. Letter to General Ilyichev, p. 2 [Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 24–25, courtesy of Rainer Karlsch and Heiko Petermann].



—3—

24

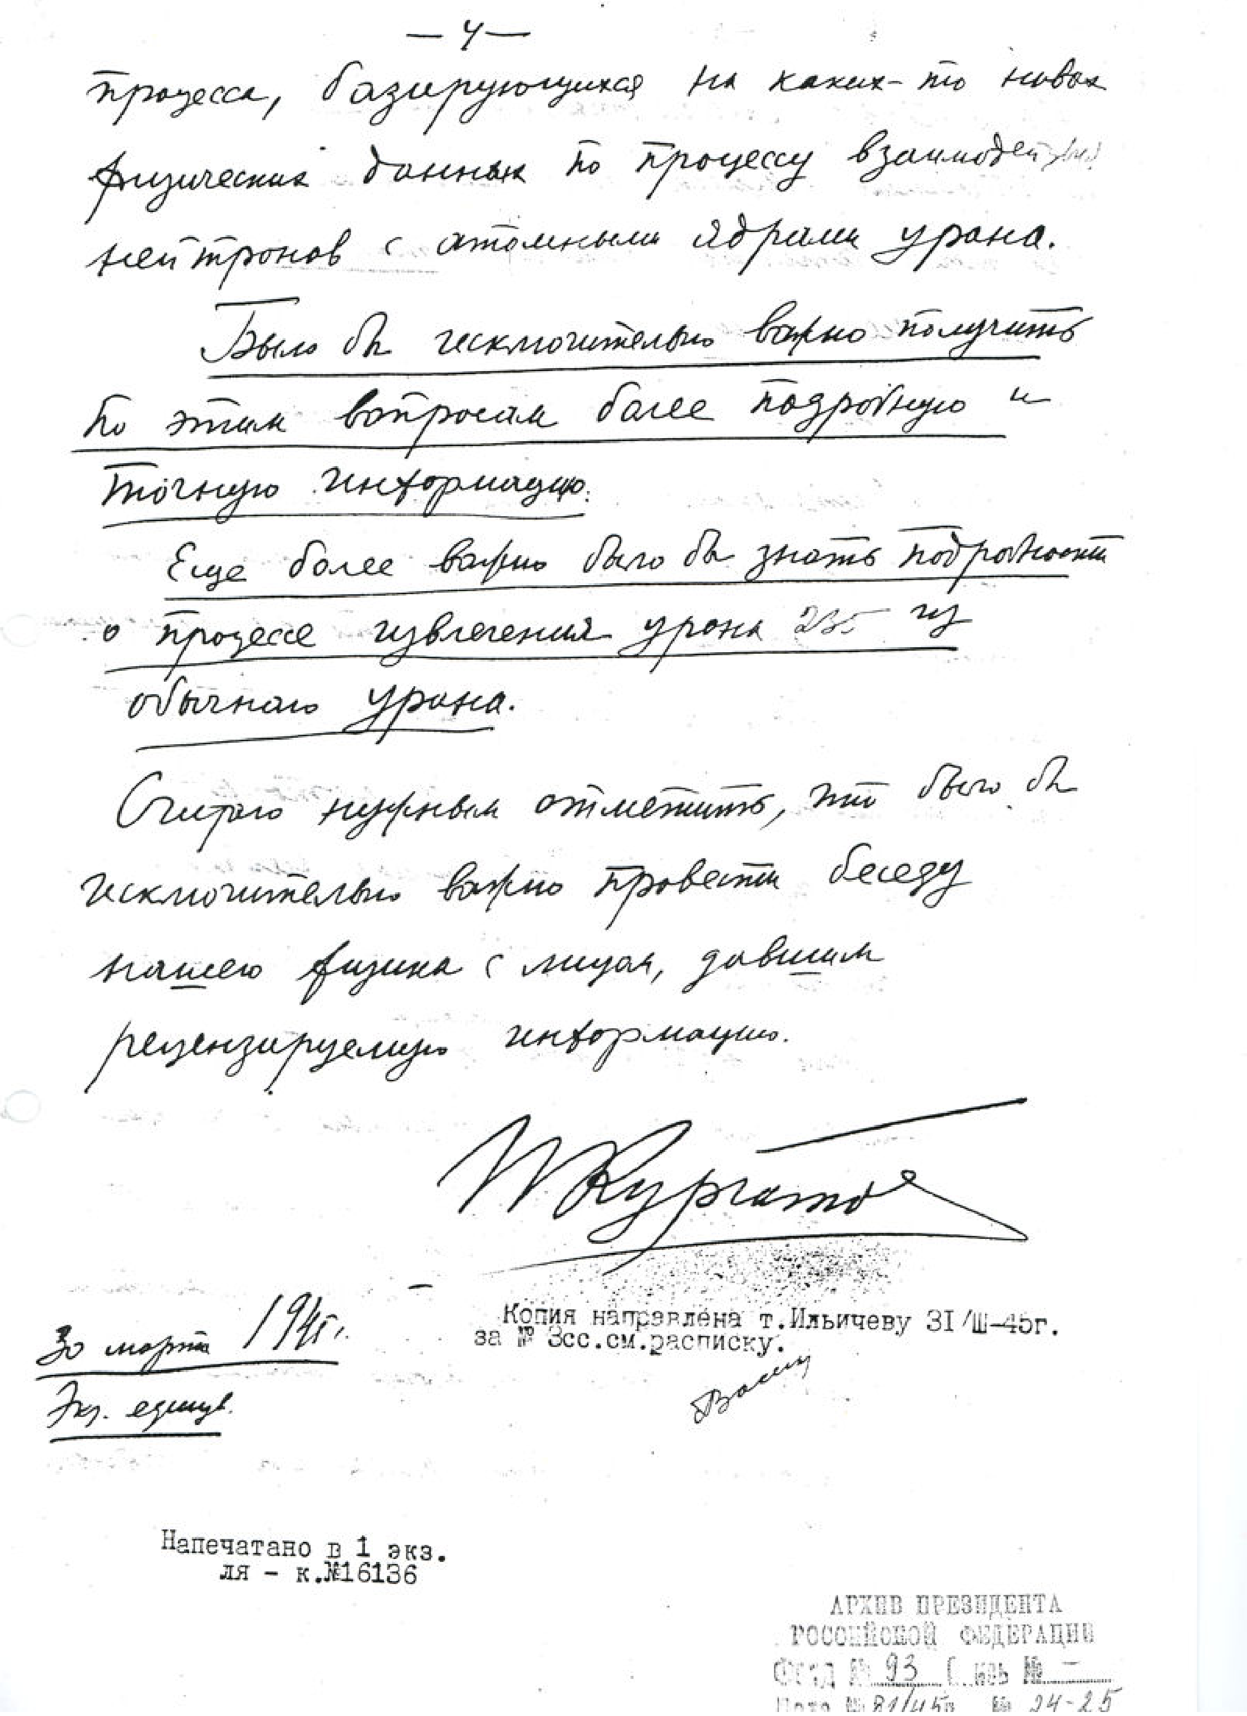
Некоторые моменты, являющиеся, судя по описанию, весьма существенными для действия атомной бомбы, остаются для меня неясными.

К ним относятся: 1) предварительное, подготовительное действие на уран гамма-лучей с энергией не больше 6 миллионов электрон-вольт, 2) указание, что на разрушение урана 235 весьма благоприятно действует радиоактивный элемент 93, который получается из урана облучением нейтронами.

Трудно себе представить, что какое бы то ни было воздействие $\overset{\text{гамма}}{\gamma}$-лучей или нейтронов могло существенным образом изменить взрывные свойства урана 235.

Только при больших интенсивностях этого облучения при помощи атомных котлов, можно заметно изменить свойства урана 235. Скорее здесь речь может идти о тонкостях начала взрывного

Figure D.706: Igor Kurchatov. 30 March 1945. Letter to General Ilyichev, p. 3 [Archive of the President of the Russian Federation, Fund 93, Division 81 (45), List 24–25, courtesy of Rainer Karlsch and Heiko Petermann].



— 4 —

процесса, базирующихся на каких-то новых физических данных по процессу взаимодействия нейтронов с атомными ядрами урана.

Было бы исключительно важно получить по этим вопросам более подробную и точную информацию.

Еще более важно было бы знать подробности о процессе извлечения урана 235 из обычного урана.

Считаю нужным отметить, что было бы исключительно важно провести беседу нашего физика с лицом, давшим рецензируемую информацию.

И. Курчатов

Ivan Ilyichev (1905–1983)

Igor Kurchatov (1903–1960)

Georgy Flerov (1913–1990)

Georgy Zhukov (1896–1974)

Figure D.708: Ivan Ilyichev, Igor Kurchatov, Georgy Flerov, and Georgy Zhukov were some of the key Soviet officials who investigated the German nuclear program.

Circa 21 May 1945 letter from Georgy Flerov to Igor Kurchatov. Published in Oleynikov 2000 and L. D. Riabev, ed. 2002. *Atomnii Projekt SSR [The Soviet Atomic Project] 1938–1945.* Vol. 1, Part 2. Moscow. pp. 310–311.

[...] Today or tomorrow we are going to fly in the direction that you know. I am taking with me Dubovsky's instrument [Geiger counter], but its sensitivity is, probably, too low. If we determine on site that there are objects of interest for examination and sensitivity of the instrument is the issue, I'll send you a cable.

You will have to assign Stoljarenko or Davidenko (if he gets back by then) to this work. Instruct them to assemble the instrument [Geiger counter] in the lightweight option: powered from the mains by 220 volts... Along with the instrument, let them pack the tables for finding the appropriate periods [half lives]...

29 May 1945 letter from Georgy Flerov to Igor Kurchatov. Published in Oleynikov 2000 and L. D. Riabev, ed. 2002. *Atomnii Projekt SSR [The Soviet Atomic Project] 1938–1945.* Vol. 1, Part 2. Moscow. pp. 312–315.

[...] Possibly, you can send somebody from the staff to help me. I think that as a result of such search we will be able to find what we need—a person who occasionally was there nearby, as there were a lot of escapees wandering through forests at the time. If successful, we will get objective confirmation of the fact, tantamount to as if we personally had been at that site. This must be done right here and right now, because afterwards all people crossing the border are dispersed through camps in Germany and then are transferred to the Soviet Union, and then even such an enthusiast as myself would question our ability to catch the right people. [...]

The second direction is connected to what I wrote you in the previous letter. In order to determine finally what was really tested there, we shall of course look after artificial, not natural radioactivity. Unfortunately, a lot of time has passed since, but I think that with [our instruments] we will be able to attain the required sensitivity. [...]

Georgy Flerov, 1983, Warsaw private interview. Stanisław Michalik, Tajemnice kopalni Wałbrzycha, *Głos Głuszycy* 2008-04-24. https://www.gornictwo.walbrzych.pl/news-91-Tajemnice_kopalni_Walbrzycha.php

G. N. Frołow—Czemu interesujecie się niemieckimi badaniami atomowymi?	Flerov—Why are you interested in German atomic research?
JR—Bywam u nas na południu Polski w Górach Sowich, w okolicach Wałbrzycha, tam są podziemne sztolnie z okresu wojny i krążą legendy o tym, że Niemcy zaczęli tam jakieś badania naukowe, a ja przecież wiem, że nie mieli bomby atomowej. Pogłoski te jednak występują tak często, że temat mnie zainteresował, a pan Szymański mówi, że wy Grigoriju Nikołajewiczu wiecie na ten temat wszystko.	JR—[interviewer]: I sometimes visit the south of Poland in the Owl Mountains, near Wałbrzych [Waldenburg in German], where there are underground tunnels from the time of the war and there are rumors circulating about the fact that the Germans started some scientific research there, but I know that they did not have an atomic bomb. However, these rumors appear so often that the topic interested me, and Mr Szymanski says that you, Georgy Nikolayevich, know everything about this subject.
GNF—(śmiech)—Nikt nie wie wszystkiego, bo Niemcy dużo dokumentów i materiałów doświadczalnych poniszczyli, a też dużo zabrali sojusznicy, Amerykanie. A gdzie byliście w tych górach koło Waldenburga?	Flerov—(laughs) Nobody knows everything, because the Germans destroyed a lot of documents and experimental materials, and the Allies, the Americans, took a lot. And where were you in those mountains near Waldenburg?
JR—Chyba wszędzie, w Głuszycy, w Walimiu,	JR—I think everywhere, in Gluszyca, in Walim,...
GNF—Chwila, chwila, używajcie niemieckich nazw. Ja tak pamiętam, polskich nie znam.	Flerov—Wait, wait, wait, use German names. I remember it this way, I don't know any Polish names.
JR—To muszę je sobie przypomnieć: Wüstegiersdorf, Ludwigsdorf, Wüstewaltersdorf, Dörnau,	JR—Then I have to remember them: Wüstegiersdorf, Ludwigsdorf, Wüstewaltersdorf, Dörnau,...
GNF—A w miejscowości Rudolfswald byliście?	Flerov—Were you in Rudolfswald?
JR—Rudolfswald, to chyba Sierpnica. Oczywiście byłem	JR—Rudolfswald, I think it is Augustine. Of course I was.
GNF—Sierpnica? No nie wiem. W dokumentach ja potem chyba inną polską nazwę widziałem, coś od drzewa—Modrzew chyba. Powiedzcie co tam było?	Flerov—Augustine? I don't know. In the documents I later saw a different Polish name, something from a tree—Larch, I think. Tell me what was there?

JR—Na południowy wschód od wsi, niedaleko, jakieś półtora kilometra takie sztolnie wykute w skale więźniowie budowali.	JR—Southeast of the village, not far from there, about a kilometer and a half from there, prisoners built such tunnels carved in the rock.
GNF—To się zgadza. (Zgadza się rzeczywiście—w 1945 roku ta wieś nosiła nazwę Modrzewki -JR) W 1945 roku nasze wojsko tam było. Ciekawe rzeczy stamtąd przywieźli.	Flerov—That is right. (That is right—in 1945 the village was called Modrzewki—JR.) In 1945 our army was there. They brought interesting things out of there.
JR—Jakie wojsko, przecież armia poszła dalej?	JR—What army, after all, the army went further?
GNF—Armia tak, ale mieliśmy takie oddziały specjalne (waha się).	Flerov—The army did, but we had such special forces (he hesitates).
JR—SMIERSZ?	JR—SMERSH?
GNF—No nie, SMIERSZ—sporo wiecie (uśmiecha się)—Szymański dobrze o Was mówił. W Rudolfswaldu i gdzie indziej był wywiad naukowy—no naukowcy w mundurach, ale nie podlegli NKMD.	Flerov—No, not SMERSH—you know a lot (smiles)—Szymanski spoke well of you. In Rudolfswald and elsewhere there was a scientific investigation—scientists in uniforms, but they were not part of the NKVD.
JR—Współpracowaliście z nimi Grigoriju Nikołajewiczu?	JR—Did you work with them Georgy Nikolayevich?
GNF—Nie, z nimi nie, dopiero w Moskwie raporty czytałem.	Flerov—No, not with them, I read the reports only in Moscow.
JF—Jak to dopiero w Moskwie, to nie byliście na Dolnym Śląsku po wojnie?	JR—What do you mean only in Moscow, you were not in Lower Silesia after the war?
GNF—Na Dolnym Śląsku nie, nie byłem (waha się), ja byłem tylko w Waldenbergu.	Flerov—Not in Lower Silesia, I wasn't (hesitates); I was only in Waldenburg.
JR—Czy możecie mi powiedzieć, co żeście tam robili wy najlepszy radziecki fizyk atomowy?	JR—Can you tell me what you, the best Soviet atomic physicist, were doing there?
GNF—(śmieje się) Takich komplementów mi nie mówcie, ja nie dziewczyna. Wielu lepszych ode mnie było. I u nas, choćby Igor Kurczatow, a i u Niemców jak się okazało.	Flerov—(laughs) Don't give me such compliments; I'm not a girl. There were many better than me. With us there was for example Igor Kurchatov, but also [some] with the Germans, as it turned out.

JR—Jak to u Niemców? Więc to prawda z tą niemiecką bombą atomową?	JR—What do you mean by Germans? So it is true about the German atomic bomb?
GNF—Prawda i nieprawda—to zawsze się ze sobą miesza (milczy dłuższą chwilę). Ile lat minęło, trzydzieści osiem chyba, no dobrze—opowiem Wam, pytajcie.	Flerov—Truth and untruth—they are always mixed with each other. (He is silent for a long time.) How many years have passed, 38, I think? Well, I will tell you, ask me.
JR—Powiem szczerze, nie wiem, o co mam pytać. Wiem za mało. Jak było w Rudolfswaldu, co tam były za ciekawe rzeczy, o których mówiliście?	JR—I will tell you honestly, I do not know what to ask you. I know too little. How was it in Rudolfswald, what were the interesting things there that you mentioned?
GNF—Rudolfswald to inna historia. Tam wojsko badało i o tym mówić nie mogę.	Flerov—Rudolfswald is a different story. The military was investigating there and I cannot talk about it.
JR—A w Wałbrzychu byliście?	JR—Were you in Wałbrzych?
GNF—W Waldenbergu byłem, ale tuż przed powrotem z Niemiec do Moskwy.	Flerov—I was in Waldenburg, but just before I came back from Germany to Moscow.
JR—Po co jechaliście do Niemiec, czy możecie opowiedzieć?	JR—Why did you go to Germany, can you tell me about it?
GNF—Mnie tam Stalin i Kurczatow wysłali. Meldunki były, że Niemcy badania atomowe prowadzą. Pojechałem tam jako przedstawiciel Ministerstwa Maszyn Lekkich. Okazało się na miejscu, że Niemcy byli bardziej zaawansowani w tych badaniach niż można było przypuszczać.	Flerov—Stalin and Kurchatov sent me there. There were reports that the Germans were conducting atomic tests. I went there as a representative of the Ministry of Light Machines. It turned out on the spot that the Germans were more advanced in the tests than one could have imagined.
JR—Przekazywali Wam informacje?	JR—Did they give you information?
GNF—Informacje i wyniki badań, różne miejsca pokazywali, i dlatego w Waldenbergu się znalazłem.	Flerov—Information and test results, various locations came up, and that is why I went to Waldenburg.
JR—Pokazywali coś w Wałbrzychu?	JR—Did they show anything in Wałbrzych?
GNF—Nie, w Waldenbergu nie, ale dowiedziałem się, że w Dreźnie wywiad trzymał niemieckiego naukowca, fizyka, który mi opowiadał o tajnych badaniach w Waldenburgu, to go wziąłem i pojechaliśmy, ale wiedział zbyt mało.	Flerov—No, not in Waldenburg, but I found out that in Dresden the “Service” [NKVD] had captured a German scientist, a physicist, who told me about secret experiments in Waldenburg, so I took him with me and we went there, but he knew too little.

JR—Jak to—za mało?	JR—What do you mean—too little?
GNF—Widzicie, Niemcy mieli dużo badawczych grup. Mój Niemiec pracował w instytucie drezdeńskim podległym Ministerstwu Poczty, tylko raz był w Waldenbergu instalować urządzenia, bo tamten ośrodek podlegał SS.	Flerov—You see, the Germans had a lot of research groups. My German worked in an institute in Dresden that belonged to the Postal Ministry. He was in Waldenburg only one time to install equipment, because that institute belonged to the SS.
JR—Zaraz, zaraz, pogubiłem się. SS mogło prowadzić badania, ale Ministerstwo Poczty? Co Poczta ma wspólnego z badaniami naukowymi?	JR—Wait a minute, wait a minute, I got lost. The SS could carry out research, but the Postal Ministry? What does the Post Office have to do with scientific research?
GNF—(śmieje się) Takie czasy były, przecież mówiłem. Nikt by się nie spodziewał atomu w Ministerstwie Poczty i (śmiech) w Ministerstwie Maszyn Lekkich jak u nas też.	Flerov—(laughs) Times were like that, I told you. No one would have expected atom [research] in the Postal Ministry and (laughs) also in the Ministry of Light Machines in our country.
JR—Ale Wasz Niemiec, ten fizyk pracował w Wałbrzychu.	JR—But your German, this physicist, worked in Wałbrzych.
GNF—Jego instytut przekazywał część urządzeń dla SS i on tylko pomagał w instalacji, ja to laboratorium chciałem koniecznie zobaczyć, ale nic z tego nie wyszło.	Flerov—His institute gave some equipment to the SS and he only helped with the installation. I wanted to see the laboratory, but was not able to.
JR—Niemcy wysadzili?	JR—Did the Germans blow it up?
GNF—Wysadzić chyba nie wysadzili, bo to pod samym miastem było, tylko on trafić nie mógł.	Flerov—I do not think they blew it up, because it was just outside the city, but he could not find it.
JR—?	JR—?
GNF—Był tam tylko raz. Samochód, który go wiózł z dworca kolejowego długo jeździł po mieście i Niemcowi droga się pogubiła. Później wjechali na teren kopalni i zwieźli go pod ziemię. Dwa dni tam siedział, pracował, jadł i spał pod ziemią. Jak skończył, to znów samochód powoził go po mieście, zanim dotarł na stację. I dlatego ze mną Niemiec niczego nie mógł znaleźć.	Flerov—He was there only once. The car that carried him from the railway station drove around the city for a long time until the German had forgotten the way. Then they drove into the mine and drove him underground. He sat there for two days, worked, ate, and slept underground. When he finished, the car drove him around the city again, before he reached the station. And that is why the German could not find anything with me.

JR—Ale przecież kopalni w Wałbrzychu nie jest tak dużo nie - mógł poznać otoczenia, budynków?	JR—But there are not so many mines in Wałbrzych—could he recognize the surroundings, buildings?
GNF—Jeździłem z nim długo, namawiałem, straszyłem, nic nie dało. On mówił, że wtedy, gdy był pierwszy raz też się bał. Mówił, że wszędzie pilnowali ludzie SS, określił ich jako "ostrych", mówił że mieli takie dziwne znaczki przy mundurach, jakich wcześniej nie widział.	Flerov—I drove around with him for a long time, I persuaded him, I threatened him, it did not work. He said that when he was there for the first time he was also afraid. He said that SS people were guarding everywhere; he described them as "sharp." He said they had strange emblems on their uniforms that he had never seen before.
JR—Mówił coś o tym co było w kopalni?	JR—Did he say anything about what was in the mine?
GNF—Tak, mówił, że z kolegami zawiózł tam cyklotron, ale okazało się, że to drugi, bo jeden już tam był. Oni zamontowali ten drugi. Opowiadał, że kopalnię specjalnie dostosowano. Były wózki, stoły, wszystkie konieczne urządzenia, a na wejściach śluzy i wartownicy. On wejść nie mógł, bo nie miał specjalnej przepustki.	Flerov—Yes, he said that with his colleagues he had installed a cyclotron there, but it turned out that it was the second one, because one was already there. They installed the second one. He told us that the mine had been specially adapted. There were trolleys, tables, all the necessary equipment, and at the entrances there were locks and guards. He could not enter because he did not have a special pass.
JR—Czy opowiadał o podziemnym laboratorium atomowym, uwierzyliście mu Grigoriju Nikołajewiczu?	JR—Did he talk about the underground atomic laboratory, did you believe him Georgy Nikolayevich?
GNF—Uwierzyłem. Mówił o drobiazgach, które znał nasz wywiad. Oni tam mieli w tej kopalni pod ziemią łączność telefoniczną z całymi Niemcami. Była podobno telewizja. Tak, ja mu uwierzyłem, on nie miał potrzeby kłamać, za to była wtedy kula.	Flerov—I believed him. He described little details that our intelligence knew. They had a telephone connection with all the Germans in the underground mine. Apparently, there was television. Yes, I believed him; he had no reason to lie, otherwise he would have been shot.
JF—Nie szukaliście dalej tej kopalni?	JR—Did you not search any further for this mine?
GNF—Jak to nie szukaliśmy? Jak można było nie szukać? Ja już nie, ale nasi długo szukali. Mieli niemieckie plany kopalni, chodzili z polskimi górnikami. Na nic było. Nie znaleźli, a kilku zginęło.	Flerov—What do you mean did we not search for it? How could one not search? I myself did not [search] further, but others were searching on our behalf for a long time. They had German plans for mines; they went out with Polish miners. It was for nothing. They did not find it, and a few died.

JR—Zawał był jakiś w kopalni?	JR—Was there a heart attack in the mine?
GNF—Nie zawał, tylko Niemcy pracujący z Polakami w kopalni potajemnie podkładali miny. To i przestali szukać.	Flerov—Not a heart attack, but Germans working with Poles in the mine had secretly laid explosive mines. So they stopped searching.
JR—I Niemcy mieli bombę atomową?	JR—And did the Germans have an atomic bomb?
GNF—Ja Wam na to pytanie nie odpowiem, ale historia może da odpowiedź. Oni mieli znacznie więcej niż mogliśmy się spodziewać.	Flerov—I will not answer that question for you, but maybe history will give you an answer. They had much more than we could have expected.

[Some especially noteworthy points from Flerov's interview include:

- Apparently a very advanced German scientific facility was located at Rudolfswald/Modrzewki (now called Sierpnica) and was removed by the Russians. It was so important and so secret that it was handled by special Russian scientists working with the Russian military, and Flerov could not discuss it even 38 years later. What work was conducted at that facility—was it nuclear or something else?

- Another advanced German scientific facility was located at Waldenburg/Wałbrzych and conducted important nuclear work during the war.

- According to conventional histories, the various underground facilities that were part of the Riese construction project in Silesia were never finished, let alone utilized. According to Flerov, though, at least two underground scientific facilities there (in Waldenburg/Wałbrzych and Rudolfswald/Modrzewki) were fully equipped and fully operational. How many other Riese facilities were equipped and operational during the war? See Figs. D.709–D.717 for examples of other Riese facilities.

- German security on the nuclear program was extremely tight. Even a German physicist working on the program was taken on a lengthy car detour between the train station and the underground nuclear facility on his way to and from the facility, so that he would not know where the facility was. He and the other workers there were not able to leave the underground facility, so they worked, ate, and slept there round the clock. Everything was tightly locked up and closely guarded. The SS guards were described as being especially "sharp," even by the standards of wartime SS members.

- At the end of the war, “the Germans destroyed a lot of documents and experimental materials” from their nuclear program. Germans kept the nuclear program very secret both during and after the war.

- Likewise, at the end of the war, the Germans sealed and booby-trapped their underground scientific facilities. That helps to explain why so little has been found, and it also poses challenges for modern researchers hoping to find and open those underground facilities.

- At the end of the war, “the Americans took a lot” of documents and materials from the German nuclear program. Flerov could not have been referring to the documents and materials that were taken by the Alsos Mission but then publicly disclosed (especially regarding the small group around Heisenberg), because he lamented that the documents and materials to which he referred were not available. What other—more important and more secret—documents and materials from the German nuclear program were taken by the United States, and where are those documents and materials now?

- Even the Russian scientific investigators like Flerov who scoured large parts of the former Third Reich and conscripted thousands of German scientists and engineers never got a complete understanding of the full extent and accomplishments of the German nuclear program, due to material that was destroyed by the Germans or removed by other Allied countries.

- The Reichspost (Post Office) and the SS were collaborating on a highly secret, high-priority nuclear program, and they had a number of advanced laboratories in remote locations, exactly as independently stated by Werner Grothmann.

- The Germans were operating multiple cyclotrons in remote locations for a highly secret, high-priority war program. That information strongly suggests that they were conducting electronuclear breeding of fission fuel for nuclear weapons.

- Even in such remote areas, German underground scientific facilities were able to communicate with other German facilities not just by telephone, but also by television for two-way video teleconferencing in a remarkably modern manner. This video teleconferencing technology was first publicly available in Germany in 1936 and was utilized for government business during the war (pp. 1013, 1014).

- Members of the specialized SS division that was conducting advanced nuclear work wore a strange emblem on their uniforms that even a German physicist has never seen before. Different parts of the SS had different emblems, but I am not aware of an example of what this one would have been. What was the emblem of the SS’s most advanced and most secret scientific division? It must have been quite distinctive to have stood out in the memory of the German physicist, and then to have been mentioned by Flerov too 38 years later.

- When asked if the Germans had an atomic bomb, rather than saying no, Flerov replied, “They had much more than we could have expected,” and predicted that history might later reveal it.

Can additional relevant documents written by Flerov, written to Flerov, or related to Flerov’s investigations of the German nuclear program be located and released from Russian archives?]

Marshal Georgy Zhukov. 2 October 1945. Report to Joseph Stalin [Archive of the President of the Russian Federation, Fund 93, Division 77 (45), List 4–11, published in Riabev 2006c, pp. 60–64]. [See document on pp. 4525–4528.]

2 October 1945
Sov. Secret
Ex. No. 1

Moscow

Generalissimo of the Soviet Union
to Comrade Stalin I.V.

In August and September, a group of employees of the Soviet Military Administration organized an inspection in the Soviet occupation zone, which was done by German scientists in the field of creating an atomic bomb.

I present brief conclusions from what I have been able to establish:

1. After the discovery in 1939 by Professor Hahn and Dr. Strassmann in Germany of the uranium decay, a society was created to use atomic energy obtained from the fission of the atom.

The society included:

> Kaiser Wilhelm Institute of Physics. Berlin-Dahlem (American zone). In 1943, it was evacuated to Hechingen (American zone), led by Professor Heisenberg and staff.
>
> Kaiser Wilhelm Institute of Chemistry. Berlin-Dahlem (American zone). Evacuated to Tailfingen (American zone), led by Professor Hahn, Dr. Strassmann, and staff.
>
> Technische Hochschule. Berlin, Institute of Physics, Professor Geiger.
>
> Dr. Diebner's working group. Berlin, later Stadtilm (Thuringia)—Soviet zone. Dr. Diebner, Dr. Czulius, Dr. Hartwig, Dr. Berkei, Professor Gerlach.
>
> Kaiser Wilhelm Institute for Brain Research, Genetic Department. Dr. Zimmer, Professor Timoféeff. Berlin-Buch (Soviet zone).
>
> Physikalische-Techische Reichsanstalt, Radiological Department. Dr. Weiss.
>
> Research Institute of the Reichspost, Miersdorf, Berlin (Soviet zone). Dr. Otterbein, Professor Flügge.
>
> Kaiser Wilhelm Medical Research Institute, Physics Department. Heidelberg (American zone). Professor Bothe.
>
> Physics Institute of Leipzig University. Professor Hofmann, Professor Döpel, Professor Heisenberg, Professor Pose.
>
> Physicochemical Institute of the University of Leipzig. Leipzig (Soviet zone). Professor Bonhoeffer.

Physicochemical Institute, University of Hamburg. Hamburg (English zone). Professor Harteck, Professor Jensen, Professor Knauer.

Physics Institute, University of Strasbourg (France). Professors Fleischmann, von Weizsacker.

Second Physics Institute, University of Vienna. Professors Stetter, Ortmann.

Institute of Physics, University of Cologne (English zone). Professor Kirchner.

Physics Institute, University of Göttingen (English zone).

Institute of Chemistry, University of Kiel (English zone). Dr. Martin.

Kaiser Wilhelm Institute of Biochemistry. Frankfurt am Main (American zone). Professor Raevsky.

Institute of Chemistry, Danzig University (Poland). Professor Albers.

Physics Institute of the University of Bon (France). Professors Schmitz, Schmitz-Dumont.

French College (Paris). Professor Bothe.

Physics Institute. Munich (American zone). Professor Clusius.

In addition, the study of the atomic nucleus in Germany was carried out by the following leading German scientists:

Von Laue – US zone
Professor von Ardenne [USSR]
Professor Kallmann – Berlin, Westend (English zone)
Professor Flügge – US area
Professor Max Planck – Rodetz, USSR zone
Professor Pascual [Jordan] – Göttingen, University (US zone)
Professor Gustav Hertz [USSR]
Professor Smekal – whereabouts unknown
Professor Erich Regener – Friedrichshafen, Bodensee (American zone)
Professor Hans Bauer – Vienna
Professor Stark – Bavaria (American zone)
Professor Seliger – Greifswalde (Soviet zone)
Professor Bechter – Munich (American zone)
Dr. Ullman – Berlin (US area)
Professor Westphal – Berlin, Zehlendorf (American zone)

Most of the major scientists working in this field were evacuated to southern Germany by the Allies.

2. In 1941, the German [Army] Ordnance Office, the Navy Research Institute, and the Air Force Research Institute set the task for the companies Pinch [or Hinch, maybe Henschel?], Siemens, and Allgemeine Elektricitäts-Gesellschaft [AEG] to create atomic weapons.

For the practical implementation of this task, German scientists worked:

> a) on the production of pure uranium oxide (coded under the name "preparation No. 38") and then from it—uranium metal.
>
> The firms of the Auergesellschaft and Degussa (Frankfurt am Main, American zone) were used.
>
> The scientific advisors were Drs. Riehl, Zimmer, Schulenburg;
>
> b) on the production of the isotope uranium-235.
>
> Scientists have found that the active element (ie, capable of explosion) is uranium-235, which is only 0.7% of the total uranium mixture.
>
> The main specialists in the field of isotope separation in Germany were Professor Harteck, Dr. Groth, who, together with the chief designer of the Anschütz company (Kiel, English zone), Dr. Beyerle, invented an ultracentrifuge built by the above company, as well as by the Hellige company (Breslau, USSR zone).
>
> Another method for separating uranium isotopes and obtaining uranium-235 was proposed by Dr. Bagge (Kaiser Wilhelm Institute of Physics);
>
> c) over the organization of the production of heavy water.
>
> Heavy water in Germany was initially brought from Norway (Norsk Hydro plant). After the termination of supplies from Norway, the Germans tried to organize their own production of heavy water in the city of Merseburg (zone of the USSR), the Leunawerke plant at two installations—"small" and "large," and at the Bitterfeld plant.
>
> Currently at the Leunawerke plant the "small installation" has been fixed again on September 7. The "large installation," destroyed by bombing during its construction, is being restored.
>
> Scientific works were supervised by Professors Harteck, Jensen, Bonhoeffer, Clusius;
>
> d) on the creation of the "Uranium-machine" installation as a source of energy obtained as a result of uranium disintegration.

3. At the direction of Professor Bonhoeffer (Leipzig, Soviet zone), valuable information about the practical application of the Hahn-Strassmann process could be given by Professor Döpel, Professor Pose, and Professor Hund (Leipzig, USSR zone). The latter showed that he knew about the existence of the atomic bomb, but the details were unknown to him. Professor Hund considers the Hechingen and Tailfingen (American zone) institutes to be important institutes where work on the atomic bomb was carried out.

4. It was established that Professor Heisenberg (Hechingen, American zone) was engaged in the practical issues of making the atomic bomb.

Gerlach (Munich, American zone) was in charge of all secret materials.

5. The Germans created to disintegrate the atomic nucleus:

- the cyclotron, built by Siemens-Schuckert, is located in Heidelberg (American zone) in an almost finished condition;
- the cyclotron built by the Pinch [or Hinch, maybe Henschel?] company in Beaune (France) has been in operation for several months;
- an installation with a high voltage of 5 million volts (Hennigsdorf, Soviet zone);
- the large cyclotron of Allgemeine Elektricitäts-Gesellschaft [AEG] in the Reichspost Zeuthen Institute (Soviet zone). Construction is not finished yet.

At the Kaiser Wilhelm Institute, Berlin-Dahlem (American zone), there is a structure for a cyclotron, not completely finished.

From the Kaiser Wilhelm Institute we have removed part of the archive of the Main Directorate of the Kaiser Wilhelm Institute, as well as laboratory and chemical preparations of Professor Hahn.

At present, in the city of Stadtilm (Thuringia, Soviet zone), Dr. Hartwig and Berkei are from the working group of Dr. Diebner (Dr. Diebner was the initiator of the creation of the working society for the use of atomic energy obtained from the decay of the atom). There is also a laboratory for experiments with the "Uran-machine," various laboratory equipment, chemicals and a physicochemical library (2,000 volumes).

According to Dr. Berkei and Hartwig, at the departure of Dr. Diebner with the Americans to the south of Germany (American zone) the following equipment and raw materials were taken:

- radium — about 4 grams;
- metal-uranium — about 1 ton;
- heavy water — 400 kg;
- 2 sets of measuring equipment for measuring machine experiments;
- photographic laboratory;
- technical library;
- instruments required for laboratory equipment: transformers, capacitors, rheostats, amplifiers, meters, vacuum pumps, etc.

When the Americans left, they took away about 10 tons of uranium oxide, beryllium, all available documentation, including personnel cards.

According to Dr. Hartwig and Dr. Berkei, Dr. Osenberg (who booked scientists on important government issues) handed over the complete list of the latter to the Americans.

Based on the collected materials, it can be concluded that the German scientists in the field of theoretical and practical research and application of atomic energy have achieved good results up to the creation of the atomic bomb.

According to German scientists, the Americans partially took advantage of the results of the work of German scientists on this issue.

All materials on the above issue, as well as those removed from the Institute Kaiser Wilhelm's chemical preparations, a group of German scientists in the field of atomic energy and the equipment, materials and a library available in Stadtilm, containing about 2,000 volumes, we handed over to the representative of the NKVD of the USSR, who arrived in Berlin, Lieutenant Colonel Comrade Sidenko on 19 September 1945.

In the future, I would consider it necessary to use the remaining group of scientists and the laboratory of the Physical Chemistry Institute in Stadtilm (Soviet zone) to collect German scientists working on atomic energy, and after gathering these scientists, evacuate them to the Soviet Union.

Commander-in-Chief of the Group of Soviet Occupation Forces in Germany,
Marshal of the Soviet Union G. Zhukov

[The names of people and places got slightly distorted in being translated from German to Russian. The proper German names are used in this English translation of the Russian document.

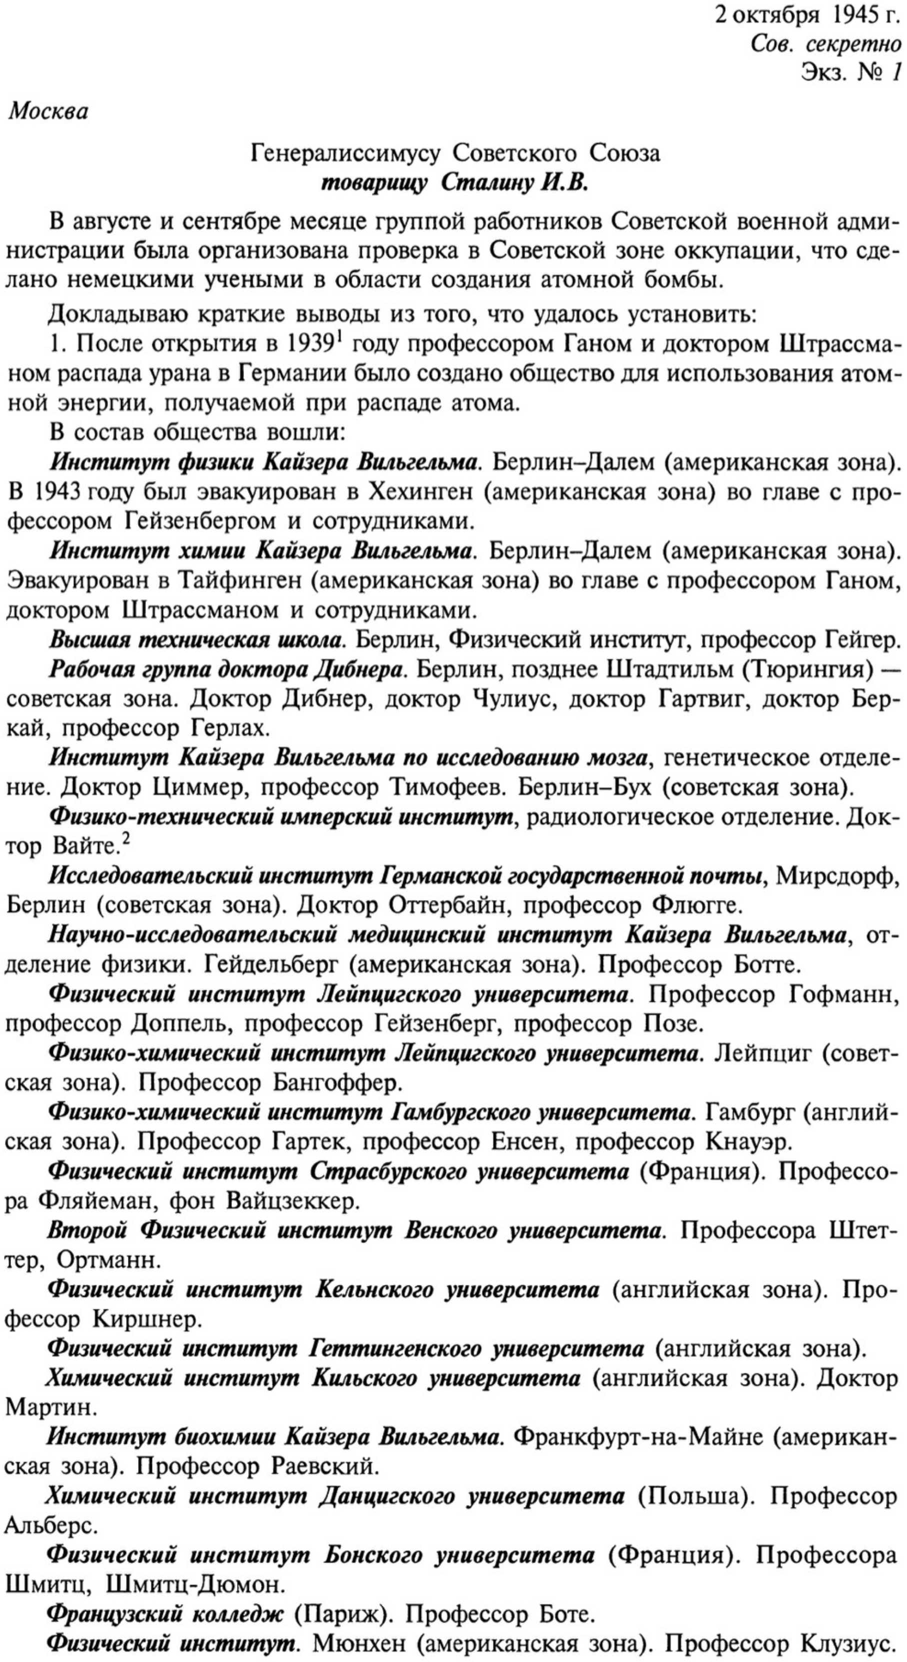
Georgy Zhukov (Russian, 1896–1974) became Marshal of the Soviet Union, the highest possible military rank, in January 1943. He led battles on the Soviet/German front, accepted the German surrender in Berlin on 8 May 1945, and commanded Soviet troops in (East) Germany after the war.

Zhukov listed numerous examples of the scientists, organizations, and locations involved in the German nuclear program. On the other hand, there are many German nuclear scientists who went to work for the Soviet Union (e.g., pp. 1633–1636) and many nuclear sites in areas occupied by the Soviet Union (e.g., pp. 2086–2099, 3405, 3407, 3671, 3841, 4030) after the war that Zhukov did not mention. Those omissions might be because Zhukov:

- Considered those details too numerous to include in this report.
- Considered those details too sensitive to include in this report.
- Did not personally inspect those sites or former projects.
- Was excluded from some of those sensitive details by other Soviet officials such as Antonov, Molotov, and Beria who were more closely associated with the fledgling Soviet nuclear program.

Nonetheless, Zhukov clearly stated that he had seen enough evidence to know for himself: "Based on the collected materials, it can be concluded that the German scientists in the field of theoretical and practical research and application of atomic energy have achieved good results up to the creation of the atomic bomb."

Zhukov stated that uranium gas centrifuges were produced by the Hellige company in Breslau (Wrocław), an important detail that does not seem to appear in any other publicly released documents. A heavy water production plant was also reported to be located just outside Breslau (pp. 4070–4071), so Breslau appears to have been an important area for nuclear work.]



2 октября 1945 г.
Сов. секретно
Экз. № *1*

Москва

Генералиссимусу Советского Союза
товарищу Сталину И.В.

В августе и сентябре месяце группой работников Советской военной администрации была организована проверка в Советской зоне оккупации, что сделано немецкими учеными в области создания атомной бомбы.

Докладываю краткие выводы из того, что удалось установить:

1. После открытия в 1939[1] году профессором Ганом и доктором Штрассманом распада урана в Германии было создано общество для использования атомной энергии, получаемой при распаде атома.

В состав общества вошли:

Институт физики Кайзера Вильгельма. Берлин–Далем (американская зона). В 1943 году был эвакуирован в Хехинген (американская зона) во главе с профессором Гейзенбергом и сотрудниками.

Институт химии Кайзера Вильгельма. Берлин–Далем (американская зона). Эвакуирован в Тайфинген (американская зона) во главе с профессором Ганом, доктором Штрассманом и сотрудниками.

Высшая техническая школа. Берлин, Физический институт, профессор Гейгер.

Рабочая группа доктора Дибнера. Берлин, позднее Штадтильм (Тюрингия) — советская зона. Доктор Дибнер, доктор Чулиус, доктор Гартвиг, доктор Беркай, профессор Герлах.

Институт Кайзера Вильгельма по исследованию мозга, генетическое отделение. Доктор Циммер, профессор Тимофеев. Берлин–Бух (советская зона).

Физико-технический имперский институт, радиологическое отделение. Доктор Вайте.[2]

Исследовательский институт Германской государственной почты, Мирсдорф, Берлин (советская зона). Доктор Оттербайн, профессор Флюгге.

Научно-исследовательский медицинский институт Кайзера Вильгельма, отделение физики. Гейдельберг (американская зона). Профессор Ботте.

Физический институт Лейпцигского университета. Профессор Гофманн, профессор Доппель, профессор Гейзенберг, профессор Позе.

Физико-химический институт Лейпцигского университета. Лейпциг (советская зона). Профессор Бангоффер.

Физико-химический институт Гамбургского университета. Гамбург (английская зона). Профессор Гартек, профессор Енсен, профессор Кнауэр.

Физический институт Страсбургского университета (Франция). Профессора Фляйеман, фон Вайцзеккер.

Второй Физический институт Венского университета. Профессора Штеттер, Ортманн.

Физический институт Кельнского университета (английская зона). Профессор Киршнер.

Физический институт Геттингенского университета (английская зона).

Химический институт Кильского университета (английская зона). Доктор Мартин.

Институт биохимии Кайзера Вильгельма. Франкфурт-на-Майне (американская зона). Профессор Раевский.

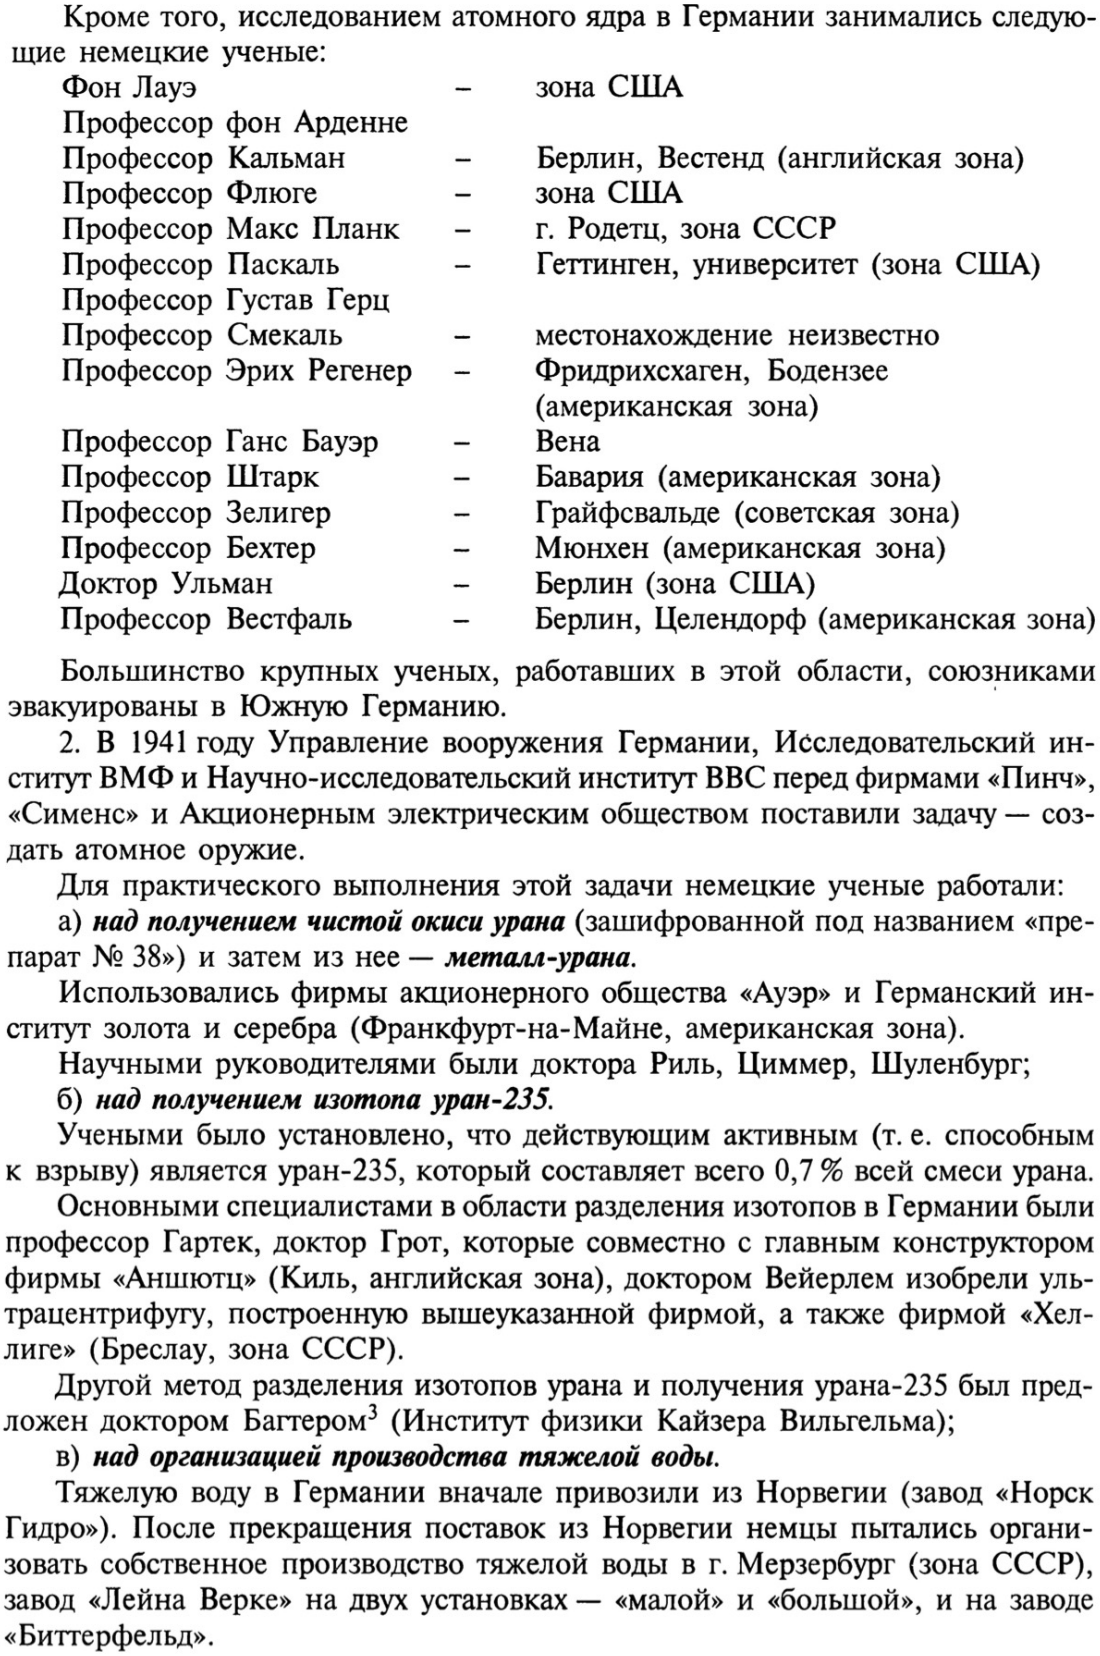
Химический институт Данцигского университета (Польша). Профессор Альберс.

Физический институт Бонского университета (Франция). Профессора Шмитц, Шмитц-Дюмон.

Французский колледж (Париж). Профессор Боте.

Физический институт. Мюнхен (американская зона). Профессор Клузиус.

Figure D.718: Marshal Georgy Zhukov. 2 October 1945. Report to Joseph Stalin [Archive of the President of the Russian Federation, Fund 93, Division 77 (45), List 4–11, published in Riabev 2006c, pp. 60–64].



Кроме того, исследованием атомного ядра в Германии занимались следующие немецкие ученые:

Фон Лауэ – зона США
Профессор фон Арденне
Профессор Кальман – Берлин, Вестенд (английская зона)
Профессор Флюге – зона США
Профессор Макс Планк – г. Родетц, зона СССР
Профессор Паскаль – Геттинген, университет (зона США)
Профессор Густав Герц
Профессор Смекаль – местонахождение неизвестно
Профессор Эрих Регенер – Фридрихсхаген, Бодензее (американская зона)
Профессор Ганс Бауэр – Вена
Профессор Штарк – Бавария (американская зона)
Профессор Зелигер – Грайфсвальде (советская зона)
Профессор Бехтер – Мюнхен (американская зона)
Доктор Ульман – Берлин (зона США)
Профессор Вестфаль – Берлин, Целендорф (американская зона)

Большинство крупных ученых, работавших в этой области, союзниками эвакуированы в Южную Германию.

2. В 1941 году Управление вооружения Германии, Исследовательский институт ВМФ и Научно-исследовательский институт ВВС перед фирмами «Пинч», «Сименс» и Акционерным электрическим обществом поставили задачу — создать атомное оружие.

Для практического выполнения этой задачи немецкие ученые работали:

а) ***над получением чистой окиси урана*** (зашифрованной под названием «препарат № 38») и затем из нее — ***металл-урана***.

Использовались фирмы акционерного общества «Ауэр» и Германский институт золота и серебра (Франкфурт-на-Майне, американская зона).

Научными руководителями были доктора Риль, Циммер, Шуленбург;

б) ***над получением изотопа уран-235***.

Учеными было установлено, что действующим активным (т. е. способным к взрыву) является уран-235, который составляет всего 0,7 % всей смеси урана.

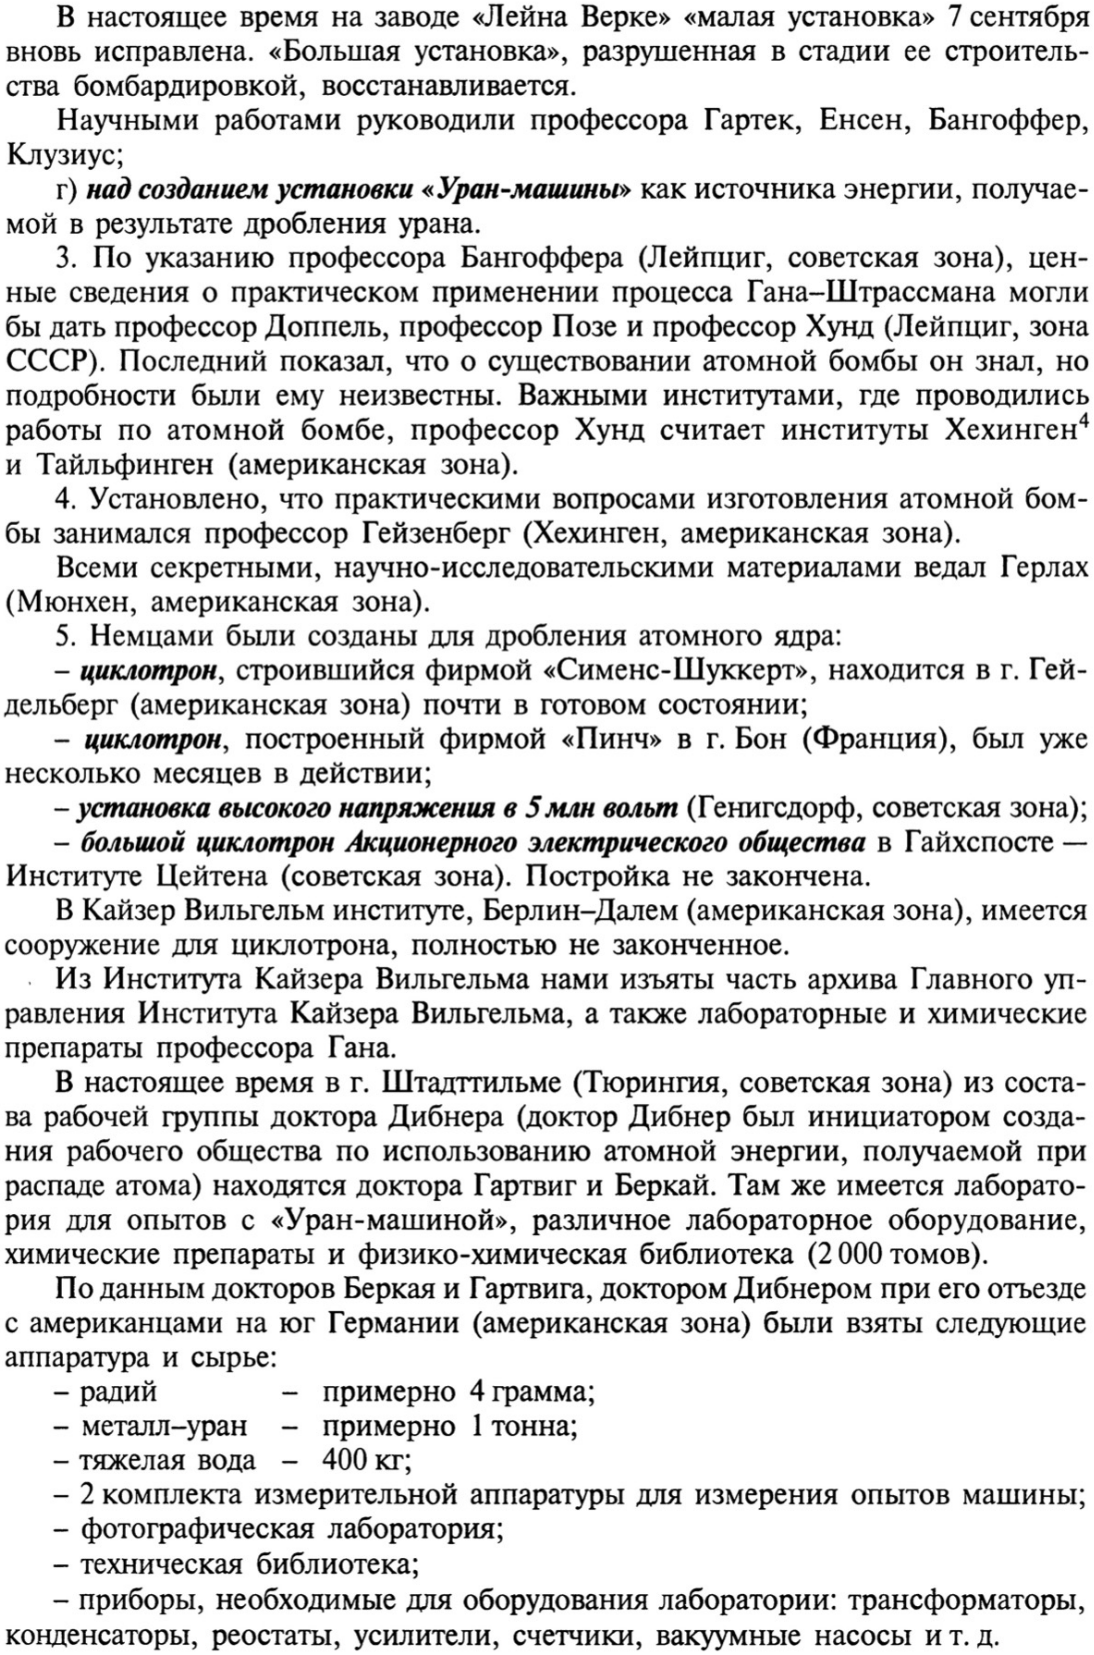
Основными специалистами в области разделения изотопов в Германии были профессор Гартек, доктор Грот, которые совместно с главным конструктором фирмы «Аншютц» (Киль, английская зона), доктором Вейерлем изобрели ультрацентрифугу, построенную вышеуказанной фирмой, а также фирмой «Хеллиге» (Бреслау, зона СССР).

Другой метод разделения изотопов урана и получения урана-235 был предложен доктором Багтером[3] (Институт физики Кайзера Вильгельма);

в) ***над организацией производства тяжелой воды***.

Тяжелую воду в Германии вначале привозили из Норвегии (завод «Норск Гидро»). После прекращения поставок из Норвегии немцы пытались организовать собственное производство тяжелой воды в г. Мерзербург (зона СССР), завод «Лейна Верке» на двух установках — «малой» и «большой», и на заводе «Биттерфельд».

Figure D.719: Marshal Georgy Zhukov. 2 October 1945. Report to Joseph Stalin [Archive of the President of the Russian Federation, Fund 93, Division 77 (45), List 4–11, published in Riabev 2006c, pp. 60–64].



В настоящее время на заводе «Лейна Верке» «малая установка» 7 сентября вновь исправлена. «Большая установка», разрушенная в стадии ее строительства бомбардировкой, восстанавливается.

Научными работами руководили профессора Гартек, Енсен, Бангоффер, Клузиус;

г) ***над созданием установки «Уран-машины»*** как источника энергии, получаемой в результате дробления урана.

3. По указанию профессора Бангоффера (Лейпциг, советская зона), ценные сведения о практическом применении процесса Гана–Штрассмана могли бы дать профессор Доппель, профессор Позе и профессор Хунд (Лейпциг, зона СССР). Последний показал, что о существовании атомной бомбы он знал, но подробности были ему неизвестны. Важными институтами, где проводились работы по атомной бомбе, профессор Хунд считает институты Хехинген[4] и Тайльфинген (американская зона).

4. Установлено, что практическими вопросами изготовления атомной бомбы занимался профессор Гейзенберг (Хехинген, американская зона).

Всеми секретными, научно-исследовательскими материалами ведал Герлах (Мюнхен, американская зона).

5. Немцами были созданы для дробления атомного ядра:

– ***циклотрон***, строившийся фирмой «Сименс-Шуккерт», находится в г. Гейдельберг (американская зона) почти в готовом состоянии;

– ***циклотрон***, построенный фирмой «Пинч» в г. Бон (Франция), был уже несколько месяцев в действии;

– ***установка высокого напряжения в 5 млн вольт*** (Генигсдорф, советская зона);

– ***большой циклотрон Акционерного электрического общества*** в Гайхспосте — Институте Цейтена (советская зона). Постройка не закончена.

В Кайзер Вильгельм институте, Берлин–Далем (американская зона), имеется сооружение для циклотрона, полностью не законченное.

Из Института Кайзера Вильгельма нами изъяты часть архива Главного управления Института Кайзера Вильгельма, а также лабораторные и химические препараты профессора Гана.

В настоящее время в г. Штадттильме (Тюрингия, советская зона) из состава рабочей группы доктора Дибнера (доктор Дибнер был инициатором создания рабочего общества по использованию атомной энергии, получаемой при распаде атома) находятся доктора Гартвиг и Беркай. Там же имеется лаборатория для опытов с «Уран-машиной», различное лабораторное оборудование, химические препараты и физико-химическая библиотека (2 000 томов).

По данным докторов Беркая и Гартвига, доктором Дибнером при его отъезде с американцами на юг Германии (американская зона) были взяты следующие аппаратура и сырье:

– радий	– примерно 4 грамма;
– металл–уран	– примерно 1 тонна;
– тяжелая вода	– 400 кг;

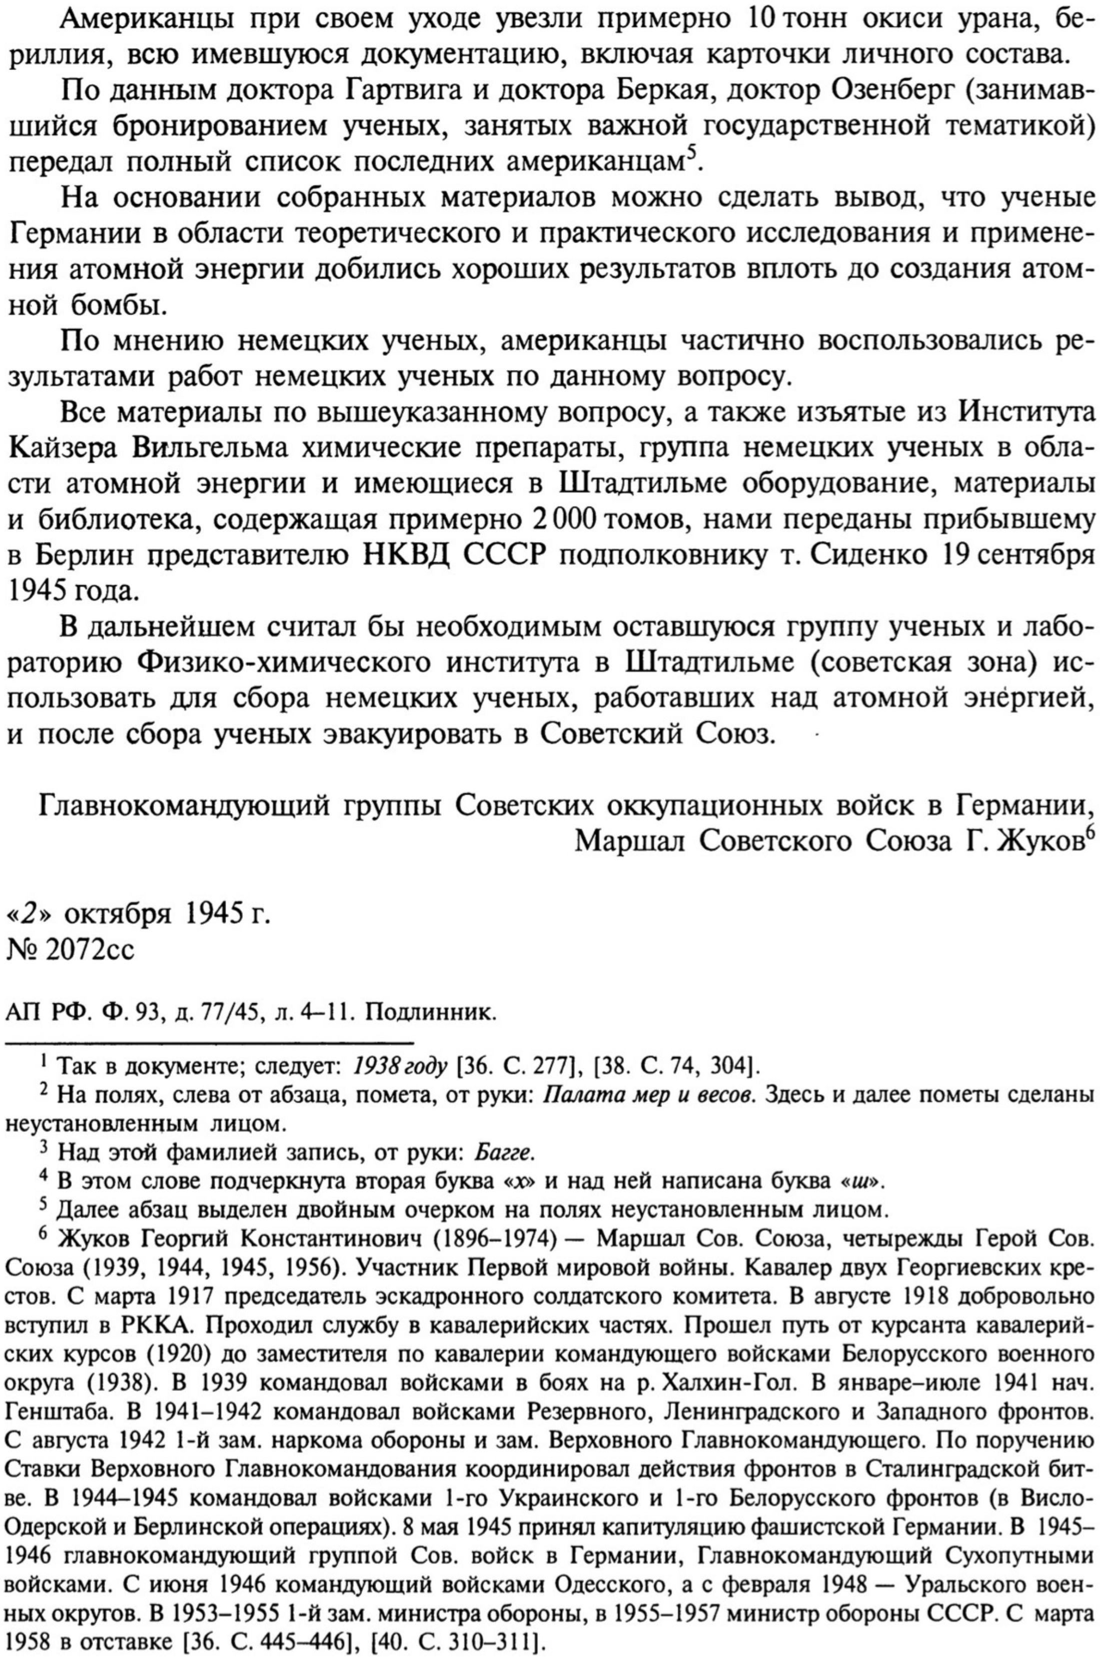
– 2 комплекта измерительной аппаратуры для измерения опытов машины;

– фотографическая лаборатория;

– техническая библиотека;

– приборы, необходимые для оборудования лаборатории: трансформаторы, конденсаторы, реостаты, усилители, счетчики, вакуумные насосы и т. д.

Figure D.720: Marshal Georgy Zhukov. 2 October 1945. Report to Joseph Stalin [Archive of the President of the Russian Federation, Fund 93, Division 77 (45), List 4–11, published in Riabev 2006c, pp. 60–64].



Американцы при своем уходе увезли примерно 10 тонн окиси урана, бериллия, всю имевшуюся документацию, включая карточки личного состава.

По данным доктора Гартвига и доктора Беркая, доктор Озенберг (занимавшийся бронированием ученых, занятых важной государственной тематикой) передал полный список последних американцам[5].

На основании собранных материалов можно сделать вывод, что ученые Германии в области теоретического и практического исследования и применения атомной энергии добились хороших результатов вплоть до создания атомной бомбы.

По мнению немецких ученых, американцы частично воспользовались результатами работ немецких ученых по данному вопросу.

Все материалы по вышеуказанному вопросу, а также изъятые из Института Кайзера Вильгельма химические препараты, группа немецких ученых в области атомной энергии и имеющиеся в Штадтильме оборудование, материалы и библиотека, содержащая примерно 2 000 томов, нами переданы прибывшему в Берлин представителю НКВД СССР подполковнику т. Сиденко 19 сентября 1945 года.

В дальнейшем считал бы необходимым оставшуюся группу ученых и лабораторию Физико-химического института в Штадтильме (советская зона) использовать для сбора немецких ученых, работавших над атомной энергией, и после сбора ученых эвакуировать в Советский Союз.

Главнокомандующий группы Советских оккупационных войск в Германии,
Маршал Советского Союза Г. Жуков[6]

«*2*» октября 1945 г.

[5] Далее абзац выделен двойным очерком на полях неустановленным лицом.

[6] Жуков Георгий Константинович (1896–1974) — Маршал Сов. Союза, четырежды Герой Сов. Союза (1939, 1944, 1945, 1956). Участник Первой мировой войны. Кавалер двух Георгиевских крестов. С марта 1917 председатель эскадронного солдатского комитета. В августе 1918 добровольно вступил в РККА. Проходил службу в кавалерийских частях. Прошел путь от курсанта кавалерийских курсов (1920) до заместителя по кавалерии командующего войсками Белорусского военного округа (1938). В 1939 командовал войсками в боях на р. Халхин-Гол. В январе–июле 1941 нач. Генштаба. В 1941–1942 командовал войсками Резервного, Ленинградского и Западного фронтов. С августа 1942 1-й зам. наркома обороны и зам. Верховного Главнокомандующего. По поручению Ставки Верховного Главнокомандования координировал действия фронтов в Сталинградской битве. В 1944–1945 командовал войсками 1-го Украинского и 1-го Белорусского фронтов (в Висло-Одерской и Берлинской операциях). 8 мая 1945 принял капитуляцию фашистской Германии. В 1945–1946 главнокомандующий группой Сов. войск в Германии, Главнокомандующий Сухопутными войсками. С июня 1946 командующий войсками Одесского, а с февраля 1948 — Уральского военных округов. В 1953–1955 1-й зам. министра обороны, в 1955–1957 министр обороны СССР. С марта 1958 в отставке [36. С. 445–446], [40. С. 310–311].

From: Technical Section HWD
Col. H. W. Dix

The five paragraphs below are of interest on the subject in hand and show Russian interest in Austrian Research Scientist on atomic energy. This report came to us from our Austrian headquarters September 29, 1945. The sub-source, who obtained the information, has not been tried before by this Organization but our Austrian office indicates that the information should be given a 3 value. The information was obtained in Vienna, Austria.

1. The following information was given by Dr. Ortner in an interview with source.

2. Dr. Ortner is a physicist who worked at the Physical Institute of the University of Vienna. He became an NSDAP member in May 1938 as a result of which he was dismissed from the staff of the Institute in May 1945. At the Institute he worked mainly on side problems connected with uranium research. He was thus in a position to know something about the advance of German scientists in the field of atom splitting.

3. On 27 April 1945 Dr. Ortner, together with Dr. Wambacher, former assistant to Prof. Stetter, head of the Physical Institute, was taken into custody by Russian authorities and flown to Moscow. They remained there until 2 August, on which date they were flown back to Vienna. They were treated well throughout their stay in Moscow, although they were under house arrest.

4. The scientists were interrogated once by three Russian officers, scientists according to Dr. Ortner. It seemed that the Russians wanted to investigate a rumor that the Germans had made successful tests with a "Uran Maschine". Such a machine would presumably make use of the energy released by the disintegration of the atom without such a process being necessarily an explosion. Dr. Ortner declares, however, that no such tests were ever made in Austria, and made statements to that effect to his Russian interrogators.

5. The Physical Institute of the University of Vienna had about 70 kg of uranium at the time of the Russian occupation. This supply was taken away by the Russians.

Figure D.722: H. W. Dix to A.E. Britt. 26 October 1945 [NARA RG 77, Entry UD-22A, Box 174, Folder 10.70 Austria Misc]. This memo from the Strategic Services Unit (formerly OSS) confirms that Russian officials were conducting a high-priority investigation of reports that German scientists had carried out successful tests of uranium devices (bombs, reactors, or both) during the war.

H. W. Dix to A.E. Britt. 26 October 1945 [NARA RG 77, Entry UD-22A, Box 174, Folder 10.70 Austria Misc].

3. On 27 April 1945 Dr. Ortner, together with Dr. Wambacher, former assistant to Prof. Stetter, head of the Physical Institute, was taken into custody by Russian authorities and flown to Moscow. They remained there until 2 August, on which date they were flown back to Vienna. They were treated well throughout their stay in Moscow, although they were under house arrest.

4. The scientists were interrogated once by three Russian officers, scientists according to Dr. Ortner. It seemed that the Russians wanted to investigate a rumor that the Germans had made successful tests with a "Uran Maschine". Such a machine would presumably make use of the energy released by the disintegration of the atom without such a process being necessarily an explosion. Dr. Ortner declares, however, that no such tests were ever made in Austria, and made statements to that effect to his Russian interrogators.

[See photo on p. 4529. This 26 October 1945 memo from the Strategic Services Unit (SSU, formerly OSS) confirms that Russian officials were conducting a high-priority investigation of reports that German scientists had carried out successful tests of uranium devices (bombs, reactors, or both) during the war. Note that Ortner only denied that such tests had occurred in Austria, not elsewhere.]

Russian summary of information obtained from Robert Döpel. 1946 [Archive of the President of the Russian Federation, courtesy of Rainer Karlsch]. [See photo p. 4531.]

Some information related to materials of Prof. Döpel about extremely powerful atomic bombs and an atomic heat source for energy-generating machines.

1. A method has been found to split atoms of uranium with the help of heavy water and rays of radium, which is accompanied by the discharge of a large amount of energy.

2. The names of institutes that worked on this problem are provided in the note.

3. It is noted that the problem of a uranium bomb has been developed to the point of testing on a [military] base.

4. The solution of the problem of a uranium heat source for use in energy-generating machines is outlined.

5. The Americans forcibly removed over 20 individuals, professors and scientists, working on this problem, and over 20 grams of radium was also removed after the transfer of the region by our troops.

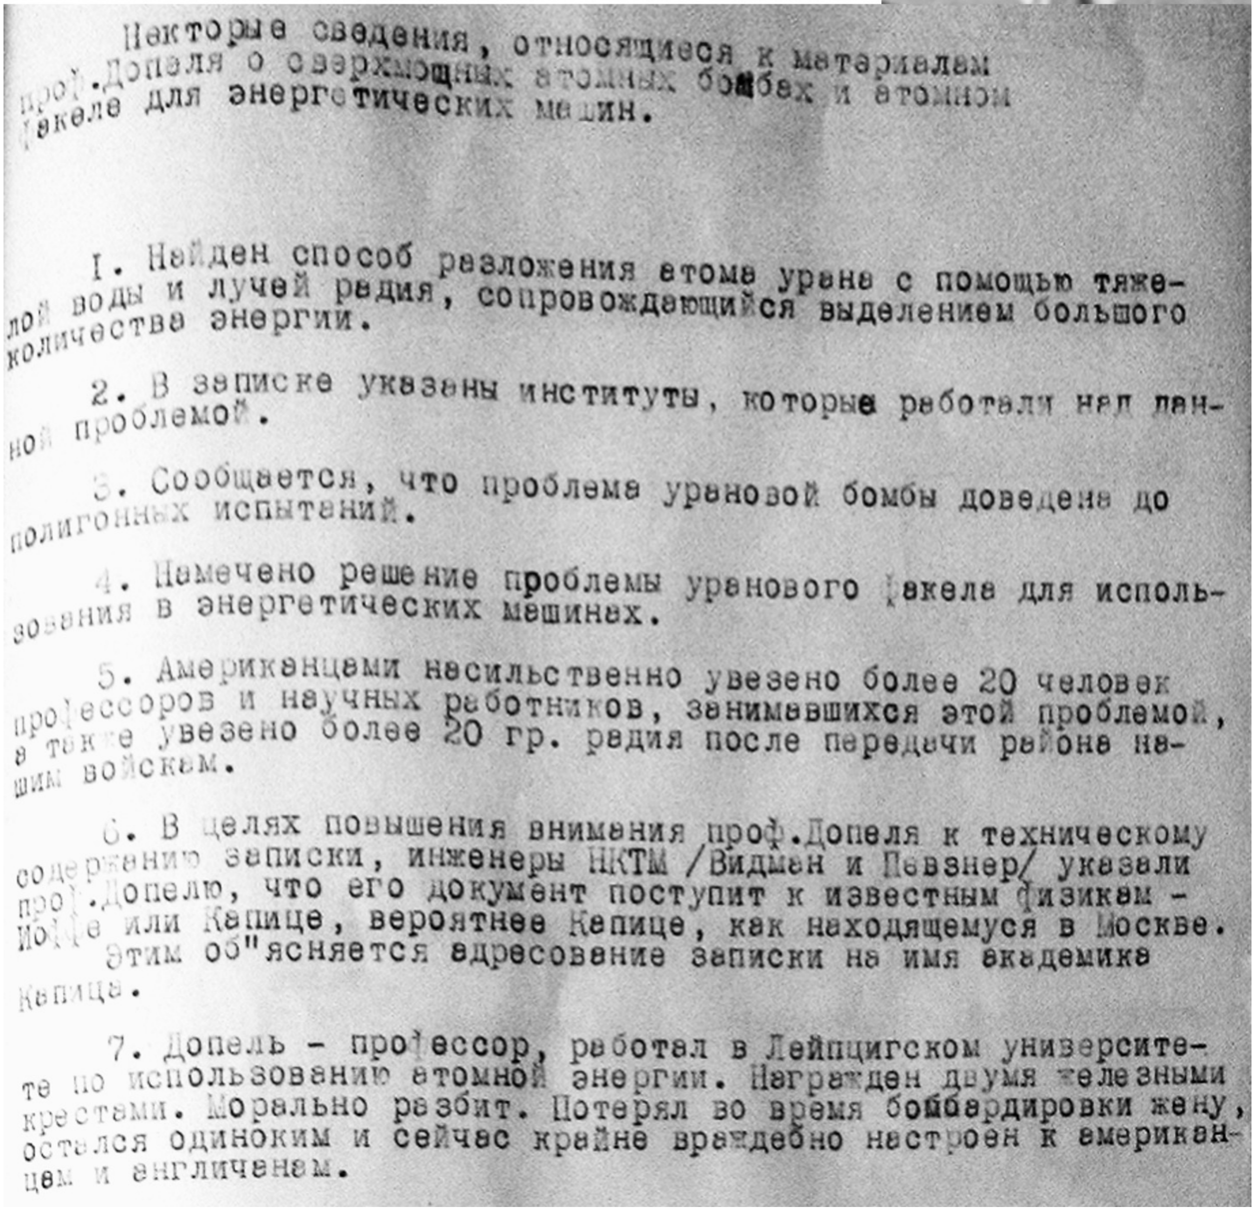
6. In order to heighten the attention of Prof. Döpel to the technical content of the note, the NKTM engineers (Vidman and Pevzner) indicated to Prof. Döpel that his document would be received by the famous physicists, Joffe or Kapitsa, more likely Kapitsa, who is located in Moscow.

This explains the fact that the note is addressed to Academic Kapitsa.

7. Döpel is a professor who worked at Leipzig University on the use of atomic energy. He has been awarded two iron crosses. He is emotionally broken. He lost his wife during the bombing and was left alone and is now extremely hostile toward the Americans and the English.

Robert Döpel
(1895–1982)

1946 Russian summary
of information obtained
from Robert Döpel



Некторые сведения, относящиеся к материалам проф.Допеля о сверхмощных атомных бомбах и атомном факеле для энергетических машин.

I. Найден способ разложения атома урана с помощью тяжелой воды и лучей радия, сопровождающийся выделением большого количества энергии.

2. В записке указаны институты, которые работали над данной проблемой.

3. Сообщается, что проблема урановой бомбы доведена до полигонных испытаний.

4. Намечено решение проблемы уранового факела для использования в энергетических машинах.

5. Американцами насильственно увезено более 20 человек профессоров и научных работников, занимавшихся этой проблемой, а также увезено более 20 гр. радия после передачи района нашим войскам.

6. В целях повышения внимания проф.Допеля к техническому содержанию записки, инженеры НКТМ /Видман и Певзнер/ указали проф.Допелю, что его документ поступит к известным физикам - Иоффе или Капице, вероятнее Капице, как находящемуся в Москве.

Этим об"ясняется адресование записки на имя академика Капица.

7. Допель - профессор, работал в Лейпцигском университете по использованию атомной энергии. Награжден двумя железными крестами. Морально разбит. Потерял во время бомбардировки жену, остался одиноким и сейчас крайне враждебно настроен к американцам и англичанам.

Figure D.723: 1946 Russian summary of information obtained from Robert Döpel, in which he mentioned a German atomic bomb test on a military base [Archive of the President of the Russian Federation, courtesy of Rainer Karlsch].

Report of the Head of the Special Camp Department of SMAD, Colonel Sviridov, No. 00400 of 11 June 1946 to the Deputy Minister of Interior of the USSR General Serov, GARF, Fund 9409, Catalog 1, File 14, Sheet 72 [discovered by Rainer Karlsch].

3. Kirfes, Horst—born 1916 in Erfurt (Thuringia), recently living in central Berlin; engineer for aircraft engine construction, took part in the production of the aircraft "jet fighter," a diesel fighter without propeller and with a speed of 1600 km/h. He was acquainted with the director of the department for the production of the V1, 2 and 4. That one told about how the V2 was made and that it was equipped with an atomic bomb. (The director died.) (At present [Kirfes] is in Special Camp 7.)

[During interrogation in the Soviet Union after the war, the engineer Horst Kirfes said he was involved in the wartime production of a supersonic jet aircraft. From his testimony, apparently that program was also somehow connected to nuclear weapons production (possibly to deliver a nuclear weapon, or to use nuclear power for the propulsion?). See p. 5761 for a very similar account of the wartime production of a nuclear-related supersonic jet aircraft by Josef Ernst, an engineer found by British investigators after the war.

Kirfes mentioned the "production" (not merely design) of the V-4. Since several different projects were vying for the title of "V-4," which one did he mean?

The department director who gave detailed information on rocket and nuclear programs to Kirfes but later died may have been Dr. Albin Sawatzki of Peenemünde.

According to the information from Kirfes, an atomic bomb was actually produced, and it was designed to be carried by a V-2 or similar rocket. That information agrees with the March 1945 report by Ivan Ilyichev (p. 4485).

Moreover, the information from Kirfes seems to indicate that the rocket was *already* "equipped with an atomic bomb," or in other words that the rocket, the atomic bomb, and the mated system of those two were either fully ready or very nearly ready before the end of the war. That information agrees with what the U.S. Army Air Forces publicly published in July 1946 (p. 5038).

For many more references to nuclear-armed rockets that were intended to attack Allied targets during the war, see the list of documents on p. 5821.]

Commentary on Horst Kirfes from Rainer Karlsch [Karlsch 2005, p. 224].

Dazu gehören die Schilderungen von Gerhard Rundnagel und Horst Kirfes. Letzterer berichtete in sowjetischer Gefangenschaft über die Verlegung von Atomforschern mitsamt fertiger Bomben aus Berlin Anfang 1945.

These include the descriptions of Gerhard Rundnagel and Horst Kirfes. The latter reported in Soviet captivity on the transfer of nuclear researchers together with finished bombs from Berlin in early 1945.

Rainer Karlsch. Stalin, der Bluff und die Bombe: Verwirrspiel um den ersten sowjetischen Atomtest. *Osteuropa* December 2007 pp. 117–175. English translation courtesy of Rainer Karlsch. [https://zeitschrift-osteuropa.de/hefte/2007/12/stalin-der-bluff-und-die-bombe/ and https://www.freitag.de/autoren/rainer-karlsch/der-grosse-bluff]

[...]In May 1949, the central committee of the Chinese Communist Party (CCP) decided to send a government delegation headed by the second highest party functionary of the CCP, Liu Shaochi, to Moscow. [...] Stalin met with Liu Shaochi for five rounds of discussions. The first reception took place at Stalin's dacha in Kuntsevo and the second that is of special interest to us, took place in the evening of July 11 in the Kremlin. [...]

However, Stalin denied the wish of Liu Shaochi. It was not in his calculation to provide nuclear technology to the Chinese. As compensation and a demonstration of his own strength, he invited his guests to a film showing instead. It showed the test explosion of an atomic bomb! The test, according to Stalin, had taken place in the upper north of the Soviet Union, in a deserted region near the polar circle. After the showing of the film Stalin bragged about the progress in science and technology achieved by the Soviet Union. His country was soon to be in the position to manufacture substantially effective weapons.[18] One thing about this story is extremely noteworthy: The showing of the film took place a few weeks before the first successful test of a Soviet atomic bomb in Semipalatinsk (on August 29, 1949). [...]

Kovalev, Stalin's China expert and the most important of Soviet functionaries in China, has reported the film showing in his unpublished memoir. He presented the background of the Soviet-Chinese relation in a series of articles in 1991/1992.[20]

Shi Zhe held a position comparable to Kovalev's function. [...] Shi Zhe also mentioned the film showing in his memoirs.[22] The Chinese historian Zhu Yuanshi also drew upon it in his account of the secret visit of Liu Shaochi in Moscow.[23]

[...] Possibly the said film was found after the war somewhere in Germany. That sounded at first like a wild conspiracy theory. Yet there are written records that support this theory. For example, a very interesting inventory of sources is in the Archive of Russian Contemporary History in Moscow. In it, hundreds of German files on the rocket development are listed. All these documents were looted in the German Reich, taken to Moscow and inventoried. Besides files, films were also listed. The content of one roll of film is written word for word as follows: "Film of the launch of a V2 and the explosion of an atomic bomb."[25] This film and still a few others, and the complete documentation on German rocket development were turned over in May 1946 by the Director of the Main Administration for Artillery of the Red Army, Marshall Nikolai Jakovlev, to the Deputy Chairman of the Special Committee for Rocket Technology, Ivan G. Zubovic.[26] [...]

For our connection, it is important to make a note of the fact that the films of interest to us were discovered sometime between May 1945 and April 1946 in Germany by workers of the Special Committee for "Reactive Technology." Likely, these films are mostly about the recordings of various rocket launches. But on one roll of film, not only a rocket launch was to be seen, but also the "Explosion of an Atomic Bomb," according to the archive inventory. This title designation seems to have been carried over word by word from the German film roll into Russian, particularly it was similarly experienced in cases of other film rolls. A translation error is to be ruled out. [...]

Unexpectedly, we came across the sequel of this saga at another station. It concerns more papers of the Special Committee for Rocket Technology (Committee No. 2) and Interior Ministry from 1948 to 1950 related to the "top-secret special films." On October 28, 1948, the already mentioned Ivan G. Zubovic turned over "top-secret' Special Film No. 185 in eight parts to the Secretary of the Interior Ministry Haritov.[30] [...]

The deputy Interior Minister Serov was responsible for the archiving. He will have inquired at the Technical Archive of the Committee No. 2 as to where the films were. Thereupon he was informed on September 23, 1949 by Zubovic that at the instigation of Nikolai Bulganin, one of Stalin's deputies, one copy of the special film had been loaned to the Ministry of Interior already on October 28, 1948.[37] A second copy, which the Committee No. 2 got from the Ministry of Armament, should be also handed over to Serov. It comes from the chief of Stalin's private chancellery, Alexander N. Poskrebyschew.[38] [...]

The last letter concerning the films was dated January 20, 1950.[39] In it, Haritonov informed his boss Serov that the archive of the MVD had turned over both top-secret special films no. 185 and no. 127 to the National Movies and Photo Archive for final safekeeping. The letter was enclosed with the film copy in turnover action. Accordingly the National Movies and Photo Archive took over the special film 185 in eight parts and also the suitcase with the second copy of the special film. All seals on the suitcase were undamaged. Furthermore the top-secret film no. 127 in two copies with four parts each were turned over to the National Movies and Photo Archive. At the end, one passage was yet included: "Inspection in the file on the movie films is prohibited without the expressed consent of the MVD."

Up until today the top secret "special films" still could not be located. They were removed in the mid-fifties from the inventory of the National Movies and Photo Archive at the instigation of the MVD (Serov's Department) and have since been missing. [...]

[Can any copies of this film (or other films of German technologies that have not been publicly acknowledged) be located in the archives of any nation and declassified?

The fact that the film highlights two projects back-to-back ("Film of the Launch of a V-2 and the Explosion of an Atomic Bomb") suggests that those two projects—long-range rockets and atomic bombs—were intended to go together. That agrees very well with evidence from many independent sources (p. 5821). Just how far did the integration of an atomic bomb with a rocket get by the end of the war?]

[There were persistent reports of one or more Soviet nuclear weapons tests in 1946, long before the first known Soviet-built bomb test in 1949 (RDS-1/Joe-1). Could those 1946 reports have been Soviet tests of captured German nuclear weapons?]

TOP SECRET

Believe importance of evaluation of information contained in ALUSMA Moscow 121350-Z to CNO warrants expression my views.

Comments:
1. Report may be true:
A. Positive: Previous rumors tests Atomic Bomb point toward explosion June or July (See R-207-46, R-152-46, and MA -50650). Present report refers to experimental drops during some months. No apparent connection between sources of these rumors.

52°03'N, 113°30'E.

Harshaw uncertain that Chita was base of experimentation, therefore Kazakhstan may have been scene. Statements high Soviet Officials indicate progress and expected early development.
B. Negative: Soviet industrial structure cannot support process following American production.

Weight and power of reported bomb not in keeping with American experience. Story copies inaccuracies of American early stories. Unlikely Soviets * of tests.
would grant leave to active participant ←

If true unlikely officer would disclose to family.

2. Report may be planted.

W. D., A. G. O. Form No. 0990 7 September 1944 (This form supersedes W. D., A. G. O. Form No. 990, 1 June 1944, which may be used until existing stocks are exhausted.) 16—41517-1 U. S. GOVERNMENT PRINTING OFFICE

Figure D.726: There were persistent reports of one or more Soviet nuclear weapons tests in 1946, long before the first known Soviet-built bomb test in 1949 (RDS-1/Joe-1). Could those 1946 reports have been Soviet tests of captured German nuclear weapons? R. H. Free to U.S. Military Attaché London. 5 December 1946 [NARA RG 77, Entry UD-22A, Box 160, Folder 205.3 Cables Outgoing, Secret and Under January 1946 thru December 1946].

Rainer Karlsch. 2013. Die Abteilung Atomphysik der PTR in Ronneburg und das deutsche Uranprojekt. *PTB-Mitteilungen* 123:1:73–81. [See also Karlsch 2005, p. 211.]

Am 28. Februar 1945 kamen Diebner und Gerlach von Berlin nach Ronneburg und forderten von Carl-Friedrich Weiss die Übergabe des gesamten Poloniumvorrates. Wofür das Polonium gebraucht wurde, erfuhren die Wissenschaftler der PTR nicht: "Bei den Besuchen hat er [Gerlach] mit mir [Weiss] nicht über die Uranfragen gesprochen, zumal wir nicht allein waren. Auf Verletzung der Geheimhaltung standen schwerste Strafen; keiner durfte mehr erfahren, als unbedingt nötig war." Was danach mit den Polonium-Präparaten geschah, ist unklar. Sie wurden nach Kriegsende nicht mehr gefunden. Die Polonium-Anlage sowie das gesamte noch in Kisten befindliche Bleinitrat mußte von Mitarbeitern der PTR am 25. Juni 1945 einer amerikanischen Militärkommission übergeben werden.

On 28 February 1945, Diebner and Gerlach came from Berlin to Ronneburg and demanded the transfer of the entire stock of polonium from Carl-Friedrich Weiss. The scientists of the PTR did not learn why the polonium was needed: "During the visits he [Gerlach] did not talk with me [Weiss] about the uranium questions, especially since we were not alone. Violations of secrecy were severely punished; no one was allowed to know more than was absolutely necessary." What happened afterwards with the polonium preparations is unclear. They were no longer found after the end of the war. The polonium plant as well as all of the lead nitrate still contained in boxes had to be handed over to an American military commission on 25 June 1945 by employees of the PTR.

Franciszek Stryjewski. 1960. *We Cieniu Krematorium.* Katowice. [Translation from Polish to German by Stefan Wohanka in Jonastalverein archive, Arnstadt.]

Die Organisation dieses Lagers fiel dem Lager Buchenwald zuteil, welches als Mutterlager wenigstens 95000 Häftlinge in verschiedenen Kommandos beschäftigte. Grössere Ansammlungen der Häftlinge, die unter der direkten Leitung der SS untergebracht waren, wie z. B. "Dora" mit 32000 Häftlingen, haben sich von dem Mutterlager nicht so langer her, erst vor drei Monaten getrennt.

- Dieses verdammte Schlachthaus Ohrdruf—fuhr der Vorarbeiter fort—besteht schon erst seit ein paar Jahren. Wir wurden mal in Buchenwald auf den Appellplatz zusammengerufen, von allen Seiten umgeben, 1000 Männer wurden ausgewählt und noch an demselben Abend abgeschickt; aus uns wurde der Ansatz eines neuen Nebenlagers Ohrdruf S: III (S = Sonderlager) organisiert. Wir haben uns als Lager schon vergrössert, wenn trotz sehr zahlreicher Todesfälle über 3000 Häftlinge heute da sind, abgesehen von diesen dort im Nordlager. Transporte kamen doch zahlreich aus Sachsenhausen, Stutthof, Krakow-Plaszow, Dachau, Auschwitz und aus vielen anderen Lagern.

Am Heiligen Abend [1944] waren wir nur durch einen halben Tag in Arbeit. Die SS-Leute wollten auch freihaben.

Der Lagerführer, der ein Stockwerk eines der repräsentativen Blocks für sein Büro reserviert hatte, lud zum Heiligen Abend alle Blockführer, Oberkapos und Kapos zu sich ein, um ihnen eine schnelle Heimkehr zu wünschen, wenn die Deutschen den vom Führer versprochenen "Endsieg" davontrügen.

- Ihr könnt ganz ruhig in die Zukunft schauen—sagte er—weil der Führer angekündigt hat, dass er eine neue Waffe einsetzen wird, die den ganzen bisherigen Verlauf des Krieges radikal verändern und die ganze Welt zu Füssen des Grossen Deutschen Reichs legen soll. [...]

The organization of this camp fell to the Buchenwald camp, which, as the mother camp, employed at least 95,000 prisoners in various commandos. Larger concentrations of prisoners housed under the direct direction of the SS, such as "Dora" with 32,000 prisoners, separated from the mother camp not so long ago, only three months ago.

- This damned Ohrdruf slaughterhouse—the foreman continued—has only existed for a few years. We were once called together on the roll call square in Buchenwald, surrounded on all sides, 1000 men were selected and sent off that very evening; the beginnings of a new Ohrdruf S: III (S = special camp) subcamp were organized from among us. We have already expanded as a camp, even though there are more than 3000 prisoners there today despite numerous deaths, apart from those in the north camp. Transports came in large numbers from Sachsenhausen, Stutthof, Krakow-Plaszow, Dachau, Auschwitz and many other camps.

On Christmas Eve [1944] we were only at work for half a day. The SS people also wanted the day off.

The camp commander, who had reserved a floor of one of the representative blocks for his office, invited all the block leaders, head kapos and kapos to his house on Christmas Eve to wish them a speedy return home when the Germans delivered the "final victory" promised by the Führer.

- You can look quite calmly into the future—said he—because the Führer has announced that he will use a new weapon which will radically change the whole course of the war so far and lay the whole world at the feet of the Great German Reich. [...]

Das Eschebachkommando wurde Anfang Februar [1945] liquidiert. Ich musste zum Steinbruch übergehen. Wir verliessen als die ersten das Lagergelände, sofort nach dem Morgenappell. Unsere Kolonne zählte 2,3–3 Tausend Häftlinge. Wir wurden von über 200 SS-Leuten begleitet. Wir gingen auf Waldwegen, immer aufwärts, bis wir nach einer Stunde Marsch einen Gebirgspass zwischen zwei Ketten von ziemlich hohen Anhöhen erreicht haben. Das war eigentlich ein grosser Bergkessel, voll von Eisenbahngleisen, Weichen und einer grossen Menge von Baustoffen. Am Fuss des südlichen Abhangs eines ca. 200 Meter hohen Berges schienen schwarze Löcher von Tunnels, die tief in den Kalkberg liefen. Etwas weiter flossen Rutschen von gelben und weissen Steinen herunter.

- Hier ist—erklärte mir August Szary—der Ort unserer Qualen. Die Deutschen nennen ihn “Jonas Tal”. Siehst du diese zwei Tunnels dort? Sie sind schon seit langem fertig. Sie sind mit Händen unserer Vorgänger gebaut worden. An diesen Tunnels fahren täglich Waggons und Kraftwagen vor. Soldaten entladen und tragen Kästen, Maschinen und weiss der Teufel was für einen Mist noch herein. In diesen Tunnels sollen superneue Einrichtungen zur Produktion von noch unbekannten Bomben montiert werden. Jemand sprach sogar von Atombomben, die durch Hitler als die “neue Waffe” angekündigt wurden. Diese drei Tunnels sind noch im Bau. Einer von ihnen reicht bis ca. 40 Meter in die Tiefe, der zweite—27 Meter, und den dritten haben wir erst begonnen, auszuhauen. Willst du eine ziemlich leichte Arbeit haben, dann ergreife die Arbeit mit einer Lore. Man belädt sie dir schön mit dem Hauerausschlag, du fährst das dorthin auf den Sturzplatz aus und so immer wieder.

The Eschebachkommando was liquidated at the beginning of February [1945]. I had to go over to the quarry. We were the first to leave the camp grounds immediately after the morning roll call. Our column numbered 2300–3000 prisoners. We were accompanied by over 200 SS men. We walked along forest paths, always uphill, until after an hour's march we reached a mountain pass between two chains of fairly high hills. This was actually a large mountain basin, full of railroad tracks, switches and a large amount of building materials. At the foot of the southern slope of a mountain about 200 meters high, black holes appeared from tunnels running deep into the limestone mountain. A little further on, chutes of yellow and white stones flowed down.

- Here is—explained August Szary to me—the place of our torment. The Germans call it “Jonas Valley.” See those two tunnels there? They were finished a long time ago. They were built with the hands of our predecessors. Wagons and motor vehicles pull up to these tunnels every day. Soldiers unload and carry in boxes, machines and who knows what else. In these tunnels, super-new facilities for the production of as yet unknown bombs are to be assembled. Someone even spoke of atomic bombs, which were announced by Hitler as the “new weapon.” These three tunnels are still under construction. One of them reaches to a depth of about 40 meters, the second one 27 meters, and the third one we have just started to excavate. If you want to have a fairly easy job, then take on the work with a wagon. You load it up with a heap of material, drive it out to the fall site and so on.

Cläre Werner. 16 May 1962 SED transcript. Jonastalverein Archive, Arnstadt.

Auch dies habe ich schon alles gesagt. Ich kann mich noch gut an den Tag erinnern. Es war der 4. März 1945. Für den Tag hatten wir eine Geburtstagsfeier für den Abend, diese wurde abgesagt. Am Nachmittag war der BDM von Gotha auf der Burg. Hans war auch da und half uns noch, dann sagte er uns, daß heute auf dem Platz Weltgeschichte geschrieben wird. Es wird etwas gemacht, was es auf der Welt noch nicht gegeben hat. Wir sollen am Abend auf den Turm [der Wachsenburg] gehen und in Richtung Röhrensee schauen. Er wisse auch nicht, wie das neue Ding aussehen wird. So waren wir ab 20 Uhr auf dem Turm.

I have already said all of this. I still remember the day well. It was March 4, 1945. For the day, we had a birthday party for the evening that was canceled. In the afternoon the BDM [Federation of German Girls] of Gotha was at the castle. Hans was also there and was helping us, and then he told us that today world history would be written on the [military training] ground. Something would be made that had not previously existed in the world. We should go on top of the tower [of Wachsenburg castle] in the evening and look in the direction of Röhrensee. He also did not know what the new thing would look like. So we were on top of the tower by 20:00.

Nach 21 Uhr, gegen halb Zehn, war hinter Röhrensee mit einmal eine Helligkeit wie Hunderte von Blitzen, innen war es rot und außen war es gelb, man hätte die Zeitung lesen können. Es war alles sehr kurz, und wir konnten dann alle nichts sehen, wir merkten nur, daß es eine mächtige Sturmbö gab, aber dann alles ruhig war.

After 21:00, at 21:30, behind Röhrensee there was all at once a brightness like hundreds of lightning bolts, it was red on the inside and yellow on the outside, you could have read the newspaper. It was all very brief, and then we could not see anything, we only realized that there was a powerful squall, but then all was quiet.

Ich wie auch viele Einwohner von Röhrensee, Holzhausen, Mühlberg, Wechmar und Bittstädt hatten am anderen Tag oft Nasenbluten, Kopfschmerzen und auch einen Druck auf den Ohren. Am Nachmittag, gegen 14 Uhr, waren so zwischen 100 und 150 SS-Leute auf einmal auf der Burg, sie fragten wo die Leichen seien, wo sie hingebracht worden seien und wer schon da war. Wir wußten von nichts, und sie fragten uns, ob sie hier im “Objekt Burg” seien. Ich sagte ihnen, sie seien hier auf der Veste Wachsenburg, die im Volk immer nur als Burg bezeichnet wird. Ein Kradfahrer gab eine Meldung ab, daß die “Burg” über Ringhofen zu erreichen ist. Daraufhin fuhren die Autos von der Burg nach Mühlberg. Ich sah vom Turm, daß sie dann zum Übungsplatz fuhren.

Like many residents of Röhrensee, Holzhausen, Mühlberg, Wechmar, and Bittstädt, the next day I also had frequent nosebleeds, headaches, and also a pressure on the ears. In the afternoon, at 14:00, between 100 and 150 SS men at one time came to the castle, they asked where the bodies were, where they had been brought and who was already there. We knew nothing, and they asked us if this was “Installation Castle [Burg].” I told them that they are here in the Veste Wachsenburg which is popularly always referred to as a castle. A motorcyclist gave a message that the “Castle” is accessible via Ringhofen. Then the cars drove from the castle toward Mühlberg. I saw from the tower that they then drove to the training ground.

Bei der zweiten Explosion war Hans mit einigen Leuten auf dem Turm, wir waren nur im Turmzimmer. Es war am 12. März 1945 gegen 22.15 Uhr. Es war nicht eine so große Helligkeit wie das erste Mal. Auch hatten wir kein Nasenbluten usw.

Auch hatte er uns verboten, etwas über die Blitze zu sagen.

For the second explosion, Hans was with some people on top of the tower, we were only in the tower room. It was on March 12, 1945, at 22:15. It was not so great a brightness like the first time. We also had no nosebleeds, etc.

He had also forbidden us to say anything about the lightning.

Figure D.735: Cläre Werner.

[In the 1990s, after the reunification of East and West Germany, a document surfaced in southern Thuringia that appeared to be transcripts of 1962 interrogations of local residents by officials from the then-ruling East German communist party, the Sozialistische Einheitspartei Deutschlands (SED, Socialist Unity Party of Germany). In these transcripts, a number of people who had lived in southern Thuringia for many years were asked what they knew about secret German military research and development that occurred in that area during World War II. Some of the respondents described witnessing or hearing about tests of a powerful new explosive and separate tests of a new rocket.

The chain of custody of the transcripts from 1962 until the 1990s is unclear, and therefore their authenticity cannot be proven. It is possible that the transcripts are simply fictions that were created by a forger in the 1990s or earlier, or that they are real transcripts that contain fictional insertions supplied by a forger. Indeed, some researchers have raised serious questions about the transcripts [e.g., Frank Döbert, in *Geheimnis Jonastal* 2011, No. 11, p. 25].

It is also possible that the testimony in the 1962 SED transcripts is authentic. Due to the highly sensitive nature of the statements in these transcripts, East German officials would almost certainly not have stored them in a regular archive where they could be routinely and permanently accessed. In any event, the 1990 transition from communist rule to unified German government rule was chaotic, and many files were destroyed, stolen, or hidden to avoid embarrassing or implicating East German officials and citizens. According to former East German officials, the 1962 SED transcripts seem to be consistent in appearance with other East German interrogation transcripts from that place and time.

Cläre Werner (1913–2003), the most important witness quoted in the 1962 SED transcripts, was a wartime lookout living in Veste Wachsenburg, a castle on a hill with an excellent view of the Ohrdruf Truppenübungsplatz military base and the surrounding area (see Fig. D.736).

In several interviews conducted between 1998 and 2003, Werner confirmed that she had seen extraordinary explosions from the castle in March 1945, consistent with the more detailed account attributed to her in the 1962 SED transcripts [Petermann 2000; Karlsch 2005, pp. 215–216; Karlsch and Petermann 2007, pp. 34–36].

Werner's testimony in the 1962 transcripts is also consistent with those of other witnesses in the transcripts and consistent with details from the other sources quoted in this section that reported the 4 March 1945 test, as summarized in Table D.6.

According to Werner's testimony in the 1962 SED transcripts, the 4 March 1945 test explosion occurred at approximately 9:30 p.m. Archived seismographic recordings from the Institut für Geowissenschaften Jena (approximately 60 km from Ohrdruf) appear to show an otherwise unidentified seismic event on 4 March 1945 at 9:25 p.m. local German time [Ziegert 2011]. See Fig. D.737. Note the jittering on the indicated line just after the square clock pulse. Could that have been the nuclear explosion, or merely an unrelated event or noise? (A nuclear explosion may not have created strong seismic waves, especially if the explosion was small and/or the bomb was detonated on a tower and not on the ground.)

As shown in the scientific analysis beginning on p. 5138, the transcribed testimony of Werner and others is highly consistent with the physics of nuclear weapons, in ways that could not have been foreseen by Werner, her interrogators, or a document forger who was not a nuclear physicist.

Therefore, despite many unanswered questions about the 1962 SED transcripts, they are quoted and analyzed in Appendices D (for parts relevant to nuclear tests) and E (for parts relevant to rocket tests; see pp. 5344–5347). I certainly do not and cannot claim that this analysis "proves" the authenticity of the SED transcripts, yet the transcripts do seem to be in remarkably good agreement with all of the other evidence.

I strongly recommend that researchers search for information to either support or refute the authenticity of the 1962 SED transcripts. Please contact me if you find relevant information.]

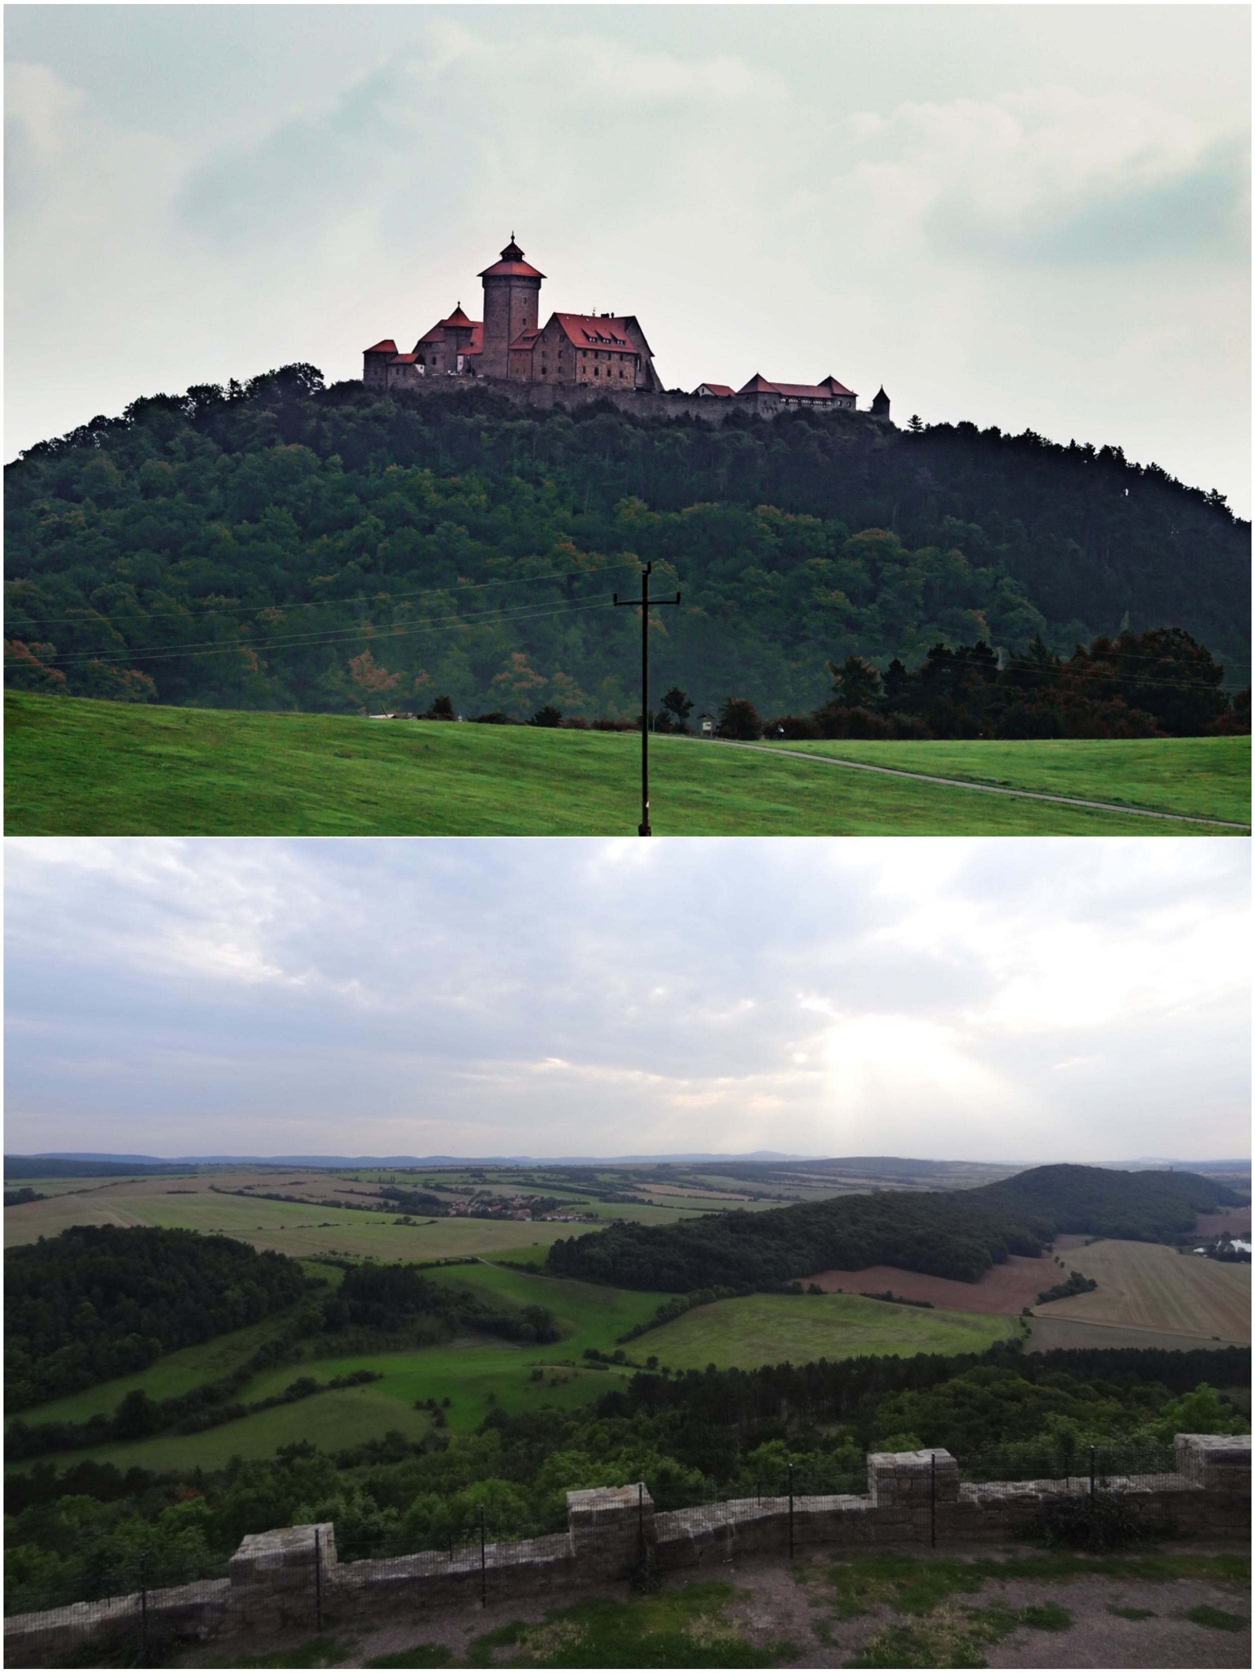

Figure D.736: Wachsenburg castle now, and the view from the castle of the village of Röhrensee and beyond.

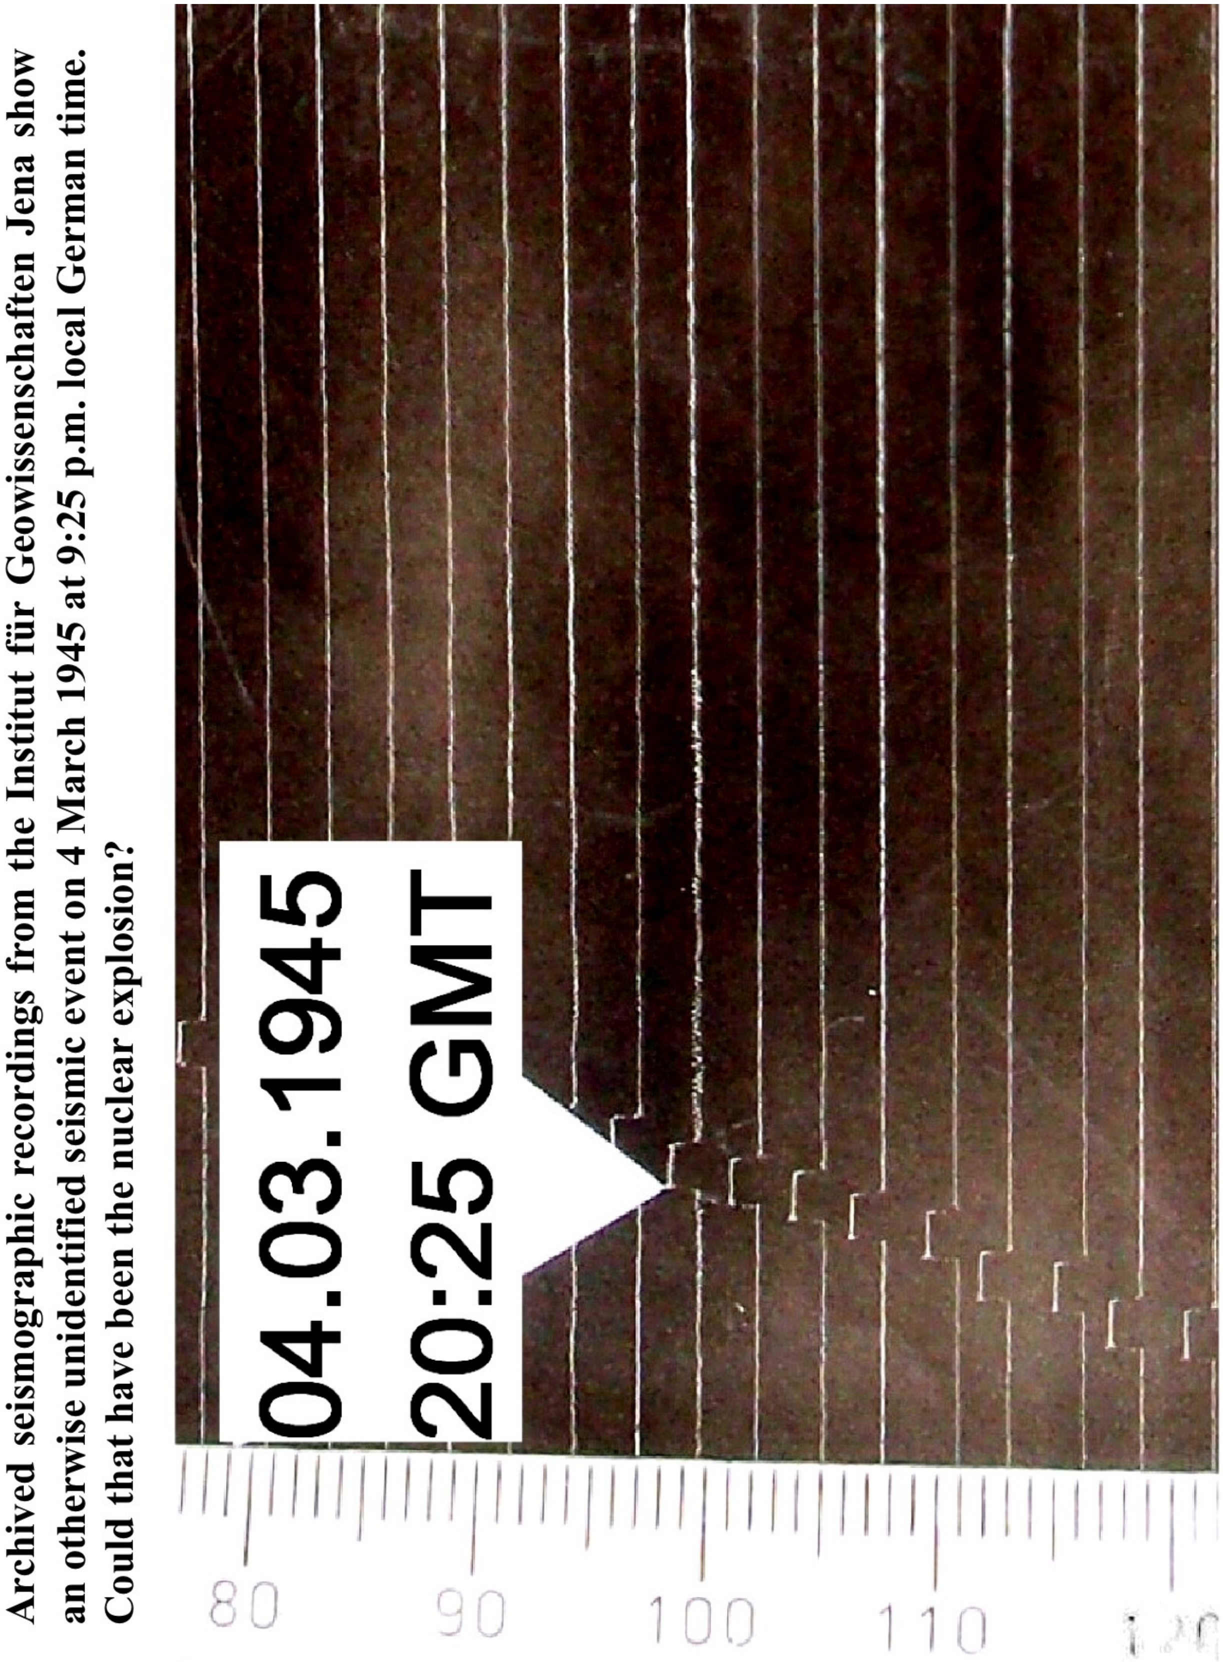

Figure D.737: Archived seismographic recordings from the Institut für Geowissenschaften Jena (approximately 60 km from Ohrdruf) appear to show an otherwise unidentified seismic event on 4 March 1945 at 9:25 p.m. local German time [Ziegert 2011]. Note the jittering on the indicated line just after the square clock pulse. Could that have been the nuclear explosion, or merely an unrelated event or noise?

Heinz Wachsmut. 16 May 1962 SED transcript. Jonastalverein Archive, Arnstadt.

[Heinz Wachsmut's testimony was also part of the 1962 SED transcripts. As discussed on p. 4551, the chain of custody for the 1962 SED transcripts is uncertain and hence their authenticity cannot be proven. However, the written testimony of Wachsmut is consistent with stories he told his family before he died [Karlsch and Petermann 2007, p. 37], consistent with Cläre Werner's testimony, and consistent in appearance with other East German interrogation transcripts from that place and time. It is also consistent with other reports of the 4 March 1945 test quoted in this section, as summarized on p. 4480. As shown in the scientific analysis beginning on p. 5138, Wachsmut's testimony is highly consistent with the physics of nuclear weapons, in ways that would not have been possible for Wachsmut, his interrogators, or a document forger to foresee. Nonetheless, I cannot claim that this analysis "proves" the authenticity of the SED transcripts. Much more research is needed to investigate their background and authenticity.]

Nach einer Straftat... wurde ich zwangsverpflichtet. Wir waren sechs Deutsche und hatten zur Hilfe 18 Häftlinge, darunter sieben Ungarn, fünf Polen und vier Russen; es waren alles Techniker, sie trugen keine Häftlingsanzüge, sondern Felddienst, und wurden auch mit uns verpflegt. Unsere Hauptaufgabe war, Tarnarbeiten durchzuführen. An gelandeten Flugzeugen, an Objekten, an Transportgut, das nicht immer sofort eingelagert werden konnte, und auch zu Hilfsarbeiten (wurden wir eingesetzt), wenn zu viele Häftlinge verstorben waren. Dazu mußten wir dann oft Holzhaufen errichten, wo die Leichen dann draufgelegt und angezündet wurden. Es gab keine Listen über die verstorbenen Häftlinge.

After a crime... I was conscripted. We were six Germans and had help from 18 prisoners, including seven Hungarians, five Poles, and four Russians; they were all engineers, they wore no prisoner suits, rather field service uniforms, and were also fed with us. Our main task was to conduct camouflage work at landed airplanes, bases, transported goods, which could not always be immediately removed, and also for auxiliary work (we were used) if too many prisoners had died. For that we often had to build wood piles, upon which the bodies were laid and set on fire. There were no lists of the prisoners who died.

Ein Tag, der immer in meinem Leben Bilder vor den Augen macht, war der Nachmittag des 5. März 1945. Wir mußten in der Polte Rudisleben Gerüste errichten für einen Versuch, der in wenigen Tagen stattfinden sollte. Am Nachmittag fuhr die SS mit LKWs vor, eigentlich hatte uns die SS nichts zu sagen, da wir ja immer mit Sonderbefehlen arbeiteten, die immer die Stempel der Reichspost bzw. des Forschungsrates trugen und nach dem Lesen sofort vernichtet werden mußten. Es war ein Befehl, der die Unterschrift von Kammler trug. Wir mußten alles Holz, das verfügbar war, aufladen. Die Fahrt ging nach Röhrensee, dort waren einige SS Ärzte tätig, da eine große Anzahl von Bewohnern Kopfschmerzen hatte und Blut spuckte. Wir waren dort falsch und wurden sofort nach Gut Ringhofen bei Mühlberg gebracht. Dort wurde uns gesagt, wir müssen Holzhaufen am Waldrand errichten, ca. 12x12 m und nur höchstens 1 m hoch, dazu mußten wir Vollschutz tragen, auch unsere Häftlinge. Am Waldrand sahen wir schon einige Haufen von Menschenleichen, die wohl ehemalige Häftlinge waren. Die Menschen hatten alle absolut keine Haare mehr, teils fehlten Kleidungsteile, sie hatten aber auch zum Teil Hautblasen, Feuerblasen, nacktes rohes Fleisch, teilweise waren einige Teile nicht mehr vorhanden. SS und Häftlinge brachten die Leichen an. Als wir die ersten sechs Haufen fertig hatten, wurden die Leichen darauf gelegt, je Haufen ca. 50 Stück, und Feuer gelegt. Wir wurden zurückgefahren. Im Gut mußten wir den Schutz und unsere gesamte Kleidung ausziehen. Diese wurde ebenfalls sofort von der SS angezündet, wir mußten uns waschen und erhielten neue Kleidung und neuen Schutz, dazu jeder eine Flasche Schnaps, auch unsere Häftlinge.

A day whose images I see before my eyes throughout my life, was the afternoon of 5 March 1945. In the Polte Rudisleben we had to erect scaffolding for a test that was supposed to take place in a few days. [16 March A-9/A-10 launch? See pp. 5344–5347.] In the afternoon the SS drove up with trucks, actually the SS did not have anything to say to us since we always worked with special orders that always bore the stamp of the Reich Post Office or the Research Council and had to be immediately destroyed after reading. It was an order that bore the signature of Kammler. We had to load up all the wood that was available. The trip went to Röhrensee, where some SS doctors were busy, since a large number of residents had headaches and were spitting up blood. We were there mistakenly and were immediately brought to the Ringhofen estate by Mühlberg. There we were told we must build woodpiles at the edge of the forest, approximately 12x12 m and only 1 m high at the highest, plus we had to wear full protection, as did our prisoners. At the edge of the forest we saw there were already a few piles of human corpses that were probably former prisoners. The people all had absolutely no more hair, some missing items of clothing, but they had also some skin blisters, fire blisters, exposed raw flesh, some were missing some [body] parts. SS and prisoners brought the bodies. When we had made the first six piles ready, the bodies were placed on them, approximately 50 per pile, and set on fire. We were driven back. At the estate we had to take off the protection and all our clothes. This was also immediately burned by the SS, we had to wash ourselves and received new clothes and new protection, to each a bottle of Schnaps, including our prisoners.

Ein hoher SS-Mann sagte mir, es habe da oben eine große Stichflamme gegeben gestern, man hat etwas neues gemacht, davon wird die ganze Welt sprechen, und wir Deutschen sind die ersten. Leider sei dabei einiges nicht so gelaufen wie geplant und einige Nichtsnutze habe man weniger.

A high-ranking SS man told me, there had been a big flash of flame up there yesterday, something new had been made, of which the whole world will speak, and we Germans are the first. Unfortunately some things did not go as planned and some unwanted people had been eliminated.

Beim zweiten Einsatz wurden nochmals drei Haufen errichtet. Dabei sahen wir, wie aus dem Wald einige völlig unmenschliche Lebewesen angekrochen kamen. Wahrscheinlich konnten einige nichts mehr sehen.—Pause—Ich kann es auch heute nicht beschreiben. Von zwei SS Leuten wurden diese ca. zwölf bis fünfzehn Menschen sofort erschossen. Ob sie wirklich schon erschossen waren, kann ich nicht sagen, da einige noch den Mund bewegten. Sie wurden bzw. mußten von anderen Häftlingen auf die in Flammen stehenden Haufen getragen werden. Wir wurden wieder zum Gut gebracht und es wiederholte sich alles. Gegen 23 Uhr fuhren wir zurück zur Polte. Am Waldrand waren 14 Feuerstellen zu sehen. Wir konnten an diesem und am nächsten Tag nichts essen, es gab für uns und die Häftlinge immer wieder Schnaps.

During our second operation three more piles were erected. There we saw, out of the forest some totally inhuman creatures came crawling. Probably some of them could no longer see. (Pause.) I cannot describe it even today. These approximately 12 to 15 people were immediately shot by two SS men. I cannot say whether they were really [all] shot, as some still moved their mouths. They were or had to be carried to the flaming pile by other prisoners. We were brought back to the estate and it [decontamination] was all repeated. At 23:00 we drove back to Polte. At the edge of the forest there were 14 fires to be seen. [14 fires × 50 bodies each = 700 bodies?] We could not eat anything on this and the next day, there was for us and the prisoners always more Schnaps.

Einer unserer russischen Häftlinge sagte uns, er habe einen der Erschossenen noch verstanden, "... großer Blitz—Feuer, viele sofort tot, von der Erde weg, einfach nicht mehr da, viele mit großen Feuerwunden, viele blind, Gruß an Mutter von Olek Barto nach Gurjew..."

One of our Russian prisoners told us that he had understood one of the injured: "... big flash—fire, many dead immediately, gone from the earth, simply not there any more, many with large burns, many blind, greetings to Mother in Guriev from Olek Barto..."

Report on interview of Erich Rundnagel. 8 July 1966 SED Arnstadt transcript. MfS-Kreisdienststelle Arnstadt, BStU Außenstelle Erfurt. Rundnagel was a plumber who worked with Fritz Rehbein and Heinz Rackwitz, members of Kurt Diebner's research group. As shown on the next page, his nephew confirmed that he had spoken to the Stasi and did not dispute the details.

[...] Weiterhin will er Gesprächen mit Dr. Rehbein entnommen haben, daß sich in dem anderen Panzerschrank zwei Atombomben befunden haben sollen, die seiner Vermutung nach später auf Hiroshima und Nagasaki abgeworfen wurden. [...]

[...] Furthermore he [Rundnagel] wanted to infer from conversations with Dr. Rehbein that two atomic bombs were supposed to have been found in the other safe, which in his speculation were later dropped on Hiroshima and Nagasaki. [...]

Erich Rundnagel [Remdt and Wermusch 2006, pp. 125–126]

[...] Ich hatte vor allem mit Dr. Rehbein und Ingenieur Rackwitz zu tun, mit denen ich in eine Art Vertrauensverhältnis kam. Es war also am 7., nein am 9. Juli [1944], als mir Dr. Rehbein sagte: "Rundnagel, nun hören Sie mal ganz genau Nachrichten, innerhalb von ein paar Tagen werden Sie eine entscheidende Meldung hören, von der abhängt, wie der Krieg ausgeht." [...] Am 20. Juli war dann das Attentat auf Hitler. Als ich Rehbein fragte, ob er das gemeint habe, lachte er nur und sagte: "Jetzt kommt sie nicht mehr zum Einsatz, der Krieg ist verloren."

Ich unterhielt mich öfters mit ihm darüber, was hier eigentlich gemacht werde; denn nach Arbeit sah das alles wirklich nicht aus. Da erzählte er mir, dass hier etwas entwickelt werde, das eine größere Sprengkraft habe als all das, was ich mir als alter Pionier vorstellen könne. Mit einer einzigen Bombe könne man im Umkreis von zwanzig Kilometern alles Leben vernichten, und wenn es hunderttausend Menschen wären. Ich antwortete, das sei doch Quatsch, mir altem Soldaten könne er so was nicht vormachen, das gebe es nicht. Ein bisschen kenne ich mich wirklich mit Sprengstoffen aus. Rehbein lächelte nur und sagte, die ganze Bombe sei nur ein paar Dezimeter groß, wiege aber so um die acht Kilo. Als ich ihn fragte, ob ich das Ding mal sehen könnte, winkte er ab: "Das könnte uns beide den Kopf kosten." [...]

[...] I was mainly involved with Dr. Rehbein and engineer Rackwitz, with whom I came into a kind of relationship of trust. It was on the 7th, no on the 9th of July [1944], when Dr. Rehbein told me: "Rundnagel, now you listen closely to the news, within a few days you will hear a decisive report, on which will depend how the war ends." [...] On July 20th was then the assassination attempt on Hitler. When I asked Rehbein whether he meant that, he just laughed and said, "Now it will no longer come to deployment, the war is lost."

I often talked to him about what was really being done here, because after work, it really did not look like anything. Then he told me that something was being developed here that had a greater explosive power than anything I could imagine as an old pioneer. With a single bomb, you could destroy all life within a radius of twenty kilometers, and if there were a hundred thousand people. I replied, that was nonsense, that he could not make such a claim to me the old soldier, that was not the case. I know something about explosives. Rehbein just smiled and said the whole bomb was only a few decimeters in size but weighs about eight kilograms. When I asked him if I could see the thing, he waved it off: "That could cost us both our heads." [...]

Gerhard Rundnagel. Letter to *Der Spiegel*. 21 March 2005 p. 14.

Sie haben aus Rainer Karlschs Buch “Hitlers Bombe” die Behauptung übernommen, ich hätte gegenüber der Stasi Aussagen über deutsche Atomwaffentests in Ohrdruf gemacht. Das stimmt nicht. Es war mein Onkel Erich Rundnagel, der mit der Stasi gesprochen hat.

Based on Rainer Karlsch’s book “Hitler’s Bomb,” you made the assertion that I had made statements to the Stasi about German atomic weapons tests in Ohrdruf. That is not correct. It was my uncle Erich Rundnagel who spoke to the Stasi.

Rainer Karlsch. 2013. Die Abteilung Atomphysik der PTR in Ronneburg und das deutsche Uranprojekt. *PTB-Mitteilungen* 123:1:73–81.

Unterdessen hatte die 3. US-Armee unter General Patton ihren schnellen Vorstoß nach Thüringen begonnen. Georg Graue, der die Kriegswirtschaftsstelle des Reichsforschungsrates leitete und die Details der Uranversuche nicht kannte, reagierte auf die Meldung über den amerikanischen Vorstoß mit den Worten: “Ja, von Stadtilm muss sofort die Atombombe weg.”

In the meantime the 3rd US Army under General Patton had begun its rapid advance to Thuringia. Georg Graue, who headed the War Office of the Reich Research Council and did not know the details of the uranium tests, responded to the report of the American attack with the words: “Yes, the atomic bomb must be immediately removed from Stadtilm.”

[The original quote is from an interview with Georg Graue on 4 April 1966, Institut für Zeitgeschichte (IfZ) München, Irving collection.]

Oscar W. Koch with Robert G. Hays. 1999. *G-2: Intelligence for Patton.* Atglen, Pennsylvania: Schiffer. pp. 115–118. Note: Koch died in 1970, but he worked on this manuscript with Hays in the 1960s, and it was published after his death.

Time had run out on Hitler's grand plan; the final chapter of the war in Europe began when soldiers of the First United States Army crossed the Remagen Bridge on March 7. The Third Army attack jumped off that same day.

In the next week, 38,572 prisoners of war passed through Third Army cages. [...]

On March 15, with well over 185,000 prisoners taken since the preceding August 1, the actual count varied from our advance intelligence estimates by only 518.

Prisoners of war could prove valuable sources of intelligence information. German soldiers, experience had shown, were remarkably well-informed. Experience had also shown that some were willing to talk. Sometimes *too* willing.

The Third Army intelligence staff would never forget one particular prisoner captured sometime earlier who had told us a convincing story.

His unit had been working on a new and unusual weapon, the PW told interrogators. Then, he said, while he was temporarily away from his post, there had been a terrific explosion. Everything at the site was a shambles and trees in a wide area of the surrounding forest had been laid low. No aircraft had been near and the blast—the most forceful he ever had witnessed—could not possibly have resulted from a bomb.

To add even more intrigue, the soldier was unable to say just what kind of weapon he had been working on. It was so secret that the individuals in his unit never knew the complete story. He knew only enough to be able to carry on his own duties.

The prisoner knew precisely where he was at the time of the blast. He readily pinpointed the exact location on a map.

His story aroused great interest in the intelligence section. The Germans had already launched V-1 and V-2 rockets, and Hitler had promised a "secret weapon" which would one day make its appearance and bring the Allies to their knees. With no other information explaining the explosion, the prisoner's account might very well mark the Allied discovery of a significant new enemy weapon.

The prisoner's story was put through the usual process of challenge. Was the information hearsay? No, it came from an eyewitness. Was the witness reliable? There was no way to know. Was the information confirmed by other sources? No, it was not. Did the information make sense in light of other data at hand? Somewhat.

There was only one loophole in the story. Through calculations of time and space, we concluded that the witness himself should have been caught in the death-dealing blast. But perhaps he had misjudged his own position, an understandable error under the circumstances. In any event, his story was worthy of further investigation. If it turned out to be true, it would be of enormous intelligence significance.

Fortunately, the story could be checked through a relatively simple expedient. If the trees had been laid low over a wide area of the forest as the prisoner said, the effects of the explosion would be readily apparent in aerial photos. Such a mission was requested and flown. The results were awaited with great anticipation.

But the photos showed that all of the trees were still standing; the area was undisturbed. The prisoner's story had been pulled out of the blue.

One of the prisoners taken in the early days of the March offensive, on the other hand, was to prove an extremely valuable source of intelligence information. [...]

Spreading the map, the prisoner explained that his duties as a German officer had been concerned with construction. Symbols on his map, he said, marked locations selected by the German high command for construction of proposed military installations as the war progressed. These were to become communications centers housed in bombproof underground shelters. A color code indicated the status of work in progress at the various sites. The map, he added, was current; none of the work had been ordered stopped.

Command requires communications. A marked map showing locations of communications centers would reflect as well the proximity of major headquarters. And from the location of headquarters sites the future planning of the German high command could be deduced. [...]

In view of the possible significance of information gained from the German major, we wanted to check the credibility of his story as quickly as possible. Some of the installations shown on his map were located in the Third Army zone of advance and could be confirmed on the ground in the near future. Until such a time, however, the prisoner's disclosure would be known to only a few persons. Patton, of course, was briefed at once.

On April 6, early in the morning, word was received that advance elements of the 4th Armored Division were approaching Ohrdruf. The closest of the reported secret underground centers would be nearby. Colonel Allen, personally selected for the mission by General Patton, departed for the 4th Armored Division command post. Following a briefing there, he would head a small inspection party which, on the following day, would visit the reported site of the enemy installation to see if things there supported the prisoner's story.

[...] At the Ohrdruf site, however, they visited the location described by the prisoner. Construction of the underground, bombproof center was complete, although the equipment was not yet operative. Time had obviously been insufficient to allow completion of the installation of the expensive and highly technical equipment. The building had never been occupied. But the site confirmed, at least in part, that the story the German major had told [...] was true.

[The German prisoner of war was apparently captured by the Americans sometime around mid-March 1945, apparently placing the test in early March. Can records of the interrogation and aerial photos be located in U.S. archives?

The account of the test is consistent with the other reports in this section, but why was it not possible to confirm the test by aerial photos? Did the test not actually occur? Were the aerial photos not of the correct location? Did senior U.S. military officials suppress aerial photos confirming the test due to secrecy? Or did the Germans replant trees or otherwise camouflage the damage at the test site?

This account also confirms the existence of some German underground installations.]

Oscar Koch
(1897–1970)

Robert Allen
(1900–1981)

Figure D.742: Oscar Koch mentioned a massive test explosion in Thuringia, and Robert Allen was sent in to investigate the area.

Robert S. Allen. [Allen 1947, pp. 369, 371–372]

The mop-up of the hilly Meiningen-Gotha-Eisenach sector produced some startling war trophies.

At Ohrdruf, 4th Armored liberated the first of the grisly Nazi horror camps and uncovered a number of astounding subterranean installations. And in the little town of Merkers, 90th Division discovered the German gold reserve.

It was found in a chemical-salt mine of tremendous proportions. The main shaft descended over 2,000 feet and there were more than 200 miles of tunnels. Some were 30 feet in height and width. [...]

The grisly horror camp and a vast, indescribably nauseous open-pit crematorium were on the outskirts of Ohrdruf.

The main architectural feature of this little Thuringian city is an imposing stone *Schloss* built before the war by a local baron. Surrounded by handsome landscaped grounds, the massive edifice was lavishly furnished and equipped with modern facilities, including tiled bathrooms, flush toilets, and an elevator. The baron was a large "employer" of inmates of the horror camp who slaved in his chemical plant. The baron also was a leading dignitary of the local Nazi organization. [...]

The underground installations were amazing. They were literally subterranean towns.

There were four in and around Ohrdruf: one near the horror camp, one under the *Schloss*, and two west of the town. Others were reported in near-by villages. None were natural caves or mines. All were man-made military installations. The horror camp had provided the labor. An interesting feature of the construction was the absence of any spoil. It had been carefully scattered in hills miles away.

Over 50 feet underground, the installations consisted of two and three stories several miles in length and extending like the spokes of a wheel. The entire hull structure was of massive, reinforced concrete. Purpose of the installations was to house the High Command after it was bombed out of Berlin. The Ohrdruf installations were to have been used by the Signal Communications Section. One, near the horror camp, was a huge telephone exchange equipped with the latest and finest apparatus. Signal Corps experts estimated their cost at $10,000,000.

This place also had paneled and carpeted offices, scores of large work and store rooms, tiled bathrooms with both tubs and showers, flush toilets, electrically equipped kitchens, decorated dining rooms and mess halls, giant refrigerators, extensive sleeping quarters, recreation rooms, separate bars for officers and enlisted personnel, a moving-picture theater, and air-conditioning and sewage systems.

Begun in 1944, the installations had been completed but never occupied. Third Army's lightning advance through central Germany had blocked that.

[U.S. government censors limited what Robert Allen could write. However, he did mention that there were many massive and well-equipped underground installations in the greater Ohrdruf area, and that U.S. forces visited “a number of astounding subterranean installations.” Where are the detailed reports of what they found there?

Allen only mentioned (or was only allowed by censors to mention) a command center and a communications center, but it is likely that most of the underground installations were involved in research, development, and production for advanced weapons.

In fact, a brief report from U.S. Army’s 80th Infantry Division in April 1945 mentioned an underground plant close to Wölfis (near Ohrdruf) and described the whole region as a “very important production area” (p. 5363).]

G-2 Periodic Report No. 177. 7 April 1945. [NARA RG 407, Entry NM3-427, Box 12342, Folder 604-2.1 G-2 Periodic Reports 4th Armored Div 1 Jan–18 May 45]

Murdercamp, vic[inity] OHRDRUF: A PW, NCO, rpts that a Concentration Camp of political prisoners, existed in the vic of OHRDRUF. According to stories told him by members of the guards, several thousand persons were killed during this winter at the camp. The PW himself happened onto an open mass grave some weeks ago, and he states that he saw nude bodies laying in lakes of blood. The PW further rpts that many, or perhaps all, of the bodies were exhumed lately and burned in the woods, vic J 115565. On 28 Mar 45, PW believes, several hundred of the political prisoners were still alive. He further states that guards in part belonged to the SS Das REICH and in part to SS LEIB-STANDARTE Adolf Hitler.

The entire area btwn OHRDRUF – SCHWABHAUSEN – WOLFIS – WECHMAR (J 1156) was a tk troop drill and maneuver ground. PW was told by an ordnance man stationed at OHRDRUF that from here a new secret wpn will shortly rise (wird steigen). It is believed that the entire area should be very thoroughly examined for new material. If any of the above mentioned political prisoners can be found alive, interesting evidence should also be forthcoming. (Source: 89 Inf Div Per Rpt No. 27).

Office of Military Government for Germany (US). Field Information Agency, Technical. DI 254-82 (FIAT) EP. 24 June 1946. Personality List No 2. [NARA RG 238, Entry NM70-160, Box 30, Folder FIAT—Misc.—Reports—No. 1–10]

BÜHL Dr. Alfons

Dir. of Inst. of Physics, Technische Hochschule, KARLSRUHE (Laboratory equipment for atomic research evacuated and also ballistic measurement apparatus)

FROM: HILDBURGHAUSEN

TO: HEIDENHEIM

[This is one of several lists of German scientists and technicians who had been relocated from the Russian Zone of postwar Germany to U.S.-controlled territory. Why did Bühl have "laboratory equipment for atomic research" and "ballistic measurement apparatus" at Hildburghausen, south of Ohrdruf? Does that confirm wartime nuclear work in the general Ohrdruf area? What exactly did Bühl do during the war? What information, hardware, or assistance did Bühl give the Soviets during his time in the Soviet Zone? What information, hardware, or assistance did Bühl give the Americans after that? Where are other U.S. records about Bühl?

Note that after the war, Bühl worked at the Karlsruhe Nuclear Research Center, was an advisor to the West German government in the field of nuclear civil defense, and wrote a book on nuclear weapons [Bühl 1972].]

Heinrich Himmler's chief adjutant Werner Grothmann [Krotzky 2002]

[See p. 4436 for Werner Grothmann's testimony about the March 1945 test in Thuringia.]

D.13 Axis Belief in the Reality of German Nuclear Weapons

[Among Axis officials in positions of knowledge, there was a widespread belief in the reality of German nuclear weapons, both during and after the war:

- There are photographs of Hitler visiting the Reichswerke Hermann Göring at Linz, Austria on 4 April 1943, apparently surrounded by nuclear scientists, indicating that the German nuclear weapons program had the highest level of support (pp. 3877–3879).

- One of Heinrich Himmler's closest diplomatic contacts, Grand Mufti Amin al-Husaini of Jerusalem, said Himmler had informed him in July 1943 that Germany was developing an atomic bomb (p. 4578).

- Himmler's political rival, Albert Speer, confirmed that Himmler was keenly interested in developing an atomic bomb during the war (p. 4593).

- Hans Ulrich Rudel, the most decorated German pilot of the war, reported that in March 1944 Hitler told him that (1) atomic bombs were at a highly advanced stage of development and (2) the bombs were intended to be delivered via V-type rockets (p. 4591).

- On 5 August 1944, Hitler informed the Romanian Prime Minister Ion Antonescu that Germany had developed and would use a V-series weapon with "such a tremendous effect that all human life would be destroyed within a radius of three to four kilometers from the impact point" (p. 4594).

- On 16 December 1944, Benito Mussolini stated that "thousands of German scientists are working day and night" to develop new weapons that would change the war, apparently in reference to information he received via Luigi Romersa (p. 4603).

- In 16 November 1944 and 9 February 1945 letters from FBI Director J. Edgar Hoover to Franklin Roosevelt's top advisor Harry Hopkins, Hoover reported that intercepted messages from Germany to German spies in the U.S. asked the spies about "the probable reaction of the people of the United States if Germany used the explosive power obtained through the splitting of the uranium atom," high-priority targets in the United States that Germany could bomb, and methods that U.S. laboratories used to avoid criticality accidents with large quantities of enriched uranium, suggesting that Germany possessed large quantities of enriched uranium (pp. 4604–4625).

- Widespread German reports from late 1944 through 1945 claimed that Germany was on the verge of deploying atomic bombs and missiles for them (p. 4627).

- On 14 February 1945, Hitler told one of his doctors: "In no time at all, I'm going to start using my Victory weapon and then the war will come to a glorious end. Some time ago we solved the problem of nuclear fission, and we have developed it so far that we can exploit the energy for armaments purposes. They won't know what hit them! It's the weapon of the future. With it Germany's future is assured" (p. 4634).

- Heinrich Himmler's physical therapist, Felix Kersten, wrote that in early March 1945, Himmler was very optimistic about the imminent success of an atomic bomb (p. 4470).

- Heinrich Himmler's personal astrologer, Wilhelm Wulff, confirmed that in mid-March 1945, Himmler was very optimistic about the imminent success of an atomic bomb (p. 4471).

- Henry Picker, a close confidant of Hitler, wrote that before the war ended, prototype fission bombs were completed and ready, and facilities for mass-producing the bombs had been built (pp. 4635–4639).

- In 2000–2002 interviews, Werner Grothmann described how an extensive program run by Heinrich Himmler developed, tested, and debated the deployment of atomic bombs (p. 4668).

- In a 1 April 1945 telegram to Allied leaders, Allen Dulles reported that Luftwaffe General Albert Kesselring mentioned deliberations among Hitler's top staff about whether to use a final secret weapon, referred to as the "desperation weapon," that would cause a "terrible blood bath" (p. 4670).

- In a September 1945 interrogation, the father of an SS officer told Americans about deliberations among Hitler's top staff over an atomic bomb in April 1945 (p. 4670).

- In Otto Hahn's autobiography, he wrote that he had heard from reliable sources that there were at least three completed atomic bombs at the end of the war (p. 4182). Lending additional credibility to Hahn's story, the bombs were said to be at Lüneburger Heide, which wartime Allied intelligence reports had identified as the site of what sounded like large underground uranium enrichment facilities producing fuel for spherical implosion bombs (Section 8.8.4). There were also other reports of nuclear-related work at Lüneburger Heide (pp. 4176–4181, 4406).

- Former SS officer Erwin Bartmann reported very similar information from his insider knowledge of conversations among Hitler, Göring, and others—there were specific mentions of "three special bombs" and even up to nine completed bombs by the end of the war (p. 4667).

- Shortly after the war, German rocket engineers Wernher von Braun and Walter Dornberger, as well as American officials who examined the German rocket program, reported that Germany planned to use its rockets to carry a "much more powerful explosive," presumably atomic bombs (p. 4681).

In the end, German leaders appear to have concluded that they did not have a sufficient number of nuclear weapons (and/or sufficiently reliable delivery vehicles) to strike enough Allied targets to change the ultimate outcome of the war. Moreover, Franklin Roosevelt and Winston Churchill had made it clear that if Germany used anything other than conventional weapons in the war, the Allies would respond by killing tens of millions of German civilians with crude but effective WWI-style chemical weapons (mustard agent and phosgene) or other means; see pp. 2632–2651. Individual German political or military leaders may have also feared even greater postwar prosecutions if they used nuclear weapons, or considered it more personally beneficial to try to trade German nuclear and other technologies to the Allies than to employ them against the Allies.]

Adolf Hitler. 19 September 1939. Speech in Danzig.
https://learninglink.oup.com/access/content/von-sivers-3e-dashboard- resources/ document-adolf-hitler-speech-in-danzig-after-the-invasion-of-poland- september-1939

[...] If peoples go to pieces it will not be the German people, who are fighting for justice, who have no war aims and who were attacked.

Rather, those peoples will break when they gradually find out what their misleaders plan, and gradually grasp for what little reason they are fighting, and that the only reasons for war are the profits or political interests of a very small clique. [...]

These gentlemen should take note of the following: Today you have the Germany of Frederick the Great before you. These gentlemen can believe this. The German people will not split up in this fight but become more unified. If anything splits up it will be those States that are not so homogeneous, those empires built on the oppression of peoples. We are fighting only for our naked beings. We are not able ourselves to be misled by propaganda.

Just imagine! There are people who say there are those ruling in another land who do not please us, so now we have war with them. Naturally they do not carry on the war themselves, but look about for someone to conduct it for them. They provide cannon and grenades while others provide grenadiers and soldiers. Such an utter lack of conscience!

What would be said if one of us should say that the present regime in France or Britain does not suit us and consequently we are conducting a war? What immeasurable lack of conscience. For that, millions of persons are whipped into death. These gentlemen can say that calmly, for they themselves never have been on the battlefield for even an hour.

But we will see how long they keep nations at war. There can be no doubt of one thing. however. We will take up the gauntlet and we will fight as the enemy fights. England, with lies and hypocrisy, already has begun to fight against women and children. They found a weapon which they think is invincible: namely, sea power. And because they cannot be attacked with this weapon they think they are justified in making war with it against women and children—not only of enemies but also of neutrals if necessary.

Let them make no mistake here, however. The moment could come very suddenly in which we could use a weapon with which we cannot be attacked. I hope then they do not suddenly begin to think of humaneness and of the impossibility of waging war against women and children. We Germans do not like that. It is not in our nature. In this campaign I gave an order to spare human beings. When columns cross a market-place it can occur that someone else becomes the victim of attack.

In those places where insane or crazy people did not offer resistance not one windowpane was broken. In Cracow, except for the air field, railroads and the railroad station, which were military objectives, not one bomb fell. On the other hand, in Warsaw the war is carried on by civilian shootings in all streets and houses. There, of course, the war will take in the whole city. We followed these rules and would like to follow them in the future. It is entirely up to England to carry out her blockade in a form compatible with international law or incompatible with international law. We will adapt ourselves thereto.

But there should be no doubt about one thing:

England's goal is not 'a fight against the regime' but a fight against the German people, women and children. Our reaction will be compatible, and one thing will be certain: This Germany does not capitulate. We know too well what fate would be in store for Germany. [...]

We are determined to carry on and stand this war one way or another. We have only this one wish, that the Almighty, who now has blessed our arms, will now perhaps make other peoples understand and give them comprehension of how useless this war, this debacles of peoples, will be intrinsically, and that He may perhaps cause reflection on the blessings of peace which they are sacrificing because a handful of fanatic warmongers, persons who stand to gain by war, want to involve peoples in war.

Raymond J. Batvinis. 2014. *Hoover's Secret War Against Axis Spies: FBI Counterespionage During World War II.*

[p. 156:] This priceless German smorgasbord included three dots filled with questions[...]

The next instruction raised terrifying concerns for the small group of scientists who would soon offer their recommendations to President Roosevelt regarding a decision to move forward on the atomic bomb:

> Decay Uran. According to some information obtained there is reason to believe that the scientific works for the utilization of the atoxic [*sic*]—kernel energy are being driven forward into a certain direction in the U.S. partly by use of helium. Continuous information about tests made on this subject are required particularly 1. What process is practiced in the U.S. for sending of heavy uran? 2. When are being made [*sic*] tests with more important quantities of uran? (Universities, industrial laboratories, etc.) 3. Which other raw-materials are being used at these tests? It is recommended to entrust only best experts with this test, and if not available, to abstain from it. [13 April 1942]

[...] The contents of these eleven microdots provided military analysts with a goldmine of insights into German intelligence gaps concerning U.S. readiness, capabilities, and strategic planning so soon after the Pearl Harbor attack.

[p. 187:] [Hans] Blum then raised another consideration, atomic research, ordering [Jorge] Mosquera to search out any information concerning "experiments performed in the United States relative to shattering of atoms." The German military was anxious to develop high explosives from atom sources that they believed would weigh no more than a pound to a pound and a half. In what was almost a premonition of the future five years hence, Blum speculated that the nation which "will be victor in this war will be the one which has accomplished the task of shattering the atoms and applying the results thereof." With training behind him and instructions in hand, Mosquera left Hamburg by train on June 15, 1941[...]

[The preceding information demonstrates that remarkably early in the war (spring 1941 to spring 1942):

- The German military knew that nuclear technology could create extremely powerful bombs (not just reactors).
- The German military was committed to developing nuclear weapons.
- The German military believed that whichever country was the first to perfect nuclear weapons would win the war.
- Germany was aware that the United States had also begun work on nuclear weapons.
- Germany was actively seeking as much information about the U.S. program as possible.
- Germany's awareness of the U.S. nuclear weapons program, combined with its belief that the first country to create such weapons would win the war, was a strong incentive for Germany to proceed as rapidly as possible with its own program.
- No later than spring 1941, German scientists believed that the critical mass of fission fuel required for a bomb could be less than one kilogram.
- That value for the critical mass appears to indicate that German scientists had a very good understanding of the relevant nuclear physics.
- That value for the critical mass also appears to show that German scientists intended to use an implosion bomb design with compression to achieve that critical mass. (A gun-type design without compression would require a far larger critical mass.)

[See also a similar version of this story in Bryden 2014, pp. 223–226.]]

Ulrich von Hassell. 2011. *The Ulrich von Hassell Diaries, 1938–1944: The Story of the Forces Against Hitler Inside Germany.* London: Frontline. p. 198

9 June 1943. [...]

In their pessimism people are clinging to the idea of 'a miracle weapon', a rocket gun which can reduce whole sections of a city to ashes from extreme distances at one blow—a terrible vision! a frightful prospect in view of the fact that this will not shorten the war with a satisfactory conclusion, but most probably lengthen it with increasing bitterness.

Heinrich Himmler's diplomatic contact, Muhammad Amin Al-Husayni, the Grand Mufti of Jerusalem. Translated and paraphrased in: Wolfgang G. Schwanitz. Review of Karlsch, Rainer; Petermann, Heiko, Für und Wider "Hitlers Bombe": Studien zur Atomforschung in Deutschland. *H-Soz-u-Kult, H-Net Reviews.* February 2009. https://www.h-net.org/reviews/showrev.php?id=24129

Am selben Tage (nach Widmung auf ihrem gemeinsamen Foto der 4. Juli 1943) habe Himmler ihm, neben einem Bericht über Panzer, eine Geheiminformation gegeben, die, wie er ihm sagte, nicht mehr als zehn Eingeweihte im Deutschen Reich kennen: den Bau einer Atombombe, die den Sieg garantiere. Dies trug seine Siegesgewissheit. Die Deutschen kamen, erläuterte Himmler dem Großmufti, in der Atomforschung voran. Die Atomwaffe werde die stärkste Waffe sein, die den Sieg garantiere." Wir haben erfahren, dass Engländer und Amerikaner auch begonnen haben, eine Atomwaffe zu erlangen. Jedoch sind wir ihnen um drei Jahre voraus. Wir werden die Atomwaffe wenigstens drei Jahre vor ihnen haben." Abd al-Karim Umar, *Muzakkirat al-Hagg Muhammad Amin al-Husaini* [*The Memoires of al-Hagg Muhammad Amin al-Husaini*], Damascus 1999, S. 127, 162f. Al-Husaini beschrieb in (alliiert abgefangenen) Briefen an den Araber Shakib Arslan 1944 "V-Waffen".

Nach 1945 meinte der Großmufti, dass die Feindspionage durch "jüdische, englische und amerikanische Geheimdienste" Deutschland "größten Schaden" zufügte. Sie konnten die Orte der "Atomreaktoren" in Ostpreußen entdecken. Ein Teil der Spione sei unter den 17 Millionen Fremdarbeitern gewesen. Sie hätten auch die geheimen Plätze in Peenemünde an der Ostsee in Ostdeutschland verraten, die die Alliierten dann zerstörten. Auch wären eine Anzahl deutscher Atomforscher getötet worden. So hätten die Alliierten verhindert, dass Deutschland eine Atombombe baute. Deutsche seien gezwungen gewesen, Betriebe auf eine Insel vor Dänemark mit unterirdischen Werken der Atomforschung zu verlagern. Abd al-Karim Umar, *Guerilla-Fidaiyun-Kommandos*, S. 145.

On the same day (after the dedication in the joint photo of 4 July 1943), Himmler had given him, besides a report on tanks, secret information which, as he told him, was known to only ten people in the German Reich: the construction of an atomic bomb guaranteeing victory. This bore its certainty. The Germans, Himmler explained to the Grand Mufti, were advanced in atomic research. The atomic weapon would be the strongest of all weapons, guaranteeing victory. "We have learned that the British and Americans have also begun to develop an atomic weapon, but we are three years ahead of them, and we will have the atomic weapon at least three years before them." Abd al-Karim Umar, *Muzakkirat al-Hagg Muhammad Amin al-Husaini* [*The Memoirs of al-Hagg Muhammad Amin al-Husaini*], Damascus 1999, p. 127, 162f. In 1944 Al-Husaini described "V-weapons" in (Allied intercepted) letters to the Arab Shakib Arslan.

After 1945 the Grand Mufti said that the enemy espionage by "Jewish, English and American intelligence services" caused "the greatest damage." They were able to discover the locations of "atomic reactors" in East Prussia. Some of the spies were among the 17 million foreign workers. They also betrayed the secret places in Peenemünde on the Baltic Sea in eastern Germany, which were then destroyed by the Allies. A number of German atomic researchers were also killed. Thus the Allies prevented Germany from building an atomic bomb. Germans had been forced to relocate operations to an island off the coast of Denmark with underground installations for atomic research. Abd al-Karim Umar, *Guerilla-Fidaiyun-Kommandos*, p. 145.

[The Grand Mufti provided numerous details that are very useful (if they are accurate):

- German intelligence was aware of the U.S. Manhattan Project.
- The goal of the German nuclear program was to develop a bomb as rapidly as possible, before the United States could.
- As of mid-1943, Heinrich Himmler (and hence the SS) was in charge of the German nuclear program.
- Security for the German nuclear program was highly compartmentalized—"only ten people" knew the whole truth about it.
- As of mid-1943, Himmler thought the German nuclear program was "three years ahead" of the U.S. program, so the German program was at least three years old and could have begun no later than mid-1940. Since Himmler knew that the U.S. program was already underway in 1943, that would push the origin of the German program back even earlier, likely to 1939 when war was declared.
- There were one or more fission reactors under construction (or operational?) in East Prussia (now northeastern Poland and western Russia). See also pp. 3929 and 4998.
- Allied intelligence was aware of the German nuclear program.
- Allied bombing and sabotage caused significant delays in the German nuclear program.
- Some nuclear work was being conducted at Peenemünde (or elsewhere on the Baltic coast).
- Some nuclear work was being conducted on the island of Bornholm.
- To avoid Allied bombing, some nuclear work was being conducted in underground installations.

The Mufti's account was not translated from Arabic until after Werner Grothmann had already died, yet all of these details are remarkably consistent with Grothmann's account of the German nuclear program and lend credibility to Grothmann as an historical source. Whether the details are accurate could still be debated, but both the Mufti and Grothmann were close associates of Heinrich Himmler and heard the same information from him.]

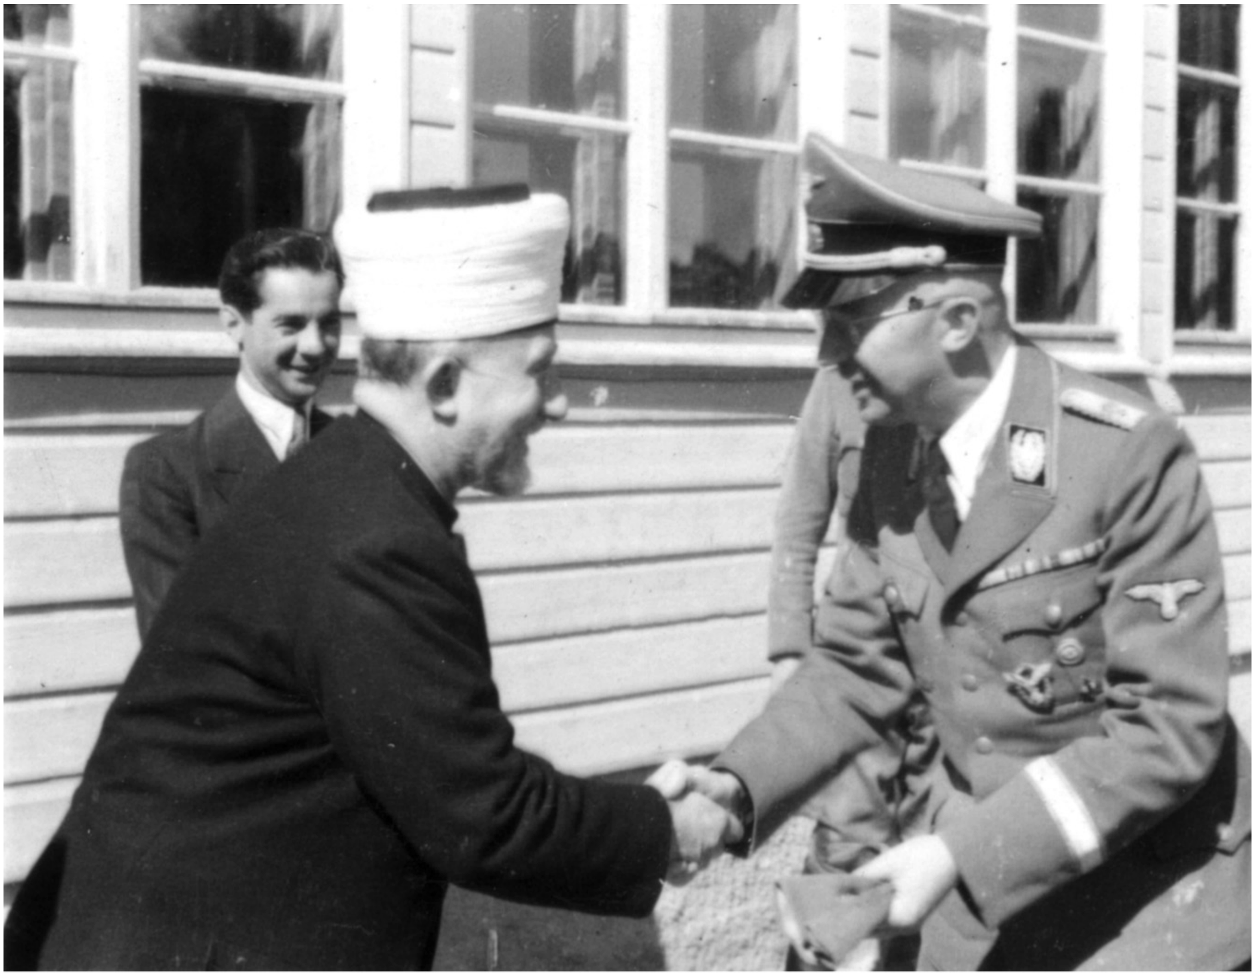

Figure D.743: Muhammad Amin Al-Husayni, the Grand Mufti of Jerusalem, meeting with Heinrich Himmler on 4 July 1943. See pp. 4578–4579.

FACT SHEET

1. Activities of Scientists

A. **Hahn**

Known to be a violent anti-Nazi.

Went to Paris early in 1942 where it is believed he discussed academic matters.

At the beginning of the war when asked by German officials to contribute to the research on fission, Hahn replied he did not want to participate.

In April 1943 Hahn visited Meitner in Sweden. When asked how the fission project was going, he replied, it isn't going.

Gave a lecture in Sweden on the general subject of fission in November 1943. Referred to the serious accomplishment of the development and research work as a post-war project.

E. **Harteck**

Physical chemist active in the development of the exchange reaction used in the production of D2O.

Made frequent trips to Norway.

F. **Jensen**

Professor of Physics at Hanover.

Makes frequent trips to Norway

Associated in his work with Harteck

Has talked at intervals with Bohr

A naturalized German, parents Danish extraction.

Has said to Bohr that the Germans have a new weapon, that he knows about it, that he is very worried and wants to go to America.

Date	Place	Source	Origin	Place Mentioned	General Topic
3/[illegible]/43 8/27/4	Stockholm	Wireless to the NEW YORK TIMES	Oslo reports	Rjukan, 130 miles east of Bergen and Vast Moorland tracts of the Hardanger plateau	A "heavy water factory" at Rjukan was blown up some weeks earlier and rumors now have it that "bigger things were being planned." British paratroop sabotage headquarters was established in vast Hardanger plateau. German police restricted movement in that entire area.
4/3/43	London	Cable to the NEW YORK TIMES	Norwegion circles in London cities German sources	Rjukan Rjukan	As a result of "saboteurs" the big electro-chemical plant of Rjukan, Norway, had been blownup in one of three recent raids against enemy occupied country--German sources announced Wednesday.
6/5/4	London	Associated Press	Albert Speer, German minister of Munitions.		Completely new weapon had been discovered.
6/5/3 9/2	London	Associated Press	P. J. Goebbels Minister of Propaganda		Germany(so he said) has in her hands all the essentials of a truly decisive victory.
7/9/3		United Press	German broadcast	Used in Russia	A new "secret weapon", called the "projector" was used by the Nazis in the current offensive in Russia "with great success" The "whole terrain looks as if a steam roller has gone over it. "There in not one crater but more than a hundred in a small area."
8/6/3	Madrid	A. P.	Goebbels		In November all plans will be completed, all factories will have completed all their production plans, and Germany will loose her "secret weapon" (not a Bomb or a gas) upon her enemies thus bringing radical destruction and ammihilation of the enemy.
7/18/43	London			Peenemuende Lake Constance (Near Swiss border)	Besides the bombing of the mystery plant at Peenemuende, an air alert in Switzerland indicated raids in the Lake Constance area. Peenemuende is sixty miles n. w. of Stellin on the Bay of Pomerania at the estuary of the Peene River. It is the biggest German research and development station.
0/43	Stockholm	B. U. P.	Reported by the newspaper, "Allhanda"	Northeastern Germany Peenemunde, north of Berlin in a thickly wooded section	General Chamier-Glisezenski, one of Germany's foremost experts on secret weapons was murdered during an air raid on the Nazi research station at Peenemuende, Near Berlin. Gen. Hans Jeschonnek, Luftwaffe's Chief of Staff, was also killed this time while studying one of Gen. Chamier's secret weapon.

	London	U. [illegible].	Lowell Bennett, reporter	Leverkusen, 4mi. north of Cologne, Schweinfurt Regensburg	British and American bombers attacked a German chemical works The main blow was directed against the city of Leverkusen, site of chemical works producing components for war gas.
	Stockholm	Reports from Malmo	Newspaper, "Aftonbladet" amd Swedish newspapers	Danish Island of Bornholm in Baltic Sea	Apilotless German "mystery plane" crashed on the Danish Island of Bornholm, directly across Baltic from Peenemeunde. Swedish newspapers have published many reports of German secret weapons. One was that Germany was building an armada of pilotless bomber planes.
		Spanish Press.			Spanish press is advertising a new German secret weapon--this time a midget plane which will carry a small but very powerful bomb. This plane would fly at extreme altitudes.
43	London	Cable to the NEW YORK TIMES	Prime Minister Winston Churchill		Churchill reveals that Nazis are using a glider bomb against Allied shipping. Bomb is radio-controlled and rocket-aided.
/43	London	Stockholm dispatch	Gunnert Pihl, Swedish correspondent	Calais Boulogne	Pihl reported that rocket guns were being installed in underground positions around Calais and Boulogne. He said great underground factories were being built by the German to hide their industry from damage by the Allied bombings.
/43	London	London and Stockholm dispatches	London and Stockholm dispatches		Dr. Niels Bohr has reached London from Sweden. A Stockholm dispatch reported that Dr. Bohr took with him data for a new war invention involving the atomic explosions. The invention is described of greatest importance and Bohr's movements secret. Germans endeavored to capture him.
13/43	London	I. N. S.	Daily Express citing an Istanbul dispatch	Positions in France	Dispatch quoted two Austrian refugees prediction that German rocket guns would shell London from positions in France. A neutral business man who recently returned from Berlin stated the capital is full of rumors of new secret weapons to be used agaon against Allies.
3/43	Stockholm	A. P.	Berlin corres. of the DAGENS NYHETER		Inthe near future the Germans are launching a fighter plane that will fire a projectile capable of blowing a 4 motor bomber to bits with a single shot. They predicted it would be a common occurenc for heavy bombers to be blown into atoms by a single shot. Sp centered upon the idea that it is an "atom gun." pectulation

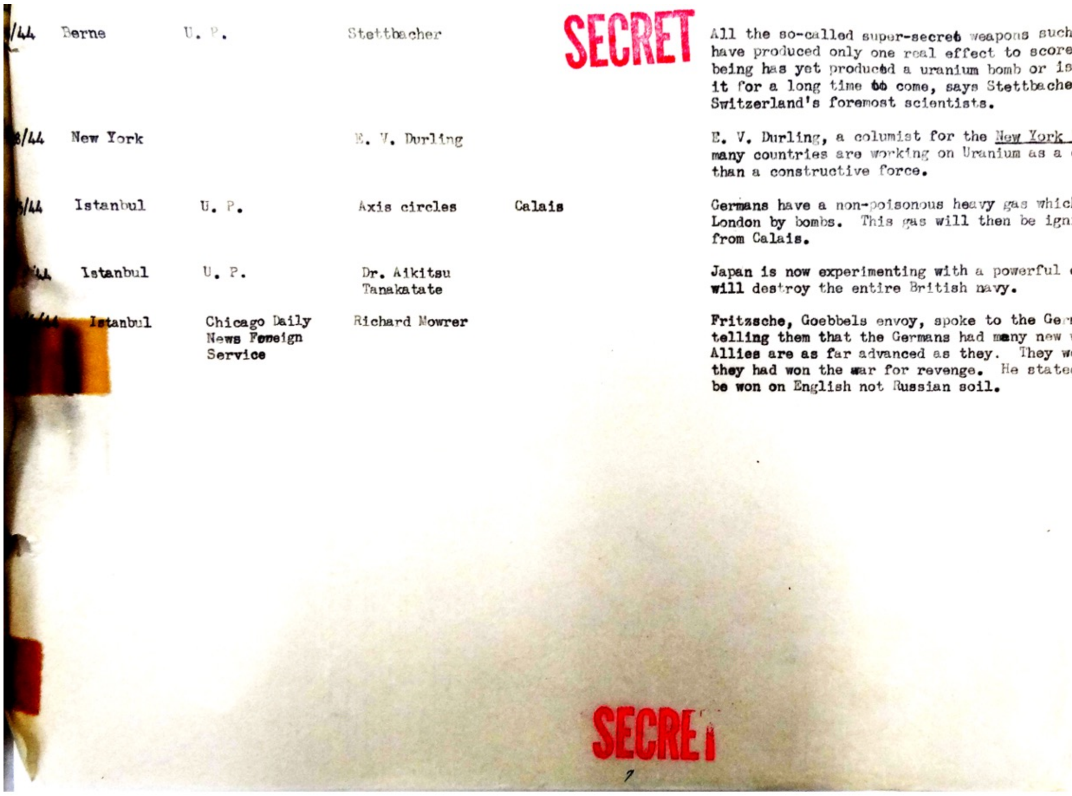
/43	Bern	By radio to Chicago DAILY NEWS and VINDICATOR	Swiss reports	German side of Lake Constance on north east border of Switzerland	Strange noises from the German side of Lake Constance on Switzerland!s north east border have been heard recently. For days and nights thunderous detonations like explosions have made the ground quake over a radius of 7 miles or more. The Swiss presumed this was the testing of high powered fuses for projectiles.
/43	Lisbon	U. P.	Latest travelers from Berlin		Germany, they said, have a new type of small bomb with a tremendous explosive power supplied by a process of splitting the atom. These bombs will be scattered by a new stratosphere planes which can fly far above ack-ack fire and each plane can be loaded with hundreds of small bombs.
	New York		Karl H. Von Wiegand		Wiegand discusses the uranium bomb (size of oranges) stories of which have leaked out of Germany. He believes that they are far from perfection yet, due to the scarcity of uranium. People of Britain are much more serious about this new threat than the Americans.
	London	I. N. S.	Dr. Alfred Stettbacher, Switzerland's foremost explosive expert		Stettbacher brands the "rocker gun" as nothing more than a weapon for war nerves. It would be impossible to fire a shell of 12 tons 120 miles much less with any degree of accuracy.
/44	Berne	I. N. S.	Ernest Zuagg	Underground laboratories	The Nazis are desperately working on a "uranium torpedo". According to reports spread by Goebbels department, the German scientists eat, sleep, and exercise at their places of work. He quotes Dr. Kai Siegbahn as saying the secret is far from being solved.
/44	Berne	I. N. S.	Ernest Zaugg	Underground laboratories	Neutral seientists doubt that Germany has perfected a new atomic bomb, but the latest rumor by Goebbels is that they have a uranium torpedo, driven by from 5 to 7 rockets and directed by radio and its final explosion is derived from an atom-splitting process.
3/44	Berne	NEW YORK TIMES	Neutral military sources	East of Lake Constance	Neutral military circles reveal that a new secret weapon, a rocket shell filled with liquid air containing a solution of uranium salt, is "nearing completion" of its experimental stages east of Lake Constance. It May ascend to a theoretical height of 30 to 35 miles before it starts falling.
/44	New York				Dr. Compton stated in his speech of resignation as president of American Association for the Advancement of Science in New York that the atomic bomb is not completed in Germany and won't be.

SECRET

Figure D.747: During the war, especially in its later years, countless newspaper articles reported that Germany was developing an atomic bomb. The U.S. Manhattan Project's Foreign Intelligence Unit analyzed many of those articles [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)].



SECRET

/44	Berne	U. P.	Stetthacher		All the so-called super-secret weapons such as uranium bombs have produced only one real effect to score people . No human being has yet produced a uranium bomb or is capable of inventing it for a long time to come, says Stettbacher who is one of Switzerland's foremost scientists.
/44	New York		E. V. Durling		E. V. Durling, a columist for the New York Times, states that many countries are working on Uranium as a destructive rather than a constructive force.
/44	Istanbul	U. P.	Axis circles	Calais	Germans have a non-poisonous heavy gas which will be laid over London by bombs. This gas will then be ignited by shells fired from Calais.
/44	Istanbul	U. P.	Dr. Aikitsu Tanakatate		Japan is now experimenting with a powerful explosive which will destroy the entire British navy.
/44	Istanbul	Chicago Daily News Foreign Service	Richard Mowrer		Fritzsche, Goebbels envoy, spoke to the Germans in Istanbul telling them that the Germans had many new weapons, but that the Allies are as far advanced as they. They would have to wait until they had won the war for revenge. He stated that the war will be won on English not Russian soil.

Figure D.748: During the war, especially in its later years, countless newspaper articles reported that Germany was developing an atomic bomb. The U.S. Manhattan Project's Foreign Intelligence Unit analyzed many of those articles [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)].

Winston Churchill. 21 September 1943. Address to Parliament, *War Situation* Vol. 392 https://hansard.parliament.uk/Commons/1943-09-21/debates/1083c667-4ccd-40de-b6a1-e387f595fee8/WarSituation

We must not in any circumstances allow these favourable tendencies to weaken our efforts or lead us to suppose that our dangers are past or that the war is coming to an end. On the contrary, we must expect that the terrible foe we are smiting so heavily will make frenzied efforts to retaliate. The speeches of the German leaders, from Hitler downwards, contain mysterious allusions to new methods and new weapons which will presently be tried against us. It would, of course, be natural for the enemy to spread such rumours in order to encourage his own people, but there is probably more in it than that. For example we now have experience of a new type of aerial bomb which the enemy has begun to use in attacks on our shipping, when at close quarters with the coast. This bomb, which may be described as a sort of rocket-assisted glider, is released from a considerable height, and is then apparently guided towards its target by the parent aircraft. It may be that the Germans are developing other weapons on novel lines with which they may hope to do us damage and to compensate to some extent for the injury which they are daily receiving from us. I can only assure the House that unceasing vigilance and the most intense study of which we are capable are given to these possibilities. We have always hitherto found the answer to any of the problems which have been presented to us. At the same time I do not exclude, and no one must exclude from their minds, that novel forms of attack will be employed, and, should they be employed, I should be able to show to the House in detail the prolonged, careful examination beforehand which we have made into these possibilities, and I trust we shall be able to show the measures which will be brought into force against them.

Associated Press. Heavy 'Retaliation' Threatened by Nazis. [Alternate title in some editions of that day's newspaper: "Huge Reprisal Blow Threatened by Nazis."] *New York Times*, 4 December 1943, p. 1.

LONDON, Dec. 3—Again threatening retaliation for the air war upon Germany, the Berlin radio said today that the German High Command "intends by one fell, drastic stroke to end the unbridled mass murder," and added that "mankind is not far from the point where it can at will blow up half the globe."

The broadcast quoted the periodical Reich as saying that "the commencement of retaliation no longer depends on technical matters, but solely on the object which is to be attained by it."

"The retaliation," it continues, "will be so powerful and will be started at such a psychologically opportune moment as to influence the development of the war. It would be superfluous to retaliate for ruins with ruins. The sense of retaliation will find quite a different and surprising expression spiritually as well as politically."

[A clipping of this newspaper article is in the Franklin Delano Roosevelt Library in Hyde Park, New York [Small Collections, Box 1, Folder 3, ATOMIC BOMB FILE]. The fact that this article was singled out to be saved and placed in a presidential file labelled "ATOMIC BOMB FILE" demonstrates that President Roosevelt and other senior officials of the U.S. government clearly understood this article to be a reference to the German nuclear weapons program.

This same 3 December 1943 German announcement was analyzed in more detail in the following article from *Newsweek*.]

Can the Nazis 'Blow Up Half the Globe'? *Newsweek* Vol. 22, No. 24, 13 December 1943, p. 32.

The plane was flying so high that only a few people saw it. And when the bombs that it dropped struck it was doubtful if anyone in the city heard the explosion. For that explosion was so tremendous and all-inclusive that in a fraction of a second the entire community had been wiped from the face of the earth.

This is the sort of destruction that scientists and novelists have often envisioned as taking place in some future war. By and large, it has had little foundation in actuality. The possibilities of inventing new explosives out of known materials have been discounted as being so remote as almost to be out of the question. The only chance seemed to be in tapping some new and frightful source of energy—as in the favorite scientific fantasy in which the atom is broken up and a cupful of water made to generate enough power to drive a steamer across the Atlantic.

Now the Germans are claiming, although not in so many words, that they have developed some such phenomenal new instrument of destruction. It is, of course, part of the propaganda campaign promising retaliation for British and American air raids. For the moment, it is obviously intended to bolster the morale of a badly shaken people. And as such it has not been taken seriously by the Allied public. However, a number of peculiar circumstances coupled with this boast give it a deeply serious significance—so serious that perhaps the world should prepare for the last stage of the war to unleash a terror beyond present comprehension.

The first circumstance is that Allied leaders expect new forms of war to be developed and have said so. Churchill was most explicit. In the same speech in which he told of the Nazi rocket-glider-bomb (and effective but not decisive weapon), he warned: "It may be that the Germans are developing other weapons on novel lines with which they hope to do us damage." Then he underlined the importance of this otherwise rather uninformative statement by referring to the "prolonged, careful examination beforehand that we have given to these possibilities."

Another circumstance stems from the reported blowing up last spring of a German electrochemical plant at Rjukan in Norway. This plant was supposed to be manufacturing "heavy water," a substance extremely useful in atom cracking (NEWSWEEK, April 19). Still another was the RAF raid last August in which 1,730 tons of bombs were lavished on a German research laboratory in the woods at Peenemünde, north of Berlin.

The wording of the German propaganda lent weight to all this evidence. On Dec. 3, the Berlin radio quoted the German High Command as saying that "the retaliation will be so powerful and will be started at such a psychologically opportune moment as to influence the development of the war." The High Command also said that it "intends by one fell, drastic stroke to end the unbridled mass murder." A hint of the method was contained in the declaration that mankind is not far from the point where it can at will blow up half the globe."

These boasts did not sound like the ordinary propaganda line for two reasons. First, they came directly from the High Command, an unusual proceeding. Second, there was no qualification to these and similar earlier promises that the retaliation would surely come. The inference was strong that the weapon itself had been perfected—a Stockholm dispatch said flatly that it was a new high explosive—and that only the moment when the maximum effect could be secured was being awaited. Finally, Hitler himself in his beer-hall speech last November proclaimed that the next target would be Britain.

U.S. Military Attaché, U.S. Embassy in Istanbul. 8 December 1943. [AFHRA A1261 electronic version p. 31] [See document photo on p. 4589 top.]

Source: M/A Istanbul, Turkey, #8507, 8 December 1943.

Before Mr. Shimura left the office, informant asked him about the damage to Berlin. Mr. Shimura said damage was enormous and effect on morale serious but not to the point of a German collapse.

"However," remarked Mr. Shimura, "the raids will not continue much longer."

"How so?", asked informant.

"Because the Allies will soon receive ten times more than they have given. The Germans have a weapon in preparation which is more devastating than anything we have ever seen." Mr. Shimura laughed. "Yes", he said, "It is coming very, very soon."

U.S. Military Attaché, U.S. Embassy in Istanbul. 18 December 1943. [AFHRA A1261 electronic version p. 27] [See document photo on p. 4589 bottom.]

Source: M/A Istanbul, Turkey, #8609, 18 December 1943.

In the course of a violent argument with a Bulgarian officer, an engineer of the Todt organization revealed in Sofia that the Germans now possess a new type of incendiary far surpassing anything yet used in warfare. The engineer intimated that London would suffer a fate worse than that of Berlin or Hamburg in the near future.

The Japanese have been given technical details about some new German weapon, possibly this one.

[Organisation Todt, founded by Fritz Todt (German, 1891–1942), developed the autobahn and many other large government and military engineering projects before and during World War II. One would expect it to have played an important role in any German nuclear weapons program, just as the U.S. Army Corps of Engineers did in the Manhattan Project.

After Fritz Todt's death in early 1942 (officially an accidental plane crash, but quite likely an assassination by his political rivals or Allied agents), formal control of Organisation Todt was granted to Albert Speer. However, direct management of Organisation Todt was carried out by Todt's former deputy, Franz Xaver Dorsch (German, 1899–1986). It seems likely that the nuclear-related aspects of Organisation Todt were subsumed by the SS's nuclear program under Heinrich Himmler and Hans Kammler.

Since 1938, Germany had been operating and receiving shipments from a uranium mine at Buchovo (or Buhovo), a suburb of Sofia, Bulgaria [Hayes 2004, p. 235; https://ejatlas.org/conflict/life-after-the-uranium-mines-in-buhovo-bulgaria]. That would explain why an engineer from Organisation Todt with apparent knowledge of the German nuclear weapons program was in Sofia in 1943.

As of late 1943, the engineer seemed to believe that the German nuclear weapons program was very far along and would soon deliver a final product. That implies that the program had been running for several years, and it is consistent with conducting the first successful tests in 1944.

Although unsigned, the above two intelligence reports are likely from George Earle, a U.S. Naval Attaché who ran a very well connected spy ring in Turkey that gathered a great deal of valuable intelligence (p. 4701).]

Source: M/A Istanbul, Turkey, #8507, 8 December 1943.

Before Mr. Shimura left the office, informant asked him about the damage to Berlin. Mr. Shimura said damage was enormous and effect on morale serious but not to the point of a German collapse.

"However," remarked Mr. Shirmura, "the raids will not continue much longer."

"How so?", asked informant.

"Because the Allies will soon receive ten times more than they have given. The Germans have a weapon in preparation which is more devastating than anything we have ever seen.", Mr. Shimura laughed. "Yes", he said, "It is coming very, very soon."

CONFIDENTIAL

8

ource: M/A Istanbul, Turkey, #8609, 18 December 1943.

In the course of a violent argument with a Bulgarian officer, engineer of the Todt organization revealed in Sofia that the rmans now possess a new type of incendiary far surpassing anything t used in warfare. The engineer intimated that London would suffer fate worse than that of Berlin or Hamburg in the near future.

The Japanese have been given technical details about some new German weapon, possibly this one.

Figure D.749: U.S. Military Attaché, U.S. Embassy in Istanbul. December 1943 [AFHRA A1261 electronic version pp. 31 (top) and 27 (bottom)].

Rocket Weapons. *New York Times*, 23 January 1944, p. 75.

Fantastic tales come out of neutral Switzerland and Sweden about Germany's secret rocket weapons. Jules Verne never gave us anything more hair-raising. The splitting of the uranium atom a few years ago, with the release of energy on a minute scale, evidently inspired the recent Swiss account of a German rocket shell which is loaded with liquid air and a solution of uranium salt. It sounds terrible after the vivid pictures that were drawn of uranium's possibilities in driving factory wheels and lighting cities. The truth is that almost any existing fuel will do for a rocket plane and any existing explosive for a rocket shell, bomb or torpedo.

Ordnance experts will probably raise a skeptical eyebrow at the devastation supposedly wrought by "uraniated" rocket shells. Buildings and vegetation are said to be destroyed with a radius of half a mile from the point of explosion. [...]

[Despite the newspaper's mixture of condescension and cluelessness, this article said that an unnamed Swiss source reported that Germany was developing a completely new type of bomb that used fission reactions, uranium, and liquid oxygen ("liquid air"), that had a blast radius of at least half a mile, and that could be delivered by a rocket. According to an intelligence report to Joseph Stalin, a German bomb exactly matching that description was successfully tested in March 1945 (p. 4485).]

Hans Ulrich Rudel. 1958. *Stuka Pilot.* New York: Ballantine Books. Ch. 13.

In March 1944 our southern front is on the defensive, fiercely contesting the efforts of strong Russian forces to effect a decisive southward breakthrough so as to liquidate the whole German front in the South. [...]

At noon the General summons me to Odessa by telephone. [...]

For two days I bask in the sun on the terrace of the Berchtesgadener Hotel, inhaling the glorious mountain air of home. Now gradually I relax. Two days later I stand in the presence of the Führer in the magnificent Berghof. [...]

Now at last I am glad and happily look forward to seeing the pleasure in the faces of my comrades when they hear that I am back.We have tea together and chat for an hour or two. New technical weapons, the strategic situation, and history are the staple of our conversation. He specially explains to me the V weapons which have recently been tried out. For the present, he says, it would be a mistake to overestimate their effectiveness because the accuracy of these weapons is still very small, adding that this is not so important, as he is now hopeful of producing flying rockets which will be absolutely infallible. Later on we should not rely as at present on the normal high explosives, but on something quite different which will be so powerful that once we begin to use them they should end the war decisively. He tells me that their development is already well advanced and that their final completion may be expected very soon. For me this is entirely virgin ground, and I cannot yet imagine it. Later I learn that the explosive effect of these new rockets is supposed to be based on atomic energy.

The impression left after every visit to the Führer is enduring.

[Rudel was the most decorated German pilot of World War II and was closely connected to Hitler and his inner circle. *Stuka Pilot* is an English translation of Rudel's memoir *Trotzdem*, which he wrote soon after the war. Thus he would have been an excellent source of information.

According to Rudel, in March 1944 Hitler said that (1) atomic bombs were at a highly advanced stage of development and (2) the bombs were intended to be delivered via V-type rockets. Both points are consistent with many other sources in this appendix.]

C.S.D.I.C. (U.K.) S. R. Report S.R.G.G. 932. 3 July 1944. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-2 GERMANY: US Wartime Positive Int. (July–October 1944)]

M 179—Generalleutnant (GOC 10th Pz. Division) Captured TUNISIA 12 May 43
CS/23(N)—Konteradmiral (Commandant, Sea Defence NORMANDY) Captured CHERBOURG 26 Jun 44

CS/23: [...] The things they told us: within a radius of 6 km—I told him 3 km would do—not a bird would remain alive, not a leaf would be left on the trees—one hit on an airfield and it would be destroyed. [...] Well, it is quite possible—they are always drivelling here about an atom bomb. With an atom bomb I can destroy the whole world.

Otto Hofmann. 22 June 1944 letter. [Bundesarchiv (Berlin Lichterfelde), Collection NS 19 (Persönlicher Stab Reichsführer SS), 317]

Reichsführer-SS [Himmler] hat bei seiner heutigen Anwesenheit wiederholt seiner Auffassung Ausdruck gegeben, daß überall, wo es nur einigermaßen angängig ist, empfindliche Rüstungsbetriebe oder zumindest die empfindlichsten Teile der Rüstungsbetriebe unterirdisch und bombensicher unterzubringen sind. Er hat kein Verständnis dafür, wenn ihm Betriebsführer erklären, daß es im Augenblick ja doch schon zu spät sei, mit entsprechenden Bauten zu beginnen. Die Dauer des Krieges sei noch nicht abzusehen, außerdem dürfte das nicht der letzte Krieg sein und zukünftige Kriege werden sicherlich nicht mehr durch lange Erklärungen eröffnet, auch nicht durch Anflüge von Luftflotten, die einigermaßen rechtzeitig erkannt werden können. Er ist der Meinung, daß durch die Fortschritte der Technik urplötzlich Sprengkörper auftauchen, deren Wirkungen und deren Schnelligkeit unsere neuesten Sprengmittel der Vergeltungswaffe in den Schatten stellen. [...]

In his presence today, the Reichsführer-SS [Himmler] has repeatedly expressed his view that, wherever there is only a moderate risk, sensitive armament plants, or at least the most sensitive parts of them, must be accommodated underground and bomb-proof. He has no sympathy for the fact that plant managers tell him that it is already too late at the moment to start building such facilities. The duration of the war could not yet be foreseen, it would also not be the last war and future wars would certainly not be opened by long explanations, not even by approaches of air fleets which could be recognized in time. He is of the opinion that with the progress of technology, explosives are suddenly emerging whose speed and effect overshadow the newest explosives of the retaliatory weapon. [...]

[As shown on the next page, Albert Speer later quoted part of the above 22 June 1944 announcement by Himmler and explained that Himmler was specifically referring to the development of an atomic bomb.]

Heinrich Himmler's political rival, Albert Speer. [Speer 1981, pp. 150–152]

A few months earlier, Himmler had been hot on the trail of new explosives. On June 22, 1944, he had announced "that with the progress of technology, explosives are suddenly emerging whose speed and effect overshadow the newest explosives of our retaliatory weapons." In my ministry, we had long since come to realize than an atomic bomb (that was the only thing he could have meant) could not be produced before the winter of 1945...

Himmler was reticent in the area of atomic research. Nevertheless, he rebuked me for neglecting it, precisely because of the consequences of nuclear fission. Himmler's letter is not extant. But my reply shows that I was forced to defend myself. On September 23, 1944, "in order to prevent misunderstandings," I informed Himmler of the following: "There can be no doubt that research must go on even in wartime, and indeed very intensively... Ultimately, however, the main issue in research is that projects advantageous to the war effort should be given preference..."

Ohlendorf [one of Himmler's deputies] interfered to a huge extent with atomic research in a letter of January 25, 1945. He accused me of neglecting a discipline that had been labeled "Jewish physics" for many years, and he rebuked me for not paying the necessary attention to atomic research...

As a precaution, I had already written to Professor Gerlach on December 19, 1944: "Because of urgent tasks, I am unable to come into personal contact with you and your work. However, I place extraordinary value on research in the field of nuclear physics and I am following your work with great expectations..."

All these orders and arrogance on the part of the SS and especially Himmler reduced our capacity for research and development and created uncertainty about the command channels and areas of responsibility.

[Speer confirmed that:

- Heinrich Himmler was strongly interested in developing nuclear weapons.
- Interest in the German nuclear program intensified further in 1944 (the Allies invaded Normandy on 6 June 1944, and there was an attempted assassination of Hitler on 20 July 1944).
- There was political rivalry for the control and direction of the German nuclear program.

This information is consistent with a number of other accounts of the German nuclear program in this appendix.]

Discussion between Adolf Hitler and Romanian Prime Minister Ion Antonescu on 5 August 1944. Reported in: Andreas Hillgruber, ed. 1970. *Staatsmänner und Diplomaten bei Hitler: Vertrauliche Aufzeichnungen über Unterredungen mit Vertretern des Auslandes 1942-1944.* Vol. 2. Frankfurt am Main: Bernard & Graefe. pp. 482–484.

In diesem Zusammenhang machte der Führer noch technische Ausführungen über weitere neue Sprengstoffe, deren Entwicklung bis zum Experimentierstadium durchgeführt sei. Er habe den Eindruck, daß der Sprung von den jetzt gebräuchlichen Explosivstoffen bis zu diesen neuartigen Sprengmaterialien größer sei, als der vom Schwarzpulver bis zu den bei Kriegsbeginn gebräuchlichen Sprengmaterialien gewesen wäre.

Als der Marschall darauf erwiderte, dass er hoffe, die Zeit der Anwendung dieser neuen Explosivstoffe, die vielleicht das Ende der Welt herbeiführen würden, nicht mehr zu erleben, erwähnte der Führer die von einem deutschen Schriftsteller vorausgesehenen weiteren Entwicklungsstufen auf diesem Gebiet, die bis zu einem Punkt führen würden, wo die Materie als solche sich auflöse und dann allerdings Katastrophen von ungeahnter Größe herbeiführen würde.

Bei dieser Forschungstätigkeit müsse man zwei Richtungen unterscheiden: einmal die militärische Auswertung bereits vervollkommneter und voll durchentwickelter Waffen und andererseits die wissenschaftlich vorbereitete, experimentell allmählich erprobte und langsam bis zur fabrikatorischen Massenherstellung durchgeführte Entwicklung neuartiger Stoffe.

Ganz allgemein gelte bei der Einführung neuer Waffen der Grundsatz, dass man sie nur dann unverzüglich zur Anwendung bringen könne, wenn man der felsenfesten Überzeugung sei, dass sie mit einem Schlage den Krieg beenden würden. In der Mehrzahl der Fälle bestehe jedoch die Gefahr, dass der Gegner sich nach Ablauf von zehn bis zwölf Monaten der gleichen Stoffe bedienen würde, so dass man solche Stoffe erst praktisch anwenden könne, wenn man selbst vorher ein Abwehrmittel entwickelt habe. [...]

In this context the Führer gave technical explanations about further new explosives, whose development had been brought to the experimental stage. He had the impression that the leap from the currently used explosives to these new explosive materials was greater than that from black powder to the explosive materials used at the beginning of the war.

When the Marshal replied that he hoped not to live to experience the time of the utilization of these new explosives, which would perhaps lead to the end of the world, the Führer mentioned the further development stages foreseen by a German writer in this field would lead to a point where matter as such would dissolve, and then disasters of unimagined size would be produced.

In these research activities, one had to distinguish two directions: on one hand the military utilization of already perfected and fully developed weapons, and on the other hand, the scientifically prepared, experimentally gradually tested and slowly developed creation of novel substances.

In general, the introduction of new weapons is based on the principle that they can only be applied without delay if one is firmly convinced that they will end the war in one stroke. In the majority of cases, however, there is a danger that the opponent would use the same substances after ten to twelve months, so that such substances can only be applied in practice if a defensive agent has already been developed. [...]

Dabei sei V1 nur eine von 4 Waffen, die Deutschland einsetzen würde. Eine andere dieser Waffen habe z.B. eine so gewaltige Wirkung, dass in einem Umkreis von 3–4 km von der Einschlagstelle alles menschliche Leben vernichtet würde.	V1 is only one of four weapons that Germany would use. Another of these weapons has for example such a tremendous effect that all human life would be destroyed within a radius of three to four kilometers from the impact point.

[During the war, uranium was being very actively mined in Romania for the German nuclear weapons program (pp. 3449–3455). Thus Hitler was telling Antonescu about some of the results of that work, and also trying to persuade him to continue the Romanian alliance with Germany. Antonescu was overthrown by pro-Soviet Romanians in late August 1944; subsequently, Romanian uranium was sent to what became the postwar Soviet nuclear weapons program.]

Figure D.750: Ion Antonescu and Adolf Hitler together in Munich on 10 June 1941.

Summary of information from OSS report. 5 August 1944. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 GERMANY: Summary Reports (1945–1946)]

5 August 1944

Summary of Information

The Germans have succeeded in isolating a small quantity of powder involving atomic separation from the element "iran" [Uran, uranium]. To do so the process has used heavy water. The product is considered of such explosive energy that the Germans have not yet dared to conduct experiments with it. Before using the secret weapon, V-2, which is not the atomic powder they want to be sure that the American experiments have not reached the point where the British and Americans could respond with a destructive weapon so powerful as they believe can be evolved from these experiments.

(OSS report)

Summary of information. August 1944. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 GERMANY: Summary Reports (1945–1946)]

SUMMARY OF INFORMATION

August

Reports received during August indicate that the Germans are engaged in research on a new and extremely powerful explosive. The head of the German Marine Intelligence Station in Paris is reported to have said that they have a new explosive involving heavy water and uranium powder but that it is of such explosive energy that they have not yet dared to conduct actual experiments with it, nor have they dared to use it as a weapon before determining what progress the Americans and British have made on similar experiments. Other reports mention research on a secret and powerful explosive being carried on at an estate in Pomerania; also that a Swiss scientist, Dr. Walter Dallenbach and a German named Binch are collaborating at the Kaiser Wilhelm Institute in Berlin on a new explosive, a small quantity of which has a devastating effect. [...]

[See document photos on p. 4597. These two documents paraphrase an OSS report from July or very early August 1944. Where is that original OSS report?

The use of uranium and heavy water, as well as the mention of separation from uranium, all suggest that the "new and extremely powerful explosive" was plutonium-239. As of July/early August 1944, the Germans were very seriously contemplating testing a device using that new explosive but had not yet done so. Progress on that atomic bomb program was directly linked to progress on the rocket program, suggesting that rockets were intended to be the (or a) delivery vehicle for the atomic bomb. Germany was concerned that use of its atomic bomb could provoke an Allied response using similar (or other) weapons of mass destruction.]

William L. Shirer. 27 August 1944 CBS radio broadcast [Shirer 1947, p. 4].

Berlin is trying to frighten us with tall talk about an atomic bomb. Scientists do say that the explosive force released by splitting the atom is more deadly than any hitherto discovered. But a scientist who knows a great deal about the atom—Theodore Svedberg, a Swede and Nobel prize-winner for his work with atoms—said last week: "Talk about the atom bomb is so much hooey."

Philip Morrison to Robert R. Furman. 28 August 1944. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 GERMANY: Summary Reports (1945–1946)]

Several people, including Prof. James Franck, have approached me about yesterday's broadcast by Wm. L. Shirer. This broadcast asserted that the rumors of atomic bomb success were current in Germany and that the whole problem had been called impossible by Thé Svedberg. It seems worthwhile for us:

1) to find out whether Shirer has any new information on the currency of atomic bomb rumors in Germany and to trace his sources,

2) to see if Svedberg has any further information. I believe that our Swedish sources have already quote Svedberg to the same effect so that this may be simply a rehash. We know, however, that Svedberg is a centrifuge expert and that Germans went to see him in this capacity. He may possibly have some useful information.

To Maj Smith
Shirer may be checked or not as you see if Svedberg has been and is to be again. I'm taking this

Figure D.752: Philip Morrison to Robert R. Furman. 28 August 1944. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 GERMANY: Summary Reports (1945–1946)]

Bruno Spampanato. 1974. *Contromemoriale.* Rome: Centro Editoriale Nazionale. pp. 1115–1116.

Nel settembre del 1944 l'ambasciatore della R. S. a Berlino trasmetteva al sottosegretario agli Esteri, Mazzolini, un rapporto "segretissimo" circa le "armi nuove". L'ambasciatore aveva avuto le informazioni da un elemento sicuro: un italiano nato in Germania e da tempo investito di funzioni di responsabilità nel Consorzio Junker (costruzioni aeronautiche).

Questi furono i dati trasmessi dall'ambasciatore Anfuso:

a) "V-2".—Si tratta di un grosso proiettile avente un carico utile di dieci tonnellate. Questo proiettile viene lanciato verticalmente fino alla stratosfera nella quale può percorrere una distanza fino a settecento chilometri, andando poi a cadere sull'obbiettivo desiderato. L'esplosione di questo proiettile provoca la totale distruzione di fabbricati esistenti in un raggio di 1.500 metri.

b) "V-3".—Si tratta di un nuovo esplosivo molto potente, applicabile soprattutto per i proiettili della Contraerea; proiettili i quali, col solo spostamento d'aria, hanno il potere di distruggere gli aerei esistenti nel raggio di un chilometra.

c) "V-4".—Si tratta di un altro nuovo e speciale esplosivo il quale, venendo a contatto con l'aria, la dissocia nei suoi componenti, sottraendo poi l'ossigeno in essa contenuto.

"Trattandosi, come è evidente, di un mezzo di guerra chimica, i tedeschi dovrebbero prepararsi ad una reazione avversaria a mezzo di gas.

"Secondo le notizie pervenute, prima ad essere messa in azione, fra breve, sarebbe la "V-3", allo scopo di ridurre fortemente l'aviazione "alleata".

In September 1944 the R. S. ambassador in Berlin forwarded to the undersecretary for foreign affairs, Mazzolini, a "secret report" about the "new weapons." The ambassador had gotten the information from a sure element: an Italian born in Germany and long invested with responsible functions in the Junker Consortium (aircraft construction).

These were the data forwarded by Ambassador Anfuso:

a) "V-2".—This is a large projectile having a carrying capacity of ten tons. This projectile is launched vertically up to the stratosphere in which it can travel a distance of up to seven hundred kilometers, eventually falling on the desired target. The explosion of this projectile causes the total destruction of existing buildings within a radius of 1,500 meters.

b) "V-3".—This is a very powerful new explosive, applicable especially for antiaircraft projectiles; projectiles which, by the mere displacement of air, have the power to destroy existing aircraft within a one-kilometer radius.

c) "V-4".—This is another new and special explosive which, coming into contact with air, dissociates it into its components, then subtracting the oxygen it contains.

"Because it is, as is evident, a means of chemical warfare, the Germans should prepare for an adversary reaction by means of gas.

"According to the reports received, first to be put into action, shortly, would be the "V-3," for the purpose of greatly reducing the "allied air force."

“Subito dopo si darebbe inizio all’impiego della “V-4”, contro le truppe combattenti.

d)—Nei dintorni di Berlino sono stati osservati voli di apparecchi da caccia di nuovo tipo, a reazione, i quali salgono, a tempo di primato, a quote altissime e sono velocissimi”. [...]

In proposito, appena finita la il generale americano Lucius Clay, governatore militare “alleato” della Germania, dichiarò che era stato scoperto un laboratorio tra i monti della Baviera, presso Braunnenberg. Il generale rivelò che in quel laboratorio scienziati tedeschi avevano posto a punto i piani di costruzione di un proiettile razzo a reazione, noto come V-3, e che doveva essere impiegato contro Londra. La dichiarazione del generale Clay fu pubblicata anche in Italia nel giornale che il PWB pubblicava a Milano (“Giornale Lombardo”. 28-5-1945).

“Subsequently, the employment of the “V-4”, against the fighting troops, would begin soon afterwards.

“d)—Flights of fighter aircraft of a new type, jet-powered, have been observed in the vicinity of Berlin, which climb, in record time, to very high altitudes and are very fast.” [...]

In this regard, as soon as the American General Lucius Clay, the “allied” military governor of Germany, was finished, he declared that a laboratory had been discovered in the mountains of Bavaria, near Braunnenberg. The general revealed that in that laboratory German scientists had finalized plans for the construction of a jet rocket projectile, known as the V-3, and that it was to be employed against London. General Clay’s statement was also published in Italy in the newspaper that the PWB published in Milan (“Giornale Lombardo.” 28-5-1945). [...]

[Bruno Spampanato (1902–1960) was a journalist and politician who was a longtime supporter of Mussolini and very well connected with high-ranking Italian officials. After the war, he wrote a multivolume memoir that preserved information from a huge number of sources that otherwise might have been lost or forgotten.

Filippo Anfuso (1901–1963) served as a diplomat to various other countries for Mussolini’s government from the 1920s to 1945. He was the ambassador to Berlin 1943–1945 and would have been an excellent source of information.

The carrying capacity of the V-2 (A-4) was 10 tons total for propellant plus warhead. With wings (A-4b or A-9 configuration), it was expected to have a 700-km range. A blast radius of 1.5 km suggests that a nuclear warhead was planned, in agreement with numerous other sources (p. 5821).]

Division of Naval Intelligence. 15 June 1945. *German Technical Aid to Japan: A Survey.* ETO S(or N)-13960, 177647, p. 177. https://ww2aircraft.net/forum/threads/german-technical-aid-to-japan.20033/

ITEM: ATOM SMASHING

INTELLIGENCE: 1. In November 1944 PW heard from his Platoon Leader, a 1st Lt. Military Academy graduate, that some time during 1944 the Japs exchanged the blueprints of their V-12 diesel tank engine used in the Type 97 Med. Tanks (HAKE) for the formula of the German Atom Bomb. According to the officer, the bombs were match box size and had an effective radius of 1,000 meters. PW did not know if the bombs were being manufactured by the Japs, nor how they would be employed. They were not used in the Philippines.

2. The U-234 had uranium oxide aboard (destination Tokyo) at the time of its surrender. It is not known that this cargo was earmarked for research on the atom bomb, but its presence in quantity is of possible significance.

[The most scientifically consistent explanation is that "match box size" referred to the size of the fission pit or the quantity of fission fuel required for the bomb, and not the overall size of the complete bomb.]

PW Intelligence Bulletin No 1/49. 19 March 1945. [AFHRA A5185 frame 0841]

13. Radium and Liquid Air Torpedoes

PW was civilian technical expert on high tension electrical systems. He reported weekly at Base Construction Depot, 20 Goslerschestr, HILDESHEIM. He overheard a discussion, middle Jan, on the safest place to store radium and liquid air rocket propelled torpedoes. All the mine shafts in HILS GEBIRGE were required. The asphalt works at ESCHERHAUSEN was most often mentioned. It is known as GUSTAV ADOLPH STOLLEN (GSGS 4416/14/361710)

(Source: Martin BINDERNAGEL, arrested ÖRDINGEN? 5 March)

[See document photo on p. 552. The wording of this report is unclear yet intriguing. Were there two separate types of valuable items to be stored: a radium stockpile (e.g., for glow-in-the-dark paints on instrument dials) and liquid air torpedoes (weapons using liquid oxygen as oxidizer for part of the propellant or part of the explosive)? Or were these weapons that used both "radium" (likely not meaning actually radium, but rather a radioactive material more generally—perhaps enriched uranium) and liquid oxygen to help implode that radioactive material?]

Benito Mussolini. 16 December 1944 speech in Milan Opera House. Variously known as the "Discorso della Riscossa" ("Speech of Revenge" or "Counterattack Speech"), "Ultimo discorso di Mussolini" ("Last Speech of Mussolini"), or "Discorso di Milano al Teatro Lirico" ("Speech at the Milan Opera House").
http://www.mussolinibenito.net/lultimo-discorso-del-dvce-dal-teatro-lirico-di-milano/

Nel periodo di tale euforia venivano svalutate e dileggiate le nuove armi tedesche, impropriamente chiamate "segrete." Molti hanno creduto che grazie all'impiego di tali armi, a un certo punto, premendo un bottone, la guerra sarebbe finita di colpo. Questo miracolismo è ingenuo quando non sia doloso. Non si tratta di armi segrete, ma di "armi nuove," che, è lapalissiano il dirlo, sono segrete sino a quando non vengono impiegate in combattimento. Che tali armi esistano, lo sanno per amara constatazione gli inglesi; che le prime saranno seguite da altre, lo posso con cognizione di causa affermare che esse siano tali da ristabilire l'equilibrio e successivamente la ripresa della iniziativa in mani germaniche, è nel limite delle umane previsioni quasi sicuro e anche non lontano.

Niente di più comprensibile delle impazienze, dopo cinque anni di guerra, ma si tratta di ordigni nei quali scienza, tecnica, esperienza, addestramento di singoli e di reparti devono procedere di conserva. Certo è che la serie delle sorprese non è finita; e che migliaia di scienziati germanici lavorano giorno e notte per aumentare il potenziale bellico della Germania.

In the period of this euphoria, the new German weapons, incorrectly called "secret," were written down and ridiculed. Others believed that through the use of such weapons, at some point, by pressing a button, the war would end abruptly. This concept is naive or even shows bad faith. There are no secret weapons, but "new weapons," and it is obvious but has to be said, that they are secret until they have been used in combat for the first time. The bitter experiences of the English people have shown them that these weapons exist indeed, and I can affirm with full knowledge of the facts that the first types will be followed by others. That they will be able to reestablish the balance and then put the initiative back into German hands, is something as sure as it can be within the limits of human foresight, and is not far off in the future.

After five years of war it is easy to understand the impatience, but these are weapons in which science, technology, experience, training of individuals and departments must proceed in tandem. What is certain is that the succession of surprises is not over; and that thousands of German scientists are working day and night to increase the war potential of Germany.

Letter from J. Edgar Hoover to Harry Hopkins. 16 November 1944. Franklin Delano Roosevelt Library, Hyde Park, New York. Small Collections, Box 1, Folder 3, ATOMIC BOMB FILE.

A German espionage agent presently in the United States under the control of this Bureau advised that he was instructed to obtain, among other subjects, information concerning (1) the progress made by the United States since 1941 with respect to the development of atomic explosives, (2) whether "heavy water" is used instead of helium in their manufacture, (3) the type of container in which the atom of uranium is split, and (4) the probable reaction of the people of the United States if Germany used the explosive power obtained through the splitting of the uranium atom.

This information is being made available to you as possibly indicating the degree to which the Germans have progressed in the development of atomic explosives. There are two other recent developments of possible interest in this connection. The first of these is that the Germans have recently made numerous inquiries of other espionage agents controlled by this Bureau concerning the exact size, number of employees, and location of various armament plants in the United States. For example, the following inquiry was received from Germany by a double agent controlled by this Bureau:

> "OF GREAT INTEREST IS SIZE, FLOOR AREA, TOTAL EMPLOYEES OF BELL, BOEING, BREWSTER, BRIGGS, BUDD, CHRYSLER, CONSOLIDATED VULTEE, CURTISS WRIGHT AIRPLANE DIVISION, DOUGLAS, EASTERN, FISHER BODY, FORD, GOODYEAR, GRUMMAN, HIGGINS, HUDSON, KAISER FACTORIES. CONTINUATION FOLLOWS."

The continuation of the above message has not as yet been received.

The second recent development of interest is the receipt of an inquiry from the Germans through a controlled double agent channel indicating that the Germans are desirous of determining the extent of off-shore coastal protection on the Atlantic seaboard of the United States and particularly as to any areas where this protection may have been curtailed.

[The first four questions suggest that Germany had or expected to soon have an atomic bomb that it could use, and wanted to know how the United States would react and whether the United States could retaliate with an atomic bomb of its own.

The questions about armament plants suggest that Germany was compiling a large list of U.S. targets to bomb in the near future, which in turn implies that Germany had or expected to soon have methods of delivering an atomic bomb or a large amount of conventional bombs to those targets via long-range bombers, long-range rockets, or submarine-launched rockets.

The final questions seem to confirm German capability for submarine-launched rockets.]

Letter from J. Edgar Hoover to Harry Hopkins. 8 December 1944. [Franklin Delano Roosevelt Library, Hyde Park, New York. Official File 10b. Box 20. Folder OF 10-b, Justice Department, FBI Reports 1944–45. 2597–2618]

As of possible interest to the President and you, information has been received from a confidential source in South America, but not confirmed by investigation, to the effect that the German Government recently sent an emissary via Spain to Argentina. This emissary contacted the heads of various German firms in Argentina and advised them to "hold the line and make no changes," because Germany has not lost the war. This German emissary is alleged to have stated that the German Army will hold out until February, 1945, when a new secret weapon with a very long range will be used. This weapon fires a projectile which on explosion will destroy an area of forty square kilometers around the point of impact.

Information has also been received that a known German agent in Latin America has recently stated that he has information that Germany will soon utilize a new explosive which will kill everyone within an area of five miles. This German agent has advised other Germans that Germany will win the war due to the use of this new explosive.

[The very large expected areas of destruction described in Hoover's 8 December 1944 letter seem to indicate an explosive yield of at least several hundred kilotons, which would suggest that the weapon was some sort of fusion-boosted fission bomb or hydrogen bomb (Section D.9), instead of a much simpler and smaller fission bomb. It was described as being delivered by a rocket (projectile) with a very long range, even by the standards of the A-4 (V-2) rocket. That strongly suggests that the intended delivery vehicle was an intercontinental rocket such as the A-9/A-10, Silbervogel, V-101, or another large rocket (Appendix E).]

OSS Report No. B-624. 20 November 1944. Secret Weapons. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-3 GERMANY: US Wartime Positive Int. (Nov. 44–June 45)] [See document photos on p. 4607.]

GERMANY: MILITARY/AIR

Secret Weapons

The source, a highly placed and sober-minded neutral industrialist, reports the following conversation with a prominent German in mid-October 1944.

According to the testimony of this German, well-informed circles in Germany say that the employment of secret weapons V-2 and V-3 was set back as a result of the invasion of the Continent which came before the moment anticipated by the Germans. Still according to this German, the final development of the new weapons is supposed to have been interrupted by the invasion and at the time of the conversation this work had still not been completed. However, work and tests are being pushed very hard and the new arms are expected to come into play before mid-winter.

On the new arms themselves the sub-source gave the following details:

V-2 is supposed to be an anti-aircraft weapon containing an explosive so powerful that by its mere deflagration everything within a radius of one kilometer would be literally pulverized. (The sub-source used the term: “Destruction of atoms.”) The Germans pin great hopes on this new device; they hope that with the help of this arm they will be able to destroy or at least completely handicap all the Allied air forces in a short time.

The new weapon V-3 is said to be identical with V-2 with the sole difference that it is supposed to be destined for use against ground troops and that its power of destruction would cover a radius of about two kilometers. V-3 would be launched against hostile troops on a flat trajectory (en trajectoire tendus).

The German informant declared that Nazi leaders are said to be convinced that V-2 and V-3 will assure final victory for the Germans. He himself, however, seemed rather skeptical on this point, particularly because of the fact that in certain German technical circles it is known that the question of the production and use of these new devices is not in a very advanced stage and that trials have not yet given really positive results.

H. Prof. Hahn, Bln.-Dahlem

Der Durchschlag (gKdos.) ist nur für Sie persönlich bestimmt. Bei Verhandlungen mit örtlichen Stellen bitte ich, den Brief selbst nicht zu benutzen, aber darauf hinzuweisen, daß der Bevollmächtigte für Kernphysik sich bereits persönlich an Herrn Reichsleiter Bormann gewendet hat.

Bln.-Dahlem, den 16. Dez. 1944
Boltzmannstr. 20
Telefon: 76 32 44/45

Herrn
Reichsleiter Martin Bormann
Berlin
Wilhelmstr. 64

RFR 66/44 Ge/Gud.

Sehr geehrter Herr Reichsleiter!

Zur Sicherstellung des für die kriegswichtige Forschung unentbehrlichen Personals haben Sie am 3.9.1944 ein Fernschreiben an alle Herren Gauleiter gerichtet, nach welchem die Heranziehung der für die Aktion "Forschung" durch das Planungsamt des Reichsforschungsrates, Herrn Professor Osenberg, sichergestellte wissenschaftliche und technische Personal von jeder Heranziehung zu Sondereinsätzen zu befreien ist.

Es ist selbstverständlich, daß sich das gesamte männliche Personal der Forschungsinstitute für den Volkssturm gemeldet hat. Hier ist in den im Gau Württemberg-Hohenzollern verlagerten Forschungsinstituten (insbes. Hechingen, Haigerloch, Tailfingen) insofern eine Schwierigkeit aufgetreten, als die dort arbeitenden Herren zu einem grossen Teil in das 1. Aufgebot des Volkssturms eingereiht wurden. Da mit der Möglichkeit gerechnet werden muss, daß aus den genannten Gegenden Volkssturmabteilungen zu Einsätzen ausserhalb des Ortes herangezogen werden, ist zunächst durch persönliche Vereinbarung der Leiter der dortigen Versuchsstellen mit den örtlichen Parteistellen eine vorläufige Freistellung von dem Einsatz ausserhalb des Ortes zugestanden worden.

Eine Abziehung des an sich auch nur eines kleinen Teils auf das allernotwendigste beschränkten Personals ist gleichbedeutend mit Einstellung der dort laufenden Arbeiten. Diese Arbeiten gehören aber gerade zu den allerwichtigsten Forschungs- und Entwicklungsvorhaben meines Bereichs. Ich muss also dafür Sorge tragen, daß diese Arbeiten unter allen Umständen ungestört weiterlaufen. Es ist Ihnen zweifellos bekannt, daß es sich um Arbeiten handelt,

welche unerwarteterweise zu einer kriegsentscheidenden Wichtigkeit kommen können. Es ist Ihnen auch bekannt, daß in Amerika auf dem gleichen Gebiete die grössten Anstrengungen gemacht werden; ich habe aber die Überzeugung, daß wir z.Zt. noch sowohl forschungs- als auch entwicklungsmässig einen erheblichen Vorsprung gegenüber Amerika haben, obwohl wir mit einem an sich verschwindend geringen Prozentsatz der Kräfte arbeiten, die in Amerika eingesetzt sind.

Ich erlaube mir daher wegen der ausserordentlichen Dringlichkeit mich unmittelbar an Sie, sehr geehrter Herr Reichsleiter, zu wenden mit der Bitte, dem Herrn Gauleiter Murr in Stuttgart, der persönlich über unser Forschungsvorhaben unterrichtet ist und bei der Verlagerung uns alle Hilfe und Unterstützung schon gegeben hat, eine Mitteilung derart zukommen zu lassen, daß die Herren der verlagerten Kaiser Wilhelm-Institute und Arbeitsstellen des Bevollmächtigten für Kernphysik nur in solche Formationen des Volkssturms eingereiht werden dürfen, welche nicht für Sondereinsätze vorgesehen sind.

Ich habe an das Präsidium des Reichsforschungsrates und an Herrn Prof. Osenberg eine Abschrift dieses Briefes geschickt.

Heil Hitler!
Ihr sehr ergebener

(Prof. Dr. Walther Gerlach)

Eine Absichung des an sich auch nur eines kleinen Teils auf das allernotwendigste beschränkten Personals ist gleichbedeutend mit Einstellung der dort laufenden Arbeiten. Diese Arbeiten gehören aber gerade zu den allerwichtigsten Forschungs- und Entwicklungsvorhaben meines Bereichs. Ich muss also dafür Sorge tragen, daß diese Arbeiten unter allen Umständen ungestört weiterlaufen. Es ist Ihnen zweifellos bekannt, daß es sich um Arbeiten handelt, welche unerwarteterweise zu einer kriegsentscheidenden Wichtigkeit kommen können. Es ist Ihnen auch bekannt, daß in Amerika auf dem gleichen Gebiete die grössten Anstrengungen gemacht werden; ich habe aber die Überzeugung, daß wir z.Zt. noch sowohl forschungs- als auch entwicklungsmässig einen erheblichen Vorsprung gegenüber Amerika haben, obwohl wir mit einem an sich verschwindend geringen Prozentsatz der Kräfte arbeiten, die in Amerika eingesetzt sind.

Drafting even a small part of the [nuclear] staff, which is limited to the bare essentials, is tantamount to discontinuing the work being carried out there. However, this work is one of the most important research and development projects in my field. I must therefore ensure that this work continues undisturbed under all circumstances. You are undoubtedly aware that this is work which could unexpectedly turn out to be of decisive importance for the war effort. You are also aware that the greatest efforts are being made in America in the same field; but I am convinced that we still have a considerable lead over America in terms of both research and development, although we are working with a small percentage of the forces deployed in America.

H. K. Calvert to Robert Furman. 30 December 1944. Subject: C.S.D.I.C. (U.K.) G.R.G.G. 238. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.7003-3 GERMANY: US Wartime Positive Int. (Nov. 44–June 45)]

1. In the above report which was prepared on P/W information gathered between the dates 23–26 December 1944, the following statement is noticed:

> "In conversation with General EBERBACH, Generalleutnant HEIM said he thought the counter-attack was only justified if it was intended to win time for the further development of secret weapons and in particular the atom-bomb. There was otherwise no point in just winning time at this stage of the war."

2. This particular paragraph has been called to the attention of C.S.D.I.C. with the request that more information be obtained from Generalleutnant HEIM, if possible, concerning what he describes in his conversation as the "atom-bomb".

3. You will be advised of the result, if any, of our inquiry.

Günter Nagel. 2012a. *Wissenschaft für den Krieg: Die geheimen Arbeiten der Abteilung Forschung des Heereswaffenamtes.* Stuttgart: Franz Steiner. pp. 177, 445.

Bei den für die Uranversorgung zuständigen Stellen dachte man offenkundig über den Tag hinaus und ergriff Maßnahmen zur Erkundung neuer Uranerzvorkommen. Daran soll auch der Grazer Prof. Armin Dadieu mitgewirkt haben.[407]

407 [...] Zur angeblichen Beteiligung von Dadieu vgl. Jürgen Scheffran: *Die heimliche Raketenmacht*, in *Info-Dienst der Informationsstelle Wissenschaft und Frieden 9 (1991) Heft 1/2*, Dossier Nr. 8, 47–62, insb. 51, vgl. auch Anm. 1173.

1173 Hermann Ibler: *Nachruf auf Prof. Dr. Armin Dadieu*, in *Akademisches Leben, Juni 1978*, I–III[....]

The authorities responsible for uranium supply were obviously thinking beyond the day and took measures to explore new uranium ore deposits. Prof. Armin Dadieu from Graz is also said to have been involved in this.[407]

407 [...] On the alleged involvement of Dadieu, see Jürgen Scheffran: *Die heimliche Raketenmacht*, in *Info-Dienst der Informationsstelle Wissenschaft und Frieden 9 (1991) Heft 1/2*, Dossier No. 8, 47–62, esp. 51, see also note 1173.

Mark Wade. 2020. *Encyclopedia Astronautica.* http://www.astronautix.com/d/dadieu.html

Dadieu, Armin

German engineer, SS Officer, and wartime governor of Styria. Worked on German uranium processing in World War 2, and for Saenger post-war. By the 1970's on review committees for post-Apollo space programs in US and Europa III LV in Europe. Consultant to West German government on OTRAG.

Born: 1901-08-20. *Died*: 1978-04-06.

Dadieu was responsible in during World War II for uranium storage and handling research in Styria, Austria. After the war he became involved in rocketry and spaceflight, working with Eugen Saenger in the 1950's. By the 1970's he was on committees on Post-Apollo space programs in the United States and reviewing the potential Europa III launch vehicle. He later was a consultant to the West German government on the work of OTRAG.

Armin Dadieu was an Austrian chemist, a National Socialist politician, and high-ranking SS officer.

Armin Dadieu was born in 1901 in Brunn bei Maribor, the son of railway inspector Josef Dadieu and his wife Friederike Dadieu Pelkhofer. His primary and secondary schooling were in Maribor. The family was expelled from Slovenia in 1919 as part of the post-World War I drawing of borders and movement of people within what was the Austro-Hungarian Empire.

In the fall of 1919 he began chemistry at the Technical University in Graz. He was active in fraternities and the Alpine Association. He graduated in 1923 as an engineer and thereafter was a research assistant at the Technical University Graz. In 1926 he received his doctorate with a thesis on electromotive behavior of aluminum. From 1930 he moved to the University of Graz, where in March 1932 he became an associate professor of inorganic and physical chemistry. In 1935 he received the Lieben Prize (the "Austrian Nobel Prize") for his work in the field of Raman spectroscopy.

Dadieu was politically active, first from 1927 to 1930 in the Styrian Homeland Security. In 1932 he joined the NSDAP (Nazi Party). In 1936 he was "People Policy Advisor" for the Fatherland Front in Styria and worked secretly for the banned NSDAP. From 1937 he covertly made explosives for the party in his university laboratory, and carried out research and set up an intelligence service for Hermann Goering. After the German annexation of Austria in March 1938 Dadieu was named state governor and Gauhauptmanns for Styria. He had joined the SS in July 1936 and was appointed Standartenfuehrer. Until 1941 he was also the NSDAP Gau Economics Adviser in Gau Styria and Head of the Chamber of Commerce, Trade and Industry. From July 1940 to July 1941 Dadieu served as a Stuka pilot in World War II. In 1942 he was appointed Oberfuehrer, then from 1943-1945, Gaudozentenbundfuehrer in Styria.

In May 1945 Dadieu was arrested by soldiers of the Red Army, but was able to escape after a brief detention. On January 13, 1946, his name appeared on a list of war criminals in the Wiener Zeitung. In March 1948 he was arrested in Austria and again set free, after which he fled across the border into Italy and then to Argentina. He was adviser to the Peron government, especially on the subject of rocket propellants (Argentine Condor missile). Austria seized Dadieu's assets in 1950.

In 1958 Dadieu left Argentina and took up a position at the Institute of Jet Propulsion in Stuttgart. Since 1962 he headed the Institute of Rocket Propellants in Stuttgart, then from 1970 the Institute of Chemical rocket engines in Lampoldshausen. He was a member of the Committees on Post-Apollo Projects and the successor for the Europa III launcher. He worked for the OTRAG and as an expert for the German government. He retired to Graz.

[See also pp. 4613–4624, 5585–5587.

Just exactly what sort of nuclear-related work was done in or near Graz during the war?

Where are the records of wartime work and postwar interrogations and reports?]

Theodor Soucek. 2001. *Mein Richter, mein Henker.* Malmö, Sweden: Bright Rainbow.

[Soucek (1919–20??) was born in Graz, Austria and served throughout the war as an officer. After the war he returned to Austria and helped run one of the "ratlines" for people fleeing Austria and Germany; in that context he sheltered and became well acquainted with Armin Dadieu, a scientist and former senior official from Graz. Soucek's memoirs were written near the end of his life and mix what he had actually seen with what he had heard or believed, so one must be quite cautious in using them, but they contain several intriguing passages that align well with independent sources.]

[S. 55–59:] Irgendwann nahm neben mir ein vielleicht fünfunddreißig Jahre alter—sicher bis vor wenigen Wochen diensttuender—Offizier der Deutschen Wehrmacht Platz, seine Uniform war deutlich erkennbar, nur die Dienstrangabzeichen und Auszeichnungen fehlten. Schnell kamen wir ins Gespräch.

"Woher kommst du und wohin willst du?", fragte ich ihn, nachdem wir festgestellt hatten, beide aus Graz zu stammen.

"Ich muß nach Graz, wichtige Papiere holen!"

"Da kannst du nicht hin, die Russen sind da und du landest schnell irgendwo in Sibirien, in einem Gefangenenlager oder Bergwerk."

"Keine Sorge, ich reise als Berater von höchsten alliierten Oberkommandos mit US-Ausweisen nach Graz und werde von den Sowjet-Dienststellen sicheres, freies Geleit erhalten, weil ich Mitarbeiter eines Forschungsteams im Dienste der US-Regierung bin, mir passiert nichts beiden Russen, da gelten Gegenseitigkeitsabkommen."

"Das ist natürlich etwas anderes! Aber wie kommst du nach Graz?"

"Man stellt mir einen US-Dienstwagen und der fährt mich hin und zurück."

Er hatte schnell Vertrauen zu mir gewonnen, nachdem ich ihm von wichtigen Persönlichkeiten berichtete, die wir in Graz und Berlin kannten und ihm meine Vertrauensposition deutlich machte, die ich aus dem Stab des Generaloberst Ringel und im Aufbau der Alpenfestung innehatte.

[pp. 55–59:] At some point, a thirty-five year old—certainly a serving officer of the German Wehrmacht until a few weeks ago—took a seat next to me, his uniform was clearly recognizable, only the rank insignia and decorations were missing. We quickly struck up a conversation.

"Where are you from and where are you going?" I asked him, after we had established that we were both from Graz.

"I have to go to Graz to get important papers!"

"You can't go there, the Russians are there and you'll quickly end up somewhere in Siberia, in a prison camp or a mine."

"Don't worry, I'm traveling to Graz as an advisor to the highest Allied high command with U.S. ID and will be given safe, free passage by the Soviet authorities because I'm a member of a research team in the service of the U.S. government, nothing will happen to me with the Russians, reciprocity agreements apply."

"That's something else, of course! But how do you get to Graz?"

"They provide me with a U.S. service car and it drives me there and back."

He quickly gained his trust in me after I told him about important people we knew in Graz and Berlin and explained to him the position of trust I held on Colonel General Ringel's staff and in the construction of the Alpine fortress.

“Was war deine Funktion in den letzten Kriegsmonaten?”	“What was your function in the last months of the war?”
“Ich gehörte zu den Forschungsgruppen des Kaiser-Wilhelm-Instituts in Berlin und habe in den Alpen der Obersteiermark unterirdische Forschungsstellen betreut, in Gstatterboden. Dort waren im Berg Spezialbauten eingerichtet, die intensiv bis Kriegsende für die Raketentechnik unter Prof. Dadieu aus Graz arbeiteten.”	“I belonged to the research groups of the Kaiser Wilhelm Institute in Berlin and was in charge of underground research stations in the Alps of Upper Styria, in Gstatterboden. Special buildings were set up in the mountain there, which worked intensively on rocket technology under Prof. Dadieu from Graz until the end of the war.”
“Aber das werden die Russen doch alles besetzt und mitgenommen haben!”	“But the Russians will have occupied all that and taken it with them!”
“Ja und nein: ich habe Zugang zu Dokumenten und Einrichtungen, die sicher bis jetzt unentdeckt geblieben sind und hole Papiere und Berichte, von denen ich weiß, wo sie sind, um diese nach den USA zu bringen.”	“Yes and no: I have access to documents and facilities that have certainly remained undiscovered until now and I am retrieving papers and reports that I know where they are in order to bring them to the USA.”
Und dann erzählte er mir von einer erstaunlichen und geradezu sensationellen Mission, an der er vor wenigen Wochen teilgenommen hatte.	And then he told me about an amazing and almost sensational mission he had taken part in a few weeks ago.
In der Nähe von Magdeburg gab es ein deutsches Bergwerk in größerer Tiefe, in welchem sich geheime Forschungszentren der Reichsregierung befanden, speziell in Verbindung mit den Atomforschungsprojekten des 3. Reiches unter Leitung des Kaiser-Wilhelm-Institutes Berlin.	Near Magdeburg there was a German mine at a great depth in which secret research centers of the Reich government were located, especially in connection with the nuclear research projects of the Third Reich under the direction of the Kaiser Wilhelm Institute in Berlin.
In einem solchen unterirdischen Bau befand sich das einzige arbeitende Zyklotron der Welt, eine Beschleunigeranlage, die so leistungsfähig nirgends sonst entwickelt worden war. Als die amerikanischen Besatzungs-Sonderkommandos, die mit höchstem Auftrag und größter Dringlichkeit nach den Geheimwaffenentwicklungen des 3. Reiches suchten, von dieser Anlage erfuhren, wurde ein US-Sonderkommando aufgestellt, das den Berichten der deutschen Mitarbeiter folgend, die Aufgabe erhielt, dieses Zyklotron auszubauen und vor dem Zugriff der Sowjets zu retten bzw. es nach den USA zum Nutzen der dortigen Forschungsarbeiten zu verbringen.	The only working cyclotron [of its type] in the world, an accelerator facility that had not been developed anywhere else with such high performance, was located in such an underground building. When the American occupation special commandos, who were searching for the secret weapons developments of the Third Reich with the utmost mission and urgency, learned of this facility, a US special commando was set up, which, following the reports of the German employees, was given the task of exploiting this cyclotron and rescuing it from the Soviets or transferring it to the USA for the benefit of the research work there.

[Compare with similar reports on pp. 3761–3772, 4853, 4980–4981, 5050.]

“Wir wurden, zum Großteil deutsche Spezialisten und Sonderkommandotrupps, mit russischen Lastwagen, russischen Uniformen und russischen Ausweisen versehen, bei Nacht und Nebel in das Bergwerk geschickt mit dem Auftrag, dieses Zyklotron auszubauen zu verladen und in die Hände der US-beauftragten Spezialeinheiten zu bringen.”

“Und das gelang?”, fragte ich erstaunt.

“Perfekt, wir haben so gut wie unentdeckt, unerkannt und unbehindert diesen Überraschungsauftrag erfüllt, das Gerät ist schon in den USA.” [...]

Mein Gesprächspartner wurde aufgerufen und verabschiedete sich herzlich.

“Glückauf”, rief ich ihm zu, “mach ’s gut, vielleicht auf Wiedersehen später in Graz!”

Viel später, im Jahre 1966, kam mir ein Sonderbericht der “Presse”, Wien, in die Hände, daß große Bombengeschwader der USA in den letzten Kriegswochen nahe Magdeburg wichtigste Forschungszentren des 3. Reiches in mehrfachen Wellen bombardiert hatten, weil es sich um Atomforschungszentren Deutschlands handelte, die zerstört werden sollten, um diese nicht in die Hände der vorrückenden, vor den Amerikanern eintreffenden, Sowjettruppen fallen zu lassen.

So bestätigte sich der Bericht meines Gesprächspartners in Liezen und fand eine Teilerklärung, deren voller Umfang wohl bis heute in Geheimakten ruht bzw. bei Teilnehmern in verschlossenen Erinnerungen und Wissensvorgängen lebt, die wir nicht kennen.

[S. 71:] Die Gattin des weithin bekannten Rektors der Universität Graz, des führenden Wissenschaftlers Prof. Dr. Armin Dadieu, kommt sehr schnell zum Kernpunkt ihres Anliegens.

“We were sent, mostly German specialists and special commandos, equipped with Russian trucks, Russian uniforms and Russian ID cards, into the mine at night and in fog with the task of dismantling this cyclotron and loading it into the hands of the U.S. special forces.”

“And that was successful?” I asked in amazement.

“Perfect, we have fulfilled this surprise mission as good as undetected, unrecognized and unhindered, the device is already in the USA.” [...]

My interlocutor was called and said goodbye warmly.

“Good luck,” I called out to him, “take care, maybe we’ll see you again later in Graz!”

Much later, in 1966, I came across a special report in the Vienna “Press” that large U.S. bombing squadrons had bombed the most important research centers of the Third Reich in several waves near Magdeburg in the last weeks of the war, because these were nuclear research centers in Germany that were to be destroyed so that they would not fall into the hands of the advancing Soviet troops arriving before the Americans.

This confirmed the report of my interlocutor in Liezen and found a partial explanation, the full extent of which is probably still kept in secret files today or lives among participants in closed memories and knowledge processes that we do not know.

[p. 71:] The wife of the widely known rector of the University of Graz, the leading scientist Prof. Dr. Armin Dadieu, very quickly came to the heart of her request.

“Lieber Herr Soucek, bitte helfen Sie meinem Mann und retten Sie ihn! Es drohen ihm sowohl die Auslieferung an Tito als auch eine Anklage seitens der alliierten Besatzungsmächte, die ihn wegen seiner Funktion und seines Ranges als Gauhauptmann der Steiermark einkerkern wollen. Sie wissen ja auch sicher, daß er als Wissenschaftler seines Ranges den Sowjets eine begehrte Beute wäre. Mein Mann befand sich bei Kriegsende im Forschungszentrum Gstatterboden, wo er mit seinen Mitarbeitern die im Auftrag des Kaiser-Wilhelm-Institutes, Berlin, eingerichteten und vom Kriegsforschungsrat bzw. dem Verteidigungsministerium unter Minister Speer geführten unterirdischen und in die Berge verlagerten Einrichtungen kontrollierte. Seine Aufgabe war es, diese Forschungsarbeiten vordem Zugriff der Alliierten zu sichern und die Arbeitsgruppen vor einer Gefangenschaft durch die Sowjets zu bewahren.”

[S. 94–105:] Dadieu wurde zu einem Treffen nach Wien bzw. auf den Semmering eingeladen, um sich mit seinem früheren Chef des Kaiser-Wilhelm-Instituts, Prof. Peter Adolf Thiessen, zu treffen, einem der führenden Atomforscher des 3. Reiches, der in Berlin und ganz Deutschland die bedeutendsten Atomforschungsanlagen errichtet hatte, die verschiedensten Forschergruppen dirigierte, die an der deutschen Atombombe arbeiteten und unter anderem auch Dadieus geheime, unterirdische Forschungsstätten in Gstatterboden führte bzw. kontrollierte. [...]

Was wir in dieser Stunde noch nicht genau und im ganzen Umfang wußten, war, daß die Sowjets in den ersten Nachkriegsmonaten über 25.000 deutsche Spitzenkräfte der Geheimwaffenentwicklung zur Verteidigung mit glänzenden Vertragsbedingungen angelockt hatten, kontrollierten und dann in einer Nacht- und Nebelaktion als Gefangene nach Rußland gebracht hatten. So auch Männer wie Prof. Thiessen.

Dear Mr. Soucek, please help my husband and save him! He is threatened with extradition to Tito as well as prosecution by the Allied occupying powers, who want to imprison him because of his function and rank as Gauhauptmann of Styria. As I’m sure you know, as a scientist of his rank he would have been coveted prey for the Soviets. At the end of the war, my husband was at the Gstatterboden research center, where he and his staff controlled the underground facilities set up by the Kaiser Wilhelm Institute in Berlin and run by the War Research Council and the Ministry of Defense under Minister Speer and relocated to the mountains. His task was to secure this research work from the Allies and to protect the research groups from being captured by the Soviets.”

[pp. 94–105:] Dadieu was invited to a meeting in Vienna and on the Semmering to meet with his former head of the Kaiser Wilhelm Institute, Prof. Peter Adolf Thiessen, one of the leading atomic researchers of the Third Reich, who had built the most important atomic research facilities in Berlin and throughout Germany, directed the various research groups working on the German atomic bomb and also managed or controlled Dadieu’s secret, underground research facilities in Gstatterboden. [...]

What we did not know at that time was that in the first months after the war, the Soviets had lured more than 25,000 top German secret weapons developers for defense purposes with brilliant contract conditions, controlled them and then brought them to Russia as prisoners in a night and fog operation. This included men like Prof. Thiessen.

Während die Amerikaner die Spitzengruppen der Geheimwaffenentwicklungen unter Führung Wernher von Brauns, die Elite der Peenemünder Raketen- und Weltraumforscher, gefangen genommen und in die USA gebracht hatten, zusammen mit der modernsten und letzten Entwicklung an Raketenprojekten, Plänen, Modellen, Fabrikanlagen und Serienerzeugnissen von V-1 bis V-9, den serienreifen interkontinentalen Fernschußraketen, die auch Atomsprengköpfe nach den USA hätten fliegen können, also kriegsentscheidend waren, hatten sich die Russen neben den in ihren Zonen gefundenen Rüstungsprodukten, Einrichtungen und Spezialisten auch entscheidender Köpfe der Atomforschung bemächtigt, wie Prof. Thiessen, Manfred von Ardenne und Dr. Riehl, dem führendsten Mann der Welt zur Herstellung von reinem Uran, der Ausgangsbasis für den Bau von Atombomben.

While the Americans had captured the top groups of secret weapons developers under the leadership of Wernher von Braun, the elite of the Peenemünde rocket and space researchers, and brought them to the USA, together with the most modern and latest developments in rocket projects, plans, models, factory equipment and series products from V-1 to V-9, the production-ready intercontinental long-range missiles, which could also have flown nuclear warheads to the USA, i.e. were decisive for the war, the Russians had seized not only the armaments products, facilities and specialists found in their zones, but also key minds in nuclear research, such as Prof. Thiessen, Manfred von Ardenne and Dr. Riehl, the world's leading man in the production of pure uranium, the starting point for the construction of atomic bombs.

Dadieu gehörte selbst zu diesen Forschern und stand bis Kriegsende in laufendem Kontakt mit Prof. Thiessen, dem Kaiser-Wilhelm-Institut und dem Reichsforschungsrat Berlins unter Minister Speer bzw. Hermann Görings Führungsorganen.

Dadieu himself was one of these researchers and was in constant contact with Prof. Thiessen, the Kaiser Wilhelm Institute and the Reich Research Council in Berlin under Minister Speer and Hermann Göring's leadership until the end of the war.

Dadieu wollte wissen, wer der Überbringer war, und wie man sich diese Zusammenkunft in der Sowjetbesatzungszone gedacht hatte. Wir waren uns sofort darüber im Klaren, daß Dadieu von einem solchen Treffen in der Russenzone nie mehr frei zurückkehren würde, daß man ihn als wichtige Beute entführen und nach der Sowjetunion verbringen würde und er vermutlich schon bei diesem Treffen gar nicht mit Prof. Thiessen zu einem Gespräch käme, sondern dessen Name nur als Leimrute zum Einfangen des "Paradiesvogels Dadieu" diene. [...]

Dadieu wanted to know who the messenger was and how this meeting had been planned in the Soviet occupation zone. We were immediately aware that Dadieu would never return free from such a meeting in the Russian zone, that he would be kidnapped as important prey and taken to the Soviet Union and that he would probably not even have a conversation with Prof. Thiessen at this meeting, but that his name would only serve as bait to catch the "game bird Dadieu." [...]

“Hast du, Hans [Dadieu], in deinen Forschungs- und Geheimwaffenentwicklungen keine direkte Kenntnis davon gehabt, wieso die Ankündigungen von Dr. Goebbels in der Wochenzeitung “Das Reich” und in seinen Reden immer wieder darin gipfelten, daß der Sieg Deutschlands nahe und unaufhaltsam sei, daß die Entscheidung zu Gunsten des Deutschen Reiches im 2. Weltkrieg noch 1945 fallen würde?”

“Natürlich hatte ich als oftmaliger Besucher Berlins bei Thiessen und im Kaiser-Wilhelm-Institut laufende Kenntnis der allgemeinen Steigerung und Verbesserung unserer Waffentechnik, unserer neuen industriellen Ergebnisse, von der Panzerfaust bis V 2, von den Schnorchelbooten bis zu den Raketenjägern, aber die Geheimhaltung war so streng, für jeden Teilbereich so bedingungslos getrennt, daß ich selbst an der Spitze bestimmter Projektarbeiten keinen Entwicklungsstand in der Atombombenforschung oder im Fernraketenbau kannte. Jeder von uns war auf seine Zielsetzungen verschworen, aber nur Thiessen, Minister Speer und das Führerhauptquartier wußten in den letzten Kriegsmonaten Einzelheiten der Schwerpunktentwicklungen, verfügten über die Resultate und trafen die Entscheidungen.”

“Aber du hast doch wie ich die im Herbst 1944 erfolgten Hinweise aus der Feder und dem Munde von Dr. Goebbels gekannt:

“Dankdem Geist der deutschen Wissenschaftler sind wir nicht mehr weit von dem Zeitpunkt entfernt, daß wir einen Teil der Erde in die Luft sprengen könnten.”

Wie er wörtlich 1944 im “Reich” schrieb, deutlich auf die Atomkraft anspielend, die dank Hahn 1939 durch die Entdeckung der Atomspaltung Deutschland allein zugänglich war, derübrigen Welt weit voraus.”

Dadieu erwiderte:

“Did you, Hans [Dadieu], in your research and secret weapons developments, have no direct knowledge of why the announcements of Dr. Goebbels in the weekly newspaper “Das Reich” and in his speeches repeatedly culminated in the fact that the victory of Germany was near and unstoppable, that the decision in favor of the German Reich in the Second World War would still fall in 1945?”

“Of course, as a frequent visitor to Berlin for Thiessen and the Kaiser Wilhelm Institute, I had ongoing knowledge of the general increase and improvement of our weapons technology, our new industrial results, from the Panzerfaust to V 2, from the snorkel boats to the rocket fighters, but the secrecy was so strict, so unconditionally separated for each sub-area, that even at the top of certain project work I knew no development status in atomic bomb research or in long-range rocket construction. Each of us was conspiring to achieve our goals, but only Thiessen, Minister Speer, and the Führer’s headquarters knew the details of the main developments in the final months of the war, had the results at their disposal and made the decisions.”

“But you, like me, were aware of the information that came from the pen and mouth of Dr. Goebbels in the autumn of 1944:

“Thanks to the spirit of the German scientists, we are not far from the time when we could blow up part of the earth.”

As he literally wrote in 1944 in “Reich,” clearly alluding to atomic power, which, thanks to Hahn’s discovery of atomic fission in 1939, was available to Germany alone, far ahead of the rest of the world.”

Dadieu replied:

“Natürlich wußten wir, daß die verschiedensten Forschergruppen unter strengster Geheimhaltung, voneinander unabhängig, an zukunftsweisenden Systemen arbeiteten. Aber alle diese Arbeiten unterlagen dem strengen Führerbefehl, daß jeder Geheimnisträger nur soviel über seinen Aufgabenbereich wissen durfte, wie dieser zur unmittelbaren Aufgabenerfüllung im Rahmen seines Wirkungsbereiches an Kenntnissen benötigte.

Nachdem ich als Mitarbeiter des Reichsforschungsrates unter dem Präsidenten des Kaiser-Wilhelm-Institutes Berlin, Prof. Dr. Adolf Thiessen, für feste Raketentreibstoffe zuständig war, wußte ich, daß in Peenemünde Dr. Walter Thiel für die Raketenantriebssysteme führend arbeitete.”

Dr. Thiel studierte bereits die Möglichkeit, als Raketenantrieb Atomenergie zu nutzen. Aber als, infolge von Verrat, im August 1944 durch eine Welle von Fliegerangriffen in der Wohnsiedlung des Raketenforschungszentrums Peenemünde auf Usedom über siebenhundert Forscher mit ihren Familienangehörigen getötet wurden, starb auch Dr. Thiel mit Frau und Kindern. Mit ihm wurden alle seine Arbeitsergebnisse vernichtet und blieben auch für die alliierten Sieger verloren.

Welchen hohen, überlegenen Stand unsere Geheimwaffenforschung einschließlich der Arbeiten an deutschen Atomwaffen erreicht hat, wissen heute in letzten Einzelheiten nur die USA und die Sowjetunion, die sich der deutschen Spitzenleistungen als Siegesbeute bemächtigten. [...]

Der Anteil der deutschen Atomforschungsergebnisse an der Atombewaffnung Amerikas bleibt ebenso ein Geheimnis in den Archiven der USA, wie die Ergebnisse deutscher Vorleistungen in den Händen der Sowjetunion, die deutsche Spitzenforscher wie Prof. Thiessen und Manfred von Ardenne mit vielen anderen Spezialisten gefangen nahm und für sich arbeiten ließ.

Of course, we knew that the most diverse research groups were working on forward-looking systems in the strictest secrecy, independently of each other. But all this work was subject to the Führer’s strict order that every person working in secrecy was only allowed to know as much about his area of responsibility as he needed to know in order to directly fulfill his tasks within his area of responsibility.

Having been responsible for solid rocket propellants as an employee of the Reich Research Council under the President of the Kaiser Wilhelm Institute in Berlin, Prof. Dr. Adolf Thiessen, I knew that Dr. Walter Thiel was working in Peenemünde as a leader in rocket propulsion systems.”

Dr. Thiel was already studying the possibility of using atomic energy for rocket propulsion. But when, as a result of betrayal, over seven hundred researchers and their families were killed in a wave of air raids on the housing estate of the Peenemünde rocket research center on Usedom in August 1944, Dr. Thiel and his wife and children also died. All the results of his work were destroyed with him and remained lost to the Allied victors.

Today, only the USA and the Soviet Union know the final details of the high, superior level of our secret weapons research, including the work on German nuclear weapons, which seized Germany’s top achievements as spoils of victory. [...]

The share of German nuclear research results in America’s nuclear armament remains just as much a secret in the archives of the USA as the results of German preliminary work in the hands of the Soviet Union, which captured top German researchers such as Prof. Thiessen and Manfred von Ardenne along with many other specialists and made them work for itself.

In diesem Zusammenhang erzählte ich Dadieu von einer außerordentlichen Begegnung mit einem hochrangigen ungarischen General, als ich mich—noch verwundet—im gleichen Zugabteil auf der Bahnfahrt von Berlin nach Wien Mitte Januar 1945 befand.

Am Vortag meiner Rückreise aus Berlin, wo ich mich auf Grund eines Sonderauftrages zur Entgegennahme neuer Einsatzbefehle befand, besuchte ich den Leiter der Privatkanzlei Adolf Hitlers, Herrn von Blankenburg, mit dem ich seit 1938 befreundet war. Von Blankenburg nahm mich zu einer Lagebesprechung zu Reichsminister Dr. J. Goebbels mit, in der dieser den geladenen Sondergästen aus höchsten deutschen und europäischen Führungs- und Regierungspositionen unter faszinierenden Erklärungen in seiner bekannten mitreißenden rednerischen Kraft wörtlich erklärte:

“Die Aufgabe der deutschen Wehrmacht in Erfüllung der Verteidigung des Deutschen Reiches besteht darin, die Feinde Deutschlands noch sechs Monate vom Reichskern fernzuhalten, denn dann wird dank der Entwicklung unserer modernen, neuen Geheimwaffen dieser Weltkrieg in 24 Stunden also am selben Tag, mit dem Sieg Deutschlands und seiner Verbündeten beendet sein.”

Noch stärkstens beeindruckt von den am Vortag erlebten Erklärungen des Propagandaministers Dr. Goebbels betrat ich mein Zugabteil zur Rückreise nach Wien und weiter in mein Lazarett, wo ich mich zur endgültigen Ausheilung meiner Verwundungen befand.

Mir gegenüber hatte ein älterer, weißhaariger Herr Platz genommen, der sich mir im Laufe der Reise nach vertraulichem und angeregtestem Gespräch als hochrangiger ungarischer General vorstellte.

Nach mehr als einer Stunde Bahnfahrt wandte sich der General überraschend und vertraulich zu mir:

In this context, I told Dadieu about an extraordinary encounter with a high-ranking Hungarian general when I was—still wounded—in the same train compartment on the train ride from Berlin to Vienna in mid-January 1945.

On the day before my return from Berlin, where I was on a special assignment to receive new deployment orders, I visited the head of Adolf Hitler’s private chancellery, Mr. von Blankenburg, with whom I had been friends since 1938. Von Blankenburg took me to a briefing with Reich Minister Dr. J. Goebbels, in which he literally explained to the invited special guests from the highest German and European leadership and government positions with fascinating explanations and his well-known rousing oratory power:

“The task of the German Wehrmacht in fulfilling the defense of the German Reich is to keep Germany’s enemies away from the Reich core for another six months, because then, thanks to the development of our modern, new secret weapons, this world war will be over in 24 hours, i.e. on the same day, with the victory of Germany and its allies.”

Still highly impressed by the statements made the day before by the Minister of Propaganda, Dr. Goebbels, I entered my train compartment for the return journey to Vienna and on to my military hospital, where I was in the process of finally healing my wounds.

An elderly, white-haired gentleman had taken a seat opposite me, who introduced himself to me as a high-ranking Hungarian general during the course of the journey after a confidential and animated conversation.

After more than an hour’s train ride, the general turned to me surprisingly and confidentially:

[Cf. pp. 4549–4550, 4587, 4627–4665, 4679–4681, 4766, 5038, 5218, 5380, 5454–5466, 5658–5659.]

“Schauen Sie, lieber junger Freund, Sie sind für mich ein frontbewährter Offizier und offenbar bedingungslos Ihrer Nation und der Verteidigung Europas verschworen, dazu noch Schriftsteller von höchstem Verantwortungsbewußtsein zur Rettung vor dem Kommunismus. So kann ich Ihnen von meinem Besuch als Vertreter der ungarischen Regierung in Berlin erzählen, weil man uns mit anderen verbündeten Regierungsvertretern der Achsenmächte in den letzten Tagen die jüngsten Entwicklungen der deutschen Geheimwaffen vorführte.

Wir wurden an der Ostsee in ein Sperrgebiet der Wehrmacht geflogen und es geschah folgendes: Als Zielgebiet zeigte man uns eine vielleicht 20–25 km entfernte kleine Insel und beschoß diese mit einer neuartigen Bombe, aus einem Flugzeug abgeworfen. Diese Bombe wirkte so beispiellos, daß von der Insel nichts mehr zu sehen war, sie war im Wasser verschwunden![4]

Mit dieser neuen Waffe werden Sie den Krieg gewinnen, Deutschlands Sieg ist nicht mehr aufzuhalten. Ich gratuliere Ihnen!”

Das waren seine Worte. Der General betonte:

“Weitere Einzelheiten möchte ich Ihnen nicht berichten, weil wir zur Geheimhaltung aus ganz natürlichen Gründen von Seiten Ihrer Regierung veranlaßt wurden, aber diese Gewißheit wollte ich Ihnen mitgeben, weil Sie ein so überzeugender Repräsentant des jungen Deutschland für mich waren.”

4 [...] Der “Schwedische Beobachter” bericht vom Verschwinden einer Insel nach Beschuß durch eine deutsche Sonderwaffe.

“Look, dear young friend, you are for me a front-line officer and obviously unconditionally sworn to your nation and the defense of Europe, in addition to being a writer of the highest sense of responsibility to save us from communism. So I can tell you about my visit to Berlin as a representative of the Hungarian government, because in the last few days we were shown the latest developments in German secret weapons together with other allied government representatives of the Axis powers.

We were flown to a Wehrmacht restricted area on the Baltic Sea and the following happened: We were shown a small island perhaps 20–25 km away as a target area and bombarded it with a new type of bomb, dropped from an airplane. This bomb had such an unprecedented effect that nothing could be seen of the island, it had disappeared into the water![4]

With this new weapon you will win the war, Germany’s victory can no longer be stopped. I congratulate you!”

Those were his words. The general emphasized:

“I don’t want to tell you any more details because we were induced to secrecy for quite natural reasons on the part of your government, but I wanted to give you this certainty because you were such a convincing representative of young Germany for me.”

4 [...] The “Swedish Observer” reports on the disappearance of an island after bombing by a German special weapon.

[Compare with similar reports in Sections D.10–D.11.]

Theodor Soucek. 4 May 2001 filmed interview with Heiko Petermann [Karlsch 2005, p. 203]. [Joseph Goebbels speaking with German military officers on 6–7 January 1945:]

Meine Herren, es kommt darauf an, dass die deutsche Wehrmacht den Feind vom Reichskern sechs Monate fern hält, dann wird die neueste Waffe, über die wir verfügen, zum Einsatz kommen, und in 24 Stunden wird dieser Krieg mit dem Sieg Deutschlands entschieden sein.

Gentlemen, it is important that the German Wehrmacht keeps the enemy away from the central Reich for six months, then the newest weapon we have will be used, and in 24 hours this war will be decided with the victory of Germany.

Maximilian Brunner. 2017. *Armin Dadieu: Versuch der Biographie eines Nationalsozialisten.* Thesis, University of Graz.
https://unipub.uni-graz.at/obvugrhs/download/pdf/1703351

[From the sources cited in this thesis, during the war Armin Dadieu was a senior administrator for at least two secretive research institutes (at Hörgas and Gstatterboden); he may have been involved with other secret research facilities as well (see p. 4624). These sources indicate that Dadieu was not merely connected with nuclear research or uranium mining, but that he was part of the German atomic bomb program. In his unpublished manuscript, Dadieu appeared to claim that by the end of the war in Europe, he knew that a horrifically powerful bomb—the German atomic bomb—had been successfully developed but that officials wisely refrained from using it. The curious mention of research on military applications of "artificial thunderstorms" may have been some nonscientific person's attempt after the fact to describe real scientific work that had been conducted during the war on particle accelerators, perhaps for electronuclear breeding or for directed energy weapons.]

[S. 35:] In den letzten Zeilen seiner Memoiren berichtet Dadieu von einer von abziehenden Wehrmachtseinheiten blockierten Straße bei Frohnleiten, dass er deswegen eine Nacht in Hörgas, wo er ebenfalls ein Institut leitete, verbringen musste und dass er am nächsten Morgen, als "die Russen bereits da" waren, seine Flucht zu Fuß weiter setzte. Obwohl er sich schon in amerikanischen Gebiet wägte, wurde Dadieu von russischen Truppen aufgespürt und verhaftet.[140] Mit dieser Episode beendet er seine autobiographischen Aufzeichnungen:

Nach einer Füsilierungsszene, an der alles dran war, haben sie mich abtransportiert, um mich in Trieben zu der dort stationierten russischen Division mit Dolmetschern zu bringen. Zusammen mit zirka fünfzig Leuten habe ich in Strechau eine sehr unangenehme Nacht verbracht. Am Morgen auf dem Weg zwischen Strechau und Trieben, an einer Stelle, wo der Wald ganz nahe an die Bundesstraße herankommt, habe ich ein 'Halt' provoziert und bin in einem unbewachten Augenblick in den Wald gesprungen und damit den Russen nach 22stündiger Haft entkommen. Damit war diese Geschichte für mich vorbei.[141]

[140–141:] DADIEU, Aus meinen Aufzeichnungen. 1978, p. 341.

[p. 35:] In the last lines of his memoirs, Dadieu tells of a road near Frohnleiten that was blocked by retreating Wehrmacht units, that he had to spend a night in Hörgas, where he also ran an institute, and that the next morning, when "the Russians were already there," he continued his escape on foot. Although he was already in American territory, Dadieu was tracked down and arrested by Russian troops.[140] He ends his autobiographical notes with this episode:

After a fusilization scene where everything was up, they took me away to bring me to the Russian division stationed there in Trieben with interpreters. Together with about fifty people, I spent a very unpleasant night in Strechau. In the morning, on the road between Strechau and Trieben, at a point where the forest came very close to the main road, I provoked a 'halt' and jumped into the forest at an unguarded moment, thus escaping from the Russians after 22 hours of detention. That was the end of the story for me.[141]

[140–141:] DADIEU, From My Notes. 1978, p. 341.

[S. 111:] Einen eindeutigen thematischen Bruch liefert das zwölfte und letzte Kapitel des Manuskriptes: Hier geht Dadieu nicht mehr per se auf dessen persönliche Kriegserfahrungen und Fronterlebnisse ein, sondern berichtet über die Schrecken der ‘neuen Waffe’, “welche die innersten Kräfte der Materie entfesselt und so ein Ausmaß der Vernichtung erreichen läßt, das jeden Widerstand zerstört”. Diese eben erst entwickelte Bombe gleiche seinem Wortlaut nach “vielmehr den Mitteln, die man verwendet um schädliche Insekten samt ihrer Brut bis in die letzten Winkel zu vertilgen”. “Der rechte Mann jedoch wird immer eine Waffe wählen die viel von ihm verlangt und welche auch dem Gegner Chancen gibt”, führt Dadieu diesen Absatz weiter aus und kommt wieder auf seine Fliegertruppe sowie auf die speziellen Attribute, die man als Pilot beziehungsweise als Bordschütze mitbringen müsse, zu sprechen, ehe seine Aufzeichnungen ganz enden.[454]

[454] Private Kriegsaufzeichnungen Armin Dadieu, Kapitel 12, p. 31, Privatsammlung Renate Moszkowicz.

[S. 134:] Abseits dieser zitierten Textauszüge versucht sich der Journalist im Zuge der Aufarbeitung verschiedener Geschehnisse immer wieder an einer Charakterisierung Dadieus, beziehungsweise, an einer Erläuterung seiner Taten und seines Wirkens. So wird einerseits berichtet, Dadieu habe in Gstatterboden an der deutschen Atombombe sowie auch an der Entwicklung künstlicher Gewitter als Kriegswaffen geforscht, andererseits wiederum wird er als ‘gemäßigter’ Nationalsozialist bezeichnet, der durch seine Haltung vor dem ‘Anschluss’, aber auch danach, auf einer Femeliste des radikalen Flügels der Partei stand.[543] Es wird sogar erwähnt, Dadieu habe gemeinsam mit Seyss-Inquart noch in den letzten Stunden der ‘Volkserhebung’ versucht, den Einmarsch der Deutschen Wehrmacht zu verhindern, um Österreich eine gewisse Eigenständigkeit zu bewahren.

[543] Vgl.: DICHAND, GRAZ. 8.1.1988, p. 21 (Teil 3).

[p. 111:] The twelfth and final chapter of the manuscript provides a clear thematic break: Here Dadieu no longer deals per se with his personal war experiences and experiences on the front, but reports on the horrors of the ‘new weapon,’ “which unleashes the innermost forces of matter and thus allows an extent of destruction to be achieved that destroys all resistance.” According to his wording, this newly developed bomb is “much more like the means used to exterminate harmful insects and their brood down to the last corner.” “The upright man, however, will always choose a weapon that demands a lot from him and which also gives the enemy a chance,” Dadieu continues this paragraph and returns to his air force and the special attributes that one must have as a pilot or gunner before his notes come to an end.[454]

[454] Private war records of Armin Dadieu, Chapter 12, p. 31, Private Collection Renate Moszkowicz.

[p. 134:] Apart from these quoted text excerpts, the journalist repeatedly attempts to characterize Dadieu and explain his deeds and his work in the course of coming to terms with various events. On the one hand, Dadieu is reported to have researched the German atomic bomb in Gstatterboden as well as the development of artificial thunderstorms as weapons of war; on the other hand, he is described as a ’moderate’ National Socialist who, due to his attitude before and after the Anschluss, was on a femelist of the radical wing of the party.[543] It is even mentioned that Dadieu, together with Seyss-Inquart, tried to prevent the invasion of the German Wehrmacht in the final hours of the ’national uprising’ in order to preserve a certain degree of independence for Austria.

Letter from J. Edgar Hoover to Harry Hopkins. 9 February 1945. Franklin Delano Roosevelt Library, Hyde Park, New York. Small Collections, Box 1, Folder 3, ATOMIC BOMB FILE. https://blog.nuclearsecrecy.com/wp-content/uploads/2013/09/1945-Hoover-to-Hopkins-German-spies.pdf

As you are well aware, the Army for the past two years has been vitally interested in a highly secret project for the development of an atomic explosive. This explosive, as you know, involves the release of energy through the shattering of atoms of heavy elements.

During the period that the Army has been engaged in the supervision of this experimentation, numerous efforts have been made by the Soviets to obtain the highly secret information concerning the experimentation and this Bureau has been actively following such Soviet efforts.

The German Government has also been interested in the same type of experimentation in Germany and has attempted to get information regarding the atomic experimentation in the United States.

Recently, in connection with the operation of a radio station by a German agent under control of the Federal Bureau of Investigation but which station the Germans believe to be a free station, an inquiry was received from Germany containing the following questions regarding the status of atomic explosive experimentation in the United States:

> First, where is heavy water being produced? In what quantities? What method? Who are users?
>
> Second, in what Laboratories is work being carried on with large quantities of uranium? Did accidents happen there? What does the protection against Neutronic Rays consist of in these Laboratories? What is the material and the strength of coating?
>
> Third, is anything known concerning the production of bodies or molecules out of metallic uranium rods, tubes, plates? Are these bodies provided with coverings for protection? Of what do these coverings consist?

We have already advised the appropriate authorities in the War Department concerning these German inquiries.

I thought the foregoing would be of considerable interest to the President.

[The Germans sounded very concerned about criticality accidents with large quantities of unshielded uranium housed in the same laboratory. That is generally only a problem with highly enriched uranium, and suggests that the Germans may have had large quantities of highly enriched uranium and may have already had a criticality accident. See p. 4626 for a report of what sounds like a criticality accident.]

PW Intelligence Bulletin 1/47, 13 March 1945 [NARA RG 165, Entry NM84-79, Box 1915]. See document photo with diagram on p. 2622.

17. Uranium Explosive

O/Lt GOTT, a chemist, OC coy in PW's bn (959 Gren Regt) had been granted indefinite leave to resume his former position as director of a chemical laboratory in S Germany. This laboratory was experimenting with uranium. It produced 1/10 milligram of an explosive which, when accidentally set off, destroyed the plant and killed the scientists engaged in the experiments. O/Lt GOTT maintained that if subsequent experiments and production have proceeded without accident, enough of the explosive should now (Feb 45) be available to "destroy England in one blow".

(Source: Lt Helmut SCHWOTZER 959 Gren Regt captured 25 Feb vic WELLDORF)

[This is a description of a laboratory somewhere in southern Germany that was enriching uranium—producing and accumulating enough uranium (235) for novel highly explosive weapons to attack the United Kingdom (and perhaps other Allied targets).

The laboratory had what sounds like a criticality accident. The interpretation of the PW's remarks that seems to make the most scientific sense is that the accident released an energy equivalent to 1/10 milligram of mass converted to energy. Using $E = mc^2$ and converting to the equivalent energy of tons of TNT, 1/10 milligram of mass would correspond to $(10^{-7}\text{ kg})(3 \cdot 10^8\text{ m/s})^2/(4.184 \cdot 10^9\text{ J/ton TNT}) = 2$ tons of TNT. That would certainly be enough explosive energy to destroy a laboratory, and that explosive energy plus the accompanying radiation would kill any personnel at the site.]

See p. 4625 for German concern about criticality accidents. Since the German nuclear weapons program was so highly compartmentalized and secretive, personnel who were producing and accumulating enriched uranium may not have been informed about the risk of criticality accidents and about safety precautions necessary to prevent them.

Wilhelm Haus, letter from the Wetzlar Court Prison to the Chairman of the 1st Criminal Chamber of the District Court in Limburg on 20 June 1947. Hessian Hauptstaatsarchiv Wiesbaden, section 463, number 920, pp. 109–112. [Porezag 1996, p. 46]

Etwa Anfang Februar 1945 erzählte mir der damalige Wehrkreisbeauftragte, Ingenieur Marsch aus Gießen, im Beisein meines damaligen ständigen Kreiswirtschaftsberaters, Dr. Hans Hensoldt, in meinem Dienstzimmer von neuen Waffen und dem 'Schweren Wasser', welche bald eingesetzt werden sollten und kriegsentscheidend wären.

Ebenfalls im Februar 1945 besuchte mich der Oberingenieur Coenders von den Röchling-Werken im Buro. Er erzählte mir von neuen Waffen, die aber nicht vor April eingesetzt werden könnten. Herr Coenders war öfters beim Führer gewesen und hatte den ersten Fritz-Todt-Preis erhalten, so daß ich des Glaubens sein konnte: Der Mann weiß sehr viel. Auch er sprach vom Sieg.

Am 26. März 1945 abends erschien auf meiner Dienststelle der damalige Gauamtsleiter von Koblenz, Andreas Bang. Er zeigte mir ein Flugblatt, welches über dem Westerwald und dem Siegerland abgeworfen wurde. Dieses Flugblatt vom Oberkommando der Deutschen Wehrmacht forderte die Bevölkerung auf, eine Zone von 50 km vom Rhein zu räumen, da mit dem 1. April neue, kriegsentscheidende Waffen eingesetzt würden, die den deutschen Sieg verbürgten. Ein gleiches Flugblatt wurde mir am 28.3.45 in Frankenberg/Eder gezeigt.

Hätte ich eine deutsche Niederlage vor Augen gehabt, hätte ich den Befehl zur Vollstreckung des Standgerichtsurteils wohl nicht befolgt, denn bei einer Niederlage hätte ich keine Folgen wegen Nichtbeachtung eines gegebenen Befehls zu fürchten brauchen.

Around the beginning of February 1945, in my office in the presence of my former ever-present economic council adviser, Dr. Hans Hensoldt, the then Military District Supervisor, Engineer Marsch from Giessen, told me about new weapons and 'heavy water' that were supposed to be used soon and would be decisive for the war.

Also in February 1945, I was visited in my office by Chief Engineer Coenders from the Röchling factory. He told me about new weapons which however could not be used before April. Mr. Coenders had often been with the Führer and had received the first Fritz Todt Prize, so I could be sure: The man knows a lot. He also spoke of victory.

On the evening of 26 March 1945, the then Office Head of Koblenz, Andreas Bang, appeared in my office. He showed me a leaflet, which had been dropped over the Westerwald and Siegerland regions. This leaflet from the High Command of the German Armed Forces urged the population to clear a zone of 50 km from the Rhine, as on April 1, new war-decisive weapons would be used, which would guarantee German victory. A similar leaflet was shown to me on 28 March 1945 in Frankenberg/Eder.

If I had envisioned a German defeat, I would probably not have followed the order for enforcing the court-martial's judgment, because in a defeat I would have had no need to fear consequences for non-compliance of a given instruction.

SECRET

Office Memorandum · UNITED STATES GOVERNMENT

DATE: 13 March 1945

TO : General Groves

FROM : Captain Britt

SUBJECT :

Attached is paraphrase of a radiogram from The Military Attache, Madrid, Spain, and a radiogram disseminating the information to Major Calvert.

Major Abbott, who received the radio, in Col. Moses' office, stated that the source and its evaluation was B-0 (usually reliable - truth cannot be judged) that no more information is available unless specific questions are asked. Major Abbott is taking no action to answer the radiogram.

The attached radiogram to Major Calvert was dispatched and no action is being taken to obtain further information from the source.

Figure D.757: Left: U.S. Military Attaché, Madrid. 10 March 1945. “The Gestapo claims... a new weapon is claimed that will cause destruction of millions of men, it is not chemical but physical for destruction of atoms and will soon be used.” Right: A. E. Britt to Leslie Groves. 13 March 1945 [NARA RG 77, Entry UD-22A, Box 165, Folder ALSOS MATERIAL].

U.S. Military Attaché Madrid. 4 April 1945. Destruction of the Atom as German Secret Weapon. [NARA RG 77, Entry UD-22A, Box 165, Folder ALSOS MATERIAL] [See document photos on pp. 4630– 4631. See also p. 4628.]

A member of the Gestapo in Madrid early in March stated that the Germans would soon use a new secret weapon for smashing the atom by physical means which would cause the death of millions of people.

2. Upon further investigation of source of above information, it was ascertained that informant was under the influence of liquor when he made his statement and our contact expressed the belief that it might readily be propaganda.

3. Rumors concerning the use of atom destruction as a weapon have recurred frequently since October 1944. It is reliably reported that during recent weeks, the subject has been frequently discussed in the German Embassy in Madrid. [...]

5. In August, 1944, Dr. Schmidt Losberg, one of the directing heads of the Speer organization in Germany, informed contact that atom destruction was the third project under study for secret weapons and that experiments were being made by I. G. Farben Industry and the more important electric manufacturing companies such as AEG and Siemens-Halske. The first project was the use of V1 and V2 bombs with possible distance development to bomb the United States. The second project was the use of bacteria and gas. [...] Secret experiments were being conducted by the SS in forests located somewhere in Germany. [...]

COMMENT: It is reported (C-2) that on 27 March, a "pep talk" was given to the Staff at the Germany Embassy urging them not to be discouraged by present Allied successes. The tide would soon change, it was said and the German High Command was only waiting for the right moment to turn loose a secret weapon of such devastating effect against the Allied Armies that ultimate German victory was assured. This talk may have been for propaganda.

A similar report has come from Bilbao that German sympathizers there have been told that a new secret terrifying weapon would soon be used and that Germans has been warned to prepare to use gas masks if the Allies retaliate with gas.

According to a "B" source on 31 March, Lieut. General Kramer, German Air Attaché in Madrid told Lindenberg, head of the Lufthansa in Spain, that preparations had been completed for use of an atom destroying bomb. Lindenberg did not believe this possible.

[This document contains details that agree with many other sources quoted in this appendix:

- Several independent sources within this document reported the development of German nuclear weapons.
- Reports of a German atomic bomb greatly intensified beginning in October 1944, which coincided with the first successful test explosion of a prototype atomic bomb (Section D.10).
- Germany had been spending the months since then working to produce enough atomic bombs to use them in a strategic strike against Allied targets.
- The development of German atomic bombs was a huge industrial program involving companies such as I. G. Farben, AEG, and Siemens-Halske.
- The German government feared that if they did use their atomic bombs, the Allies would retaliate with a devastating chemical attack on the German populace.]

Subject: Destruction of the atom as German Secret Weapon 1/G/M/ BID 0400. 0403.0500
(Brief descriptive title)

From M. A. Madrid Report No. R-89-45 Date 4 April 1945 8025.

Source and degree of reliability:

Source:
Eval:

SUMMARY.—Here enter careful summary of report, containing substance succinctly stated; include important facts, names, places, dates, etc.

The following paragraphs 1,2,3,4, and 5, cover information already reported by cables during March, and paraphrased in compliance with instructions contained in BID - 2, d (2) sentence 2.

1. A member of the Gestapo in Madrid early in March stated that the Germans would soon use a new secret weapon for smashing the atom by physical means which would cause the death of millions of people.

2. Upon further investigation of source of above information, it was ascertained that informant was under the influence of liquor when he made his statement and our contact expressed the belief that it might readily be propaganda.

3. Rumors concerning the use of atom destruction as a weapon have recurred frequently since October 1944. It is reliably reported that during recent weeks, the subject has been frequently discussed in the German Embassy in Madrid.

4. A well informed and reliable German contact (See Source Letter dated 9 February 1945 to Chief, MIS, War Dept.) does not believe that in Germany the principle of breaking up the atom for use as a weapon in war ever reached the point of development to be practically applied.

5. In August, 1944, Dr. Schmidt Losberg, one of the directing heads of the Speer organization in Germany, informed contact that (atom destruction) was the third project under study for secret weapons and that experiments were being made by I. G. Farben Industry and (the more important electric manufacturing companies such as AEG and Siemens - Halske.) The first project was the use of VI and V2 bombs with possible distance development to bomb the United States. The second project was the use of bacteria and gas. Informant doubted very much if the second project could be effectively

used on a large scale on account of weakness of the German Luftwaffe. Secret experiments were being conducted by the SS in forests located somewhere in Germany. A chemical having an oil base has been developed which when it is spread on the ground begins to evaporate and spreads a poison gas. Contact believes that the production of poison gas in Germany has been greatly increased during the past two years.

6. The following additional information regarding possible use of an atom destroying weapon was obtained by our German contact from Dr. Wolfgang Marguerre, Chief Engineer of the Madrid Office of the AEG.

7. Although not a physicist, and hence not in a position to speak as a specialist on the subject, nevertheless from his experience and contacts with others, Mr. Marguerre did not believe it possible that such a weapon had aas yet been developed in Germany for practical use. He believed that researches in this direction were further advanced in the United States than anywhere else. In Europe, research work by physicists on destruction of the atom had been restricted to Berlin, London, and Paris.

8. He said that the leading world authority on this type of research is Professor Einstein now in the United States. Professor Sommerfield, the well known British Scientist is another. Both of them would be best informed regarding the work of the most prominent German physicists in this field. Among the latter, he mentioned Professor Heisenberg of Leipzig and Professor Lennard of Heidelberg.

9. The following research institutes in Germany have beenactive in this field:

(1) Die Physikalisch-Technische Reichsanstalt-Berlin-Dahlem. Professor Stark of this Institute was very highly honored by Hitler for his researches, but is not recognized by German scientists as really great. Dahlem had a first class high-tension apparatus built by Siemens for handling 1 and a half to 2 million volts but which, it is understood was destroyed by bombing.

(2) Das Forschunginstitut der AEG (Research Institute of AEG) Berlin. This was headed by Dr. Ramsauer whom contact knows personally. The development of the Electron-microscope is closely connected with this problem.

(3) Das Forschungsinstitut Siemswerke (Research Institute of the Siemens works). Ruska and von Borries associated with this Institute have distinguished themselves in the research field in connection with destruction of the atom. The Nazis decorated Ruska with the gold Merit cross (Verdienstkreuz) and publicly referred to the high value of his work in connection with a weapon of destructive possibilities hitherto unimaginable. Informant, however, has from the beginning believed that the rewards and prominence given to Dr. Ruska were largely for propaganda purposes.

COMMENT: It is reported (C-2) that on 27 March, a "pep talk" was given to the Staff at the German Embassy urging them not to be discourgged by present Allied successes. The tide would soon change, it was said and the German High Command was only waiting for the right moment to turn loose a secret weapon of such devastating effect against the Allied Armies that ultimate German victory waa assured. This talk may have been for propaganda.

8025.

A similar report has come from Bilbao that German sympathizers there have been told that a new secret terrifying weapon would soon be used and that Germans had been warned to prepare to use gas masks if the Allies retaliate with gas.

According to a "B" source on 31 March, Lieut. General Kramer, German Air Attache in Madrid told Lindenberg, head of the Lufthansa in Spain, that preparations had been completed for use of an atom destroying bomb. Lindenberg does not believe this possible.

RESTRICTED OI-SR/36

the relationship with Eva Braun had a sexual consummation. Hitler gave the impression of a timid man who could not become active himself. This may have been the reason for his frequent and sudden unfounded excitement.

With few exceptions, there were no real ladies in Hitler's circle. For a certain period of time, Magda Goebbels, who was a lady, received Hitler in her house. It was hoped that this environment would have a beneficial effect, but because of the usual intrigues nothing came of it. Through men like Hoffmann and Gauleiter Wagner, only a low class of women was brought into Hitler's circle. He had the Munich Kuenstlerhaus renovated in 1937 at his own expense for the benefit of the artists. On his occasional visits there, he was confronted with ballet dancers, movie extras, and student actresses, brought there on the last-minute orders of Wagner. They were supposed to represent artists' gatherings, and Hitler did not see the farce behind it because he never approached the women. He had no idea what went on after his departure, either at the Kuenstlerhaus or in the houses of Bormann and Wagner and in the Prinz Karl Palace. I never took part in these festivities, but was well informed on them by my SD personnel. The general public also knew what went on because the participating women were prone to speak of their experiences with the influential Party members. Serious artists and ladies would have no part in these activities, even at the earlier stages in the Kuenstlerhaus when Hitler was there. The wives of Hitler's oldest and best comrades remained plain and simple; for this reason, they were criticized by his entourage, and later by Hitler himself, and eventually were ostracized from the group.

5. Giesing: Report on Hitler

a. Preliminary Description

I knew Adolf Hitler from 22 July 1944 to 7 October 1944, the period in which I made examinations of his ears, his left maxillary cavity, and his larynx to determine if he had sustained serious injury when he was catapulted from his Bunker during the attempted assassination on 20 July. I also made two physical and neurological examinations of him, one on 26 August 1944, and the other on 3 October 1944. During this time I had approximately fifty-five talks with Hitler on diverse topics. We met only once later, accidentally, in mid-February 1945. I shall try to present a short characterization of his physical constitution, his personality, his mental capabilities, and his willpower as I observed them during my frequent, but short visits to his Bunker. I am aware of the incompleteness of my characterization, for I am neither a trained psychiatrist or neurologist nor an expert on military or political matters.

My first impression of Hitler was not of a powerful and feared man with a fascinating, hypnotic personality. He seemed to me, from my first observance, an aged, almost exhausted man who had to use sparingly the remainder of his strength. I did not find his eyes soul-penetrating nor his nature tyrannical, as they had been described to me by the press, the radio, and by the accounts of other men. However, I do not hesitate to admit that I had a strange, uneasy feeling when, on 22 July 1944, Brandt suddenly ordered me to treat Hitler's ears. This feeling became intense during the time that I had to wait in a small room of Hitler's Bunker for the appearance of this "tremendous, mystical superman". That is how his chief adjutant, Gen Schmundt, had described him to me. I would have preferred that my first encounter with Hitler had taken place in a large room so that Hitler would have had to walk a few steps towards me and I could have had a chance to observe him -- even though only for a few minutes -- before being introduced. Nevertheless, in the circumstances as they were, I was the doctor and he only the patient. A realization of this relation, perhaps, prevented me from having a foregone feeling of inferiority and insignificance as I faced the head of the state. In addition, the confidence shown me by Hitler, after he had looked at me silently for a short while, facilitated the bridging of the gap in rank and importance.

and even higher gambling debts than I did. I feel sorry for his wife and his nice children, but this Augean stable has to be swept with an iron broom, no quarter given. If I don't root out these traitors completely, there might be more of these damned things, and the poor German soldier up there on the line has to pay with his life for the stupidity of those people. I'm really thankful to Rehmer, who mastered the situation so quickly up there in Berlin. What I need is more of that kind of excellent and politically clever officers, and then I wouldn't be afraid of the future. But this bunch of cowards in Berlin sends me this even more cowardly Stauffenberg. If he had at least been enough of a man to stay next to me with his briefcase — but as it is, the bullet that hit him was really wasted. I have often wondered what these people wanted. To end the war and then have their government of jokers start peace negotiations with the enemy because their bunch was too cowardly and too incapable to go on with the war? As though Mr Stalin, Mr Churchill and Mr Roosevelt would have given a hoot about our sudden desire for peace. The Russians would have been in Berlin within eight days, and that would have been the end of Germany forever."

(7) Attitude in February 1945

Hitler and I sat down on a bench in the corner. He seemed more aged and stooped than ever. His face was pale as usual, and he had large bags under his eyes; his hands too were pale and the fingernails bloodless. He spoke clearly but in very low tones. I immedietely noticed the strong tremor of the left arm and hand. Because the tremor increased when the hand was not supported, Hitler kept his arm on the table or his hand on the bench throughout the conversation. I had the impression that Hitler was exhausted and rather absent-minded, and no longer concentrated well. Twice he asked me where my family lived, and twice I told him that they lived in Krefeld. Just after I had answered his question the second time, he suddenly began to talk about the war. He said, "Well, Germany is in a difficult position, but I'll master the situation. The Anglo-Americans will find that they're very much mistaken in thinking that their victory is certain. They're going to have a tough time. I'm going to commit my V-weapons soon, and then the war will be brought to a glorious end. The problem of atom splitting has been solved a long time ago, and it has been so far developed that we can make use of this energy for weapons. These people are going to see something. This is the weapon of the future, and with it Germany's future is secured too. Providence has already shown me this last and victorious road, and I know that the final turn of fortune is about to come." Hitler said these things mainly to himself, looking at a point on the floor. The tremor of the left arm was clearly apparent when he let the arm hang. Then he asked me again where my family was. I repeated that they were in Krefeld, and he said, "Nothing can happen to them there, that is certain. The West Wall will hold, absolutely, and our V-weapon will decide the war in no time at all. Doctor, I want you to believe firmly that this is so." He looked at the floor for some time, and then suddenly began to speak again. "If the war should take an unfavorable turn after all -- well, all of us will have to go down in a decent manner. I shall place myself at the head of my troops and die as a soldier. But Providence has led me safely so far, and I shall go my prescribed road no matter what happens." He stood up quickly and extended his hand, looking past me into empty space. He did not say anything more, but walked away with tired steps towards a large open door where Linge was waiting for him.

6. Hasselbach: Hitler

a. Knowledge and Mental Capacity

Hitler's general knowledge was amazing in view of the fact that he had not attended even high school. As he matured, a tremendous thirst for knowledge, an indefatigable diligence, and an enviable memory furnished him sufficient knowledge to dominate every discussion, and to express well-founded, if sometimes rather surprising ideas in many fields.

Conforming with his task as a politician, his main interest lay in the field of history, which he made the basis of his political views and

Monthly Intelligence Summary. March 1945. [NARA RG 77, Entry UD-22A, Box 168, Folder 202.3-1 LONDON OFFICE: Combined Intell Rpts.]

a. In a broadcast by German Home Service the program took the form of two Germans discussing the reasons for the Germans continuing to fight. The following conversation was noted:

> "In the air war a first victory has likewise been won by the German mind over material. The...... retaliation weapon goes on its destructive uncanny way without needing men or a costly return flight...... Do not forget that all these things had to be created at five minutes to twelve out of nothing. We need time to exploit all possibilities, to make them reality. Our enemies know this and this is the point of this gruesome race for time."

It was also recalled that "Hitler once said: 'May God forgive me for the last ten minutes of the war!'"

Henry Picker. 2009. *Hitlers Tischgespräche im Führerhauptquartier.* 2nd ed. Berlin: Propyläen-Taschenbuch bei Ullstein.

[S. 42:] Und um wieviel mehr Tote, Kriegsbeschädigte, Flüchtlinge und Zerstörungen wären zu beklagen gewesen, wenn Hitlers Gegner nicht—wie Churchill sagte—“fünf Minuten vor 12 Uhr” gesiegt gehabt und im Frühjahr 1945 damit Hitlers neue Rundumverteidigung vereitelt hätten. Denn mit den in Peenemünde entwickelten, auch ihre Ziele in den USA erreichenden “Interglobalraketen” A 9 und mit den kleinkürbisgroßen, im Lichterfelder Forschungsamt der Reichspost nach Mitteilung Schaubs bis zur Prototyp-Reife durchkonstruierten “Uraniumbomben” (mit ihrer Vollzerstörungskraft im 3-km-Radius) hätte Hitler, wenn er diese Waffen de facto noch einsatzbereit bekommen hätte, das Leid, die Grausamkeit, die Härte, die Ausdehnung und die Dauer des II. Weltkriegs mit Sicherheit vervielfacht.

[S. 245:] Der durch Treibstoffmangel und Luftunterlegenheit bedingte endgültige Mißerfolg wirkte dann ab Februar 1945 doppelt niederschmetternd auf ihn. Während sein Geist zupackend, sein Namens- und Zahlengedächtnis präsent blieben, wurde er körperlich zum Greis. Nur unter Aufbietung aller Kräfte bewegte er sich—aschgrau im Gesicht, mit dicken Tränensäcken unter glanzlosen Augen—fast schleppend durch die Räume seines letzten FHQu, der Berliner Reichskanzlei. Auf seine neuen Waffen, insbesondere die Uraniumbombe hoffend, stimulierte aber immer noch der Glaube an seine “Mission” ein erstaunliches Durchhaltevermögen bei ihm. Noch am 11. März 1945 besuchte er die Oderfront und bemühte sich, sie mit Durchhalteparolen zum Standhalten zu bringen.

[p. 42:] And how much more death, war damage, refugees, and destruction would have been the result if Hitler’s opponents had not won—as Churchill said—“five minutes before midnight” and thus thwarted Hitler’s new end-run defense in the spring of 1945. For with the A-9 “interglobal rockets” developed in Peenemünde, which also reached their targets in the USA, and with the small-pumpkin-sized “uranium bombs” (with their full destructive energy in a 3-km radius), which according to Schaub’s information had been developed to ready prototypes at the Reichspost’s research office in Lichterfeld, if Hitler had been able to make these weapons actually deployed, the suffering, the cruelty, the harshness, the extension, and the duration of World War II would certainly have been multiplied.

[p. 245:] The final failure caused by lack of fuel and air inferiority had a doubly devastating effect on him from February 1945 onward. While his mind was sharp and his memory for names and numbers remained present, he physically became an old man. Only with the exertion of all his strength did he move—ash gray in the face, with thick bags under dull eyes—almost dragging himself through the rooms of his last Führer Headquarters, the Berlin Reich Chancellery. Hoping for his new weapons, especially the uranium bomb, the belief in his “mission” still stimulated an amazing staying power in him. As late as 11 March 1945, he visited the Oder front and tried to make it hold out with slogans of endurance.

[S. 493:] Hitlers letzter Frontbesuch erfolgte am 11. März 1945 an der mittleren Oderfront in Schloß, Freienwalde bei der 9. Armee. Hitler beschwor den Oberbefehlshaber, General Theodor Busse, und seine Offiziere, den russischen Ansturm auf Berlin wenigstens so lange aufzuhalten, bis seine neuen Waffen einsatzbereit seien. Er verwies auf das Beispiel des Generalfeldmarschalls Ferdinand Schörner, der mit seiner "Heeresgruppe Mitte" Schlesien und den böhmischen Raum mit unverminderter Kampfkraft verteidige. Und er erklärte abschließend: "Jeder Tag und jede Stunde sind kostbar, um die fürchterlichen Waffen fertigzustellen, welche die Wende bringen!"

Mit den "fürchterlichen Waffen" war nach Schaub vor allem die prototypreif durchkonstruierte "Uranium-Bombe" gemeint, die in der Größe eines kleinen Kürbis in einem unterirdischen SS-Werk im Süd-Harz (mit einer Produktionskapazität von 30 000 Arbeitskräften) hergestellt werden sollte. Das Werk wurde 1945 nach der bedingungslosen Kapitulation Deutschlands von der Roten Armee nach der UdSSR verlagert. Die gelegentliche Mitteilung des US-Präsidenten über die amerikanische Entwicklung einer Atombombe tat Stalin daher mit absolutem Desinteresse ab. Den deutschen Atom-Praktiker Manfred von Ardenne aber zeichnete er mit dem damaligen sowjetischen "Nobel"-Preis, dem "Stalinpreis", aus.

[S. 531:] 9. 6. 1942 mittags (Reichskanzlei)

Hitler freute sich über die Rüstigkeit der beiden alten Herren, die beim Essen links und rechts von ihm saßen und die er verstohlen immer wieder betrachtete: Reichsschatzmeister Schwarz und Reichspostminister Ohnesorge.

[p. 493:] Hitler's last visit to the front took place on 11 March 1945, on the middle Oder front in Freienwalde Castle with the 9th Army. Hitler implored the commander-in-chief, General Theodor Busse, and his officers to delay the Russian onslaught on Berlin at least until his new weapons were ready for use. He referred to the example of Field Marshal Ferdinand Schörner, who with his "Central Army Group" defended Silesia and the Bohemian region with undiminished fighting strength. And he concluded: "Every day and every hour is precious to complete the terrible weapons that will bring about the turnaround!"

According to Schaub, the "terrible weapons" meant above all the "uranium bomb" with the size of a small pumpkin which was to be produced in an underground SS plant in the southern Harz region (with a production capacity of 30,000 workers). The plant was relocated to the USSR by the Red Army in 1945 after Germany's unconditional surrender. The statement around that time by the U.S. President about the American development of an atomic bomb was therefore dismissed by Stalin with absolute disinterest. He did, however, award the German nuclear practitioner Manfred von Ardenne with what was then the Soviet "Nobel" Prize, the "Stalin Prize."

[p. 531:] 9 June 1942 noon (Reich Chancellery)

Hitler was pleased with the sprightliness of the two old gentlemen who sat to his left and right during dinner and whom he secretly looked at again and again: Reich Treasurer Schwarz and Reich Post Office Minister Ohnesorge.

Dr. Ohnesorges "Reichspost-Forschungsanstalt" in Berlin-Lichterfelde und Klein-Machnow, wo—parallel zu einem erfolglosen Professoren-Team [Heisenberg et al.]—tatsächlich ein Prototyp der deutschen "Uranium-Bombe" konstruktionsreif entwickelt wurde, stattete Hitler bei Berlin-Aufenthalten Besuche ab, bei denen Dr. Ohnesorge nicht einmal den Hitler begleitenden Militäradjutanten Engel die Forschungsanlagen mit besichtigen ließ. Der 1872 geborene Ohnesorge verstand sich auf Geheimhaltung. Er war im I. Weltkrieg Chef der Telegraphendirektion des Großen Hauptquartiers gewesen. Nach dem Kriege an diversen Oberpostdirektionen tätig, wurde er 1929 Präsident des Reichspostzentralamtes in Berlin-Tempelhof und 1933 Staatssekretär, 1937 Reichsminister im Reichspostministerium. Von Haus aus Mathematiker und Physiker, hatte er als Elektro- und Elektronikspezialist zahlreiche, von aller Welt übernommene Erfindungen gemacht (z. B. die der Fernkabel-Telephonie aufgrund der Vierdrahtschaltung).

At Dr. Ohnesorge's "Post Office Research Institute" in Berlin-Lichterfelde and Klein-Machnow—parallel to an unsuccessful team of professors [Heisenberg et al.]—a prototype of the German "uranium bomb" was actually developed ready for production. Hitler paid visits during which Dr. Ohnesorge did not even let the military adjutant Engel, who accompanied Hitler, visit the research facilities near Berlin. Ohnesorge, born in 1872, was a man who understood secrecy. During World War I, he had been head of the telegraph directorate of the supreme headquarters. After the war, he worked in various senior postal administrations, becoming president of the Post Office Central Department in Berlin-Tempelhof in 1929 and state secretary in 1933, then head of the Post Office Ministry in 1937. A mathematician and physicist by training, he had made numerous inventions as an electrical and electronics specialist that were adopted from all over the world (e.g. the invention of long-distance cable telephony based on the four-wire circuit).

Hitler, der ihn seit 1920 kannte, bewunderte an dem schweigsamen Mann, daß, er aus seinen und seiner Mitarbeiter Erfindungen stets praktisch anwendbare Resultate zu entwickeln verstand. Unter den Mitarbeitern Ohnesorges in der Reichsforschungsanstalt finden sich u. a. solche Kapazitäten wie der Atomphysiker Baron Manfred von Ardenne. Der Uranbrenner in Kummersdorf fiel 1945 in sowjetische Hände. 1 kg Uran 235 entwickelte die Explosionskraft von 20 000 t chemischen Sprengstoffs. Die Amerikaner zündeten den Prototyp ihrer ersten Atombombe am 16. Juli 1945 in New Mexico auf dem Versuchsgelände Alamogordo.

Hitler, who had known him since 1920, admired that the quiet man always knew how to develop practical results from his and his colleagues' inventions. Among Ohnesorge's collaborators at the Reich Research Institute are such experts as the nuclear physicist Baron Manfred von Ardenne. The uranium reactor in Kummersdorf fell into Soviet hands in 1945. 1 kg of uranium-235 developed the explosive energy of 20,000 tons of chemical explosives. The Americans detonated the prototype of their first atomic bomb on 16 July 1945 in New Mexico at the Alamogordo test site.

[S. 586:] Auch die Flüssigstoff-Fernrakete 'Rheinbote' und die USA-Fernrakete A9 waren erst 1945 einsatzbereit.

[p. 586:] Also the liquid-material long-range rocket 'Rheinbote' and the USA long-range rocket A-9 were not operational until 1945. [Rheinbote had solid propellant. Did Picker mean the intended payload was liquid material?]

[S. 683:] Am 7. Juli 1943 empfing Hitler die Erbauer der Weltraum-Rakete V2, den Oberst Walter Dornberger und den Diplomingenieur Wernher Freiherr von Braun, im FHQu, sah voller Begeisterung ihre V-2-Farbfilme und ernannte Dornberger zum Generalmajor und v. Braun zum Professor. Die Ernennungsurkunden unterschrieb er persönlich. Immer wieder betonte er seine Verehrung für den 1894 in Herrmannstadt (Siebenbürgen) geborenen Professor Hermann Oberth, der mit seinen wissenschaftlichen Erkenntnissen und Berechnungen die Flüssigstoffrakete V2 und die späteren Weltraumraketen erst möglich gemacht hatte.

Über 2000 Wissenschaftler und Ingenieure ließ, Hitler für die Entwicklung der Flugkörper-Feststoffrakete V1 und die der Flüssigstoffraketen V2 (= A4) und A9 vom Wehrdienst freistellen. Bis Anfang 1945 wollte er auch die—gegen die USA konstruierte—Fernrakete A-9 serienmäßig und zielsicher einsatzbereit haben. Er hoffte, mit dieser Interkontinental-Rakete die USA "friedensbereit" schießen zu können, zumal wenn er erst einmal den Raketenkopf mit mehreren kleinen Uranium-Bomben hätte bestücken können. Bereits 1943 ließ, er an der Nordspitze der ost-kanadischen Halbinsel Labrador durch U 537 eine Wetterstation hierfür errichten.

Ich habe aus militärischen Geheimhaltungsgründen Hitlers Raketen-Ausführungen seinerzeit nicht mitaufgezeichnet. Hitler äußerte sich z.B. am 5. Mai 1942 recht ärgerlich, daß, die Peenemünder über alle möglichen Erfindungen und Entwicklungen ihre eigentliche Aufgabe, Raketen-Waffen zu bauen, vernachlässigten.

[p. 683:] On July 7, 1943, Hitler received the builders of the V-2 space rocket, Colonel Walter Dornberger and the graduate engineer Wernher Freiherr von Braun, at the Führer Headquarters, watched their V-2 color films with enthusiasm and appointed Dornberger a major general and von Braun a professor. He personally signed the certificates of appointment. Again and again, he emphasized his admiration for Professor Hermann Oberth, born in Herrmannstadt (Transylvania) in 1894, whose scientific knowledge and calculations had made the V-2 liquid fuel rocket and the later space rockets possible in the first place.

Hitler had over 2000 scientists and engineers exempted from military service for the development of the V-1 missile/solid rocket [for launching it] and the liquid fuel rockets V-2 (= A-4) and A-9. Up to early 1945, he also wanted the A-9 long-range rocket, intended against the USA, to be ready for series production and completely operational. He hoped that this intercontinental rocket would make the USA "amenable to peace," especially if he could have equipped the rocket warhead with several small uranium bombs. As early as 1943, he had a weather station built for this purpose [trans-Atlantic guidance] at the northern tip of the eastern Canadian peninsula of Labrador by submarine U-537.

For reasons of military secrecy, I did not record Hitler's rocket plans at the time. Hitler, for example, on 5 May 1942, was quite annoyed that the Peenemünde people, pursuing all kinds of inventions and developments, neglected their actual task of building rocket weapons.

[Henry Picker (German, 1912–1988) was a lawyer whom Hitler invited to attend and take notes on many of his mealtime meetings and conversations. After the war, Picker published those notes, along with his own postwar commentary, as *Hitlers Tischgespräche*, or *Hitler's Table Talk*. Many former officials of the Third Reich vouched for the accuracy of Picker's recollections and comments.]

Picker openly stated that he did not take notes on the more secret meetings, and of course he would have been excluded from many secret meetings. However, through his conversations with Hitler and others within the inner circle, Picker learned the gist of some of the most important secret weapons programs. He mentioned a few details about them, and those details agree well with information from other sources in Appendices D and E:

- Werner Heisenberg's group never even got close to producing a nuclear weapon.
- However, a program that involved Reichspost scientists such as Manfred von Ardenne and was managed by Wilhelm Ohnesorge did produce a prototype uranium fission bomb.
- A 30,000-person underground facility in Thuringia was set up to mass-produce such fission bombs, but was interrupted by the end of the war. The facility had reached a sufficient point of readiness, though, that it was removed by Soviet forces and taken back to the Soviet Union to help start the nuclear weapons program there.
- The nuclear weapons program was so secretive that even one of Hitler's military adjutants, Gerhard Engel (German, 1906–1976) was not allowed to tour the nuclear production facilities. Whatever Engel learned directly or indirectly was likely one of Henry Picker's sources of information. Picker wrote repeatedly that another of his key sources of information on the secret weapons programs was another of Hitler's adjutants, Julius Schaub (German, 1898–1967).
- The uranium fission bomb was approximately the size of a pumpkin. For a spherical fission implosion bomb, the inner nuclear components and the outer conventional explosive components would have been produced separately. While the complete fission implosion bomb would have been much larger than a pumpkin, the inner nuclear core would have been pumpkin-sized. Plausible physics estimates (p. 5157) are that the uranium tamper and the key nuclear components within it would have had a radius of $\sim$11 cm, or a diameter of $\sim$22 cm. If the surrounding aluminum pusher were also included, the radius would have been $\sim$23 cm, or the diameter $\sim$46 cm.
- The fission bomb had a radius of destruction of approximately 3 km, or an explosive yield (p. 5142) of roughly $(3000 \text{ meters}/85.5 \text{ meters})^3$ tons, or $\sim$40 kilotons. That would have been approximately twice the yield of the first U.S. fission bombs.
- The fission bomb was designed to be delivered by a rocket such as the A-9.
- The A-9 rocket was intended to strike targets in the United States. To achieve that sort of range, the A-9 would have had to be launched on top of a larger A-10 first stage. Thus whenever Picker mentioned the A-9, he was apparently referring to the complete A-9/A-10 intercontinental rocket.
- Prototypes of the A-9/A-10 rocket were completed and ready for launch before the war ended.
- Mass-production of the A-9/A-10 was planned and facilities were built, but those operations were interrupted by the end of the war.
- Hitler considered it vital for the German military to hold geographical areas that were closely associated with the nuclear weapons and intercontinental rocket programs until those weapons could be used. Those areas included Silesia, Bohemia, Thuringia, and the Berlin area.]

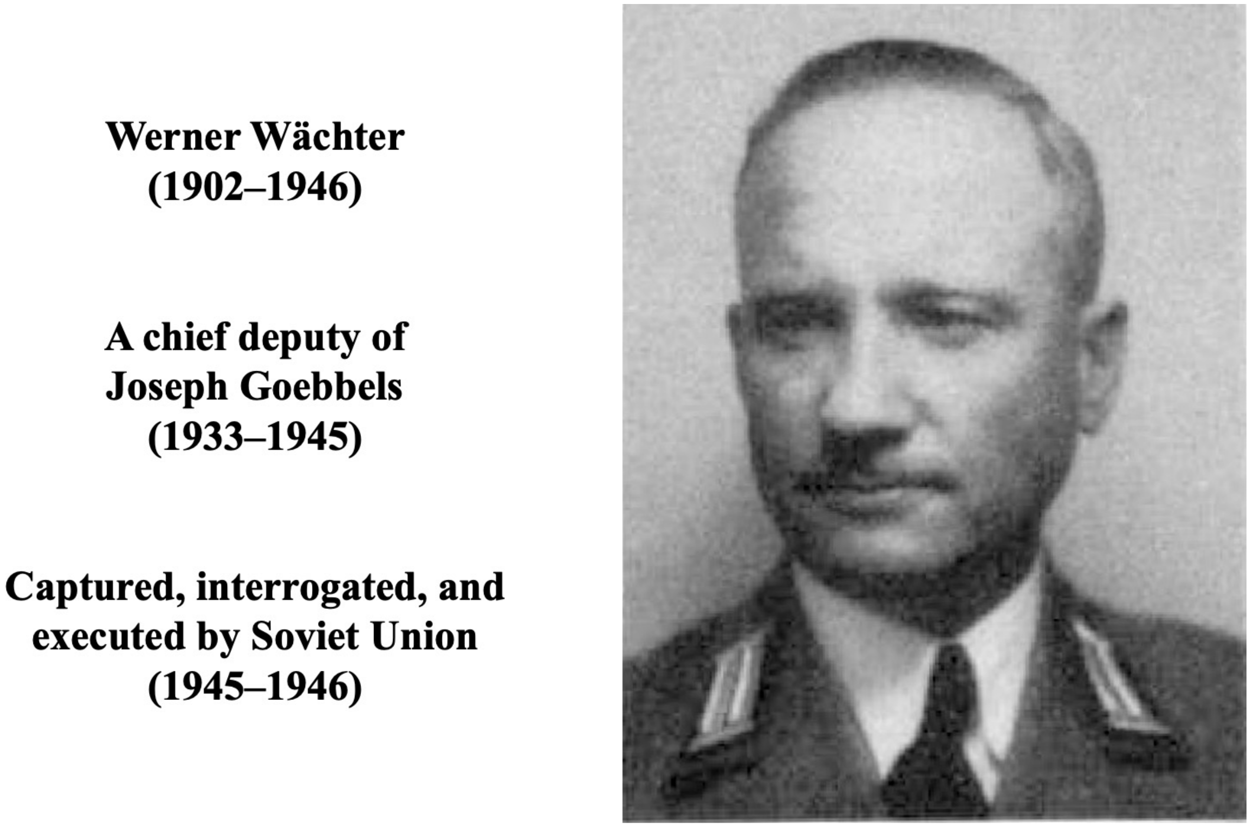

Figure D.762: Werner Wächter, one of the chief deputies of Joseph Goebbels.

[The following pages present original Russian reports (plus English translations) regarding postwar Soviet interrogations of Werner Wächter. Wächter (born in 1902) was one of the chief deputies of Joseph Goebbels from the 1930s until the end of the war. In September 1945, he was captured by Aleksei Sidnev, head of Soviet NKVD forces in Berlin. Wächter was interrogated in September by Sidnev and again in October 1945 by Sidnev's NKVD boss, Ivan Serov. Wächter was executed by the Soviet Union in 1946.

During World War II, Wächter had a high-ranking and well-connected position, and (according to these interrogations) he received information from multiple official and unofficial channels that:

- Germany had a large program throughout the war to develop nuclear weapons and by 1943 was already very close to attaining its first nuclear weapon.
- By the end of the war in Europe, Germany possessed a significant number of nuclear weapons, and it was on the verge of using them against several targets in the Soviet Union and the United States when the war ended.
- Long-range bombers capable of transporting atomic bombs to the United States and deep into the Soviet Union had been constructed.
- A number of these long-range bombers were actually stationed at an airfield near Celle (a documented German nuclear site) and also "were concentrated at other airfields."
- Rockets more advanced than the standard V-2 (A-4), capable of carrying an atomic bomb and traveling from Germany to the United States, were under development and almost ready by the end of the war.]

Aleksei Sidnev to Ivan Serov. Letter regarding NKVD interrogation of Werner Wächter. September 1945 (filed away 20 October 1945). [FSB Archive, Moscow]

TOP SECRET.-

TO THE DEPUTY PEOPLE'S COMMISSAR OF INTERNAL AFFAIRS OF THE USSR

Colonel-General

COMRADE SEROV

SPECIAL MESSAGE

In addition to the special messages of 6 and 10.9.45 regarding the detainee

WÄCHTER Werner, born 1902, former
Chief of Staff of the NSDAP Propaganda Directorate

we are transmitting additional materials received as a result of further investigation of the case.

As already reported, WÄCHTER, in addition to the post of Chief of Staff of the Propaganda Directorate, also held the post of Chief of the General Armament and Construction Reporting, which is part of the Propaganda Ministry.

The tasks of reporting included:

First, joint work with the Speer Ministry of Armaments to review and accept into production the latest inventions in the field of military technology. To carry out this task, WÄCHTER was subordinate to: Referent Etlich from the Speer Ministry; the head of the military-economic department of the General Staff, Reuter; the representative of the Aviation Ministry, Schroeter; and Doctor Wiebe from the Propaganda Ministry.

The invention projects were checked by special commissions and then passed on to the scientific consultant Professor Dietrich. In their finished form, the proposals of the reporting office were forwarded to the head of the production department of the Ministry of Armaments Saur.

During the interrogation, WÄCHTER gave a number of examples regarding those latest inventions that passed through his reporting office.

In 1943, the office examined and approved a 21 cm caliber jet aircraft weapon for firing at ground targets. Testing of this weapon yielded positive results.

The Messerschmitt factories developed and launched into production a project for a jet fighter, the fuel for which was special grades of oil, which was very important given the shortage of ordinary gasoline that the German economy had been experiencing recently.

At a meeting on this issue, Sauer and Speer stated that German industry was capable of producing up to 5,000 aircraft monthly in November 1944. Speer proposed to eliminate the fuel difficulties by building several hundred small hydrogenation plants capable of producing up to 3,000 tons of synthetic gasoline per month. According to WÄCHTER, these plants were built and began operating. As a result of these measures, the fuel situation improved significantly, since the scattered small plants had very little exposure to danger [from Allied bombing].

In the same year of 1944, projects were developed for very long-range bombers capable of bombing military manufacturing centers of the Soviet Union in the Urals and industrial facilities in North America. These bombers were supposed to be used to transport atomic bombs.

WÄCHTER reports that, according to the report of Air Force Colonel [Hajo] Hermann, at one of the meetings with Hitler, the latter very sharply singled out Goering for the failure of the Aviation Ministry to implement the program for the construction of these aircraft. Soon after this meeting, the aviation industry was transferred to the Speer Ministry, where General Field Marshal of the Air Force Milch also transferred to work.

The main manager of all work on the latest types of weapons was General [Walter] Dornberger, who was responsible for the production of the V-1 and V-2, as well as atomic bombs.

A direct inventor of the V-2 missiles was engineer Dr. Paul Heylandt.[16] While the V-1 missile was launched by a machine device [catapult] and had a very limited range, the V-2 could hit targets located in the middle of the Atlantic Ocean with its missiles. Heylandt informed WÄCHTER that work was being done as a result of which the V-2 missile would be able to rise to 120 km in altitude and hit industrial targets in North America. A standard V-2 missile could reach an altitude of 80 km.

WÄCHTER knows that the V-2 missile is fired from the HARZ region and near the city of Saalfeld (Thuringia).

Heylandt was also the organizer of the construction of large oxygen liquefaction plants. These plants were of great importance in the V-2 production program, since it was precisely with the help of liquid oxygen that the engines that launched the V-2 rockets operated. Liquid air factories were located in Erfurt, Frankfurt, and Munich (Linde company). The missile itself was manufactured at the Rax plant on the outskirts of Vienna, at a test plant near the town of Bodensee (Swiss, border), and at Peenemünde (near Stettin).

The head of the testing center in Peenemünde was Freiherr von Braun.

Already in 1943, WÄCHTER learned in a conversation with the chief engineer of the propaganda ministry, [Hans] Dominik, that a lot of work was being done to invent atomic bombs. Later, in conversations with Professor Dr. Erich Schumann [pp. 4186–4255] and Prof. [Rudolf] Mentzel, WÄCHTER learned that the work on atomic bombs was being carried out at the Kaiser Wilhelm Institute in Berlin. The head of the production department of the armament ministry, [Karl-Otto] Saur, and his deputy, Feldmann, were personally responsible for the production of atomic bombs.

The most knowledgeable people in this regard should be General Dornberger and Dr. Erich Schumann, who worked specifically on scientific research questions related to the production of the atomic bomb.

Schumann was simultaneously a professor of physics, biology, medicine, and music, and was known to the general public as a professor of music.

---

[16] https://repository.si.edu/bitstream/handle/10088/30574/Winter%20Neufeld%20Heylandt.pdf

According to WÄCHTER's testimony, Schumann lived in Berlin until the end of April and should be in the city to this day. (Schumann is being sought [pp. 3294–3296]).

WÄCHTER himself does not know the factories where the atomic bomb was manufactured and designed, since he was not admitted to the secret meetings on this issue held at Speer's [office].

The second task of the general office headed by WÄCHTER was to conduct so-called economic propaganda. This included: propaganda for saving coal, water, electricity, propaganda for intensive work, the struggle (agitational) against "chatterboxes", spies, etc.

All the largest posters on this topic were published on the initiative of WÄCHTER.

The reporting office also published a special magazine titled "A Handbook for Propagandists," which gave advice and instructions to the propagandists of the regional offices.

Finally, the function of the armament reporting office included propaganda about new weapons. It was assumed that as a result of this propaganda it would be possible to convince the German people to hold out to the last degree, since a new victorious weapon would soon come into action.

WÄCHTER also testified that he headed a special council for repairing Berlin streets damaged by the bombing.

The investigation into WÄCHTER's case continues. Further results will be reported separately.

CHIEF OF THE OPERATIONAL SECTOR OF THE NKVD BERLIN

СОВЕРШЕННО СЕКРЕТНО.-

ЗАМЕСТИТЕЛЮ НАРОДНОГО КОМИССАРА ВНУТРЕННИХ ДЕЛ СССР
Генерал-полковнику

ТОВАРИЩУ СЕРОВУ

СПЕЦСООБЩЕНИЕ

В дополнение к спецсообщениям от 6 и 10.9.45 года в отношении задержанного -

ВЕХТЕР Вернера, 1902 года рождения, бывшего начальника штаба Управления пропаганды НСДАП

передаем дополнительные материалы получение в результате дальнейшего следствия по делу.

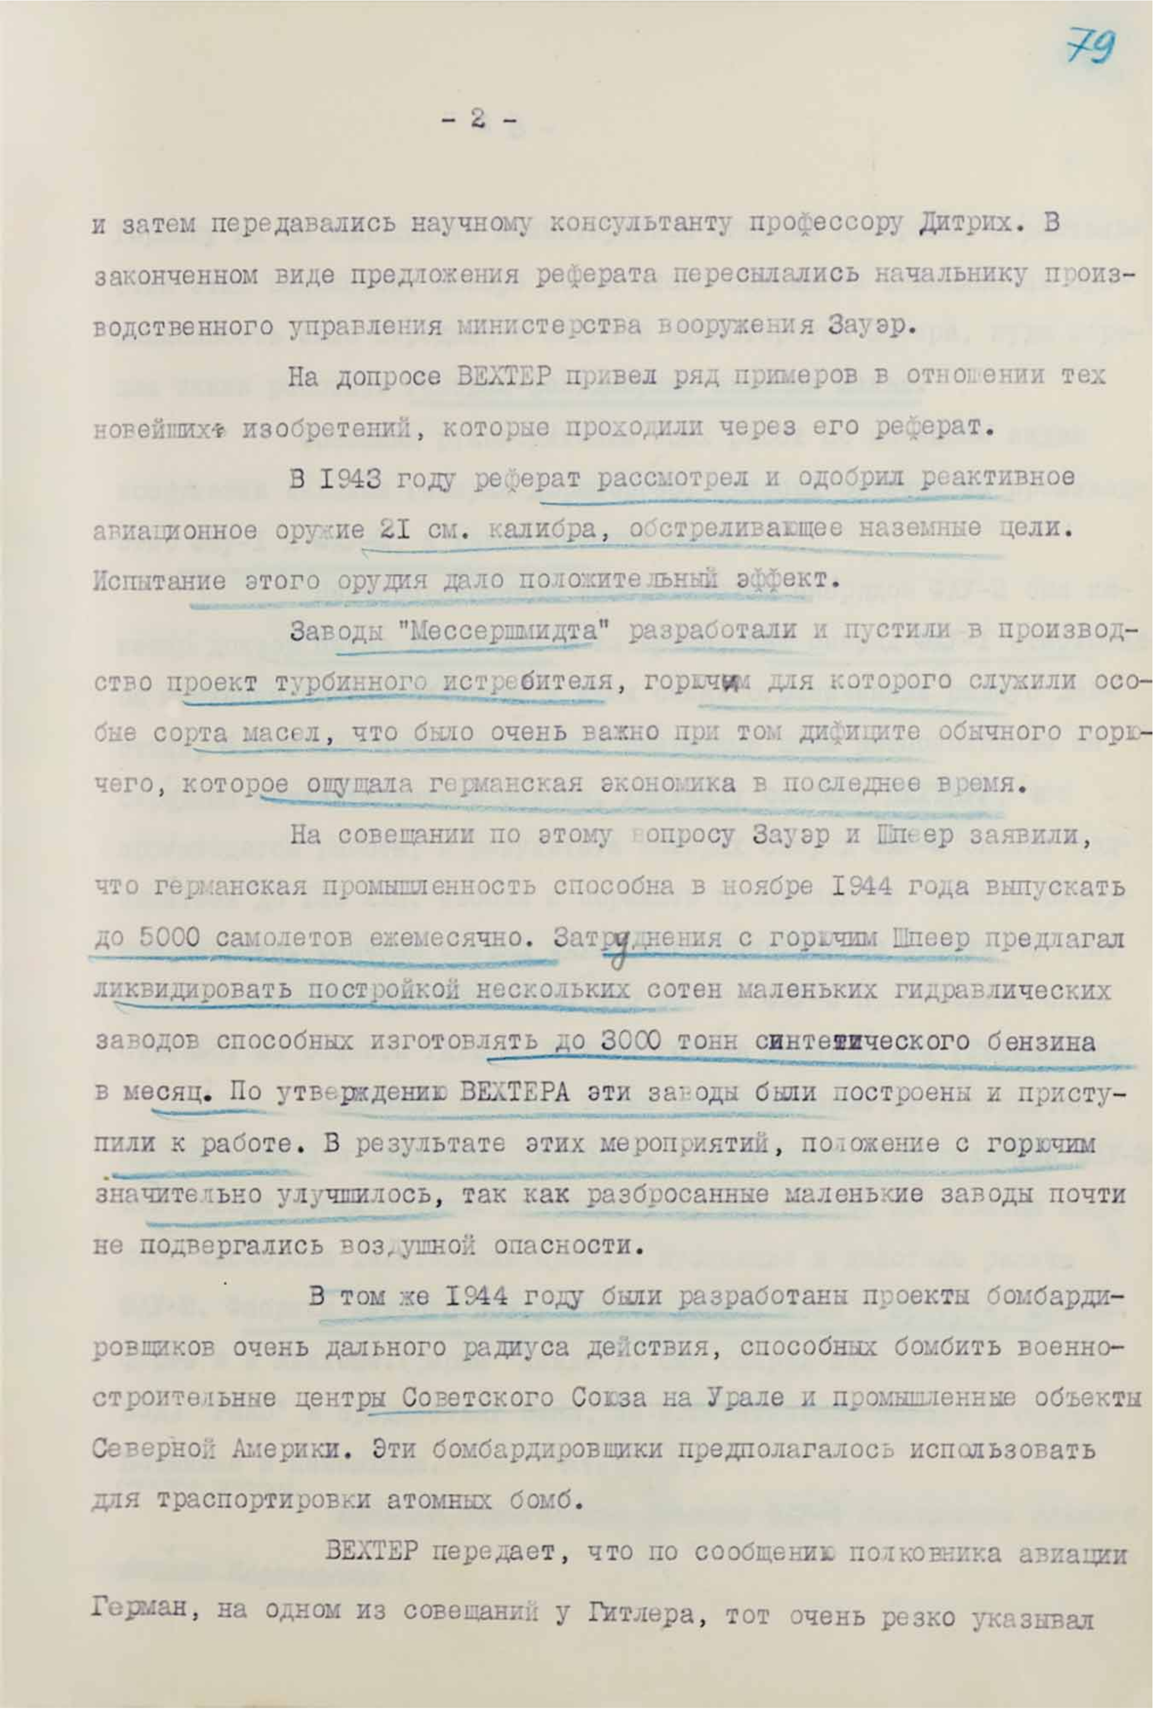
Как уже сообщалось, ВЕХТЕР одновременно с должностью Начальника штаба Управления пропаганды, занимал также пост начальника генерального реферата вооружения и строительства, входящего в состав министерства пропаганды.

В задачи реферата входило:

Во первых - совместная работа с министерством вооружения Шпеера по рассмотрению и принятию в производство новейших изобретений в области военной техники. Для выполнения этой задачи, в подчинение ВЕХТЕРА находились: референт Этлих от министерства Шпеера, начальник военно-хозяйственного управления генерального штаба - Ройтер, представитель министерства авиации - Претер, доктор Вибе от министерства пропаганды.

Проекты изобретений проверялись на специальных комиссия

Figure D.763: Aleksei Sidnev to Ivan Serov. Letter regarding NKVD interrogation of Werner Wächter. September 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



79

- 2 -

и затем передавались научному консультанту профессору Дитрих. В законченном виде предложения реферата пересылались начальнику производственного управления министерства вооружения Зауэр.

На допросе ВЕХТЕР привел ряд примеров в отношении тех новейших изобретений, которые проходили через его реферат.

В I943 году реферат рассмотрел и одобрил реактивное авиационное оружие 2I см. калибра, обстреливающее наземные цели. Испытание этого орудия дало положительный эффект.

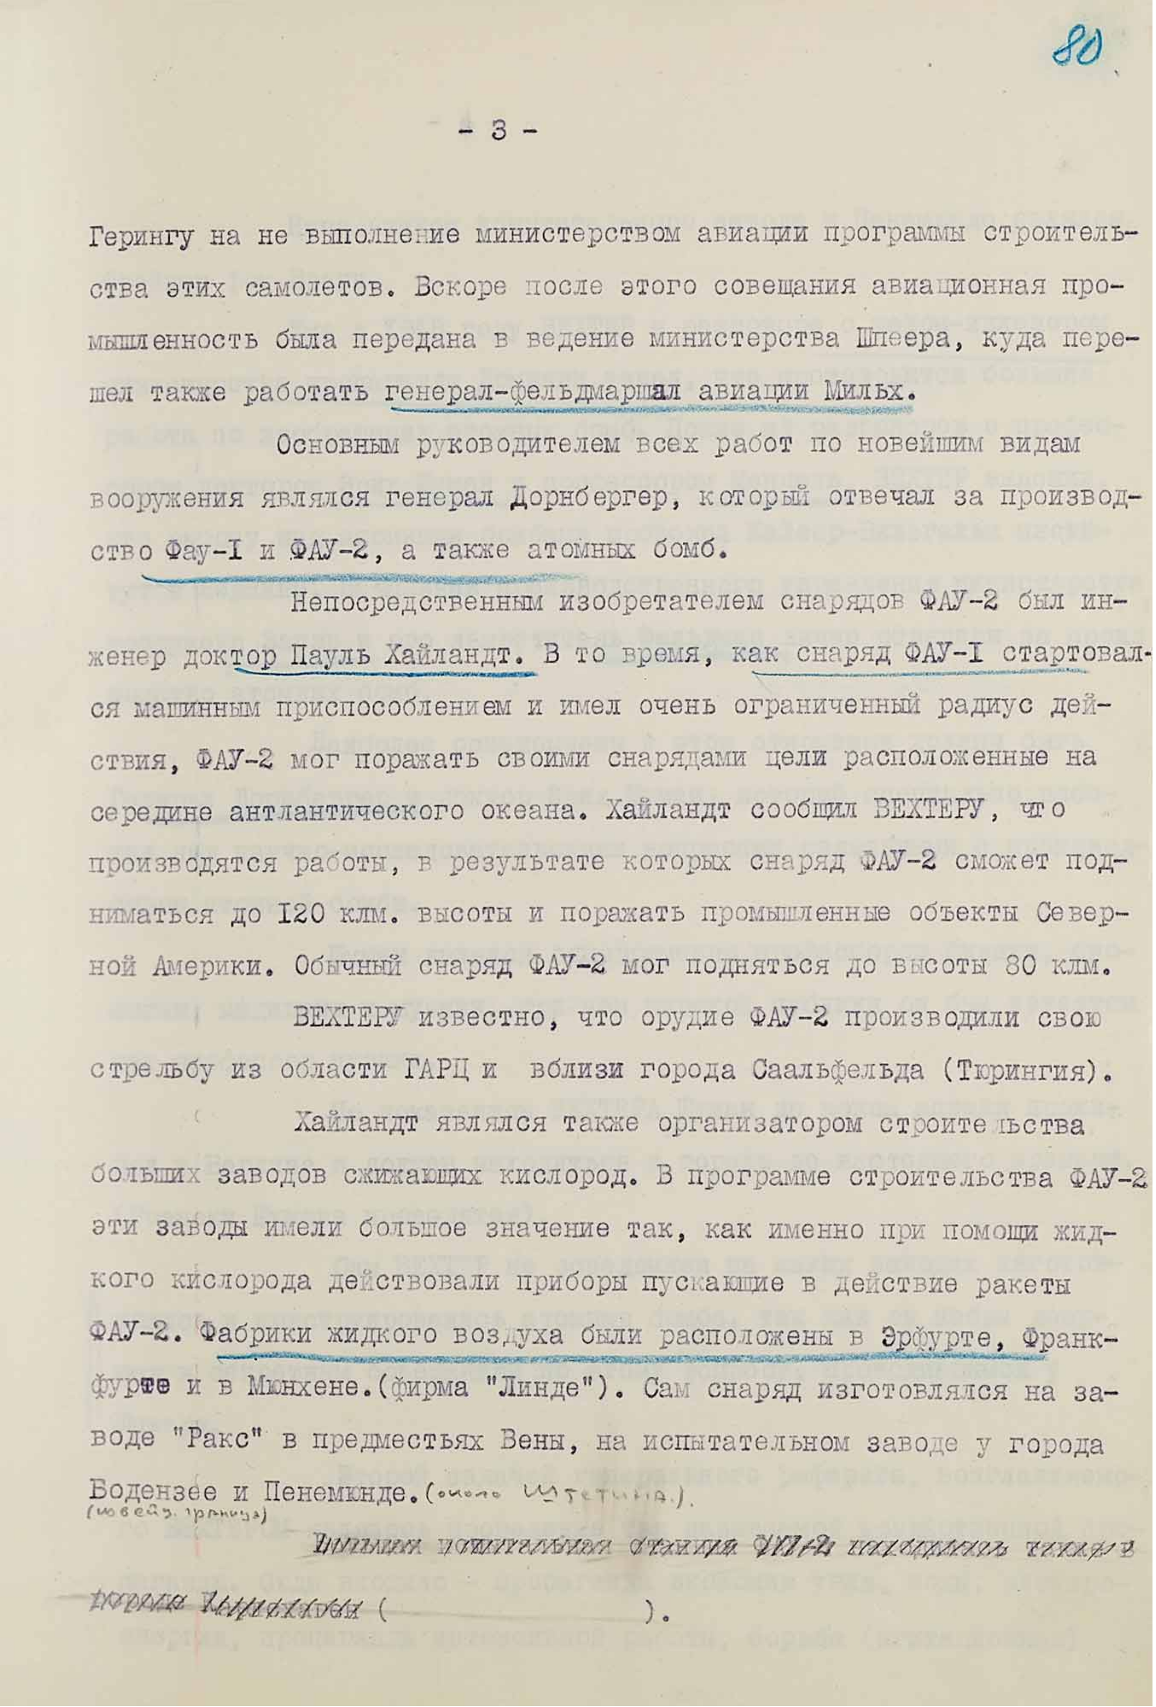
Заводы "Мессершмидта" разработали и пустили в производство проект турбинного истребителя, горючим для которого служили особые сорта масел, что было очень важно при том дифиците обычного горючего, которое ощущала германская экономика в последнее время.

На совещании по этому вопросу Зауэр и Шпеер заявили, что германская промышленность способна в ноябре I944 года выпускать до 5000 самолетов ежемесячно. Затруднения с горючим Шпеер предлагал ликвидировать постройкой нескольких сотен маленьких гидравлических заводов способных изготовлять до 3000 тонн синтетического бензина в месяц. По утверждению ВЕХТЕРА эти заводы были построены и приступили к работе. В результате этих мероприятий, положение с горючим значительно улучшилось, так как разбросанные маленькие заводы почти не подвергались воздушной опасности.

В том же I944 году были разработаны проекты бомбардировщиков очень дальнего радиуса действия, способных бомбить военностроительные центры Советского Союза на Урале и промышленные объекты Северной Америки. Эти бомбардировщики предполагалось использовать для траспортировки атомных бомб.

ВЕХТЕР передает, что по сообщению полковника авиации Герман, на одном из совещаний у Гитлера, тот очень резко указывал

Figure D.764: Aleksei Sidnev to Ivan Serov. Letter regarding NKVD interrogation of Werner Wächter. September 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



Герингу на не выполнение министерством авиации программы строительства этих самолетов. Вскоре после этого совещания авиационная промышленность была передана в ведение министерства Шпеера, куда перешел также работать генерал-фельдмаршал авиации Мильх.

Основным руководителем всех работ по новейшим видам вооружения являлся генерал Дорнбергер, который отвечал за производство Фау-I и ФАУ-2, а также атомных бомб.

Непосредственным изобретателем снарядов ФАУ-2 был инженер доктор Пауль Хайландт. В то время, как снаряд ФАУ-I стартовался машинным приспособлением и имел очень ограниченный радиус действия, ФАУ-2 мог поражать своими снарядами цели расположенные на середине антлантического океана. Хайландт сообщил ВЕХТЕРУ, что производятся работы, в результате которых снаряд ФАУ-2 сможет подниматься до I20 клм. высоты и поражать промышленные объекты Северной Америки. Обычный снаряд ФАУ-2 мог подняться до высоты 80 клм.

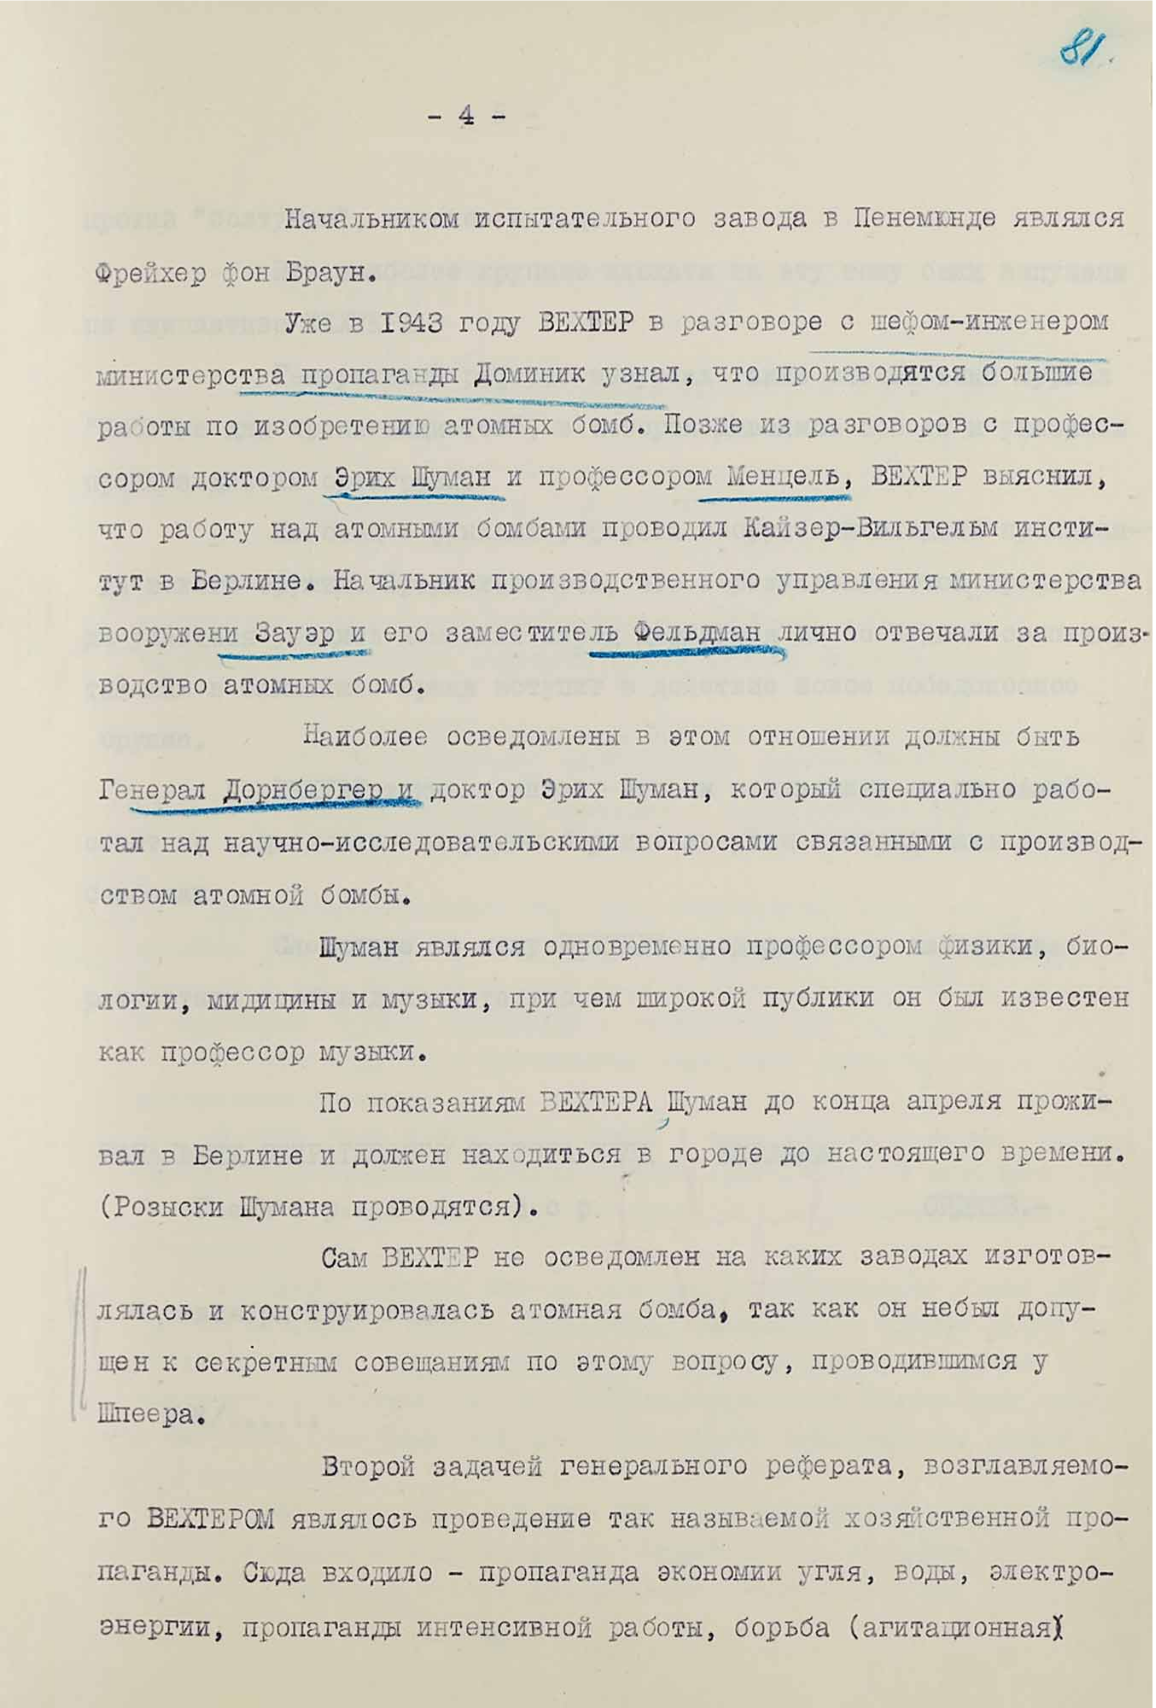
ВЕХТЕРУ известно, что орудие ФАУ-2 производили свою стрельбу из области ГАРЦ и вблизи города Саальфельда (Тюрингия).

Хайландт являлся также организатором строительства больших заводов сжижающих кислород. В программе строительства ФАУ-2 эти заводы имели большое значение так, как именно при помощи жидкого кислорода действовали приборы пускающие в действие ракеты ФАУ-2. Фабрики жидкого воздуха были расположены в Эрфурте, Франкфурте и в Мюнхене. (фирма "Линде"). Сам снаряд изготовлялся на заводе "Ракс" в предместьях Вены, на испытательном заводе у города Бодензее и Пенемюнде. (около Штетина.)
(швейц. граница)

~~[illegible] станция ФАУ-2 [illegible]~~

~~[illegible]~~ (   ).

Figure D.765: Aleksei Sidnev to Ivan Serov. Letter regarding NKVD interrogation of Werner Wächter. September 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



Начальником испытательного завода в Пенемюнде являлся Фрейхер фон Браун.

Уже в 1943 году ВЕХТЕР в разговоре с шефом-инженером министерства пропаганды Доминик узнал, что производятся большие работы по изобретению атомных бомб. Позже из разговоров с профессором доктором Эрих Шуман и профессором Менцель, ВЕХТЕР выяснил, что работу над атомными бомбами проводил Кайзер-Вильгельм институт в Берлине. Начальник производственного управления министерства вооружени Зауэр и его заместитель Фельдман лично отвечали за производство атомных бомб.

Наиболее осведомлены в этом отношении должны быть Генерал Дорнбергер и доктор Эрих Шуман, который специально работал над научно-исследовательскими вопросами связанными с производством атомной бомбы.

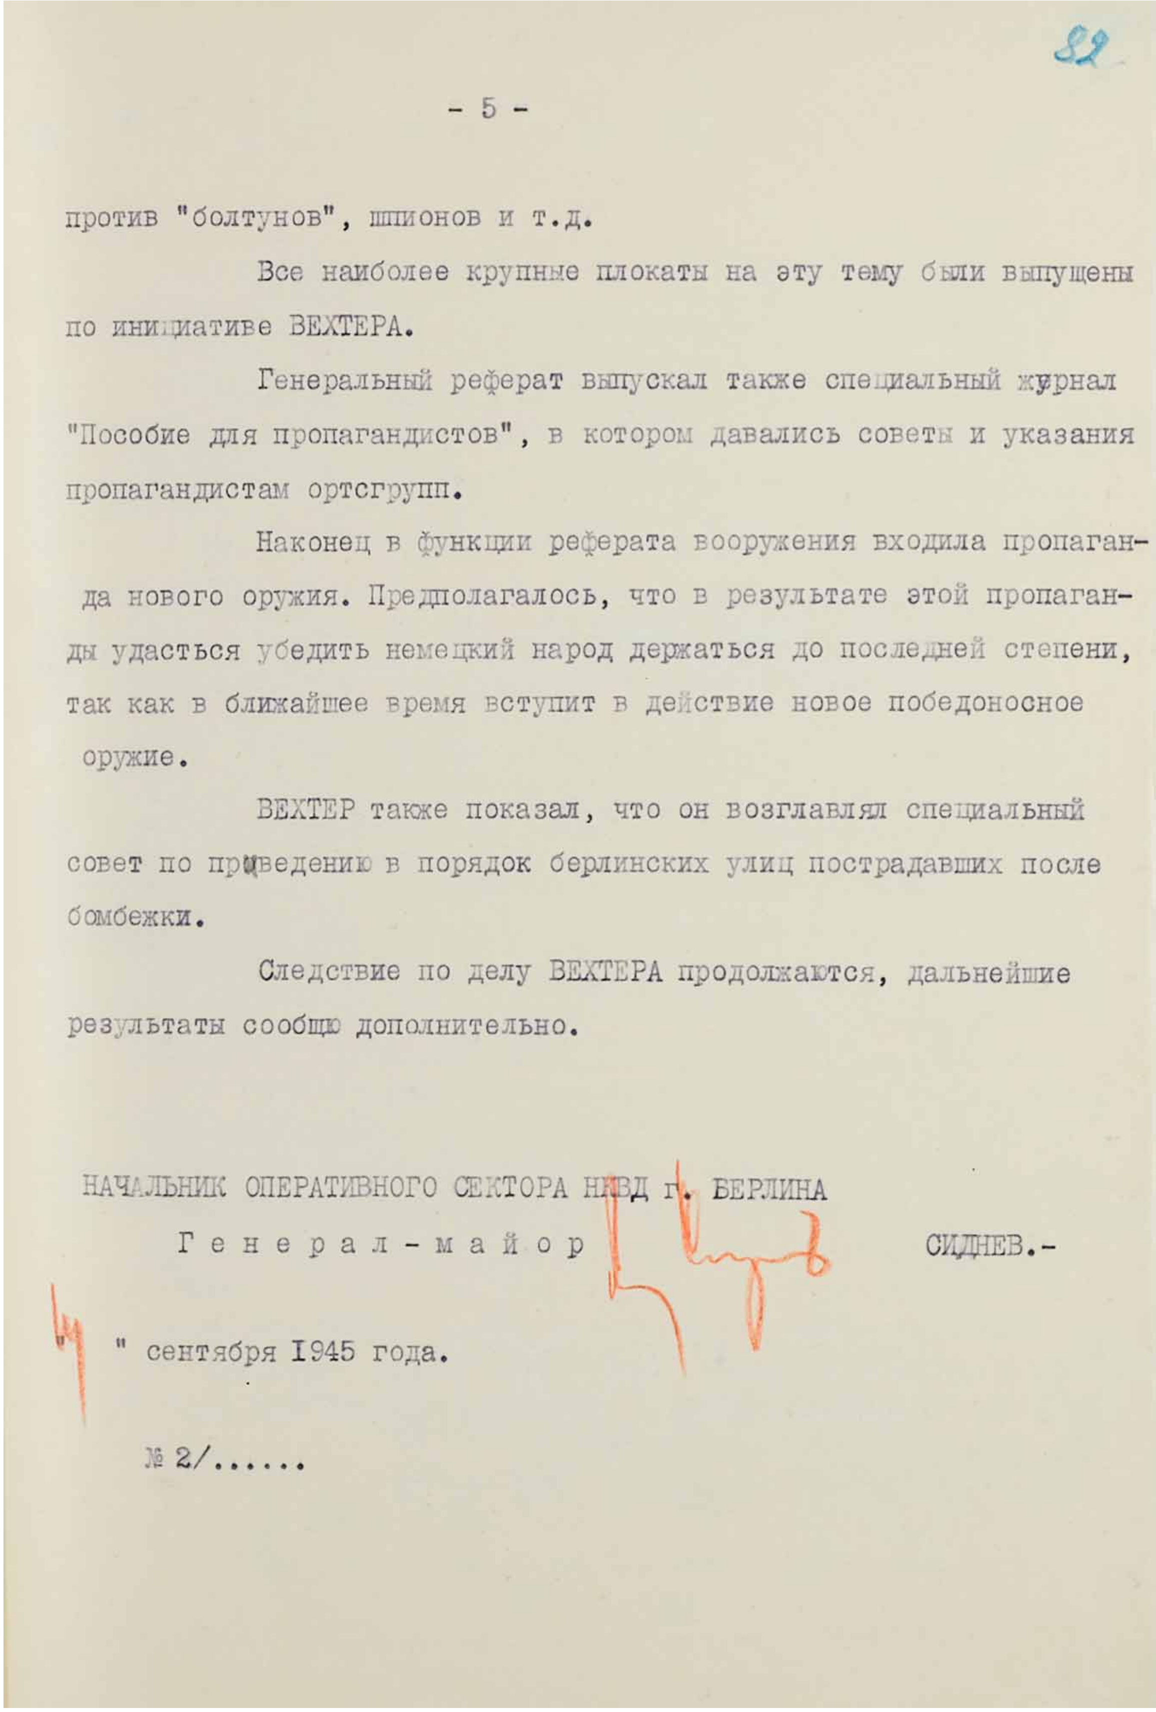
Шуман являлся одновременно профессором физики, биологии, мидицины и музыки, при чем широкой публики он был известен как профессор музыки.

По показаниям ВЕХТЕРА Шуман до конца апреля проживал в Берлине и должен находиться в городе до настоящего времени. (Розыски Шумана проводятся).

Сам ВЕХТЕР не осведомлен на каких заводах изготовлялась и конструировалась атомная бомба, так как он небыл допущен к секретным совещаниям по этому вопросу, проводившимся у Шпеера.

Второй задачей генерального реферата, возглавляемого ВЕХТЕРОМ являлось проведение так называемой хозяйственной пропаганды. Сюда входило - пропаганда экономии угля, воды, электроэнергии, пропаганды интенсивной работы, борьба (агитационная)

Figure D.766: Aleksei Sidnev to Ivan Serov. Letter regarding NKVD interrogation of Werner Wächter. September 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



82

- 5 -

против "болтунов", шпионов и т.д.

Все наиболее крупные плокаты на эту тему были выпущены по инициативе ВЕХТЕРА.

Генеральный реферат выпускал также специальный журнал "Пособие для пропагандистов", в котором давались советы и указания пропагандистам ортсгрупп.

Наконец в функции реферата вооружения входила пропаганда нового оружия. Предполагалось, что в результате этой пропаганды удастся убедить немецкий народ держаться до последней степени, так как в ближайшее время вступит в действие новое победоносное оружие.

ВЕХТЕР также показал, что он возглавлял специальный совет по приведению в порядок берлинских улиц пострадавших после бомбежки.

Следствие по делу ВЕХТЕРА продолжаются, дальнейшие результаты сообщу дополнительно.

Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945. [FSB Archive, Moscow]

Transcript.

INTERROGATION PROTOCOL

of the arrested WÄCHTER Werner.-

10 October 1945.

WÄCHTER W., born in 1902, native of Erfurt, Germany, former Chief of the Economic Administration of the German Ministry of Propaganda and staff officer of the Main Administration of NSDAP Propaganda with the rank of "SA Gruppenführer."

Interrogation began at 11:50.
Interrogation ended at 17:00.

Question — In previous interrogations you testified that you were aware of the preparations being carried out in Germany for the use of an atomic bomb.

From what sources did you know about this?

Answer — I first learned that the German Ministry of Armaments was preparing to use an atomic bomb from engineer [Hans] DOMINIK [pp. 1218, 1968, 1970].

Question — Who is DOMINIK?

Answer — Dominik (I don't remember his name) worked in the Ministry of Propaganda as a communications engineer and, by the nature of his work, maintained contact with senior engineers, specialists working in the field of secret weapons and, in particular, on the atomic bomb. I had known DOMINIK since 1940 from our joint work in the Propaganda Ministry.

Question — In connection with what and what exactly did DOMINIK tell you about the manufacture of the atomic bomb?

Answer — DOMINIK spoke to me about the atomic bomb in 1943 in one of his private conversations.

He told me that German scientists had succeeded in achieving the splitting of the atomic nucleus and that engineers and specialists were developing methods and ways of practical application of this energy as a means of waging war. To my question—is the enemy working on a solution to this problem—DOMINIK answered that similar work was being carried out by the British and Americans, but Germany, allegedly, was ahead of them in this field by a year and a half. He did not name the exact date of the beginning of this work.

Question — Obviously, corresponding practical work was also carried out in Germany to prepare for the use of the atomic bomb? Can you tell us about it?

Answer — I knew that the Ministry of Armaments was carrying out practical work to prepare for the use of the atomic bomb. I learned about this from my friend, the editor of the secret government bulletin, Hans HERTEL.

As HERTEL told me, in February 1945, on behalf of the Minister of Propaganda GOEBBELS, he went on a business trip to the city of Celle and met there with his acquaintance, the head of the military air force school for special purposes, Colonel Hajo HERMANN, who told him in a private conversation that the school was armed with aircraft of the latest design. These aircraft have a long range and will be armed with this bomb. As Colonel Hajo [HERMANN] stated to HERTEL—the new aircraft were intended for bombing industrial centers of the Soviet Union, located in the Urals and Central Asia, with atomic bombs.

From HERTEL, I know that at the airfield in the city of Celle there were both bombers of the latest design and fighters intended to protect them during flights. In addition, HERTEL reported that aircraft of this design were concentrated at other airfields.

Based on conversations with DOMINIK and HERTEL, I came to the conclusion that the German Ministry of Armaments was preparing to use atomic bombs in 1945. I could also judge this from other facts that were known to me as a leading official of the German Ministry of Propaganda.

Question — What other facts are you talking about?

Answer — I do not have precise information about the exact dates the atomic bombs would have been used against the Soviet Union during the war. However, I would like to tell the investigation about certain signs that give me reason to believe that an atomic bomb could have been used in the war against the Soviet Union in the summer of 1945.

In one of my conversations with him, the State Secretary of the Propaganda Ministry, Dr. [Werner] NAUMANN, speaking about the military and political situation in Germany at the last stage of the war, stated that everything should soon change for the better [p. 4429] and referred to the words of Hitler, who in a narrow circle of trusted people said: “Yes, God forgive me for the last 14 days of the war.”

In addition, at the beginning of 1945, I met with the head of the armament department, [Karl-Otto] SAUR, one of the leaders of German industry and, in fact, the deputy minister of armaments of [Albert] SPEER. SAUR secretly informed me that at present intensive work is being carried out on the production of the newest weapons, which will soon be used at the front.

In the spring of 1945, the inventor from the German Scientific Research Council, Professor [Erich] SCHUMANN, spoke to me about this, stating that he was carrying out a lot of work on a secret weapon that could change the entire course of the war in Germany’s favor [pp. 4186–4255].

Question — What secret weapon did SAUR and SCHUMANN talk to you about?

Answer — They did not tell me what new weapon had been invented, but knowing from DOMINIK and HERTEL that work was underway to make an atomic bomb, I believe that SCHUMANN and SAUR also meant an atomic bomb.

I must state that the conversations with SCHUMANN and SAUR were of a strictly confidential nature and they could not tell me in detail about the manufacture of the new weapon, since it was a special state secret.

Question — It must be assumed that you, as a leading official of the fascist party and the Propaganda Ministry, were also aware of other, more specific facts.

Answer — I told the investigation all the facts known to me and some signs indicating the plans of the German government to use secret weapons and, in particular, an atomic bomb in the war against the USSR in the summer of 1945. I can add that in March 1945, GOEBBELS, in my presence, gave instructions to an employee of the Propaganda Ministry, von BORKE, to put up a horoscope for the month of June, supposedly predicting HITLER's fate, since June was considered especially favorable for HITLER. The predictions of the horoscope, by order of GOEBBELS, were supposed to be distributed among the population of Germany in June 1945.

When compared with other data, I believe that behind this instruction was concealed the intensive preparations for the use of secret weapons, calculated for June 1945.

In addition, in April 1945, GOEBBELS, at a meeting of the employees of the Propaganda Ministry, in a report on the tasks of National Socialist propaganda, stated: "Despite the difficult challenges, we should not lose confidence, since soon a new weapon will be used that will change the entire course of the war."

Question — Can you name the specialists who directly worked on the manufacture of the atomic bomb in Germany?

Answer — I know that the following persons had a direct relationship with all types of secret weapons and, in particular, the atomic bomb: General [Walter] DORNBERGER, head of the office of new types of weapons of the SPEER Ministry, previously lived in Berlin-Charlottenburg, Riehlstrasse. I do not know where DORNBERGER is now.

SAUR, the head of the industry department of the Ministry of Armaments was one of the trusted people of the Minister of Armaments TODT, and then of his successor SPEER. SAUR was actually in charge of the production of all the new types of weapons in Germany. As far as I know, he personally reported every month to HITLER about the quantity of military products manufactured.

FELDMANN (I don't know his name) was SAUR's deputy in the Ministry of Armaments. I know that SAUR and FELDMANN fled to Kulmbach (northern Bavaria) in April 1945.

Professor [Max] PLANCK is one of the oldest leaders of the Kaiser Wilhelm Research Institute. He worked for a long time on the problem of splitting the atomic nucleus, which was known to the leading officials of Germany, including me.

Question — Where is PLANCK currently located?

Answer — I assume that PLANCK lives in Berlin in the Dahlem district. In addition to Planck, Professor [Wilhelm] ZEYSS [pp. 5674–5682], who was in charge of the construction of aircraft intended for dropping atomic bombs, had a direct relationship with secret weapons issues.

From the words of ZEYSS's nephew I know that he currently lives in the suburb of Berlin-Rahnsdorf.

Question — Regarding the production of new types of weapons, besides the V-bomb [V-1], what do you know?

Answer — I also knew about the production of the new secret weapon “V-2.” I knew about this from my close friend HEYLANDT.

Question — Who is HEYLANDT?

Answer — Dr. Paul HEYLANDT, an engineer and inventor. I have known him since 1925. Back in 1930, he told me that he had managed to invent a new type of rocket engine for a car. In 1935, the German Ministry of War confiscated the patent for this invention. However, HEYLANDT continued to work on this invention, but under the control of the Ministry of War, and he was the owner of a rocket engine factory in Berlin.

In 1943, while visiting HEYLANDT at his country house in the Königs Wusterhausen area, he told me that he was working on a new, in his words ”terrible and deadly weapon” rocket projectile, which Hitler named “V-2.”

According to HEYLANDT, the “V-2” is a rocket-propelled missile of enormous destructive power, loaded with one ton of explosive and with a high flight speed. According to HEYLANDT’s calculations, this speed is so high [during reentry] that the missile’s controls would become unusable and its practical use would be impossible. He solved this problem by enclosing the missile’s control mechanisms in a shell of liquid air [coolant].

HEYLANDT also said that he is working on solving the problem of increasing the flight altitude to 120 kilometers. The fact is that, according to his reckoning, the “V-2” can reach an altitude of 80 kilometers during flight, but this is not enough to fire at the USA from German territory. Having reached an altitude of 120 km, a rocket projectile fired from Germany could reach New York.

Question — Have you personally visited the HEYLANDT plant?

Answer — Yes, I have been to this plant many times, but I have never seen a “V-2.” I personally examined 7–8 meter high rocket towers in special halls. The towers were intended for launching “V-2,” which gave them a direction of flight.

Later, the HEYLANDT plant was moved to the town of Gassen [Guben or Gablenz?] near Sohmer not far from the city of Cottbus.

Question — What else do you know about the production of “V-2”?

Answer — HEYLANDT told me that in 1943–44 in Belgium, in the area of the city of Liège, underground structures were built for firing the rocket projectile “V-2.” Later, these underground structures were destroyed by Anglo-American aircraft, and the remaining equipment was taken to Thuringia in the area of the city of Saalfeld and in the area of Harz, where practical testing of the “V-2” was carried out.

Question — Where else were the test stations located?

Answer — I know from HEYLANDT that there were also testing stations in the Peenemünde area (northern Germany) and one testing site was located on the Swiss border in the Lake Constance area. For the sake of secrecy, the town of Peenemünde was recently renamed “Karlshagen.”

HEYLANDT said that he was present at the “V-2” test at the testing station in the Lake Constance area. According to his stories, the inhabitants of the Swiss border strip were very surprised by the bright light and loud noise produced by the test.

Question — Do you know where HEYLANDT is currently located?

Answer — I know from my brother's wife Charlotte WÄCHTER that HEYLANDT was sent to Moscow by representatives of the Soviet military authorities.

Question — Can you name the persons who were directly involved in the development of secret weapons or were aware of it?

Answer — A person knowledgeable about secret weapons was the former head of the culture department and head of propaganda of the Ministry of Armaments, HOFFMANN.

Question — What do you know about the whereabouts of HOFFMANN?

Answer — HOFFMANN lived in the eastern part of Berlin. My former personal secretary Edith RICHERT, who lives in Berlin-Weissensee, Generalstrasse, can tell about him.

In addition, the person in the know was the secretary for secret affairs of Minister SPEER, Annemarie KEMPF (maiden name WITTENBERG). KEMPF lives in Berlin-Steglitz with her mother WITTENBERG, not far from the Magistracy (Rathaus). I know that KEMPF was in charge of the special secret correspondence of Minister SPEER and personally printed his reports for Hitler on the state of the military industry.

The interrogation transcript from my words is written down correctly and the German language spoken to me is correct:

(WÄCHTER)

INTERROGATOR: COLONEL-GENERAL: (SEROV)

MAJOR: (KOZYREV)

TRANSLATOR: JUNIOR LIEUTENANT: (RUDIN)

Werner Wächter

ПРОТОКОЛ ДОПРОСА

арестованного ВЕХТЕР Вернера.-

от 10 октября 1945 года.

ВЕХТЕР В., 1902 года рождения, уроженец г.Эрфурт, немец, быв.Начальник Хозяйственного Управления Германского Министерства пропаганды и штаб-шеф Главного Управления пропаганды НСДАП в звании "группенфюрер СА".

Начало допроса - в 11 час. 50 м.
Конец -"- - в 17 час. 00 м.

Вопрос - На прошлых допросах вы показали о том, что были осведомлены о проводившейся в Германии подготовке к применению атомной бомбы.

Из каких источников вам было известно об этом?

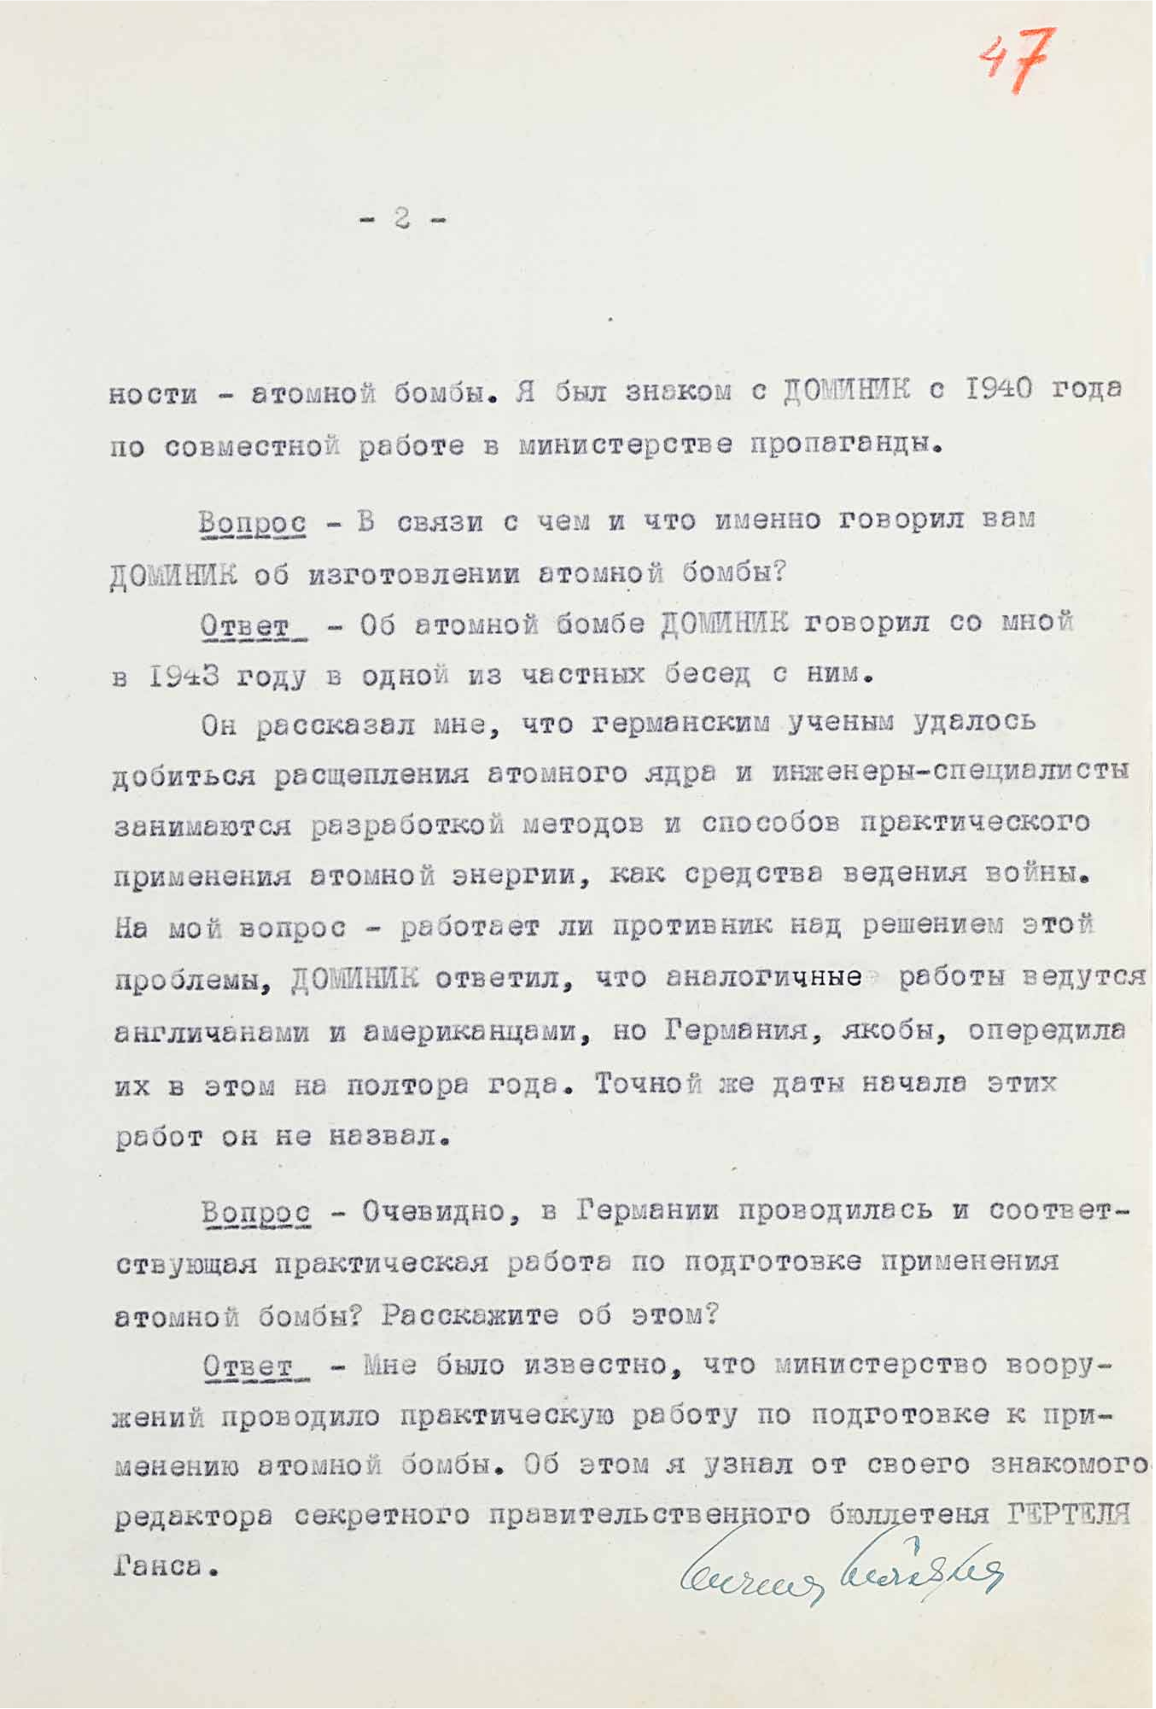
Ответ - О том, что Германское министерство вооружений проводит подготовку к применению атомной бомбы я впервые узнал от инженера ДОМИНИК.

Вопрос - Кто такой ДОМИНИК?

Ответ - ДОМИНИК /имени его не помню/, работал в Министерстве пропаганды инженером связи и по роду своей работы поддерживал контакт с руководящими инженерами-специалистами, работавшими в области секретного вооружения и, в част-

Werner Wächter

Figure D.768: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



ности - атомной бомбы. Я был знаком с ДОМИНИК с 1940 года по совместной работе в министерстве пропаганды.

Вопрос - В связи с чем и что именно говорил вам ДОМИНИК об изготовлении атомной бомбы?

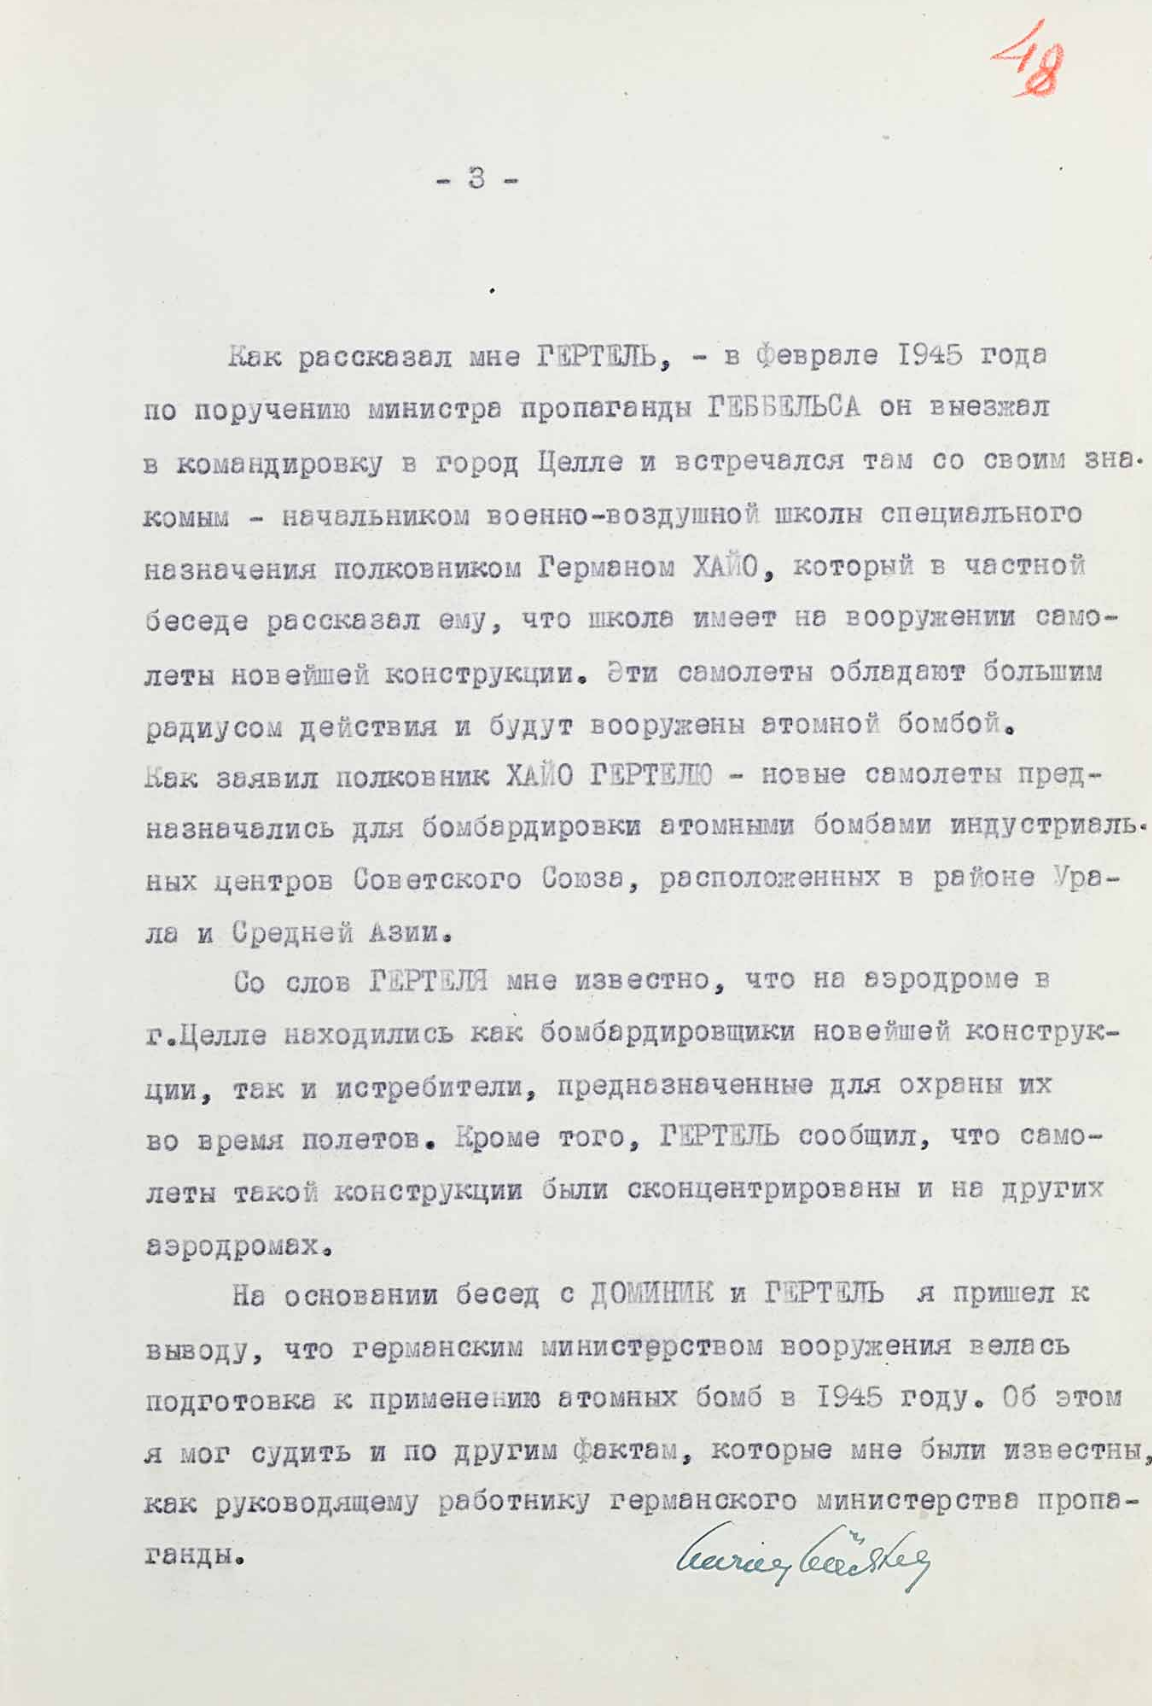
Ответ - Об атомной бомбе ДОМИНИК говорил со мной в 1943 году в одной из частных бесед с ним.

Он рассказал мне, что германским ученым удалось добиться расщепления атомного ядра и инженеры-специалисты занимаются разработкой методов и способов практического применения атомной энергии, как средства ведения войны. На мой вопрос - работает ли противник над решением этой проблемы, ДОМИНИК ответил, что аналогичные работы ведутся англичанами и американцами, но Германия, якобы, опередила их в этом на полтора года. Точной же даты начала этих работ он не назвал.

Вопрос - Очевидно, в Германии проводилась и соответствующая практическая работа по подготовке применения атомной бомбы? Расскажите об этом?

Ответ - Мне было известно, что министерство вооружений проводило практическую работу по подготовке к применению атомной бомбы. Об этом я узнал от своего знакомого редактора секретного правительственного бюллетеня ГЕРТЕЛЯ Ганса.

Figure D.769: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



48

- 3 -

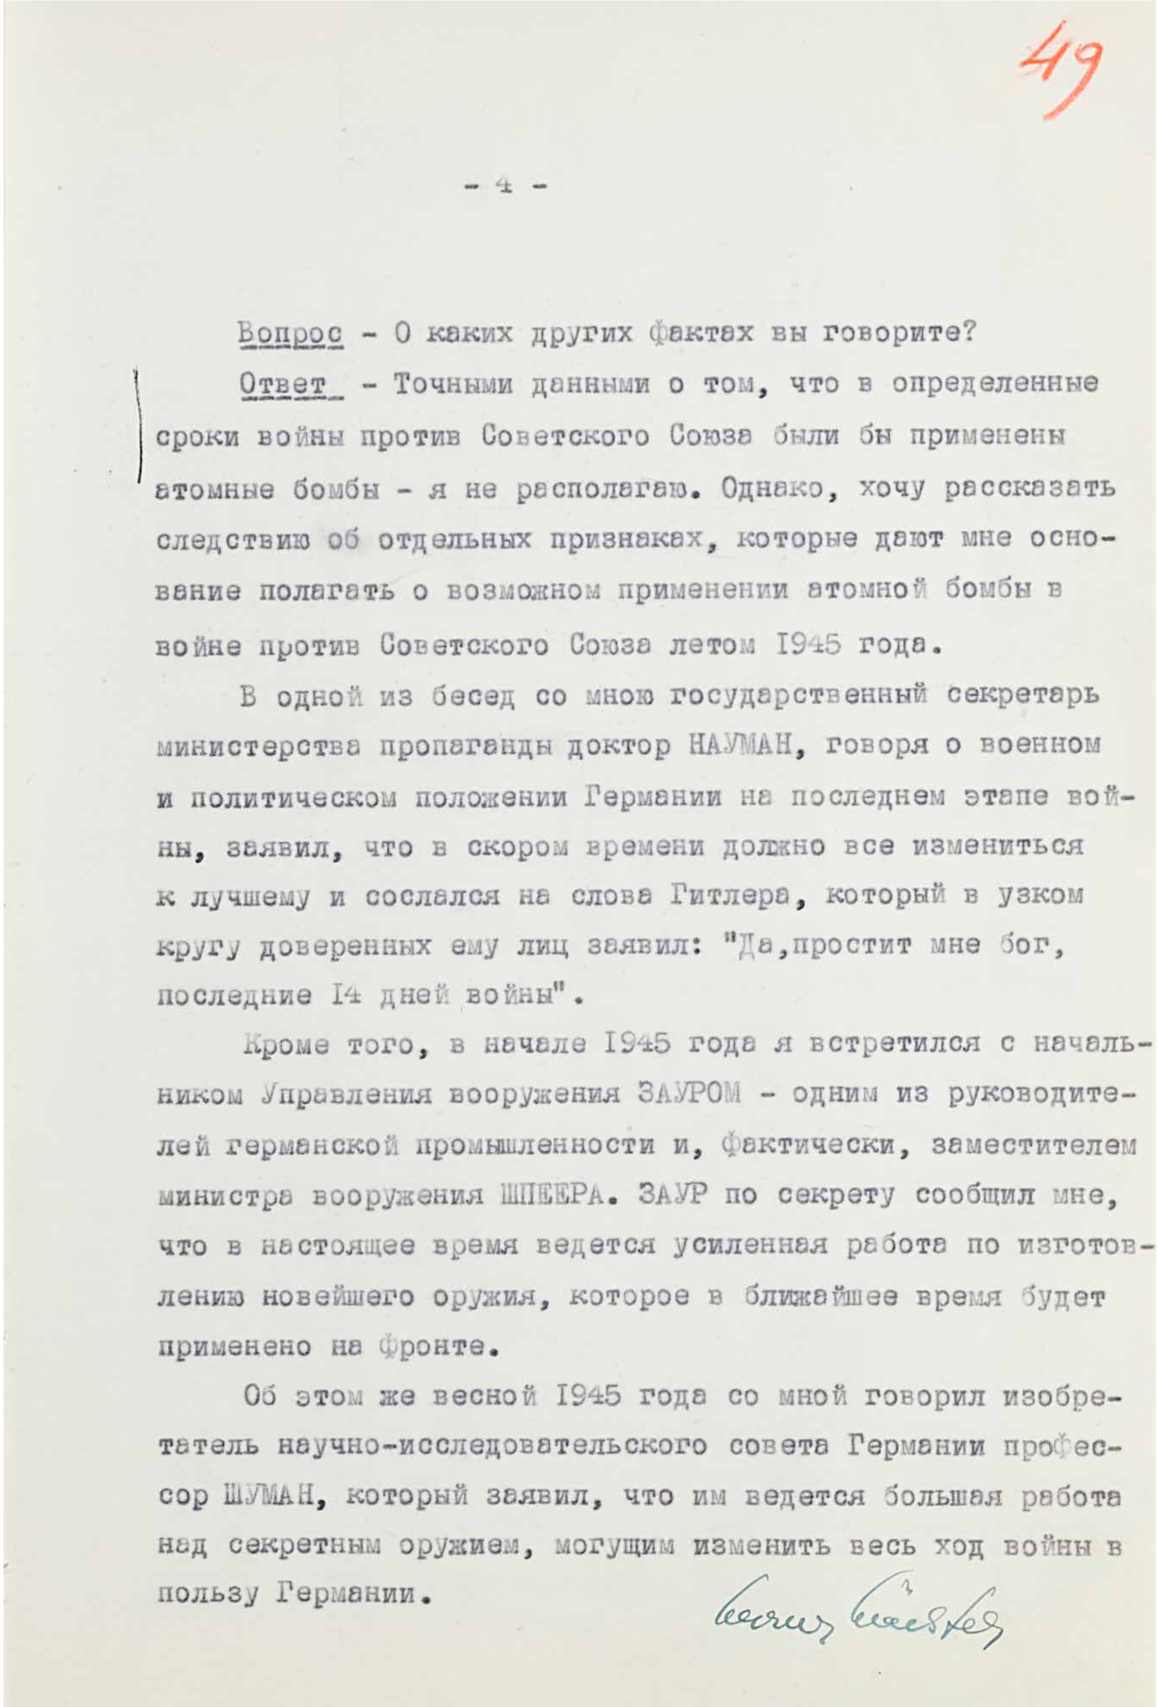
Как рассказал мне ГЕРТЕЛЬ, - в феврале 1945 года по поручению министра пропаганды ГЕББЕЛЬСА он выезжал в командировку в город Целле и встречался там со своим знакомым - начальником военно-воздушной школы специального назначения полковником Германом ХАЙО, который в частной беседе рассказал ему, что школа имеет на вооружении самолеты новейшей конструкции. Эти самолеты обладают большим радиусом действия и будут вооружены атомной бомбой.

Как заявил полковник ХАЙО ГЕРТЕЛЮ - новые самолеты предназначались для бомбардировки атомными бомбами индустриальных центров Советского Союза, расположенных в районе Урала и Средней Азии.

Со слов ГЕРТЕЛЯ мне известно, что на аэродроме в г.Целле находились как бомбардировщики новейшей конструкции, так и истребители, предназначенные для охраны их во время полетов. Кроме того, ГЕРТЕЛЬ сообщил, что самолеты такой конструкции были сконцентрированы и на других аэродромах.

На основании бесед с ДОМИНИК и ГЕРТЕЛЬ я пришел к выводу, что германским министерством вооружения велась подготовка к применению атомных бомб в 1945 году. Об этом я мог судить и по другим фактам, которые мне были известны, как руководящему работнику германского министерства пропаганды.

Figure D.770: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



Вопрос - О каких других фактах вы говорите?

Ответ - Точными данными о том, что в определенные сроки войны против Советского Союза были бы применены атомные бомбы - я не располагаю. Однако, хочу рассказать следствию об отдельных признаках, которые дают мне основание полагать о возможном применении атомной бомбы в войне против Советского Союза летом 1945 года.

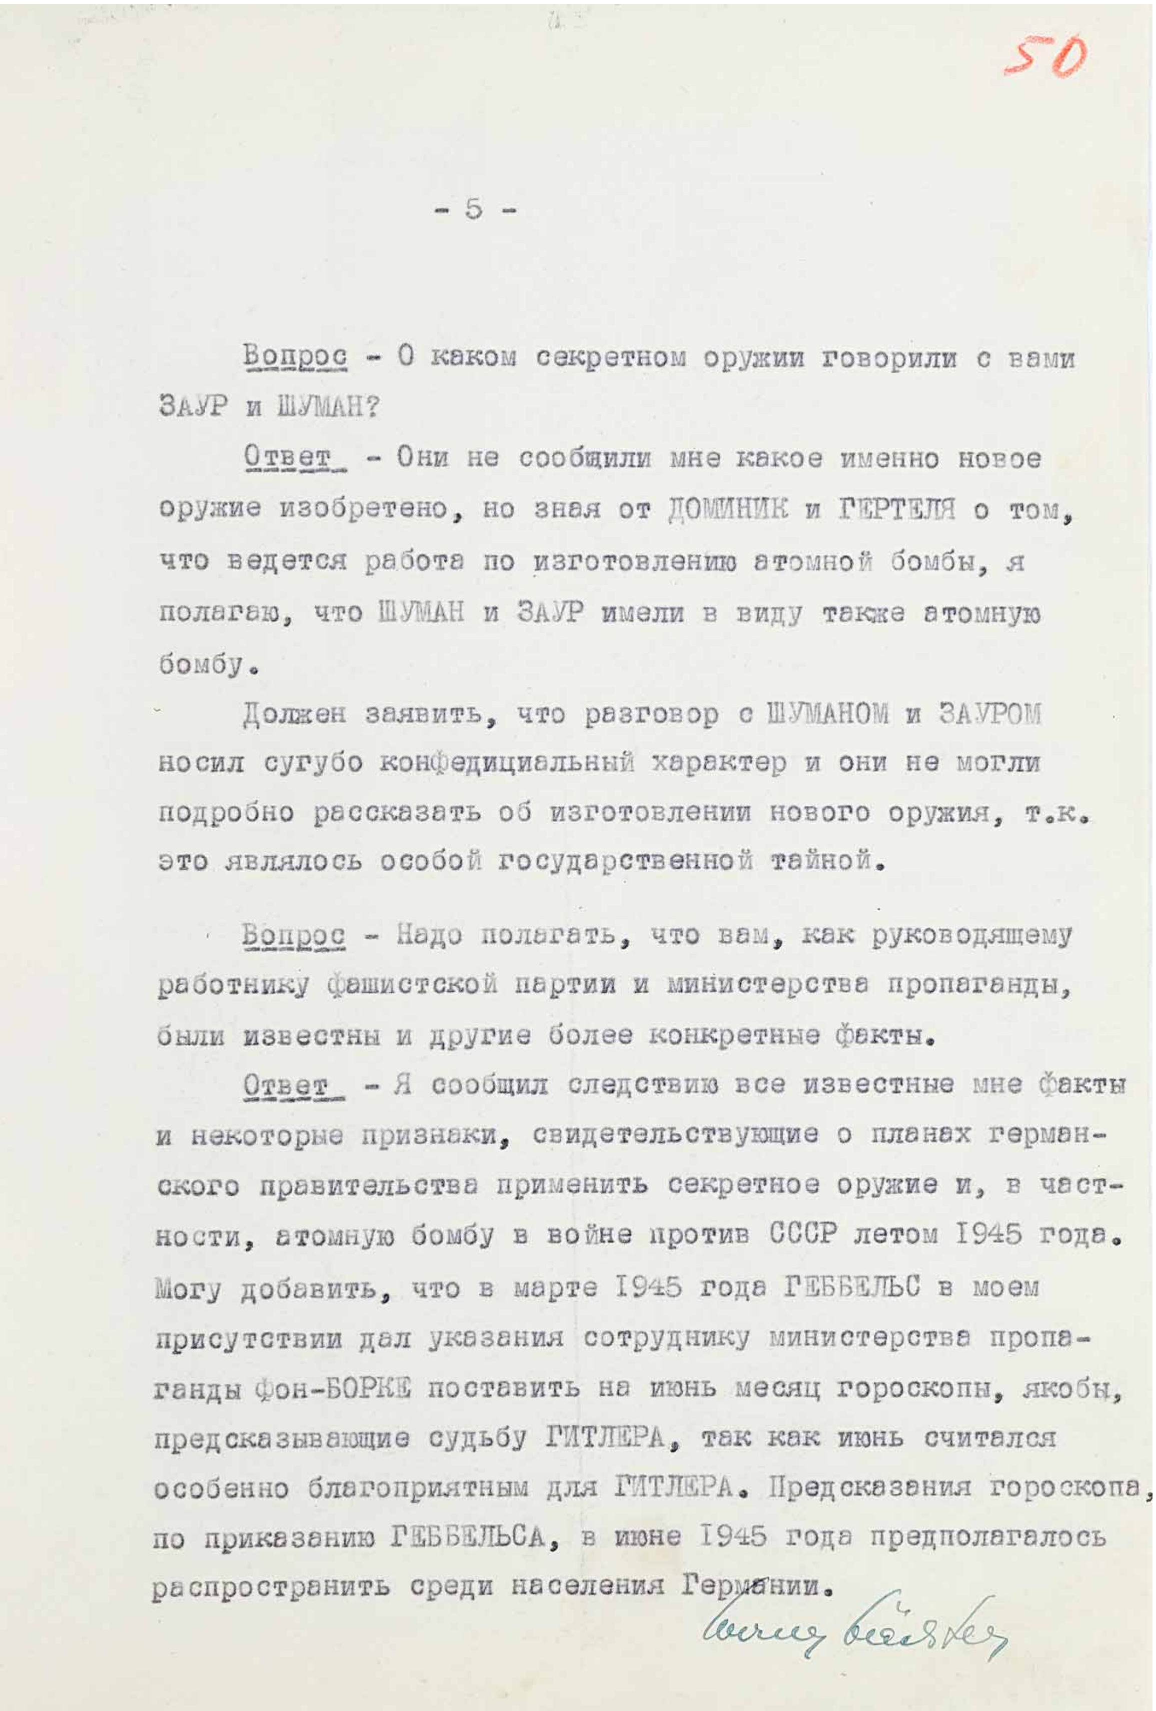
В одной из бесед со мною государственный секретарь министерства пропаганды доктор НАУМАН, говоря о военном и политическом положении Германии на последнем этапе войны, заявил, что в скором времени должно все измениться к лучшему и сослался на слова Гитлера, который в узком кругу доверенных ему лиц заявил: "Да,простит мне бог, последние 14 дней войны".

Кроме того, в начале 1945 года я встретился с начальником Управления вооружения ЗАУРОМ - одним из руководителей германской промышленности и, фактически, заместителем министра вооружения ШПЕЕРА. ЗАУР по секрету сообщил мне, что в настоящее время ведется усиленная работа по изготовлению новейшего оружия, которое в ближайшее время будет применено на фронте.

Об этом же весной 1945 года со мной говорил изобретатель научно-исследовательского совета Германии профессор ШУМАН, который заявил, что им ведется большая работа над секретным оружием, могущим изменить весь ход войны в пользу Германии.

Werner Wächter

Figure D.771: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



50

- 5 -

Вопрос - О каком секретном оружии говорили с вами ЗАУР и ШУМАН?

Ответ - Они не сообщили мне какое именно новое оружие изобретено, но зная от ДОМИНИК и ГЕРТЕЛЯ о том, что ведется работа по изготовлению атомной бомбы, я полагаю, что ШУМАН и ЗАУР имели в виду также атомную бомбу.

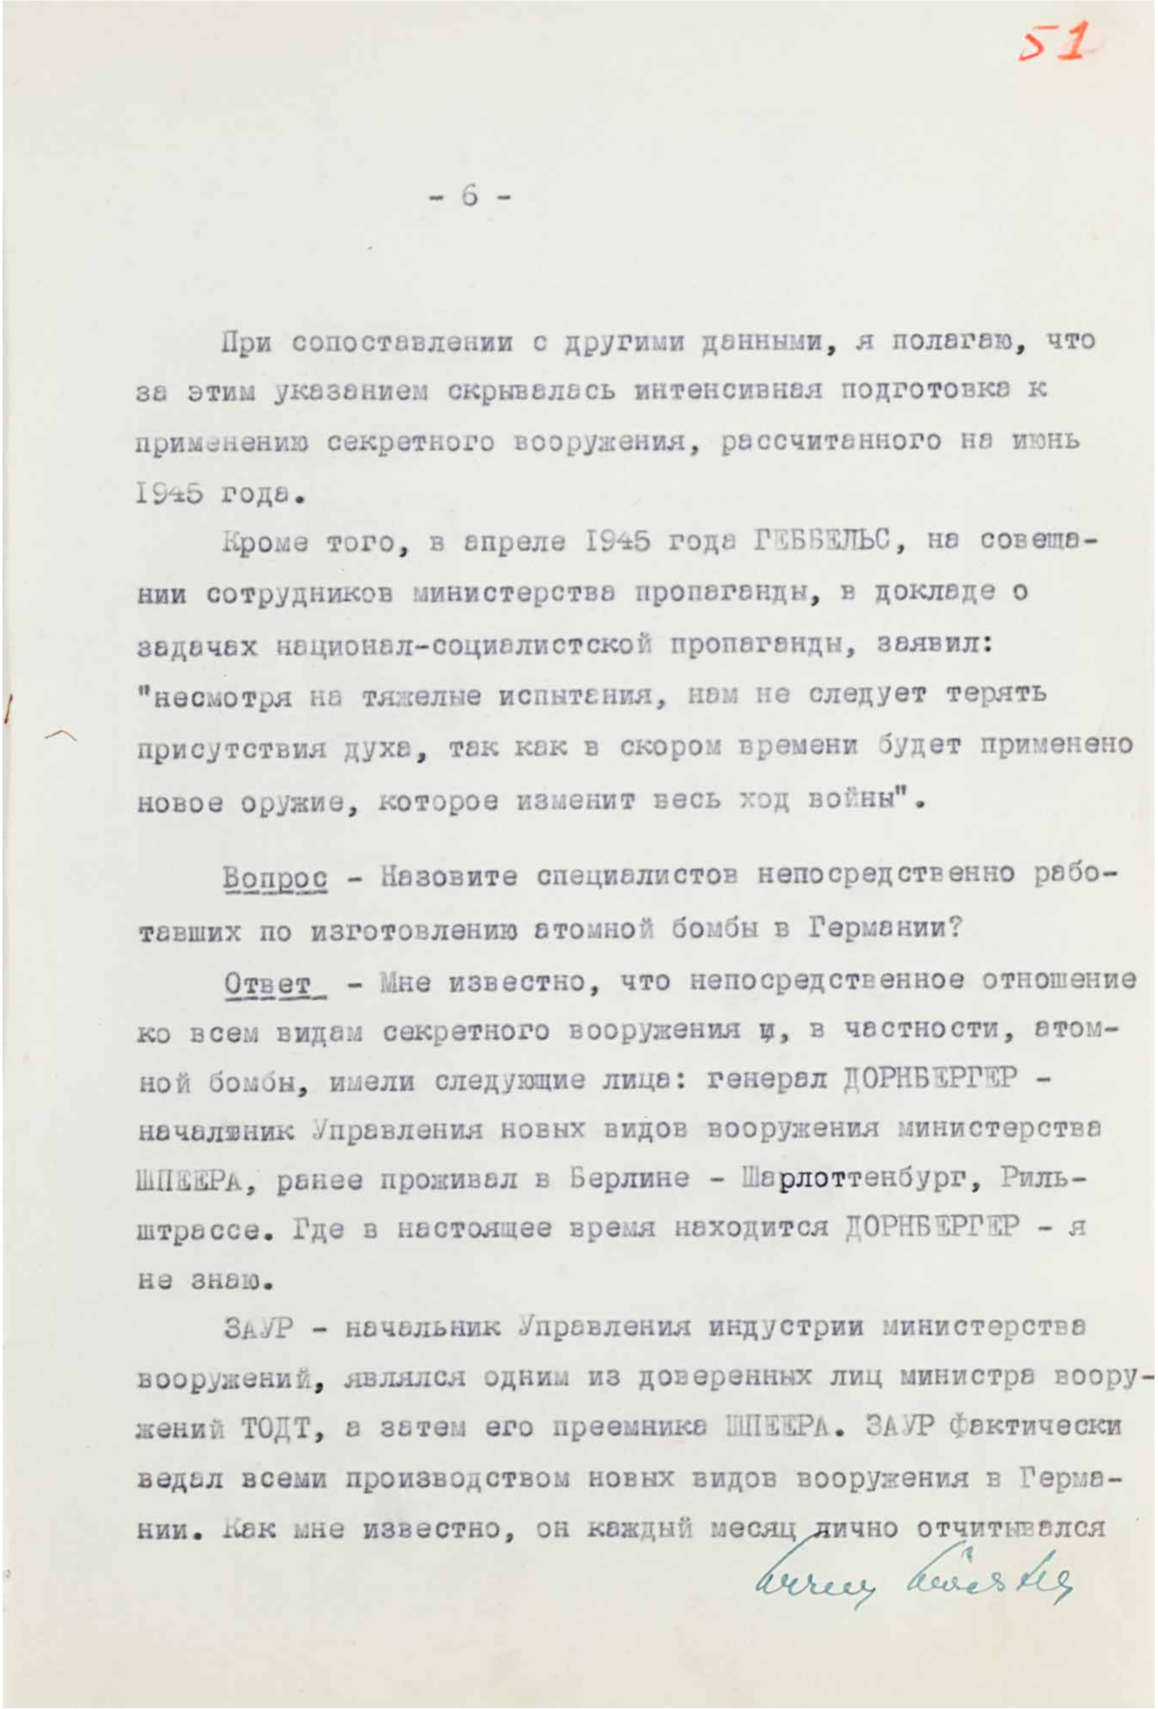
Должен заявить, что разговор с ШУМАНОМ и ЗАУРОМ носил сугубо конфедициальный характер и они не могли подробно рассказать об изготовлении нового оружия, т.к. это являлось особой государственной тайной.

Вопрос - Надо полагать, что вам, как руководящему работнику фашистской партии и министерства пропаганды, были известны и другие более конкретные факты.

Ответ - Я сообщил следствию все известные мне факты и некоторые признаки, свидетельствующие о планах германского правительства применить секретное оружие и, в частности, атомную бомбу в войне против СССР летом 1945 года. Могу добавить, что в марте 1945 года ГЕББЕЛЬС в моем присутствии дал указания сотруднику министерства пропаганды фон-БОРКЕ поставить на июнь месяц гороскопы, якобы, предсказывающие судьбу ГИТЛЕРА, так как июнь считался особенно благоприятным для ГИТЛЕРА. Предсказания гороскопа, по приказанию ГЕББЕЛЬСА, в июне 1945 года предполагалось распространить среди населения Германии.

Werner Wächter

Figure D.772: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



При сопоставлении с другими данными, я полагаю, что за этим указанием скрывалась интенсивная подготовка к применению секретного вооружения, рассчитанного на июнь 1945 года.

Кроме того, в апреле 1945 года ГЕББЕЛЬС, на совещании сотрудников министерства пропаганды, в докладе о задачах национал-социалистской пропаганды, заявил: "несмотря на тяжелые испытания, нам не следует терять присутствия духа, так как в скором времени будет применено новое оружие, которое изменит весь ход войны".

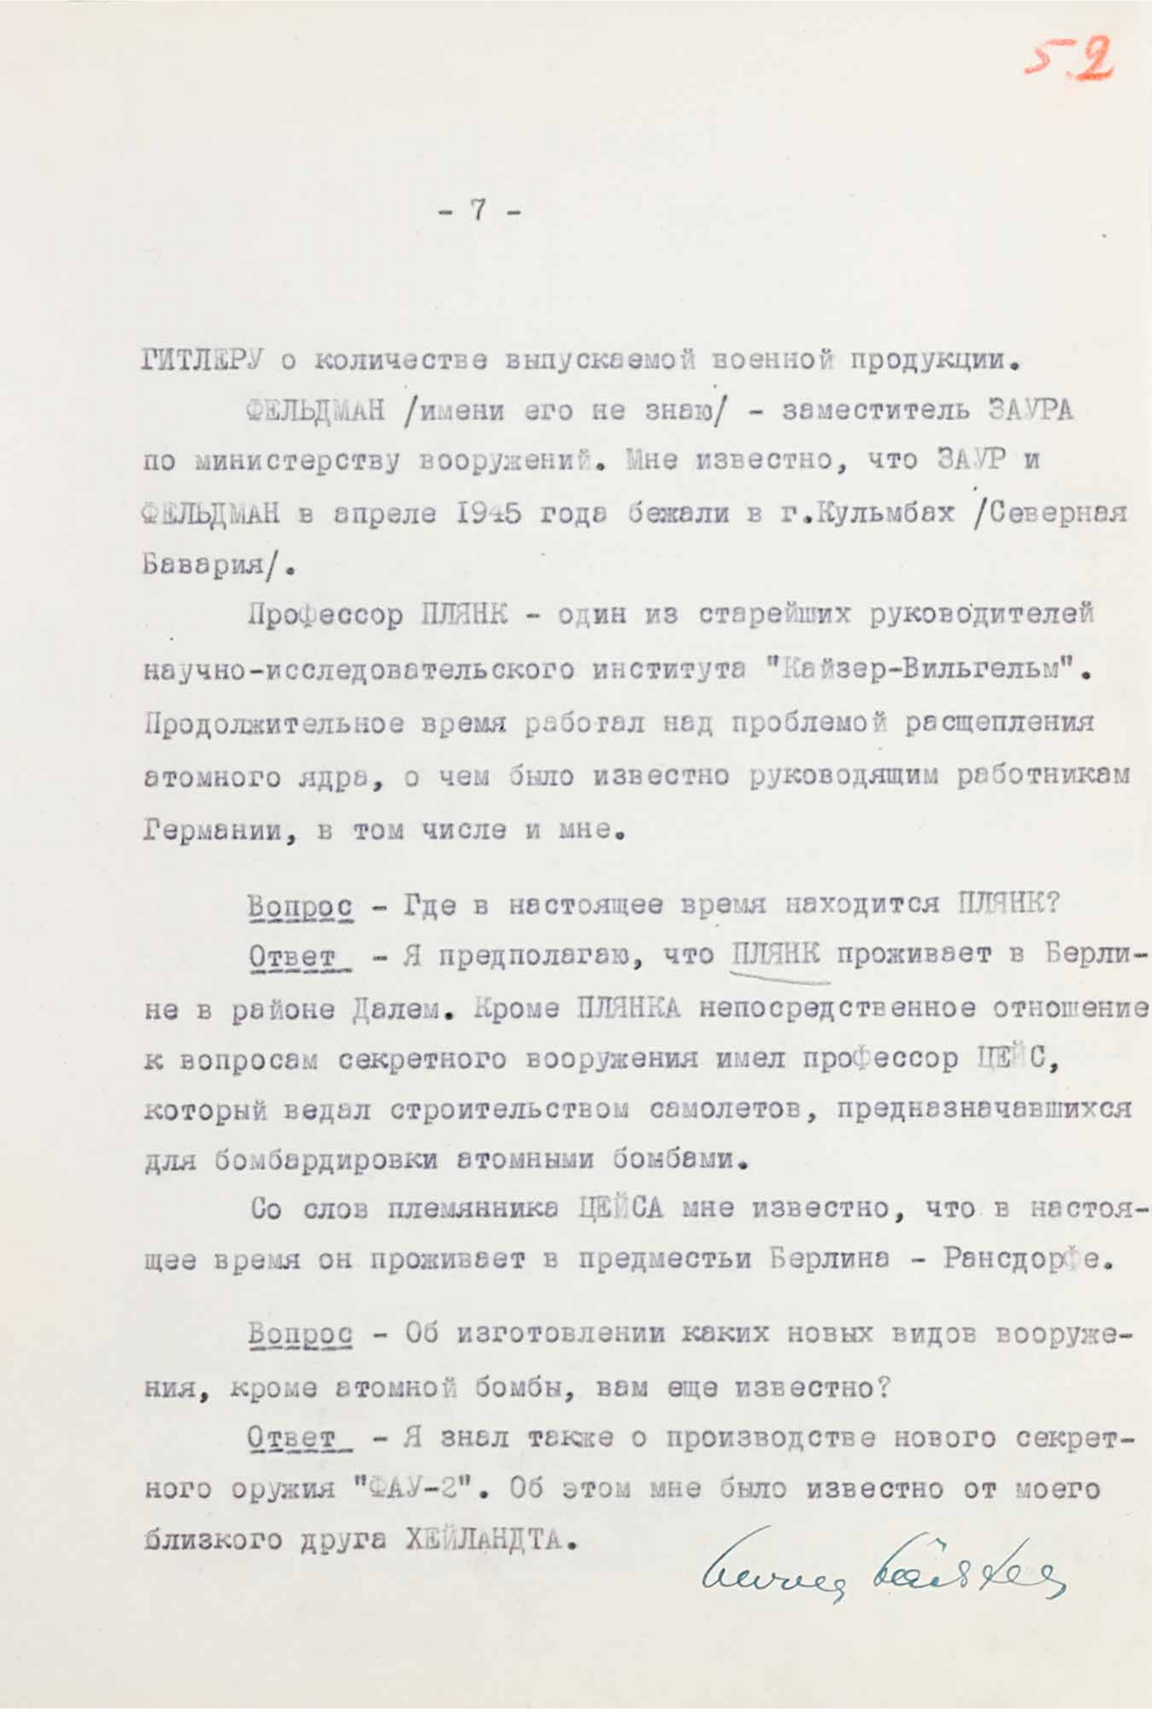
Вопрос - Назовите специалистов непосредственно работавших по изготовлению атомной бомбы в Германии?

Ответ - Мне известно, что непосредственное отношение ко всем видам секретного вооружения и, в частности, атомной бомбы, имели следующие лица: генерал ДОРНБЕРГЕР - начальник Управления новых видов вооружения министерства ШПЕЕРА, ранее проживал в Берлине - Шарлоттенбург, Рильштрассе. Где в настоящее время находится ДОРНБЕРГЕР - я не знаю.

ЗАУР - начальник Управления индустрии министерства вооружений, являлся одним из доверенных лиц министра вооружений ТОДТ, а затем его преемника ШПЕЕРА. ЗАУР фактически ведал всеми производством новых видов вооружения в Германии. Как мне известно, он каждый месяц лично отчитывался

Werner Wächter

Figure D.773: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



ГИТЛЕРУ о количестве выпускаемой военной продукции.

ФЕЛЬДМАН /имени его не знаю/ - заместитель ЗАУРА по министерству вооружений. Мне известно, что ЗАУР и ФЕЛЬДМАН в апреле 1945 года бежали в г.Кульмбах /Северная Бавария/.

Профессор ПЛЯНК - один из старейших руководителей научно-исследовательского института "Кайзер-Вильгельм". Продолжительное время работал над проблемой расщепления атомного ядра, о чем было известно руководящим работникам Германии, в том числе и мне.

Вопрос - Где в настоящее время находится ПЛЯНК?

Ответ - Я предполагаю, что ПЛЯНК проживает в Берлине в районе Далем. Кроме ПЛЯНКА непосредственное отношение к вопросам секретного вооружения имел профессор ЦЕЙС, который ведал строительством самолетов, предназначавшихся для бомбардировки атомными бомбами.

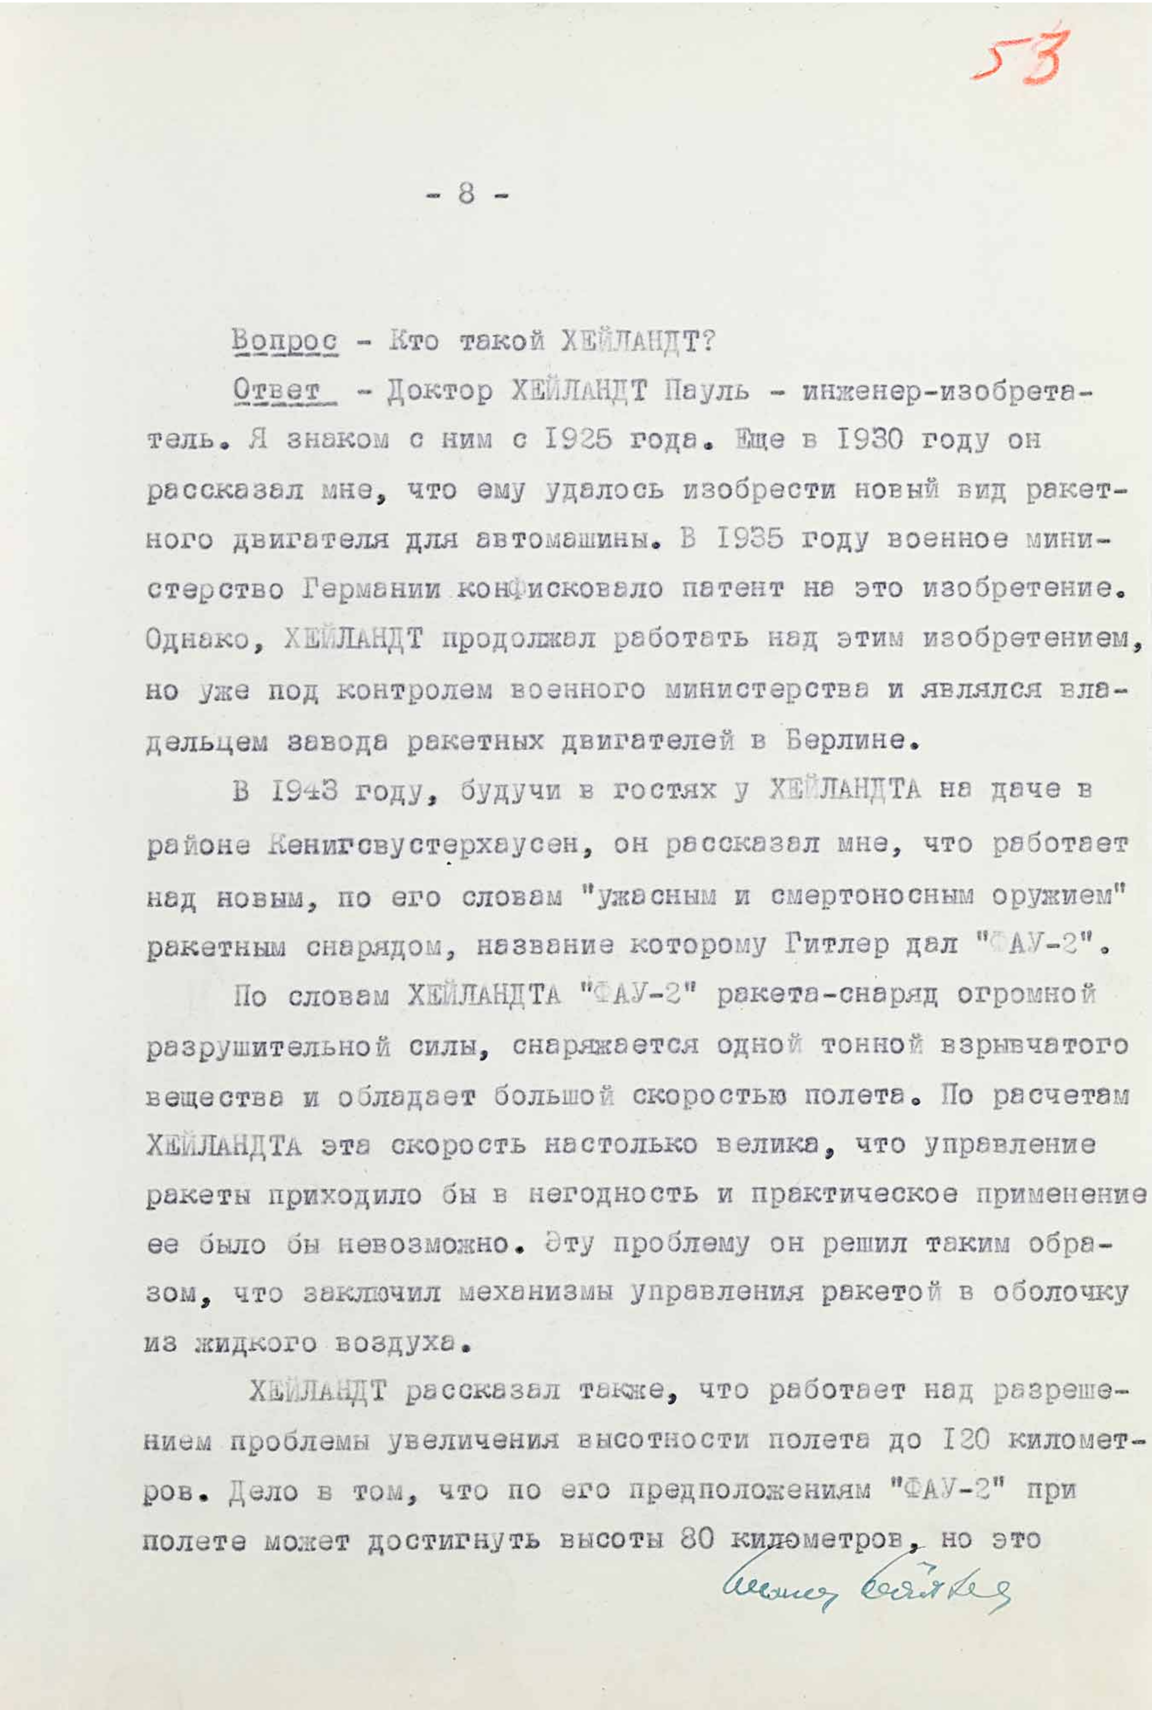
Со слов племянника ЦЕЙСА мне известно, что в настоящее время он проживает в предместьи Берлина - Рансдорфе.

Вопрос - Об изготовлении каких новых видов вооружения, кроме атомной бомбы, вам еще известно?

Ответ - Я знал также о производстве нового секретного оружия "ФАУ-2". Об этом мне было известно от моего близкого друга ХЕЙЛАНДТА.

Werner Wächter

Figure D.774: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



53

Вопрос - Кто такой ХЕЙЛАНДТ?

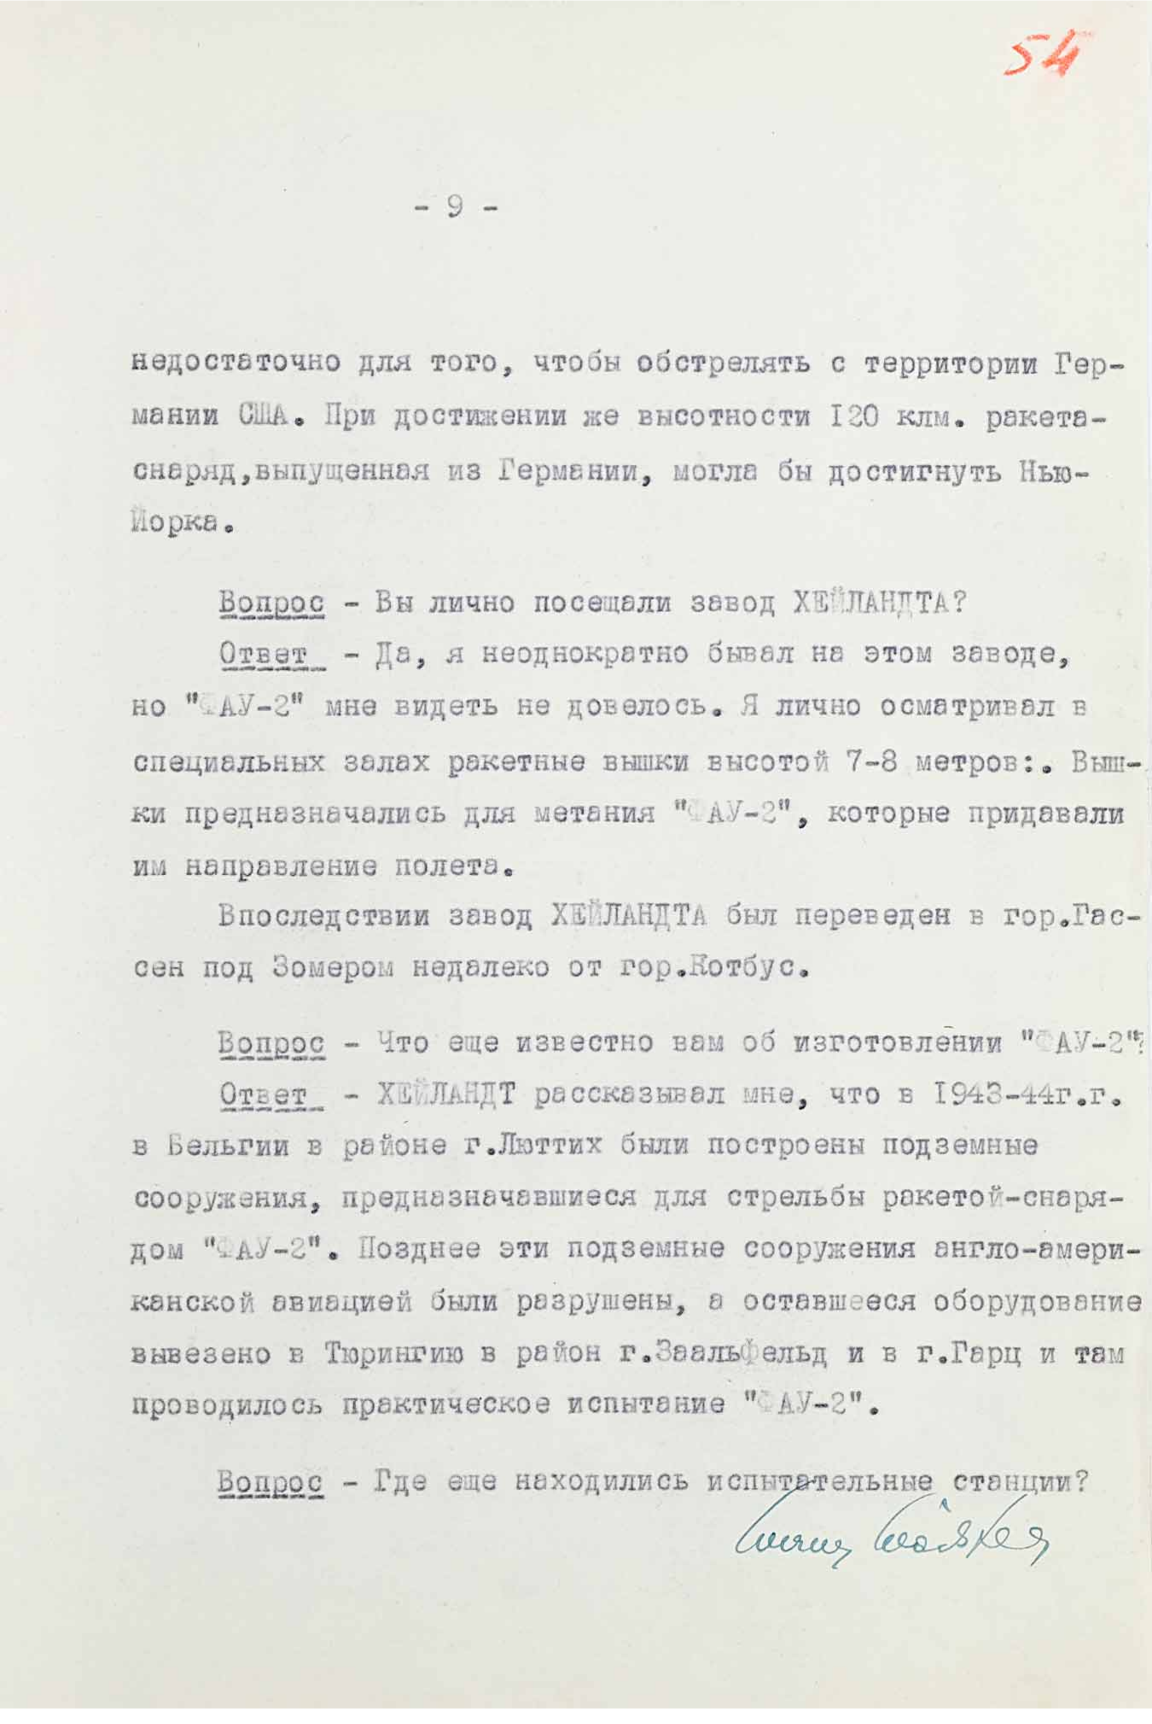
Ответ - Доктор ХЕЙЛАНДТ Пауль - инженер-изобретатель. Я знаком с ним с I925 года. Еще в I930 году он рассказал мне, что ему удалось изобрести новый вид ракетного двигателя для автомашины. В I935 году военное министерство Германии конфисковало патент на это изобретение. Однако, ХЕЙЛАНДТ продолжал работать над этим изобретением, но уже под контролем военного министерства и являлся владельцем завода ракетных двигателей в Берлине.

В I943 году, будучи в гостях у ХЕЙЛАНДТА на даче в районе Кенигсвустерхаусен, он рассказал мне, что работает над новым, по его словам "ужасным и смертоносным оружием" ракетным снарядом, название которому Гитлер дал "ФАУ-2".

По словам ХЕЙЛАНДТА "ФАУ-2" ракета-снаряд огромной разрушительной силы, снаряжается одной тонной взрывчатого вещества и обладает большой скоростью полета. По расчетам ХЕЙЛАНДТА эта скорость настолько велика, что управление ракеты приходило бы в негодность и практическое применение ее было бы невозможно. Эту проблему он решил таким образом, что заключил механизмы управления ракетой в оболочку из жидкого воздуха.

ХЕЙЛАНДТ рассказал также, что работает над разрешением проблемы увеличения высотности полета до I20 километров. Дело в том, что по его предположениям "ФАУ-2" при полете может достигнуть высоты 80 километров, но это

Figure D.775: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



недостаточно для того, чтобы обстрелять с территории Германии США. При достижении же высотности I20 клм. ракета-снаряд,выпущенная из Германии, могла бы достигнуть Нью-Йорка.

Вопрос - Вы лично посещали завод ХЕЙЛАНДТА?

Ответ - Да, я неоднократно бывал на этом заводе, но "ФАУ-2" мне видеть не доводилось. Я лично осматривал в специальных залах ракетные вышки высотой 7-8 метров:. Вышки предназначались для метания "ФАУ-2", которые придавали им направление полета.

Впоследствии завод ХЕЙЛАНДТА был переведен в гор.Гассен под Зомером недалеко от гор.Котбус.

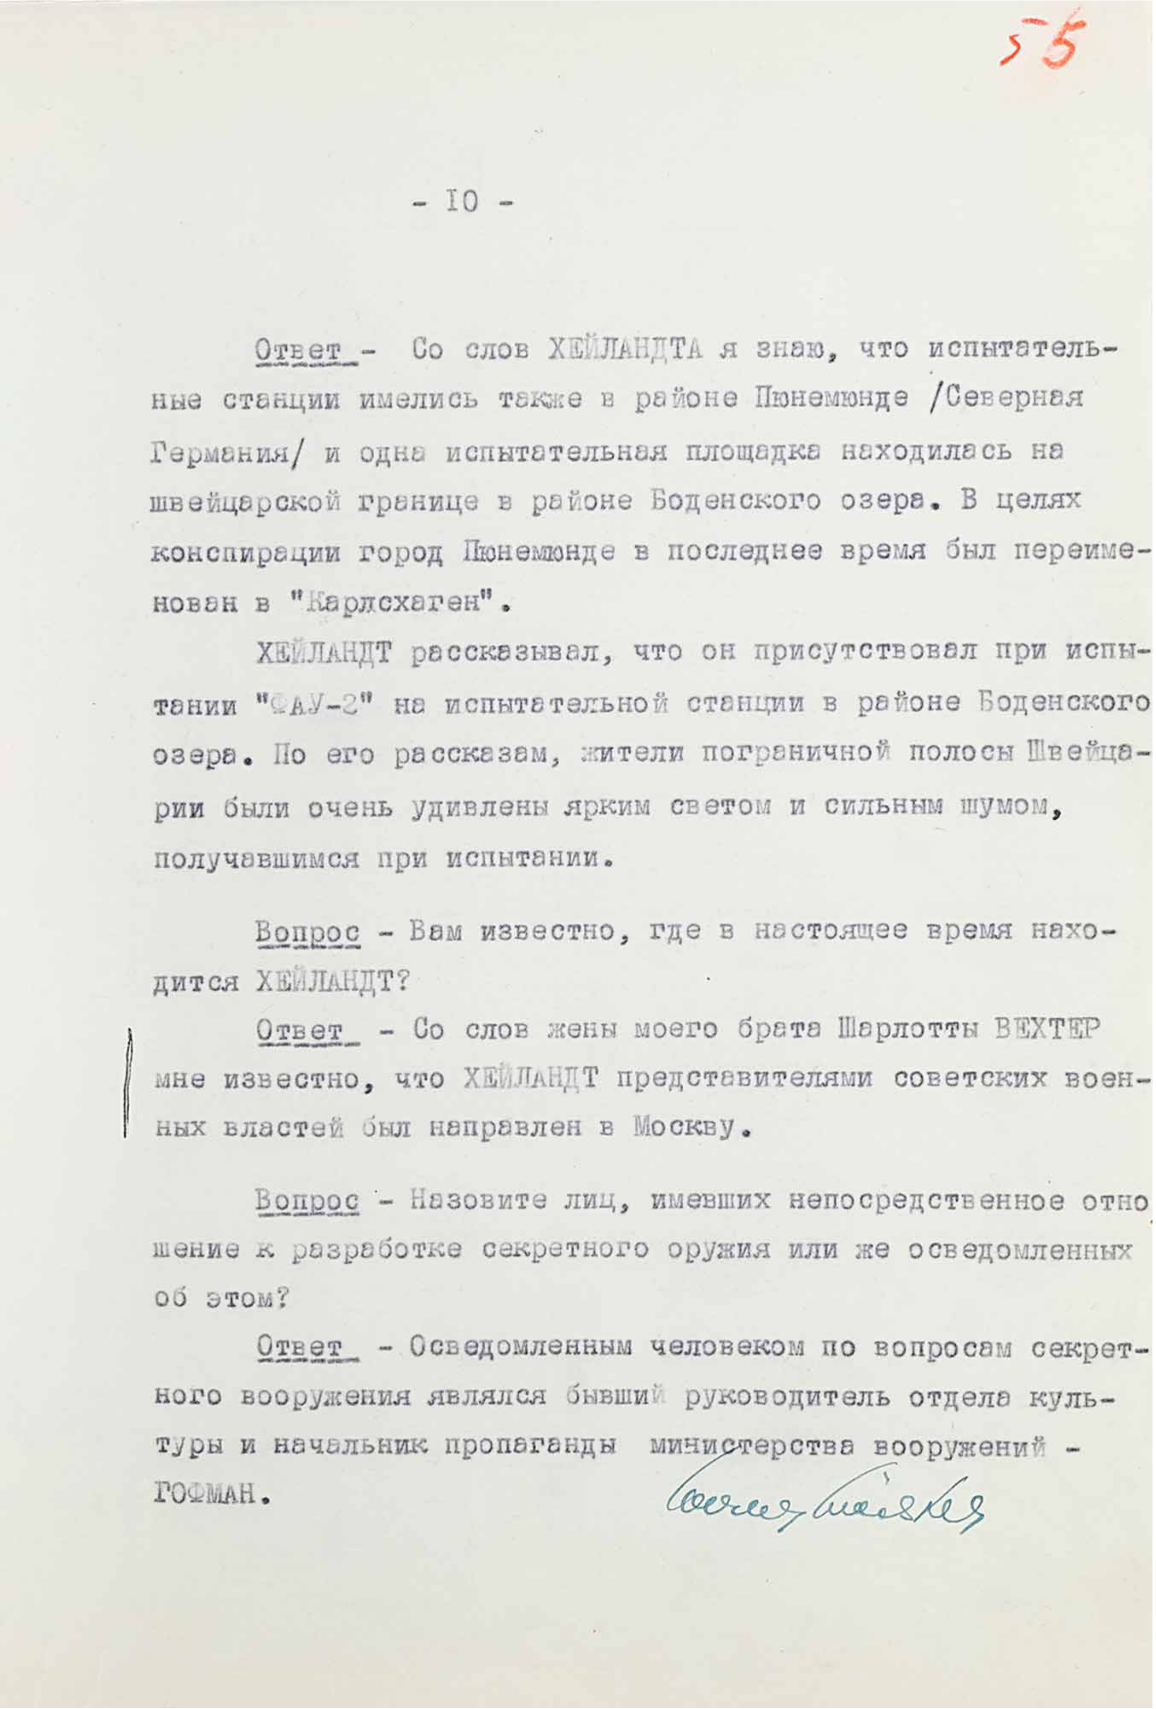
Вопрос - Что еще известно вам об изготовлении "ФАУ-2"?

Ответ - ХЕЙЛАНДТ рассказывал мне, что в I943-44г.г. в Бельгии в районе г.Люттих были построены подземные сооружения, предназначавшиеся для стрельбы ракетой-снарядом "ФАУ-2". Позднее эти подземные сооружения англо-американской авиацией были разрушены, а оставшееся оборудование вывезено в Тюрингию в район г.Заальфельд и в г.Гарц и там проводилось практическое испытание "ФАУ-2".

Вопрос - Где еще находились испытательные станции?

Werner Wächter

Figure D.776: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



Ответ - Со слов ХЕЙЛАНДТА я знаю, что испытательные станции имелись также в районе Пюнемюнде /Северная Германия/ и одна испытательная площадка находилась на швейцарской границе в районе Боденского озера. В целях конспирации город Пюнемюнде в последнее время был переименован в "Карлсхаген".

ХЕЙЛАНДТ рассказывал, что он присутствовал при испытании "ФАУ-2" на испытательной станции в районе Боденского озера. По его рассказам, жители пограничной полосы Швейцарии были очень удивлены ярким светом и сильным шумом, получавшимся при испытании.

Вопрос - Вам известно, где в настоящее время находится ХЕЙЛАНДТ?

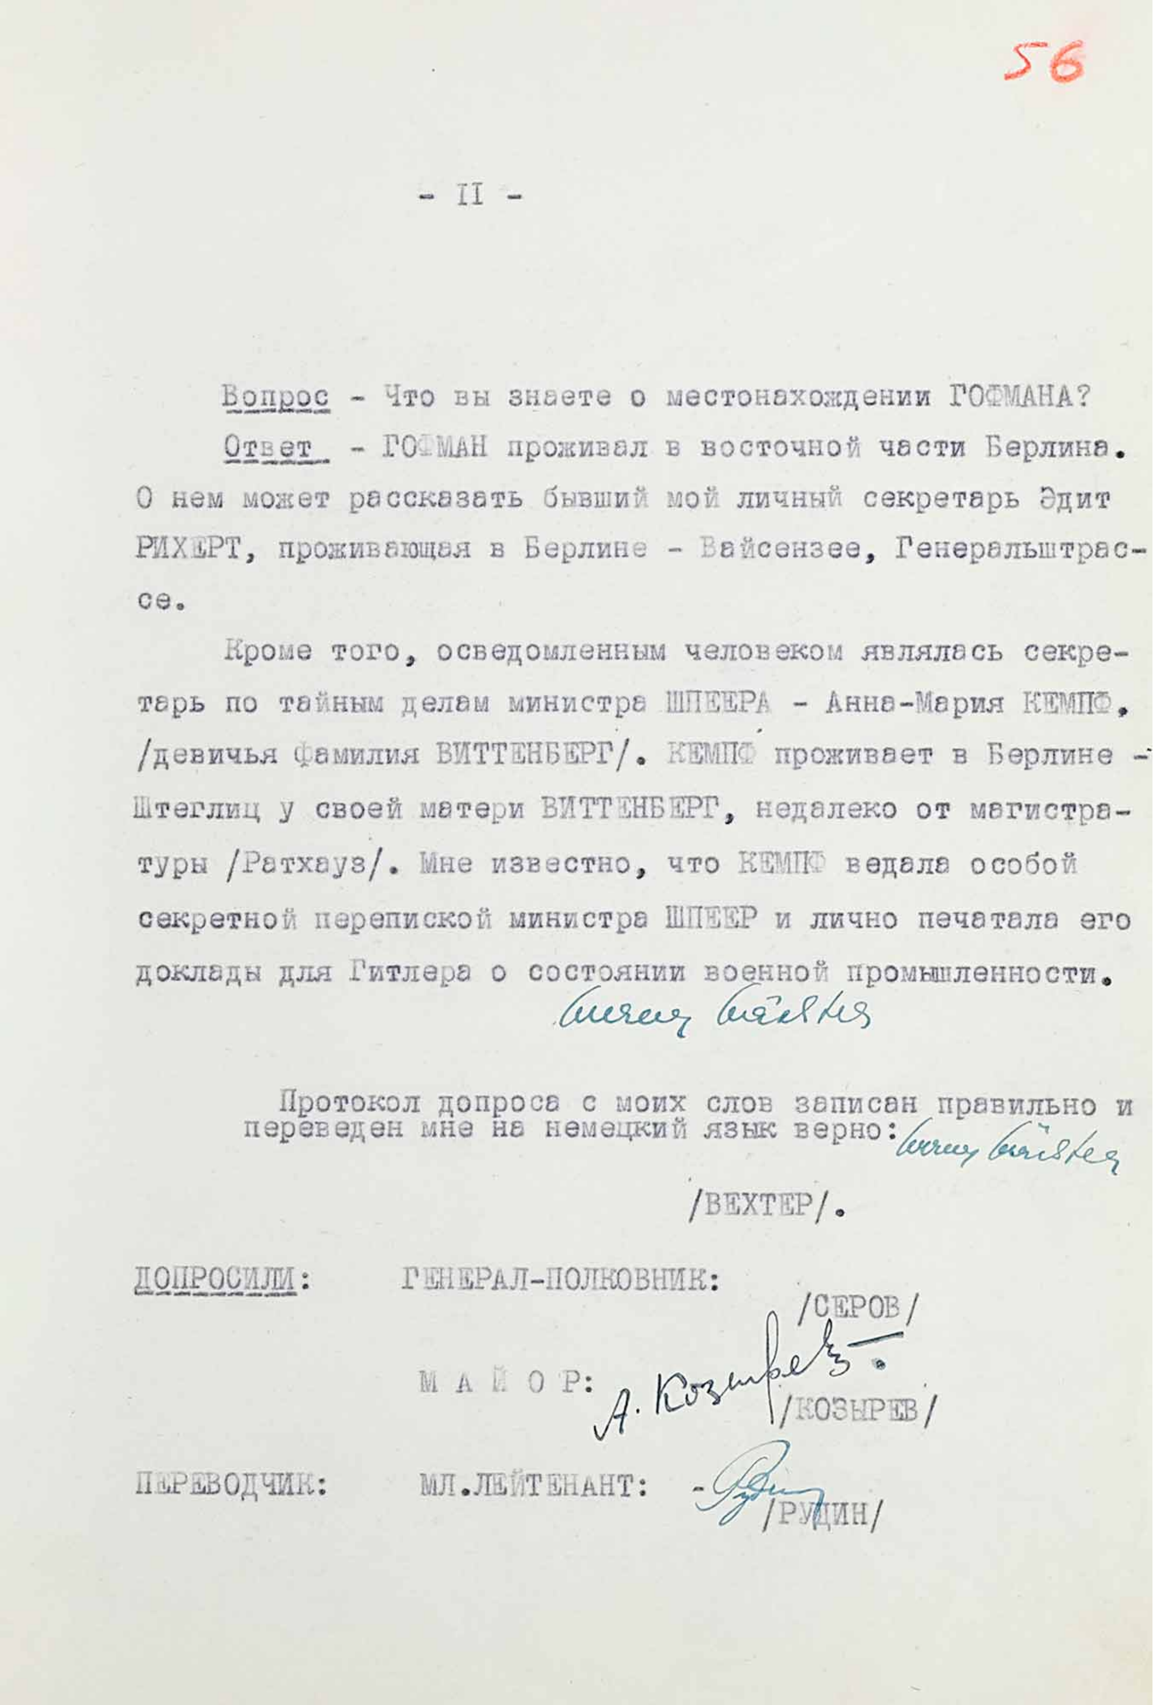
Ответ - Со слов жены моего брата Шарлотты ВЕХТЕР мне известно, что ХЕЙЛАНДТ представителями советских военных властей был направлен в Москву.

Вопрос - Назовите лиц, имевших непосредственное отношение к разработке секретного оружия или же осведомленных об этом?

Ответ - Осведомленным человеком по вопросам секретного вооружения являлся бывший руководитель отдела культуры и начальник пропаганды министерства вооружений - ГОФМАН.

Werner Wächter

Figure D.777: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].



Вопрос - Что вы знаете о местонахождении ГОФМАНА?

Ответ - ГОФМАН проживал в восточной части Берлина. О нем может рассказать бывший мой личный секретарь Эдит РИХЕРТ, проживающая в Берлине - Вайсензее, Генеральштрассе.

Кроме того, осведомленным человеком являлась секретарь по тайным делам министра ШПЕЕРА - Анна-Мария КЕМПФ, /девичья фамилия ВИТТЕНБЕРГ/. КЕМПФ проживает в Берлине - Штеглиц у своей матери ВИТТЕНБЕРГ, недалеко от магистратуры /Ратхауз/. Мне известно, что КЕМПФ ведала особой секретной перепиской министра ШПЕЕР и лично печатала его доклады для Гитлера о состоянии военной промышленности.

Werner Wächter

Протокол допроса с моих слов записан правильно и переведен мне на немецкий язык верно: Werner Wächter

/ВЕХТЕР/.

ДОПРОСИЛИ: ГЕНЕРАЛ-ПОЛКОВНИК: /СЕРОВ/

МАЙОР: А. Козырев /КОЗЫРЕВ/

ПЕРЕВОДЧИК: МЛ.ЛЕЙТЕНАНТ: /РУДИН/

Figure D.778: Transcript of NKVD interrogation of Werner Wächter by Ivan Serov. 10 October 1945 [FSB Archive, Moscow, courtesy of Matthias Uhl].

Leroy Vogel. Interrogation Records Prepared for War Crimes Proceedings. Activities of Jürgen Stroop. 1945. https://www.fold3.com/image/232067115

14 Apr Held 20 minute talk with HIMMLER who convinced STROOP that Germany could still win the war. Received instructions to convey this opinion to all HSSPF's in Southern Germany. HIMMLER gave STROOP full freedom of action.

[Jürgen Stroop was an SS general who reported directly to Heinrich Himmler. The above interrogation record indicates that Himmler told him about a weapon so powerful that even in April 1945, it had the potential to help Germany win the war.

In 1949, Stroop spent over eight months in the same Polish jail cell as Kazimierz Moczarski, a dissident journalist who later wrote about his conversations with Stroop. In the conversation below, Stroop confirmed to Moczarski that the powerful new weapon was indeed an atomic bomb.

During the war, Stroop would have had direct knowledge of the development of the German atomic bomb, both from his conversations with Himmler and likely from other conversations within the SS, which was deeply involved in running the German nuclear program in the final years of the war. After the war, on the other hand, Stroop would have been left wondering why the German atomic bomb had not been employed by the end of the war, so his 1949 explanations for that below must be regarded as simply his own speculations.]

Kazimierz Moczarski. 1981. *Conversations with an Executioner: An Incredible 255-Day-Long Interview with the Man Who Destroyed the Warsaw Ghetto.* Englewood Cliffs, New Jersey: Prentice-Hall. p. 214

One day the talk turned to the wonder weapons which Germany had dreamed of producing in 1944–45.

"What were they going to be?" I asked. "Improved V rockets? A new kind of artillery along the lines of the Russian Katyusha? Jet aircraft?"

"None of those, *Herr* Moczarski," Stroop said firmly. "We hadn't started mass-producing jet planes yet, although we had prototypes in the air. I saw one once in my district. It flew amazingly fast. But new planes, rockets, and artillery weren't what Adolf Hitler was after." Stroop paused, then continued dramatically: "We were one step away from discovering a new explosive to be used in aerial warfare."

I tried not to smile.

"You mean you were about the invent the atomic bomb?"

"Exactly. All through the war, German and Anglo-Saxon scientists raced neck and neck to perfect such a weapon. . . ."

"And guess who crossed the finish line first? The Americans at Hiroshima," I said with satisfaction.

"Inevitable, *Herr* Moczarski. Inevitable. We lacked topflight physicists, and our research laboratories had been badly bombed."

Benito Mussolini. 20 April 1945 interview. In: Gian Gaetano Cabella. 1948. *Testamento politico di Mussolini.* Rome: Tosi. p. 45.
https://antonioportobello.wordpress.com/2011/04/24/il-testamento-politico-di-mussolini-lultima-intervista-dettata-corretta-siglata-dal-duce-il-22-aprile-1945-gian-gaetano-cabella/

"Le famose bombe distruttrici sono per essere approntate. Ho, ancora pochi giorni fa, avuto notizie precisissime. Forse Hitler non vuole vibrare il colpo che nella assoluta certezza che sia decisivo.

Pare che siano tre, queste bombe e di efficacia sbalorditiva. La costruzione di ognuna ètremendamente complicata e lunga."

"The famous destroyer bombs are going to be prepared. I have, still a few days ago, received very precise news. Perhaps Hitler does not want to strike the blow except in the absolute certainty that it is decisive.

It seems that there are three of them, these bombs, and of astounding effectiveness. The construction of each is tremendously complicated and time-consuming."

[According to Cabella, this 1948 booklet is a transcript of an interview he conducted with Mussolini on 20 April 1945 (eight days before his execution). Cabella was a journalist who had manufactured propaganda for Mussolini during the war and thus his writings must be treated cautiously.[17]

However, Edoardo Susmel and Duilio Susmel considered Cabella's account of his 20 April 1945 interview with Mussolini to be accurate and included it in their *Opera omnia di Benito Mussolini*, Vol. XXXII, pp. 191–201. Moreover, the details of Cabella's account agree with other sources that Cabella would not have known about at the time he wrote:

- Cabella wrote that he interviewed Mussolini on 20 April 1945 starting at 15:20 (3:20 p.m., pp. 14–16). The calendar of Mussolini's appointments has since been published, and it shows that Mussolini met with a long series of people that day [Guerrazzi 2020, p. 359]. While it does not name Cabella specifically, it shows that Mussolini had a gap in his schedule 15:20–16:00 during which he would have been available to meet with Cabella, exactly as Cabella claimed.
- After the war, Luigi Romersa repeatedly confirmed that he had provided Mussolini with information about German nuclear weapons (pp. 4427–4434).
- Mussolini had other sources of information about German nuclear weapons (e.g., pp. 4366, 4600).
- Mussolini spoke on other occasions about German nuclear weapons (e.g., pp. 4603, 4667).
- According to Cabella, Mussolini spoke of three bombs. If he meant three physical bombs ready for deployment, there were other sources that also spoke of three deployable bombs (e.g., pp. 4182, 4667). If he meant three different types of bombs, with unspecified numbers of each, there were other sources that mentioned three different types of nuclear weapons (e.g., p. 3401).
- According to Cabella, Mussolini thought Germany was reluctant to use the nuclear weapons if they would not have a decisive effect on the war. Other knowledgeable sources said the same thing (e.g., pp. 4668–4670).]

Georg Zachariae. 1948. *Mussolini si confessa.* Milan: Garzanti. Reprinted in 2004 by Milan: BUR; see p. 183. [Zachariae was Mussolini's personal physician.]

Il duce fino all'ultimo momento non aveva perso la speranza che si potesse vincere la guerra; egli era convinto che le armi segrete tedesche avrebbero provocato un capovolgimento della situazione, che appariva ormai disperata. Egli aveva apertamente sostenuto questa sua convizione con tutti coloro che negli ultimi mesi avevano avuto contatti con lui. Anche intrattenendosi confidenzialmente con me era difficile che si lasciasse persuadere della fallacia delle sue opinioni. Verso la fine però egli ammise che la guerra era perduta militarmente, e nel riconoscere l'ineluttabilità della disfatta egli mi diceva che anche il suo destino era segnato.

Until the last moment the duce had not lost hope that the war could be won; he was convinced that the German secret weapons would cause a reversal of the situation, which by then appeared desperate. He had openly supported this belief of his with all those who had had contact with him in the last months. Even talking confidentially with me it was difficult for him to be persuaded of the fallacy of his opinions. Towards the end, however, he admitted that the war was militarily lost, and, in recognizing the inevitability of defeat, he told me that his fate was also sealed.

Erwin Bartmann. 2013. *Für Volk und Führer: The Memoir of a Veteran of the 1st SS Panzer Division Leibstandarte SS Adolf Hitler.* Solihull, UK: Helion.

[pp. 160–161:] 'What I am about to tell you is top secret—you must not repeat this—tell no one.'

Wide-eyed with expectation, Papa and I nodded.

Mama's brows furled. 'Then perhaps you shouldn't tell us, Horst.'

'I trust my own family Mama,' replied Horst, brushing across her concerns. He leaned forward in his seat and whispered, 'As you know, I am responsible for making the telephone connections when calls are made to and from the Air Ministry. Listen to this—the other day I made a connection between Göring and the *Führer.*'

Mama gasped. 'Oh Horst.'

'Göring asked the *Führer* for permission to use three special bombs but he refused. "If I use them in the east they will get us from the west," said the *Führer.*'

Papa pulled his chair closer to the table. 'What were these special bombs?'

'I don't know for sure but they must be powerful—although Göring clearly mentioned three I got the impression there might be more.'

'This is the *Wunderwaffe*,' exclaimed my father. 'Our scientists have done well with their rockets—who would put it past them to come up with something like this? It would really surprise the British if they put one of these special bombs in a rocket.' [...]

[p. 231:] After the war, I became friends with Rochus Misch, a fellow *Leibstandarte* veteran and communications officer in the *Führerbunker* until the final days of the *Reich.* The topic of the special bombs came up in conversation. 'Three bombs,' he said, 'where did you hear that? There were nine.'

There has been much speculation about the possession of atomic weapons by Germany. Whether the bombs that my brother mentioned were conventional or atomic remains a matter of conjecture.

Heinrich Himmler's chief adjutant Werner Grothmann on why nuclear weapons were not used in combat [Krotzky 2002]. For a discussion of the background and reliability of this source, see pp. 3396–3397. See also Grothmann's testimony on pp. 3401, 4271, and 4436.

[S. 13] Himmler hat sich jedenfalls Bericht erstatten lassen und es wurde beraten, was wir jetzt noch machen können. Das eine Problem war die geringe Menge und immer noch die Unsicherheit, wie es im Einsatz klappen würde. Das andere war die Frage nach der tatsächlichen politischen Wirkung.

[S. 13] Manche meinten, ein Volltreffer auf Moskau müßte das erste Ziel sein. Dem ist aber widersprochen worden mit dem Argument, das würde an der Ostfront nichts mehr ändern.

[S. 14] Wenn wir also jetzt auf Hitlers Befehl eine solche Waffe zum Beispiel über London einsetzen würden, ergäbe sich eine völlig neue Situation, aber nicht in unserem Sinne. Wenn die Waffenwirkung den Berechnungen entspricht, fallen zwar wichtige Teile der politischen und militärischen Führung aus, aber viele andere Ebenen, die außerhalb untergebracht waren, bleiben erhalten. Es gibt schwere Verluste unter der Zivilbevölkerung und wenn sich das Entsetzen gelegt hat stellt man fest, dass die Versorgung der englischen Truppen, die im Reich stehen, über ihre Häfen und die unter ihrer Kontrolle weiter möglich ist. Außerdem stehen die Engländer eben auf unserem Gebiet. Und das wichtigste Argument: bei uns glaubte niemand wirklich daran, dass die dann abziehen würden. Ganz im Gegenteil. Ihre Reaktionen gegenüber unserer Bevölkerung konnten wir uns ausmalen. Die andere Seite, die man auch betrachten muß, sind die Amerikaner.

[S. 15] Bei den Besprechungen, die ich erlebt hatte oder über die ich in Andeutungen erfuhr, war keiner so verrückt, eine Waffe einzusetzen, die uns nicht mehr helfen konnte, sondern nach Lage der Dinge alles nur noch viele schlimmer machen würde.

[p. 13] Himmler had in any case come up with a report, and a consultation took place regarding what we could make now. The one problem was the small quantity [of fuel] and always still the uncertainty of how it would work in action. The other was the question of the real political effect.

[p. 13] Some said that a direct hit on Moscow must be the first goal. But this has been countered by the argument that this would not change anything on the eastern front.

[p. 14] If we were now to use such a weapon on Hitler's order, for example to employ it on London, a completely new situation would arise, but not in our favor. If the weapon's impact corresponds to the calculations, important parts of the political and military leadership will fall, but many other levels that have been relocated outside will be preserved. There are heavy casualties among the civilian population, and when the horror has subsided, it is clear that the supply of potential British troops in the Reich is still possible via their ports and is still under their control. Besides, the British are also on our territory. And the most important argument: with us, no one really believed that they would then withdraw. Quite the contrary! We could picture their reactions to our population. The other side, which must also be considered, is the Americans.

[p. 15] At the meetings I attended, or about which I learned in hints, no one was so crazy to use a weapon which could no longer help us, but would only make things even much worse.

[S. 16] Also, der erste Punkt war, dass die Entscheidungsträger wissen mussten, was ihnen persönlich blüht, wenn eine völlig neue, furchtbare Massenvernichtungswaffe von unserer Seite eingesetzt würde, Wirkung erzielt, der Krieg aber trotzdem von uns verloren wird. Was die Sieger dann aus der Genfer Konvention herauslesen würden war klar.	[p. 16] So, the first point was that the decision-makers had to know how they personally fared, if a completely new, terrible mass-destruction weapon were deployed by our side and achieved its effect, but the war were nevertheless lost by us. What the victors would then read out of the Geneva Convention was clear.
Der zweite Punkt war der hier: Damals lag doch die Forderung nach bedingungsloser Kapitulation schon längst auf dem Tisch. Und die war das Ergebnis der normalen Kriegslage. Was hätte sich dann ergeben nach dem Einsatz unserer Atombombe? Ihnen sind bestimmt auch die Vorstellungen von Morgenthau bekannt. Es würde alles noch viel schlimmer kommen.	The second point was that: At that time, the demand for unconditional surrender had long been on the table. And that was the result of the normal war situation. What would have happened after the use of our atomic bomb? You are certainly familiar with the ideas of Morgenthau. Everything would be much worse.

[Grothmann made several points:

- By the end of the war, there was only enough fission fuel for a very small number of bombs.
- With the possibilities of rockets malfunctioning, aircraft getting shot down, or the bombs themselves malfunctioning, there was no guarantee that those bombs could be successfully delivered to Allied targets.
- Even if the bombs were successfully delivered and destroyed a very small number of Allied cities, they would not stop the large Allied military forces that were invading Germany, and in fact they would only inspire the Allied forces to defeat Germany more quickly before it could deliver more bombs.
- If Germany had used nuclear bombs against Allied targets, the Allies would have retaliated with even greater destruction (such as firebombing or mustard gas) against German targets than what the Allies were already doing.
- If Germany had used nuclear bombs against Allied targets, those individuals who were responsible would have been prosecuted for war crimes after the war.
- If Germany had used nuclear bombs against Allied targets, the Allies would have imposed much harsher terms on Germany after the war. Grothmann mentioned the Allied Morgenthau plan that was actually considered but not implemented, which would have eliminated all industry in postwar Germany.

Grothmann's arguments are the same reasons why Germany did not use its stockpile of very advanced nerve gas [Tucker 2006], which was far larger than its stockpile of nuclear weapons as estimated by Grothmann.]

Allen Dulles. 1 April 1945. Cable IN 9061 from Bern, Switzerland to Office of Strategic Services. [NARA RG 226, Entry UD-90, Box 6, Folder 64 SUNRISE] [See document photos on pp. 4671–4672.]

[...] 8. In his conversation with Emperor [Kesselring], latter said to Critic [Wolff] our situation is desperate, nobody dares tell truth to Fuehrer who surrounded by small group of advisers who still believe in a last specific secret weapon which they call "Verzweiflunge" weapon [die Verzweiflungswaffe or the "desperation weapon"]. Emperor believed this weapon can prolong war but not decide it, but might cause terrible blood bath on both sides. Emperor said if Fuehrer gave him order to use weapon he would surrender his command. [...]

Allen Dulles. 5 April 1945. Cable IN 9470 from Bern, Switzerland to Office of Strategic Services. [NARA RG 226, Entry UD-90, Box 7, Folder 86 BERN–IN OUT 1944–1945]

[...] Following information given by Wood mostly dated middle March when he left Berlin. [...]

4. Archivabteilung of Foreign Office is located in the Harz near Quedlinburg and archives distributed in old salt mines. Current files were still Berlin middle March.

5. Burning of archives proceeding on large scale and instructions to this effect have been given to every government office in case of danger of enemy occupation. Unfortunately material which Wood had put in his office safe was burned during his last absence from Berlin. [...]

Karlsch 2005, pp. 253–254, 388, citing: CIC Documentation "Adolf Hitler" 1944–1953, Interrogation of Hans Fegelein. 21 September 1945. Institut für Zeitgeschichte (IfZ), Munich, F 135/3, pp. 384ff.

Mit Vorsicht kann dies auch aus einer Befragung von Hans Fegelein, dem Vater Hermann Fegeleins, geschlossen werden. SS-Gruppenführer Hermann Fegelein, seit 1944 Himmlers Verbindungsoffizier im Führerhauptquartier und Schwager Eva Brauns, war noch am 28. April 1945 wegen Fahnenflucht standrechtlich erschossen worden. Sein Vater berichtete den Amerikanern im September 1945 über die dramatischen letzten Kriegstage. Hitler sei sehr erregt darüber gewesen, dass ihm Himmler die neue Atombombe vorenthalten hätte. Er wollte damit noch eine Kriegswende herbeiführen.Im Befragungsprotokoll heißt es: "Die Ingenieure, die zuletzt im Führerhauptquartier waren, und auch der Führer selbst erwarteten täglich den Gefechtseinsatz der Atombombe. Aber Saboteure verhinderten dies." Wer die Saboteure gewesen sein sollen, erwähnte Hans Fegelein nicht.

With caution this can also be inferred from a survey conducted by Hans Fegelein, the father of Hermann Fegelein. SS group leader Hermann Fegelein, since 1944 Himmler's liaison officer at the Führer's headquarters and brother-in-law of Eva Braun, had been legally shot dead on 28 April 1945 because of desertion. His father told the Americans in September 1945 about the dramatic last war days. Hitler was very angered that Himmler had deprived him of the new atomic bomb. He wanted to turn the war around. The survey report states: "The engineers who were last at the Führer Headquarters and also the Führer himself expected the atomic bomb to be deployed every day. But saboteurs prevented this." Hans Fegelein did not mention who the saboteurs were.

#8009. SUNRISE. Forgan, Armour, Gamble only from 110. Information: 109. #9119 to London; #8329 to Paris.

Following is summary of information received 31, AFHQ representatives reporting direct. Zimmer gave us following report:

1. Critic arrived Fasano Friday morning and immediately summoned Parrilli and Zimmer to Fasano where they spent Friday afternoon together. Zimmer was then sent here by Critic, Parrilli remaining Fasano.

2. Critic endeavored contact Vietinghoff before he went to see Emperor, but was unable to reach him.

3. Trip to Emperor most difficult and when he reached Emperor's headquarters, hell had already broken loose. First conversation took place only 15 km. from our advancing forces. Critic presented his plan for Italian surrender and Emperor advised him to go through with it. He, Emperor, regretted he was not also in Italy.

4. In a second conversation with Emperor, latter again expressed his agreement with Critic's plan and that he should so advise Vietinghoff, but said that on his front he could not go along (Mitmachen). Emperor found himself largely surrounded by strangers whom he did not trust. Zimmer gained impression from Critic Emperor was half a prisoner (From 110: No mention was made of Westphal).

5. Immediately on his return, Critic had tried to reach Glazier but he was on an inspection trip at the front and was returning to his headquarters only night of 31. Critic proposed to see him im-

RECEIVED

mediately and would spend Sunday with him. Critic gave this message to Zimmer for 110: I am ready to come to a final conversation in order to arrange matters. I hope to come with Rahn, Dollman and either Vietinghoff or a staff officer.

6. Rahn had been called back to Germany but avoided the trip by alleging serious strike conditions North Italy which he had to handle. Harster did return Germany, but apparently on account of a row with Gauleiter Hofer of the Tyrol. Neither summons believed to be connected with Sunrise.

7. While in Germany and one of reasons for delay, Critic was summoned by Himmler, who asked him to explain his surrender of British agent Tucker. Critic replied that he was arranging an exchange and he wanted to give the Fuehrer Wuensche as birthday present. Himmler also accused him of having been in Switzerland and asked the reasons. Critic answered that he had a contact in Milan who promised to bring him in touch with Allies and that he was acting pursuant Fuehrer's recent secret order to seek any possible contact with Allies. Critic had heard that many efforts had failed and wanted to see what he could do. Himmler ordered Critic to wait around for couple of days as he wanted to think the matter over. However, Himmler was suddenly called urgently to Hungary and referred Critic to Kaltenbrunner. Himmler told him that he sould not leave Italy and particularly that he should not go to Switzerland. Critic did not see Kaltenbrunner but left for Italy.

8. In his conversation with Emperor, latter said to Critic our situation is desperate, nobody dares tell truth to Fuehrer who surrounded by small group of advisers who still believe in a last specific secret weapon which they call "Verzweiflungs" weapon. Emperor believed this weapon can prolong war but not decide it, but might cause terrible blood bath on both sides. Emperor said if Fuehrer gave him order to use weapon he would surrender his command. End of Zimmer report.

9. Under foregoing program and assuming no further delays which may be inherent in situation, Critic should come to a meeting sometime Monday or early Tuesday. Any action by Kesselring via Critic seems excluded. Whether Critic will win over Vietinghoff is still matter of conjecture, despite Critic's apparent optimism. Zimmer understands Critic has support of one of Vietinghoff's chief subordinates.

Figure D.780: Allen Dulles. 1 April 1945. Cable IN 9061 from Bern, Switzerland to Office of Strategic Services. [NARA RG 226, Entry UD-90, Box 6, Folder 64 SUNRISE]

T. R. Hogness and F. A. C. Wardenburg. 4 April 1945. Subject: Report on Interrogation of Professor Walter Bothe. [NARA RG 77, Entry UD-22A, Box 166, Folder 32.22-1 GERMANY—Research—TA (1943–June 1946)]

Dr. Bothe said that about two weeks ago, under orders from the German government, all secret documents in connection with his work were burned and this included some correspondence with Heisenberg and all papers relating to the TA project.

Samuel A. Goudsmit and Robert R. Furman. 9 April 1945. TA Report—Detailed Report of Conversation with Gentner on 5 April 1945. [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)]

A military committee visited Heidelberg about a week before the German troops retreated and carried out orders to burn all secret documents. This included Bothe's work on uranium and anything else marked "Secret." The fact that these records were destroyed was confirmed by rigorous interrogation of the persons involved. The practice seems to be current and can be expected in other localities. All scientific work seems to be classified whether it is directly connected with war work or not because it is necessary to have a classification in order to get priority for materials.

T. R. Hogness to Francis J. Smith. 9 April 1945. Re: Position of German TA Work. [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)]

All papers and data pertaining to nuclear physics were stamped "secret" and two weeks before the Americans arrived in Heidelberg a general order was issued to the effect that all "secret" papers were to be destroyed.

TRANSLATION

(?) FRANZ: I hope HIMMLER doesn't fire V-6 or V-7.

(?) GOERBIG: Do you really think we still have something up our sleeves?

(?) FRANZ: Yes, I believe so most definitely. I mean to say it wasn't ready; they hadn't advanced far enough to be brought into use. But I'm certain that a lot of experiments were in progress; it is a fact that some of those projectiles could be fired as far as NEW YORK or elsewhere.

(?) GOERBIG: Did you get that from a reliable source?

(?) FRANZ: I know that for certain.

(?) GOERBIG: With what effect?

(?) FRANZ: With a colossal explosive effect, a strong detonation which really would wipe out everything within a radius of 2 or 3 km. However, the thing isn't ready for immediate use yet. They couldn't make any progress, but next time they will and next time a think like this starts it'll be ghastly. If HIMMLER and his faithful followers turn up one day with all the patents etc., with a sample, it will not be viewed with displeasure by STALIN. There is a risk of HIMMLER betraying the V-weapon preparations to the Russians: "Here are half-completed inventions which will give you great power. You can have them on such and such conditions."

[See document photos on pp. 4676–4677.

All three prisoners being held together were very high-ranking generals in the German army who had been captured in mid-April 1945, and thus would have known the very latest wartime information that they had had access to. The British personnel who were secretly recording and translating the prisoners' conversation were somewhat uncertain which prisoner was speaking, but believed that the main speaker was General Gerhard Franz (German, 1902–1975).

On the basis of whatever high-level classified information Franz had seen or heard before he was captured on 8 April 1945, he was certain that:

- In addition to the well-known V-1 and V-2, there were at least five or so other new secret weapons systems that were sufficiently revolutionary to be dubbed V-weapons.

- Those weapon systems had definitely reached the point at which "a lot of experiments were in progress," and some were sufficiently mature that Franz thought they might be "fired" in actual combat at any time.

- Some of the new V-weapons could reach New York. Franz believed "it is a fact" they already existed. He also seemed to believe that there were multiple V-weapons that could reach New York and other U.S. cities ("some of those projectiles").

- There was a weapon "with a colossal explosive effect, a strong detonation which really would wipe out everything within a radius of 2 or 3 km." That sounds exactly like a fission bomb, and Franz's certainty implied that it had already been tested.

- The long-range V-weapons were intended to deliver such fission bombs to New York or other Allied targets. While Franz seemed to imply that the long-range delivery methods were ready to be fired and that the fission bomb had been tested, he apparently felt that the integrated systems of the nuclear-armed intercontinental weapons were still being perfected.

- All of these advanced weapons were completely controlled by "Himmler and his faithful followers," not other branches of the government or even Hitler.]

GERMAN TEXT

(?)FRANZ : Ich hoffe, der HIMMLER schiesst nicht mit V-6 oder V-7.

(?)GOERBIG : Glauben Sie denn, dass es noch was gibt?

(?)FRANZ : Das glaube ich bestimmt, 100%ig. Ich meine, das war bloss noch nicht fertig, also sie waren noch nicht so weit, dass sie das schon praktisch anwenden konnten. Aber dass sie da schon schwer am Probieren waren, das ist ganz sicher; dass sie da so einige solche Pillchen durch die Luft fahren lassen können bis nach NEW YORK, meinetwegen, oder sonst wo hin, so viel steht schon fest.

(?)GOERBIG : Haben Sie das von authentischer Seite gehört?

(?)FRANZ : Das weiss ich genau.

(?)GOERBIG : Mit was für einer Wirkung denn?

(?)FRANZ : Mit einr Wirkung von einer kolossalen Explosionskraft. Also eine starke Detonation, die also wirklich in einem Mordsumkreis von 2 bis 3 km alles radikal um die Ecke bringt. Bloss, die Sache ist noch nicht so weit, dass sie es schon machen konnten. Sie kamen noch nicht zum Zuge mit der Sache, das kommen sie aber beim nächsten Mal, wenn sie wieder mal so was machen und dann wird es natürlich faul. Wenn der HIMMLER mit seinen Getreuen erscheint da drüben eines Tages und bringt dem gleich die ganzen Patente mit und alles, mit einem Gebrauchsmuster, dann ist das dem alten Herrn STALIN auch nicht so sehr unangenehm. Die Gefahr könnte bestehen, dass HIMMLER den Russen die vorbereiteten V-Waffen verrät, dass er sagt 'Hier sind Erfindungen, halb fertig, die euch grosse Macht geben. Ihr könnt sie haben unter diesen und diesen Bedingungen'.

Gordon Young. Dr. V2 Braun Laughs—at London. *Daily Express* (U.K.), Monday, 18 June 1945, pp. 1, 4.

Garmisch-Partenkirchen, Sunday [17 June 1945].

Thirty-four-year-old Dr. Wernher von Braun today told exclusively for the Daily Express the whole story of how he had invented the V2 rockets which bombarded Britain. [...]

I found von Braun in the white-walled bed-sitting-room of General Dornberger, head of the rocket research section.

It is a room in a former museum in this little mountain town in Bavaria, to which rocket scientists from Peenemünde were moved during the Allied advance into Germany.

Here they carried on their V2 experiments right up to the time of the entry of the American Army.

From the start of our talk he made it clear that his one passion in life was the success of his rockets. [...]

“I always thought, and still believe, that rockets will be the future means of high-speed travel.”

Here General Dornberger interposed excitedly: “Yes, that’s right—why, you may soon be able to develop a rocket plane that will travel at well over 2,000 miles an hour and take you, say, from Europe to America in an hour or so.”

“Yes,” nodded von Braun. [...]

Von Braun said the maximum range of the rockets used on London was about 225 miles, while that of the best experimental types was about 340 miles. [...]

“And now,” said Dornberger, “what we hope is that the world will use our experiences of the last 15 years for rocket development in travel and other ways.”

[This story was partially reprinted in other newspapers, for example:

> V2 Rocket Inventor Tells Story of Bomb. *The Advertiser* (Adelaide, Australia), 19 June 1945, p. 4. https://trove.nla.gov.au/newspaper/article/43498163
>
> V2 Rocket Inventor Tells Story of Bomb. *Army News* (Darwin, Australia), 21 June 1945, p. 4. https://trove.nla.gov.au/newspaper/article/47719491

This is one of several independent sources that reported that during the war, Germany successfully produced improved rockets with a range of ∼350 miles (∼560 km) instead of the usual ∼200 miles (∼320 km) for the standard A-4 (V-2), and/or a length of 18 meters instead of the usual 14 meters (p. 5794).

During this 17 June 1945 interview, von Braun and Dornberger appear to have also told Gordon Young about nuclear warheads that were almost ready for the rockets—see the next page.]

Unconditional Bombs for More Jap War Bases Soon: How We Dropped It: By Atomic Raiders. *The Daily Express* (U.K.), 8 August 1945 p. 1, column 1.

[...] General Spaatz, who commanded the U.S. strategic air forces in Europe, said that one of his major worries then was the fear that the Germans had perfected some secret weapon comparable with the atomic bomb.

Date fixed last year

“They were experimenting in this direction in a huge factory at Oranienburg, on the northern edge of Berlin, but we wiped out the factory in a big raid in the spring of this year,” he added.

(Gordon Young, cabling from Paris last night, said that the Germans planned to have atomic V2s in use by this month.)

Replying to a question whether the atomic bomb would have speeded the end of the European war, General Spaatz said: “If we had had it, it might have shortened the war by six or eight months. We might not even have had a D Day.” [...]

Brigadier-General Thomas F. Farrell, aide to Major-General Leslie Groves, who was in charge of the bomb development programme, disclosed that the date for dropping the first atomic bomb—August 6, 1945—was set well over a year ago.

[George Gordon Young (English, 1908–1963) was a field reporter on staff at *The Daily Express*. He was stationed in continental Europe to find, write, and cable back to the U.K. stories for his newspaper (or others on the wire service) to print. He would not have sent a cable from Paris to his newspaper telling them to add one tangential sentence to an article they had not even finished writing yet—he would have sent a complete story of his own. Judging from the one sentence above, on the evening of 7 August 1945, Gordon Young sent *The Daily Express* an article stating that during the war, the Germans had developed an atomic bomb, had adapted a V-2 rocket to carry it, and had made definite plans to begin launching nuclear-armed V-2 rockets at Allied targets by early August 1945 if the war had continued. Gordon Young interviewed Wernher von Braun and Walter Dornberger in Germany on 17 June 1945 (p. 4678), so this information appears to have come directly from them. The following sequence of events seems likely:

- Gordon Young presumably wrote a story about German plans to launch nuclear-armed V-2s immediately after interviewing von Braun and Dornberger on 17 June 1945. Finding and immediately reporting sensational stories was what he was paid to do.

- A story about atomic bombs, and certainly German atomic bombs, would have been rejected by government censors in June 1945, when the United States was still racing to finish its own highly classified atomic bomb program. This general policy is confirmed by the document on p. 5018, and the censors’ specific rejection of Young’s June 1945 story is confirmed in the following documents.

- Young did publish a story about von Braun and Dornberger in June 1945, but it mostly covered the well-known conventional V-2 program, with two somewhat cryptic mentions of improved rockets (p. 4678).

- Once the United States dropped an atomic bomb on Japan and publicly announced its capabilities to the world, Gordon Young must have decided to submit an updated version of his original atomic V-2 story for publication, now that (he thought) atomic censorship had been lifted. He filed his story on the evening of 7 August and expected it to be published on 8 August 1945.

- Young's atomic V-2 story, announced in advance by the one sentence in the article above, never appeared in *The Daily Express* or any other European or American newspapers. The government censors must have still banned the story.

- However, as shown below, a version of Young's story went out on the wire to affiliated newspapers in Australia, and a few of them published it before the censors realized what happened.

- The story as it appeared in the Australian newspapers is curiously brief, as if parts were still cut out. Perhaps the Australian newspapers received a brief summary of Young's story, and not the actual story itself. Alternatively, maybe the cautious newspaper editors significantly censored the story themselves, or maybe a government censor in charge of Australia had at least approved part of the story.

- In any event, the Australian stories do reveal the basic details: there was a German atomic bomb, there were V-2 rockets designed to carry that it, and there were detailed plans to begin launching such nuclear-armed rockets by early August if the war had continued. The Australian stories also explicitly confirmed that government censors had prevented Young from publishing his story in June 1945.

- The story was never mentioned again by Gordon Young. The censors were almost entirely successful in erasing the history of what had really happened.

However, in 1947, Squadron Leader E. J. André Kenny (one of the most important British aerial photo interpreters for Operation Crossbow) confirmed that von Braun "had spoken of atomic energy at Garmisch, in 1945" (p. 5763).

See also the testimony given by former Nordhausen forced laborer Alex Baum (p. 5335). Baum remembered that von Braun eagerly expected the arrival of a new rocket warhead with tremendous destructive power.

For further evidence of rockets with nuclear warheads, see the summary of the interrogation of engineer Horst Kirfes (p. 4532), as well as the July 1946 *AAF Review* (p. 5038).

For additional references that escaped historical censorship and mentioned nuclear-armed rockets that were intended to attack Allied targets during the war, see the list of documents on p. 5821.]

Hitler's Physicists Hoped to Blast British Cities with Atomic Bombs. *The Mercury* (Hobart, Tasmania, Australia) 9 August 1945 p. 2.
https://trove.nla.gov.au/newspaper/article/26155313

Radio-steered rockets with atomic bombs in their warheads to blast British cities were "weapons to end war," which Hitler's scientists hoped to produce, says Gordon Young, "Daily Express" correspondent in Paris.

"When I met the rocket inventor, Prof von Braun, and Gen Dornberger, head of the Wehrmacht's rocket research branch, they referred to 'much more powerful explosive' with which they had planned to load V-2s," Young says.

"There seemed little doubt that they envisioned the atomic bomb, but nothing could be written then because of a censorship ban.

"The explosion which shattered Hiroshima will have blasted the hopes of von Braun, Dornberger, and 400 other German research workers under guard in Bavaria that the German general staff might be able to keep their atomic bomb for use in another war after just—but only just—failing to use it in this.

"A member of the American Embassy in London recently disclosed that the Germans hoped to have the atomic bomb ready this month."

Nazis Planned to Link Atomic Bomb with V-2's. *The Courier Mail* (Brisbane, Queensland, Australia, 9 August 1945 p. 2).
https://trove.nla.gov.au/newspaper/article/50272870

LONDON, August 8 (Special).—Hitler's scientists hoped to produce radio-steered rockets, with atomic bombs in the war heads.

The Daily Express correspondent in Paris, reporting this, says that the rocket inventor (Professor von Braun) and the head of the Wehrmacht Rocket Research (General Dornberger) had referred to "much more powerful explosives" with which they planned to load V-2's.

"There is little doubt that they envisioned the atomic bomb," he writes.

"The explosion which shattered Hiroshima will have blasted the hopes of von Braun, Dornberger, and 400 other German research workers under guard in Bavaria."

The German General Staff had no doubt planned to keep their atomic bomb for use in another war after just—but only just—failing to use it in this.

An American of the Embassy staff in London recently disclosed that the Germans hoped to have had their atomic bomb ready this month.

[The above version of the article from *The Courier Mail* was also reprinted verbatim (with only a few punctuation changes) as: Nazis Planned Atom Rocket. *Army News* (Darwin, Australia) 16 August 1945 p. 3. https://trove.nla.gov.au/newspaper/article/47723184

Note that these stories also reference Herbert Agar's June 1945 statement that Germany had planned to use atomic bombs by 6 August 1945; see pp. 5017–5018.]

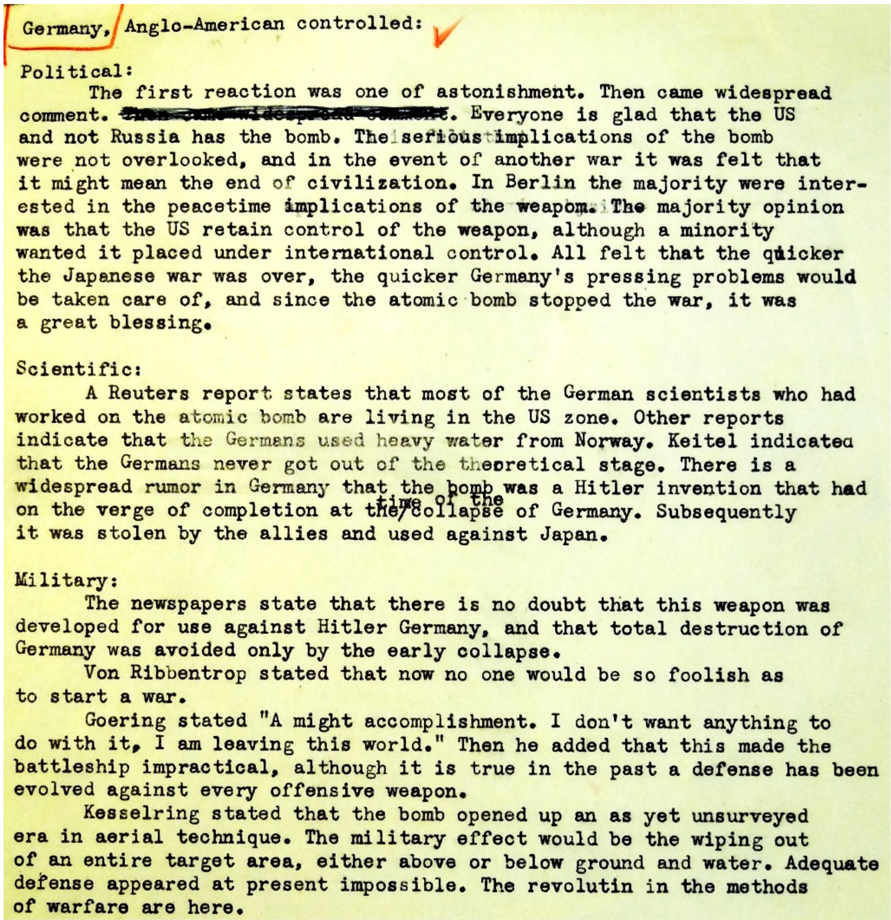
From Salzburg, Germany we have received comments dated August 21 about the bomb and the reaction thereto. The cable answer is as follows:

> REACTION TO ATOMIC BOMB IN WESTERN AUSTRIA LARGELY RELIEF AT FACT THAT AMERICA HAS PERFECTED WEAPON WHICH MAY BECOME CHECK ON FURTHER RUSSIAN MILITARY EXPANSION. WIDESPREAD BELIEF THAT BASIC MATERIALS FOR IT AVAILABLE IN QUANTITY ONLY IN AMERICA AND BRITAIN. RUMORS CIRCULATING IN SOME QUARTERS THAT ATOMIC BOMB REALLY GERMAN INVENTION.

[See document photo on p. 4683 bottom.]



Germany, Anglo-American controlled: ✓

Political:

The first reaction was one of astonishment. Then came widespread comment. ~~Then came widespread comment~~. Everyone is glad that the US and not Russia has the bomb. The serious implications of the bomb were not overlooked, and in the event of another war it was felt that it might mean the end of civilization. In Berlin the majority were interested in the peacetime implications of the weapom. The majority opinion was that the US retain control of the weapon, although a minority wanted it placed under international control. All felt that the quicker the Japanese war was over, the quicker Germany's pressing problems would be taken care of, and since the atomic bomb stopped the war, it was a great blessing.

Scientific:

A Reuters report states that most of the German scientists who had worked on the atomic bomb are living in the US zone. Other reports indicate that the Germans used heavy water from Norway. Keitel indicated that the Germans never got out of the theoretical stage. There is a widespread rumor in Germany that the bomb was a Hitler invention that had on the verge of completion at the time of the collapse of Germany. Subsequently it was stolen by the allies and used against Japan.

Military:

The newspapers state that there is no doubt that this weapon was developed for use against Hitler Germany, and that total destruction of Germany was avoided only by the early collapse.

Von Ribbentrop stated that now no one would be so foolish as to start a war.

Goering stated "A might accomplishment. I don't want anything to do with it, I am leaving this world." Then he added that this made the battleship impractical, although it is true in the past a defense has been evolved against every offensive weapon.

Kesselring stated that the bomb opened up an as yet unsurveyed era in aerial technique. The military effect would be the wiping out of an entire target area, either above or below ground and water. Adequate defense appeared at present impossible. The revolutin in the methods of warfare are here.

Report on information obtained from Senior Officer PW on 28 Jul – 7 Aug 45 [...]

V THE ATOM BOMB

1. Generalleutnant DORNBERGER gave to SS-Obergruppenführer v. HERFF and Generalleutnant HEIM the following account of German attempts to split the atom:

DORNBERGER: Our people [at Peenemünde] tried to split the atom by means of high tension current. About 50 [or 5 or 15, if misheard by the translator or misremembered by Dornberger?] million volts are needed to get the pitchblende [uranium oxide], mixed with heavy water, to disintegrate. But the amount of energy released was only as much as that put in. We haven't yet got it to the stage where the process will continue independently. That was the result obtained in 1941. There is also another method, not with high tension [voltage] but with some kind of static tension [pressure]. It's not the destruction of the atom, but the disintegration of the atom. That can be harnessed, and considerably less energy is needed. It's done by chemicals which disintegrate [chemical explosives]. That is what this [Hiroshima] appears to be, because chemists were largely involved in those experiments, and not nearly so many physicists.

DORNBERGER (Cont'd): I wanted Professor [Wernher von] BRAUN to give us a lecture on the atom bomb, as the results of the research work could have materially influenced the development of the V-weapons.

DORNBERGER also spoke as below to HEIM and Generalmajor BASSENGE:

DORNBERGER: The IO [interrogation officer] also asked me if we intended to produce one, radio-activated—

HEIM: Was it something to do with your thing?

DORNBERGER: Yes, with tungsten(?) as the motive power. It would be a fine thing if they had it, but I don't believe they can direct the rays. That is the decisive thing we need. Because the speed is a hundred times great than that of our ...... which we have now. [This seems to have been a description of using nuclear energy to obtain much higher exhaust velocities for rocket propulsion.]

[...]

VI THE 'V 2'

1. Generalleutnant DORNBERGER stated as below to Generalleutnant HEIM that HITLER had publicly apologised for his failure to appreciate the full worth of the 'V 2' weapon:

DORNBERGER: The following incident was interesting: When I saw the Führer the last time, which was in May 1943, after I'd shown him a film about us, he was quite taken aback. Formerly the Führer had always turned the V-2 business down 100%. He said: "If only I'd believed in it!" "If it really comes to anything, Europe is too small for the war", and all kind of things like that. Then he said: "There are two people in my life whose pardon I must ask. One is Generalfeldmarschall v BRAUCHITSCH, who said at the end of each report he made to me: "My Führer, think of Peenemünde!", and the other is you, general, for not having believed in you."

HEIM: It's incredible that he admitted it.

DORNBERGER: he admitted it in front of Keitel and the others.

HEIM: I believe that really is the only thing he ever admitted in his life.

2. DORNBERGER claimed, on the other hand, that he had begged the Führer to stop the V-weapon propaganda, because nothing more could be expected from just one ton of explosive. To this Hitler had replied that DORNBERGER: might not expect more but he himself certainly did.

3. DORNBERGER alleged in the following passage with Generalmajor BASSENGE that the Russians had made offers to men concerned in "V 2" development and had undertaken to double any bids from the American side:

DORNBERGER: The Russians sent one of my engineers to me when I was with the Americans, who told me under the seal of secrecy that he had such and such an offer to make to us on behalf of the Russians. We were to go back to Peenemünde. Peenemünde would be rebuilt and a parallel factory in Russia, and they offered us double what the Americans were offering us, and we could move our families with us and all that sort of thing. We turned it down flat. They tried again to kidnap our leading lights from us—BRAUN at Witzenhausen(?). They appeared at night time in English uniform; they didn't realize it was the American zone. They came to us and wanted to come in. They had a proper pass. But the Americans were quick to realize it and wouldn't let them in. So they got into cars and drove off again. That's how the people work. Real kidnapping, they don't stick to the boundaries at all.

4. DORNBERGER spoke to Generalleutnant HEIM as below about his intention to sell his services to the best bidder:

DORNBERGER: If the English make me a better offer than the Americans within the next fortnight, I'm preparing to work for them at Vancouver. I have given instructions that nothing is to be signed yet., Actually I don't want to work for the English at all, I only want to play them off against the Americans.

5. Asked by Generalmajor v. PFUHLSTEIN whether he spoke English, DORNBERGER replied that with the Englishmen he did not do so on principle. He could understand them quite well but it gave him more time if he pretend otherwise. To PFUHLSTEIN's suggestion that he should not weaken his position by giving too much away, DORNBERGER replied that he intended to reveal no real technical secrets noting of decisive value. Asked by Generalleutnant HEIM whether he was going to America to work there, he replied that he was, or rather that he did not know whether, as a 'general' he would be allowed to go there.

6. DORNBERGER stated to General FINK that KAMMLER had been ordered by the Führer not

to let BRAUN, DORNBERGER and the 450 scientists and technicians at Peenemünde fall into Anglo-American hands but to liquidate them all beforehand.

7. DORNBERGER, in conversation with Generalmajor BASSENGE, made the following miscellaneous remarks dealing with the 'V 2'. He said that:

a. 720 persons were killed in the first raid on PEENEMÜNDE [17 August 1943] and all the work there suffered two months' delay.

b. In POLAND, at the HEIDELAGER, they had once fired a 'V 2' into a concentration camp. He consoled himself with the thought that that would be chalked up to the SS and not to themselves.

c. A German general in a Russian tank had one day appeared in front of one of DORNBERGER's 'Regimenter' which was near ARNSWALDE and had called upon its members by megaphone to come over to the Russians. He had promised them that the TCHOCHINSKI Works were waiting to receive them and would pay them the maximum wages to build 'V 2s' for STALIN.

d. BRAUN and DORNBERGER himself had realised at the end of December 1944 that things were going wrong and had consequently been in touch since that time with the General Electric Company through the German Embassy in Portugal, with a view to coming to some arrangement.

VII GERMAN ATROCITIES

[...]

DORNBERGER: Look, what a fuss they've made about all those concentration camps. In the first place, one can counter them simply, because all the [unsupportive?] ministers and officials have been in concentration camps, and if things had gone as badly as that with them, they wouldn't be alive. Of course, swinish things did happen. At Nordhausen Standartenführer BEHR (?) said: "We've got 6000 people who are ill and cannot be taken away; what shall we do with them?" KAMMLER said: "Get rid of them!" He said: "How am I supposed to get rid of 6,000 people?" "Oh, take them to that rock and then blow it up over them, and then the matter's settled." That's how he dealt with people. The Allies are very much after him. The fellow was ruthless. In Holland, he made Dutchmen build the sites for the V 2, then he had them herded together and killed by MG fire. He opened brothels for his soldiers with 20 Dutch girls. When they'd been there a fortnight they were shot and new ones were brought along, so that they couldn't divulge anything they might discover from the soldiers.

VIII THE 20TH JULY 'PUTSCH'

[...]

They shot FROMM, quite recently, perhaps a fortnight before the collapse. HIMMLER had a persecution mania. He had me arrested on 27 Apr, for not carrying out orders. I only got away thanks to KAMMLER, who was also to be arrested. We both drove off to Garmisch.

[See document photos on pp. 4688–4691.

Dornberger and the other high-ranking German prisoners may have suspected that their conversations were being monitored and thus withheld information or provided false information. Nonetheless, the details given in the preceding document at least sound credible.

This is only an English translation of the German conversations. If a German version was typed up, it was either destroyed or not included with the English copy in this file. Can a German version be located in other archival files? The English translation does not choose the optimum words for translating scientific German, since the translator was probably not overly familiar with scientific details. While it would be better to have the original German transcript, one can still make sense of the English version.

In Section V, Dornberger appeared to describe three different nuclear approaches:

1. An accelerator-driven subcritical fission reactor, with less than a critical mass of unenriched uranium dioxide fuel in heavy water, with a 50(?)-MeV particle beam (either an electron beam from a betatron or an ion beam from a cyclotron) focused on the uranium to initiate and maintain fission reactions. Dornberger said this experiment occurred in 1941, apparently at Peenemünde. It is unclear if larger or more sophisticated experiments were conducted later or at other locations. Even the 1941 experiment could be suitable for electronuclear breeding of plutonium if it were continued long enough and done at sufficient scale (pp. 5133–5134). There were numerous other reports of similar experiments (pp. 3020–3091, 3954–4022, 4504–4510).

2. An approach using chemical explosives to create high pressure, which would then cause the fission of a mass of uranium, resulting in the sudden release of a large amount of nuclear energy. This seems like a clear reference to a fission implosion bomb; there were numerous other reports of the same design (Section D.8). Dornberger was apparently prompted to make this remark by news of the U.S. bombing of Hiroshima. He said that during the war, he wanted Wernher von Braun to give the other Peenemünde staff a lecture on the (apparently quite real) German atomic bomb, since it was intended to be a payload for their rockets.

3. A method of using fission power to obtain much higher rocket exhaust velocities than were possible with chemical rocket propellants. Unfortunately only a snippet of this conversation was recorded and translated, so it is unclear which of several possible nuclear rocket propulsion approaches Dornberger was referring to.

If the SS was willing to launch a V-2 rocket into a Polish concentration camp as Dornberger mentioned here, one could envision the SS also testing a fission bomb on a Polish concentration camp as reported by a number of sources in Section D.11. Perhaps those were even the same test, if the fission bomb was delivered by a rocket instead of an aircraft or other means.

Dornberger said that he and von Braun had been in touch with U.S. representatives months before the end of the war. This information raises an enormous unanswered historical question: How much contact did the Allies have with key German officials, and how much did those contacts influence the course of the war, especially in the final months of the war?

Can U.S./U.K. transcripts and reports on postwar interrogations of Dornberger and von Braun be located and declassified?]

I ARRIVAL

Generalleutnant Walter DORNBERGER, 'Beauftragter z.b.V. der Heeres Werke G.m.b.H.' and Inspector of the Long-Range Rocket Arm (Inspekteur der Fernraketentruppe), has now arrived at No. 11 Camp.

DORNBERGER is 49 years old and a Protestant; his home is in BERLIN. He was captured at GARMISCH-PARTENKIRCHEN on 2 May 45.

Some details of his career are as follows:

1914-18	Served as an artillery officer.
Early 1930s.	In charge of 'Abteilung Versuch West' at KUMMERSDORF artillery range, set up for the purpose of rocket experiments. Held the rank of 'Hauptmann'.
1933	Chief adviser to the Department for Development and Testing of Weapons (Amtsgruppe für Entwicklung und Prüfung von Waffen), of which his 'Abteilung Versuch West' formed a section.
1935-36	His ideas for powder-fuel rocket propulsion were adopted with a view to the laying of smoke-screens and the 'Nebelwerfertruppe' was accordingly formed. The 'Do-Geräte' took their name from him. Promoted 'Major' and Group Leader (Gruppenleiter) of Group 'D' (DORNBERGER). Persuaded the Army Ordnance Branch to take up liquid-fuel rocket propulsion, as a result of which PEENEMÜNDE experimental site came into being.
1937-38	Promoted and made head of the Testing Department, later 'Wa-Prüf' Department 11, which grew out of his Group 'D'. Appears to have exercised a general supervision over rocket developments since that time.

The story of rocket development as seen by a PW who served under DORNBERGER and described by him in interrogation has been published as S.R.M. 1264.

II DEPARTURES

The following have now left No. 11 Camp and will, therefore, no longer figure in reports in this series:

General der Infanterie	THUMM (Führerreserve OKH)	Captured WELZHEIM	19 Apr 45
SS-Obergruppenführer	Von HERFF (Chef des Personal Hauptamtes)	Captured FLENSBURG	9 May 45
Generalleutnant	SIEWERT (Führerreserve OKH)	Captured NIENDORF LÜBECK	4 May 45
Generalmajor	Von FELLERT (Feldkommandantur 560 BESANÇON)	Captured LANDRESSE	5 Sep 44
Generalmajor	KOHLBACH (Wehrbezirks Kdo. GELSENKIRCHEN-RECKLINGHAUSEN)	Captured WIEDENBRUGGE	9 Apr 45
Generalmajor	KÖNIG (Comd., 12 VGD)	Captured WUPPERTAL	18 Apr 45

III POST-WAR GERMANY

1. The British Labour Government and Post-War GERMANY

a. Generalleutnant ELFELDT and Oberst WILDERMUTH discussed as follows the possible attitude of the British Labour Government towards GERMANY:

/2

R-2293

[redacted]

(29112) Wt.51756/3516 263,000 2/45 A.& E.W.Ltd. Gp.698 J,7393

- 2 -

ELFELDT : As regards GERMANY, I think it quite possible that German workers won't be worse off than they would have been under a CHURCHILL government; I think their efforts to form trades unions, and the struggles of the working class will get better support than they would have under CHURCHILL. We shall not get out from here.

WILDERMUTH: More than that will happen. For one thing the Labour Party is more in favour of a reconciliation of nations than the Tories were; secondly they are convinced that GERMANY will be needed as an economic factor in world economy. They take a longer view than the average Tory does. Both these factors will have a favourable effect on our situation. Unfavourable for our situation will be the fact that the Labour Party will not stand up to the Russians as CHURCHILL did. Firstly their social reforms; their economic situation is in a state of revolution - it means a revolution for ENGLAND - a switch-over from 'free economy' to 'planned economy'. That's the point. To achieve that switch-over they need peace without any foreign-political disturbances; they'll be prepared to pay a high price for it, especially if we have to pay the price and not they themselves. That's the disadvantage.

ELFELDT : For instance, in my opinion one thing which will undergo a decisive turn for the bad is this war criminal business.

b. Generalmajor BASSENGE and Generalmajor WAHLE speculated as below upon the Allied attitude to the re-emergence of political opinion in GERMANY:

BASSENGE : (Re: BBC news). What did you think of what was said about the expression of political opinion in GERMANY? They said it was not possible because so many young men were still in PW camps, or something like that.

WAHLE One can't tell whether that's the real reason.

BASSENGE : No, but what did you make of it? That was the interpretation they gave; I noticed that; it was the first time that they had said anything like that.

WAHLE : Well, they don't want to have a united GERMANY at first, and they've got to have some excuses for that, and this is one of those excuses; even to-day's papers put it like that.

BASSENGE : So did you understand it in the same way as I have just said?

WAHLE : Yes, they don't want GERMANY to come into the political picture again yet; they want to leave that until later on, and it's not difficult to find some excuse or other for that.

BASSENGE : No, they have absolute power, the power of the Tartars.

WAHLE : Of course, we have gone from one dictatorship to another, we poor fools.

BASSENGE : The moment a united GERMANY with a government of its own appears, then the antagonism between East and West will become still more evident, so everyone would much rather fish in troubled waters for the present and then see which way the wind blows.

WAHLE : Of course, that's just what I made of it too.

2. Expected Attitude of RUSSIA

Generalleutnant DORNBERGER, speaking to Generalleutnant HEIM, gave the following forecast of trends, particularly on the part of RUSSIA, quoting the industrialist Geheimrat RÖCHLING for some of his conclusions:

HEIM : Do you also believe that Communism is the only solution?

DORNBERGER: It's not the only chance. There are two possibilities. Either the Russians will get GERMANY, BELGIUM, HOLLAND, FRANCE by peaceful means, and they can do that very easily if the English and Americans pursue their present policy - which is again shown in the POTSDAM-protocol - of insisting that the Western part of GERMANY, which means 65 million people, shall feed itself. That is quite impossible. They are naturally trying to bring up foodstuffs, so that the populations in the big towns particularly shall not be allowed to starve. But in the long run they will find it too expensive. As a result, it will soon come about that the Americans withdraw, and the Russians will then march in, or there will be hunger revolts because they don't provide enough. In the winter the cold is bound to lead to revolts. Then we shall get disturbances in GERMANY, directed less against the occupying power than - as is the German custom - against their own people. Then GERMANY will be ripe for Bolshevism. On the other hand, the following point must be considered: the Russians moved all the industry from the Russian zone of occupation, particularly the key industries such as SIEMENS, SIEMENS-HALSKE, WERNER-SIEMENS, AEG, TELEFUNKEN, ZEISS, all GERMANY's big firms, including the aircraft industry, to ODESSA or to the CRIMEA, complete to the last screw hammer, before the Americans and British reached BERLIN. Geheimrat RÖCHLING, with whom I've just been for a few days at GRANSBERG(?) CASTLE, where SPEER is too, reckons that the Russians need about two years before they've got that industry working to capacity. Then, if the Russian attitude is what the Americans think it is, namely peaceful and satisfied with what they have, they will flood the world market with the cheaply produced German machines and mass-produced goods. According to RÖCHLING, the Russians need about five years and four months for that - he's worked it all out exactly. He assumes that in five years and four months the Russians will be so well-prepared that they can face the English and Americans. They will then sweep with 200,000 tanks through GERMANY, through AUSTRIA, through FRANCE to the ATLANTIC. EUROPE will then be lost, and the aircraft carrier GT. BRITAIN will be done for as well. Later on they will go to INDIA and PERSIA and so the war will go on. Then Bolshevist EUROPE and ASIA will be united against AMERICA and BRITAIN.

3. Present-Day GERMANY seen through German eyes

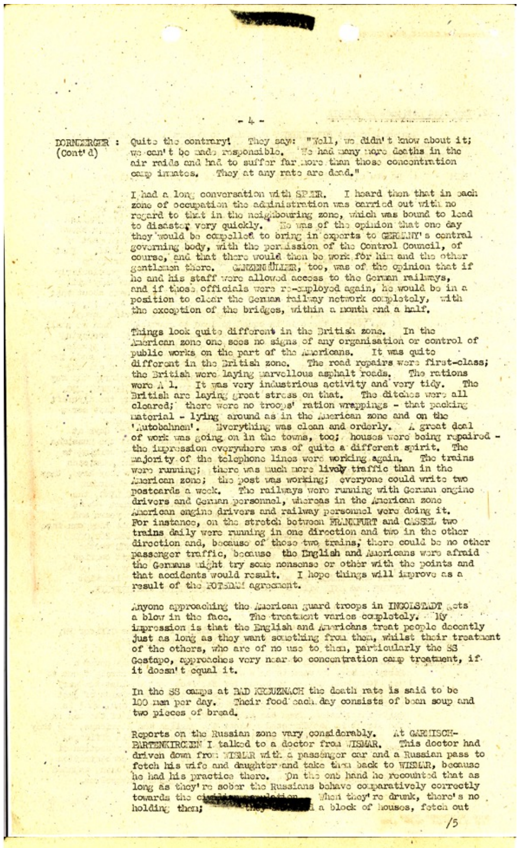
a. Generalleutnant DORNBERGER, addressing his fellow Senior Officer PW, painted the following picture of GERMANY under Allied occupation:

DORNBERGER: I was once with the Bürgermeister of GIESSEN. He was never a Party member, he used to be a democrat, and he said straight out to me: "General, who is to blame for the fact that we lost the war? The FÜHRER meant well." But that's not only the opinion of just that one man; I've heard it very often from people and, what is quite interesting, from the soldier PW. The hatred of the man in the street is not directed against the English and Americans, for they are providing the food, but it is directed against his officers, just as in 1918. Another interesting point is that a section of the German people is completely uninterested in the concentration camp horrors. It's not a case of the German people being ashamed of the business or of them chalking it up against themselves.

[redacted]

R-2293

(29112) Wt.51756/3516 263,000 2/45 A.& E.W.Ltd. Gp.698 J.7393



[redacted]

- 4 -

DORNBERGER : (Cont'd) Quite the contrary! They say: "Well, we didn't know about it; we can't be made responsible. We had many more deaths in the air raids and had to suffer far more than those concentration camp inmates. They at any rate are dead."

I had a long conversation with SPEER. I heard then that in each zone of occupation the administration was carried out with no regard to that in the neighbouring zone, which was bound to lead to disaster very quickly. He was of the opinion that one day they would be compelled to bring in experts to GERMANY's central governing body, with the permission of the Control Council, of course, and that there would then be work for him and the other gentlemen there. GANZENMÜLLER, too, was of the opinion that if he and his staff were allowed access to the German railways, and if those officials were re-employed again, he would be in a position to clear the German railway network completely, with the exception of the bridges, within a month and a half.

Things look quite different in the British zone. In the American zone one sees no signs of any organisation or control of public works on the part of the Americans. It was quite different in the British zone. The road repairs were first-class; the British were laying marvellous asphalt roads. The rations were A 1. It was very industrious activity and very tidy. The British are laying great stress on that. The ditches were all cleared; there were no troops' ration wrappings - that packing material - lying around as in the American zone and on the 'Autobahnen'. Everything was clean and orderly. A great deal of work was going on in the towns, too; houses were being repaired - the impression everywhere was of quite a different spirit. The majority of the telephone lines were working again. The trains were running; there was much more lively traffic than in the American zone; the post was working; everyone could write two postcards a week. The railways were running with German engine drivers and German personnel, whereas in the American zone American engine drivers and railway personnel were doing it. For instance, on the stretch between FRANKFURT and CASSEL two trains daily were running in one direction and two in the other direction and, because of those two trains, there could be no other passenger traffic, because the English and Americans were afraid the Germans might try some nonsense or other with the points and that accidents would result. I hope things will improve as a result of the POTSDAM agreement.

Anyone approaching the American guard troops in INGOLSTADT gets a blow in the face. The treatment varies completely. My impression is that the English and Americans treat people decently just as long as they want something from them, whilst their treatment of the others, who are of no use to them, particularly the SS Gestapo, approaches very near to concentration camp treatment, if it doesn't equal it.

In the SS camps at BAD KREUZNACH the death rate is said to be 100 men per day. Their food each day consists of bean soup and two pieces of bread.

Reports on the Russian zone vary considerably. At GARMISCH-PARTENKIRCHEN I talked to a doctor from WISMAR. This doctor had driven down from WISMAR with a passenger car and a Russian pass to fetch his wife and daughter and take them back to WISMAR, because he had his practice there. On the one hand he recounted that as long as they're sober the Russians behave comparatively correctly towards the c[redacted] When they're drunk, there's no holding them; [redacted] a block of houses, fetch out

- 5 -

DORNBERGER : (Cont'd) all the women and then allow them to go home again the next morning. There are comparatively few humanitarian Russians who have any understanding of what all that means.

It's interesting to note that the 'Bürgermeister' who have been installed by the Russians in their zone are not only communists but are of all types, as long as they were against the Party, and that all the same they look after their people pretty well, and that it's those 'Bürgermeister', who are continually changing, who offer a fair amount of resistance(?) to the Russians, in that their collaboration doesn't go to the lengths of covering up everything the Russian soldiery do. The Russians don't keep strictly to the boundaries; if they see any people they particularly want in a neighbouring place, they put on English or American uniform, drive over the boundary and fetch them. That's what happened to us at WITZENHAUSEN.

It's known that the Russians transferred the whole electrical industry from BERLIN before the English and Americans arrived. They took some of the technicians and industrialists along with them and their families too are to go to the UKRAINE; some of them have already been taken there. The Russians ruthlessly take what they can get from our industry; they have no interest in getting any factories running; only those necessary for quite essential production - electricity, water and gas - are kept up by them.

An interesting incident in the Russian zone was that about a week ago a man reported to us who had fought at STALINGRAD, had been a Russian PW and had worked in a factory in the URALS, where, alone amongst those in his camp, he was suddenly given a pass to travel through GERMANY, through the Russian zone, and suddenly turned up in the American zone...... The man was of the opinion that he was only being used as propaganda for the Russians, because there was certainly no call for them to act in that way.

There is far more 'fraternising' in the Russian zone than in the English and American ones. The Russians understand very cleverly how to treat the little man, and they purposely occupied the eastern and northern sections of BERLIN. They carry on intensive propaganda to win over the German work-people in BERLIN to Communism. It's the same in all the towns. Terrific propaganda is made, continuous film-shows, music, theatres, sometimes very good concerts given by German artists. If you compare the news at the end of a week you can see what strides the Russians are making to gain a complete upper hand over the Germans in their zone of occupation. That is why these decrees have been issued by MONTGOMERY and EISENHOWER, in order to keep in step with the Russians.

b. DORNBERGER stated to Generalmajor BASSENGE that a number of people had already returned to GERMANY from Russian captivity, but that he held this to be merely a propaganda move.

4. GERMANY and the Next War?

In the following conversation with General v. THOMA, General RÖHRICHT welcomed the fact that GERMANY had no central government of its own which the Allies could make a scapegoat:

RÖHRICHT : To-day for the first time there's talk in the newspapers of the third world war. That's meant against RUSSIA, of course.

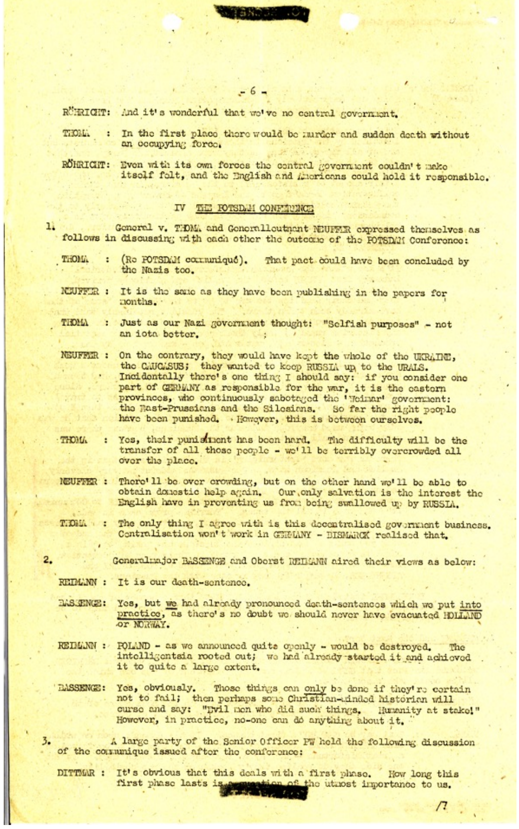
THOMA : That may be GERMANY's first chance. It all depends upon on which side GERMANY finds herself or whether - and this is to be feared as a great misfortune - she may be torn asunder between them. On the one side they do realise they've taken on the responsibility.

[redacted]

/6

R-2293

(29112) Wt.51756/3516 263,000 2/45 A.& E.W.Ltd. Gp.698 J.7393



[redacted]

- 6 -

RÖHRICHT: And it's wonderful that we've no central government.

THOMA : In the first place there would be murder and sudden death without an occupying force.

RÖHRICHT: Even with its own forces the central government couldn't make itself felt, and the English and Americans could hold it responsible.

IV THE POTSDAM CONFERENCE

1. General v. THOMA and Generalleutnant NEUFFER expressed themselves as follows in discussing with each other the outcome of the POTSDAM Conference:

THOMA : (Re POTSDAM communiqué). That pact could have been concluded by the Nazis too.

NEUFFER : It is the same as they have been publishing in the papers for months.

THOMA : Just as our Nazi government thought: "Selfish purposes" - not an iota better.

NEUFFER : On the contrary, they would have kept the whole of the UKRAINE, the CAUCASUS; they wanted to keep RUSSIA up to the URALS. Incidentally there's one thing I should say: if you consider one part of GERMANY as responsible for the war, it is the eastern provinces, who continuously sabotaged the 'Weimar' government: the East-Prussians and the Silesians. So far the right people have been punished. However, this is between ourselves.

THOMA : Yes, their punishment has been hard. The difficulty will be the transfer of all those people - we'll be terribly overcrowded all over the place.

NEUFFER : There'll be over crowding, but on the other hand we'll be able to obtain domestic help again. Our only salvation is the interest the English have in preventing us from being swallowed up by RUSSIA.

THOMA : The only thing I agree with is this decentralised government business. Centralisation won't work in GERMANY - BISMARCK realised that.

2. Generalmajor BASSENGE and Oberst REIMANN aired their views as below:

REIMANN : It is our death-sentence.

BASSENGE: Yes, but we had already pronounced death-sentences which we put into practice, as there's no doubt we should never have evacuated HOLLAND or NORWAY.

REIMANN : POLAND - as we announced quite openly - would be destroyed. The intelligentsia rooted out; we had already started it and achieved it to quite a large extent.

BASSENGE: Yes, obviously. Those things can only be done if they're certain not to fail; then perhaps some Christian-minded historian will curse and say: "Evil men who did such things. Humanity at stake!" However, in practice, no-one can do anything about it.

3. A large party of the Senior Officer PW held the following discussion of the communique issued after the conference:

DITTMAR : It's obvious that this deals with a first phase. How long this first phase lasts is [redacted] the utmost importance to us.

- 7 -

PFUHLSTEIN: Five years.

DITTMAR : The demands in the Press, even those of GARVIN, are all for three to five years.

ELFELDT : When they can find any grounds whatsoever the people here will take us for compulsory labour as war criminals - they won't shoot everyone - but they will send us to RUSSIA, in order to rid themselves of many people here.

PFUHLSTEIN: Nothing was said about compulsory labour for the German workers.

ELFELDT : No, nothing was said at all as to how GERMANY was to make reparations in manpower, but what was given on the radio was only an excerpt. At any rate, things are just what one imagined they would be from the first day onwards. Just imagine the industry of the RUHR, the RHINELAND and the whole of that area, restricted to the needs of this small state.

PFUHLSTEIN: The people will just have to export.

ELFELDT : Only raw materials and coal, no manufactured goods, there's nothing left. Everything else comes under the heading of war potential and will be taken away or destroyed.

KÖNIG : There's one thing to be remembered: the number of people in that small area is being tremendously increased, with the result that the needs of the people are pretty big. In addition to that we have to export, and it won't be so easy.

SCHLIEBEN : I've got the impression that it's been dictated by hatred very largely.

BROICH : Yes, but why not? Did you expect anything else? It's obvious that they are delighted about the millions of Germans who will die next winter.

ELFELDT : The only thing which isn't so terrible is that the crazy evacuation from CZECHOSLOVAKIA and POLAND is to be stopped. The fact that it's already happened, at any rate in POLAND -

KÖNIG : But those who remain there have nothing to laugh about anyway. The most appalling things will go on.

PFUHLSTEIN: And then the secretaries of State!

BROICH : Well, that will be our first government.

PFUHLSTEIN: The beginnings, which will afterwards form the basis -

KÖNIG : Oh well, it will take some time, they are only temporary skeleton appointments.

BASSENGE : We must realize that GERMANY will be constricted into the smallest possible area -

BROICH : For the next 100 years, if not for longer.

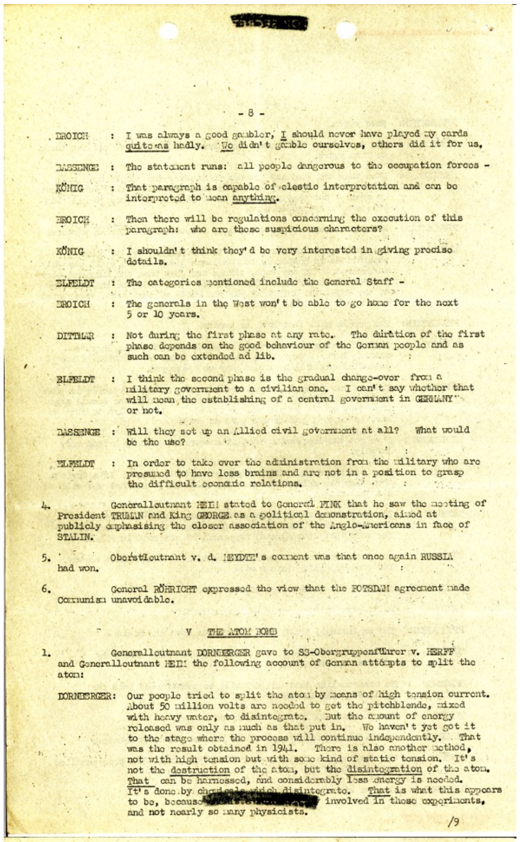
BASSENGE : She'll be completely out of the picture for many decades.

DITTMAR : The development from the year 1200, 700 years, has been annulled by a stroke of the pen.

BASSENGE : Yes, we staked [redacted] card.

(29112) Wt.51756/8516 263,000 2/45 A.& E.W.Ltd. Gp.698 J,7393

R-2293 8



[redacted]

- 8 -

BROICH : I was always a good gambler, I should never have played my cards quite as badly. We didn't gamble ourselves, others did it for us.

BASSENGE : The statement runs: all people dangerous to the occupation forces -

KÖNIG : That paragraph is capable of elastic interpretation and can be interpreted to mean anything.

BROICH : Then there will be regulations concerning the execution of this paragraph: who are these suspicious characters?

KÖNIG : I shouldn't think they'd be very interested in giving precise details.

ELFELDT : The categories mentioned include the General Staff -

BROICH : The generals in the West won't be able to go home for the next 5 or 10 years.

DITTMAR : Not during the first phase at any rate. The duration of the first phase depends on the good behaviour of the German people and as such can be extended ad lib.

ELFELDT : I think the second phase is the gradual change-over from a military government to a civilian one. I can't say whether that will mean the establishing of a central government in GERMANY or not.

BASSENGE : Will they set up an Allied civil government at all? What would be the use?

ELFELDT : In order to take over the administration from the military who are presumed to have less brains and are not in a position to grasp the difficult economic relations.

4. Generalleutnant HEIM stated to General FINK that he saw the meeting of President TRUMAN and King GEORGE as a political demonstration, aimed at publicly emphasising the closer association of the Anglo-Americans in face of STALIN.

5. Oberstleutnant v. d. HEYDTE's comment was that once again RUSSIA had won.

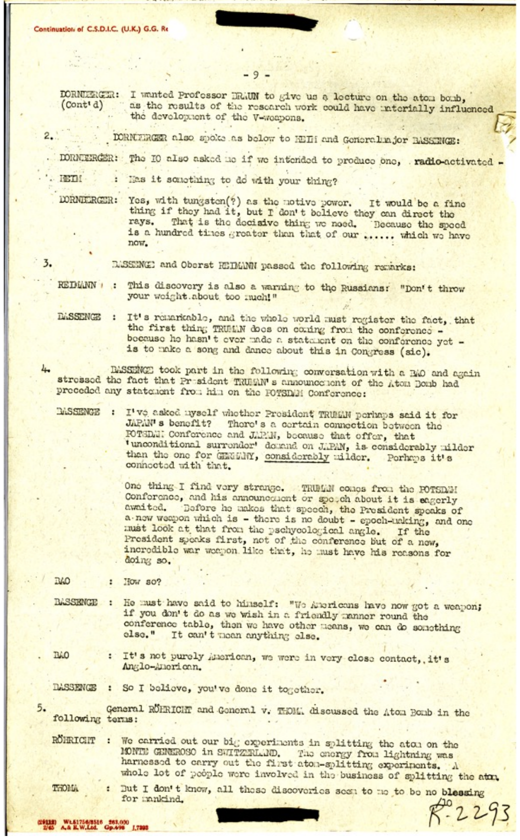
6. General RÖHRICHT expressed the view that the POTSDAM agreement made Communism unavoidable.

V THE ATOM BOMB

1. Generalleutnant DORNBERGER gave to SS-Obergruppenführer v. HERFF and Generalleutnant HEIM the following account of German attempts to split the atom:

DORNBERGER: Our people tried to split the atom by means of high tension current. About 50 million volts are needed to get the pitchblende, mixed with heavy water, to disintegrate. But the amount of energy released was only as much as that put in. We haven't yet got it to the stage where the process will continue independently. That was the result obtained in 1941. There is also another method, not with high tension but with some kind of static tension. It's not the destruction of the atom, but the disintegration of the atom. That can be harnessed, and considerably less energy is needed. It's done by ch[redacted] disintegrate. That is what this appears to be, because[redacted] involved in those experiments, and not nearly so many physicists.

/9



Continuation of C.S.D.I.C. (U.K.) G.G. Re [redacted]

- 9 -

DORNBERGER: (Cont'd) I wanted Professor BRAUN to give us a lecture on the atom bomb, as the results of the research work could have materially influenced the development of the V-weapons.

2. DORNBERGER also spoke as below to HEIM and Generalmajor BASSENGE:

DORNBERGER: The IO also asked me if we intended to produce one, radio-activated -

HEIM : Has it something to do with your thing?

DORNBERGER: Yes, with tungsten(?) as the motive power. It would be a fine thing if they had it, but I don't believe they can direct the rays. That is the decisive thing we need. Because the speed is a hundred times greater than that of our ...... which we have now.

3. BASSENGE and Oberst REIMANN passed the following remarks:

REIMANN : This discovery is also a warning to the Russians: "Don't throw your weight about too much!"

BASSENGE : It's remarkable, and the whole world must register the fact, that the first thing TRUMAN does on coming from the conference - because he hasn't ever made a statement on the conference yet - is to make a song and dance about this in Congress (sic).

4. BASSENGE took part in the following conversation with a BAO and again stressed the fact that President TRUMAN's announcement of the Atom Bomb had preceded any statement from him on the POTSDAM Conference:

BASSENGE : I've asked myself whether President TRUMAN perhaps said it for JAPAN's benefit? There's a certain connection between the POTSDAM Conference and JAPAN, because that offer, that 'unconditional surrender' demand on JAPAN, is considerably milder than the one for GERMANY, considerably milder. Perhaps it's connected with that.

One thing I find very strange. TRUMAN comes from the POTSDAM Conference, and his announcement or speech about it is eagerly awaited. Before he makes that speech, the President speaks of a new weapon which is - there is no doubt - epoch-making, and one must look at that from the pschycological angle. If the President speaks first, not of the conference but of a new, incredible war weapon like that, he must have his reasons for doing so.

BAO : How so?

BASSENGE : He must have said to himself: "We Americans have now got a weapon; if you don't do as we wish in a friendly manner round the conference table, then we have other means, we can do something else." It can't mean anything else.

BAO : It's not purely American, we were in very close contact, it's Anglo-American.

BASSENGE : So I believe, you've done it together.

5. General RÖHRICHT and General v. THOMA discussed the Atom Bomb in the following terms:

RÖHRICHT : We carried out our big experiments in splitting the atom on the MONTE GENEROSO in SWITZERLAND. The energy from lightning was harnessed to carry out the first atom-splitting experiments. A whole lot of people were involved in the business of splitting the atom.

THOMA : But I don't know, all these discoveries seem to me to be no blessing for mankind.

VI THE 'V 2'

1. Generalleutnant DORNBERGER stated as below to Generalleutnant HEIM that HITLER had publicly apologised for his failure to appreciate the full worth of the 'V 2' weapon:

DORNBERGER: The following incident was interesting: When I saw the FÜHRER the last time, which was in May, 1943, after I'd shown him a film about us, he was quite taken aback. Formerly the FÜHRER had always turned the V-2 business down 100%. He said: "If only I'd believed in it! If it really comes to anything, EUROPE is too small for the war", and all kinds of things like that. Then he said: "There are two people in my life whose pardon I must ask. One is Generalfeldmarschall v. BRAUCHITSCH, who said at the end of each report he made to me: 'My FÜHRER, think of PEENEMÜNDE!', and the other is you, General, for not having believed in you."

HEIM : It's incredible that he admitted it.

DORNBERGER: He admitted it in front of KEITEL and the others.

HEIM : I believe that really is the only thing he ever admitted in his life.

2. DORNBERGER claimed, on the other hand, that he had begged the FÜHRER to stop the V weapon propaganda, because nothing more could be expected from just one ton of explosive. To this HITLER had replied that DORNBERGER might not expect more but he himself certainly did.

3. DORNBERGER alleged in the following passage with Generalmajor BASSENGE that the Russians had made offers to men concerned in 'V 2' development and had undertaken to double any bids from the American side:

DORNBERGER: The Russians sent one of my engineers to me when I was with the Americans, who told me under the seal of secrecy that he had such and such an offer to make to us on behalf of the Russians. We were to go back to PEENEMÜNDE, PEENEMÜNDE would be rebuilt and a parallel factory in RUSSIA, and they offered us double what the Americans were offering us, and we could move our families with us and all that sort of thing. We turned it down flat. They tried again to kidnap our leading lights from us - BRAUN at WITZENHAUSEN(?). They appeared at night time in English uniform; they didn't realise it was the American zone. They came to us and wanted to come in. They had a proper pass. But the Americans were quick to realise it and wouldn't let them in. So they got into cars and drove off again. That's how the people work. Real kidnapping, they don't stick to the boundaries at all.

4. DORNBERGER spoke to Generalleutnant HEIM as below about his intention to sell his services to the best bidder:

DORNBERGER: If the English make me a better offer than the Americans within this next fortnight, I'm prepared to work for them at VANCOUVER. I have given instructions that nothing is to be signed yet. Actually I don't want to work for the English at all, I only want to play that off against the Americans.

5. Asked by Generalmajor v. PFUHLSTEIN whether he spoke English, DORNBERGER replied that with Englishmen he did not do so on principle. He could understand them quite well but it gave him more time if he pretended otherwise. To PFUHLSTEIN's suggestion that he should not weaken his position by giving too much away, DORNBERGER replied that he intended to reveal no real technical secrets, nothing of decisive value. Asked by Generalleutnant HEIM whether he was going to AMERICA to work there, he replied that he was, or rather that he did not know whether, as a 'General', he would be allowed to go there.

6. DORNBERGER stated to General FINK that KAMMLER had been ordered by the FÜHRER not to let BRAUN, DORNBERGER and the 450 scientists and technicians at PEENEMÜNDE fall into Anglo-American hands but to liquidate them all beforehand.

7. DORNBERGER, in conversation with Generalmajor BASSENGE, made the following miscellaneous remarks dealing with the 'V 2'. He said that:

a. 720 persons were killed in the first raid on PEENEMÜNDE and all the work there suffered two months' delay.

b. In POLAND, at the HEIDELAGER, they had once fired a 'V 2' into a concentration camp. He consoled himself with the thought that that would be chalked up to the SS and not to themselves.

c. A German General in a Russian tank had one day appeared in front of one of DORNBERGER's 'Regimenter' which was near ARNSWALDE and had called upon its members by megaphone to come over to the Russians. He had promised them that the TCHOCHINSKI(?) Works were waiting to receive them and would pay them the maximum wages to build 'V 2s' for STALIN.

d. BRAUN and DORNBERGER himself had realised at the end of December 1944 that things were going wrong and had consequently been in touch since that time with the General Electric Company through the German Embassy in PORTUGAL, with a view to coming to some arrangement.

VII GERMAN ATROCITIES

1. Oberstleutnant v. d. HEYDTE stated to other Senior Officer PW that to him it was no favour, but a punishment, to have to see the atrocity films. It was just clumsy propaganda, and he would no more yield to pressure on that issue than he had formerly done as regards reading the 'Völkischer Beobachter' or 'Vorwärts'.

2. Generalleutnant DORNBERGER, after maintaining to Generalmajor BASSENGE in the following passage that the Concentration Camp stories were one-sided, went on to blame KAMMLER for some very definite atrocities:

DORNBERGER: Look, what a fuss they've made about all those concentration camps. In the first place, one can counter them simply, because all the ministers and officials have been in concentration camps, and, if things had gone as badly as that with them, they wouldn't be alive. Of course, swinish things did happen. At NORDHAUSEN Standartenführer BEER(?) said: "We've got 6000 people who are ill and cannot be taken away; what shall we do with them?" KAMMLER said: "Get rid of them!" He said: "How am I supposed to get rid of 6000 people?" "Oh, take them to that rock and then blow it up over them, and then the matter's settled." That's how he dealt with people. The Allies are very much after him. The fellow was ruthless. In HOLLAND he made Dutchmen build the sites for the V 2, then he had them herded together and killed by MG fire. He opened brothels for his soldiers with 20 Dutch girls. When they'd been there a fortnight they were shot and new ones were brought along, so that they couldn't divulge anything they might discover from the soldiers.

VIII THE 20TH JULY 'PUTSCH'

Generalleutnant DORNBERGER gave to Generalmajor BASSENGE the following description of what he saw when he went to report to FROMM on 21 Jul 44:

DORNBERGER: On 21 Jul I went to make my report to FROMM. I arrived at 8.30 in the morning and STAUFFENBERG and Co. were lying out in the courtyard. I had no idea what was going on.

- 12 -

BASSENGE : Did you see him lying there?

DORNBERGER: Yes.

BASSENGE : With any signs of maltreatment?

DORNBERGER: No, shot. They were lying there near the sand heap, just at the door.

BASSENGE : Not even covered over?

DORNBERGER: Nothing at all. Shortly afterwards they were taken away - there were four of them. General OLBRICHT was one of them - they'd torn off his shoulder badges. I then went up, I had no idea at all what was happening. They said FROMM wasn't there; I waited two hours and then HIMMLER came. Only then we realised what was up. HIMMLER addressed the nation. They shot FROMM, quite recently, perhaps a fortnight before the collapse. HIMMLER had a persecution mania. He had me arrested on 27 Apr, for not carrying out orders. I only got away thanks to KAMMLER, who was also to be arrested. We both drove off to GARMISCH.

IX THE GERMAN ATTACK ON RUSSIA

General RÖHRICHT gave to various other Senior Officer PW the following picture of the background against which the decision to attack RUSSIA in 1941 was taken:

SCHLIEBEN : How was it that we actually came to attack RUSSIA?

RÖHRICHT : We ourselves at FONTAINEBLEAU were very surprised when it turned out that this GAF attack on ENGLAND had proved an absolute failure, and we had to draw the conclusions for the whole prosecution of the war. "ENGLAND cannot be defeated now; in order to bring the GAF and the navy up to the pitch necessary to defeat ENGLAND, we must forfeit a great part of the army. As long as the army is still available let's quickly make one last big effort and form the new 'Divisionen'."

That very pleasant and unbiassed man SIEWERT (PW) here, will confirm that at that time HITLER sent for FROMM to come to the OBERSALZBERG, and discussed with FROMM the possibility of forming further 'Divisionen', before von BRAUCHITSCH heard anything about it. BRAUCHITSCH was told about it by FROMM. Even if the army had a higher opinion of RUSSIA's power than the Party did, it didn't estimate it nearly high enough. KINZEL, who was Chief of General Staff 'East', always said, even in his report before the Russian campaign, when it was primarily for the OKH a question of concentrating: "We have no definite information. The only means we have at the moment, apart from diplomatic sources and what we find out by devious means, is wireless interception, and according to that the situation looks thus and thus; how much of that is true, and how much they are bluffing us, I don't know. The frontier is hermetically sealed." As well as that there was the fact that the campaign against FINLAND had not made any overwhelming impression on us. When HALDER expressed his opinion of the affair, he said something which gave us a terrible shock: "There will be surprises, perhaps on a tremendous scale." One of those was the Russians' improvised strategic concentrations brought up by rail for the move into POLAND. HALDER said that was an achievement of which no-one would have thought the Russians capable.

- 13 -

RÖHRICHT (Cont'd) : That is illustrated very well by the personal memories of HEIM (PW); the idea was rampant that if we defeated the Russians at the front the State would collapse anyhow, and that in winter we would simply advance into RUSSIA and change over to form strongpoints there from which to suppress any risings. HEIM said that this order was issued more or less at a time when they were in the midst of heavy fighting, and all the suppositions proved false.

X LITERATURE SUPPLIED TO PW

1. Newspapers supplied to PW:

Neuer Hannoverscher Kurier	- 3. 7. 45.
Nordwest Nachrichten	- 6. 7. 45.
Neue Westfälische Zeitung	- 20. 7. 45.
Hessische Post	- 14. 7. 45.
Weser Bote	- 21. 7. 45.
Neue Hamburger Presse	- 21. 7. 45.
Frankfurter Presse	- 19. 7. 45.
Die Weltwoche - Zürich	- 6. 7. 45.
Basler Nachrichten	- 4. 7. 45.
Salzburger Nachrichten	- 14. 7. 45.
Bayrischer Tag	- 14. 7. 45.
Münchner Zeitung	- 14. 7. 45.
Salzburger Nachrichten	- 16. 7. 45.

2. Books supplied to PW:

James BURNHAM	- The Managerial Revolution.
H.O. EVENNETT	- The Catholic Schools of England and Wales.
George Burton ADAMS	- Constitutional History of England.
A.J.P. TAYLOR	- The Course of German History.

3. The 'Wochenpost' Controversy

Articles written by Senior Officer PW for the 'Wochenpost' newspaper circulated to PW camps have brought forth rejoinders from PW in other camps and have led to acrimonious correspondence in that paper. Oberstleutnant v.d. HEYDTE, one of the men attacked, discussed the situation as follows with Generalleutnant v. SCHLIEBEN:

HEYDTE : Now come the accusations from Stabsfeldwebel SETH. But first of all you must know what went before: Some 'Stabsfeldwebel', who were officer candidates, were sent to us at the front to prove themselves under fire, and they were led by a Stabsfeldwebel SETH. I was at my battle HQ, there was a certain amount of firing, and this 'Stabsfeldwebel' trembled and was so jumpy - I can still remember it - that I wanted to send in a report on him. But on the advice of my regimental M.O. I sent him to an institution for nervous disorders for examination; I crossed him off my list. This Stabsfeldwebel SETH was exactly sixteen days with me, and naturally when there was firing, a long way away, I cursed him "You bloody fool", etc.

SCHLIEBEN : It's typical, and a sign of the times, that an 'Unteroffizier' and a 'Stabsfeldwebel' should write that kind of thing. If your name were simply Oberstleutnant MÜLLER, instead of Freiherr von der HEYDTE, you wouldn't be attacked in this way.

SCHLIEBEN (Cont'd) : There you have it! Every engagement into which one led the troops is being chalked up against one; it's crazy! It merely makes one sorry that the English should see what lousy fellows we have.

HEYDTE : It's very interesting.

SCHLIEBEN : But look, you can see it in this article by Herr KROLL(?). At the end he makes the Prussian Junkers responsible for HITLER. What stupidity! It's very interesting. Where did you get it?

HEYDTE : From the M.O.; the War Office wants me to give my opinion.

SCHLIEBEN : The War Office wants you to give your opinion -

HEYDTE : Well, I can only say: "I don't know whether I was regarded as a thruster" (laughing).

SCHLIEBEN : Yes, I would simply say that, nothing else.

Speaking to Generalmajor BASSENGE and Oberst WILDERMUTH, v.d. HEYDTE stated that the facts in the replies received by the 'Wochenpost' from ORs were on the whole correct and the replies were really quite a good appreciation of himself.

XI PERSONALITIES

1. Oberstleutnant v. d. HEYDTE (PW)

a. General RÖHRICHT commented to General v. THOMA that Oberstleutnant v.d. HEYDTE was tremendously ambitious and was already spending all his time preparing a niche for himself in GERMANY later on. He was backing the Catholic Church 100%.

b. Generalleutnant HEIM said to Generalmajor BASSENGE and Oberst REIMANN that he hoped the eyes of the English would be opened to v.d. HEYDTE's double game and his opportunism. He remarked that it served v.d. HEYDTE right that his hypocritical article (in the 'Wochenpost') had had the opposite from the desired effect on the English and had made them wise to him. See also Section X (3).

2. Generalleutnant DORNBERGER (PW)

a. Generalleutnant NEUFFER stated to a number of Senior Officer PW of long standing in the camp that he did not entirely trust DORNBERGER. The people coming to it from other PW camps, and particularly those coming from GERMANY now, were notorious line-shooters.

b. DORNBERGER himself stated that he was arrested by HIMMLER on 27 Apr for failure to carry out orders.

3. Others

1.	KAMMLER	See Sections VI (6), VII (2) and VIII.
2.	RÖCHLING	Geheimrat. Big industrialist in the SAAR. For views expressed by him about RUSSIA's post-war industrial development, see Section III (2).
3.	SCHNEIDER	Of the Weapon Testing Branch (Waffenprüfungsamt). Stated by DORNBERGER to have been arrested for not passing on developments which had been laid down by higher authority, e.g. the rifle which could fire round corners. He was to have been shot later.

D.14 Allied Belief in the Reality of German Nuclear Weapons

[Both during and after the war, highly placed Allied officials expressed belief in the reality of advanced German nuclear weapons programs. In fact, it appears that after the war, the four major Allied countries found and benefited from materials and expertise from the German nuclear weapons program. All of the relevant wartime and postwar reports with the detailed evidence remain classified or missing entirely from archives. Nonetheless, enough sources are available to prove that those reports did indeed exist, and presumably still do exist.

For convenience, this section is divided into categories of intelligence sources:

D.14.1. U.S. presidential intelligence.

D.14.2. Alsos and other Manhattan Project intelligence.

D.14.3. Dutch intelligence.

D.14.4. French intelligence.

D.14.5. German and Japanese submarines.

D.14.6. High-level interrogations.

D.14.7. U.S. inspections of possible nuclear facilities.

D.14.8. German and Austrian scientists in the United States.

D.14.9. Other intelligence services.

D.14.10. Fritz Lang and the leak that almost revealed everything.

D.14.11. Allied intelligence officials who would/should have known.

Some examples of Allied wartime and postwar intelligence include:

- Vice President Henry Wallace, Vannevar Bush, George Strong, and other top U.S. officials were actively investigating the German nuclear program in 1942 and 1943, but their reports are still classified and unavailable to the public (pp. 4699–4700). Why?

- In two December 1943 cables to Washington, the U.S. Military Attaché in Istanbul warned that "an engineer of the Todt organization revealed in Sofia that the Germans now possess a new type of incendiary far surpassing anything yet used in warfare. The engineer intimated that London would suffer a fate worse than that of Berlin or Hamburg in the near future." The reports added: "The Germans have a weapon in preparation which is more devastating than anything we have ever seen" (pp. 4588–4588). Germany had been mining uranium in Sofia since 1938 (Section 8.8.3).

- In July 1944, Manhattan Project physicists Philip Morrison and Karl Cohen analyzed available intelligence on the German nuclear program and concluded (p. 4739): "Recent evidence essentially confirms our earlier general statements on enemy bomb production. The reports now at hand lead us to conclude: A German "Y" [enrichment] project has been underway since early 1943. A D_2O pile is in operation, but we do not believe that this is on production level. [...] In either case the first completed device could be in enemy hands now." Just exactly what evidence did the United States possess?

- The *Daily Telegraph and Morning Post* reported that in August 1944, the British government had intelligence that Germany was preparing "an atomic bomb" with "an explosive radius of more than two miles," or three kilometers (p. 5011). As noted in Section 8.8.5, the Royal Air Force went to extreme lengths to bomb what appears to have been a German fission reactor and fuel reprocessing complex near Königsberg during the period 26–30 August 1944.

- In September 1944, the *Los Angeles Times* reported that invading U.S. troops in France had found evidence that Germany was preparing a rocket-launched bomb "with an explosive radius of three kilometers" (p. 5012). What exactly was the evidence, and where are the official reports?

- Margaret Suckley, Franklin Roosevelt's secretary, wrote in her diary on 9 December 1944 that Roosevelt had received reliable reports that the Germans had successfully developed a bomb capable of killing everything within a mile and that the German program was "way ahead" of similar U.S. research (p. 4703).

- A tantalizing December 1944 summary report from the Manhattan Project's Foreign Intelligence Unit concluded (p. 4703): "Intelligence indicates that the enemy is working in the project field. It is likely that he has undertaken one or several of the various processes for the production of bombs on a small scale and to have organized an installation equivalent to our project on final utilization. (TAB A)." Unfortunately, instead of TAB A, the collected intelligence evidence for the German nuclear weapons program, the NARA file only includes a note stating: "In the review of this file this item was removed because access to it is restricted" (p. 4707).

- In a 9 December 1944 memo, U.S. Admiral William Leahy stated that on 8 December the Joint Chiefs of Staff discussed the possibility of a "V-3 stratospheric bomb attack" on the United States (p. 4702).

- In March 1945, Gerard Kuiper, a highly knowledgeable investigator in the Alsos Mission, wrote a letter that contradicted what the heads of Alsos were claiming at that time (p. 4766): "One is again surprised to see quotations from U.S. senators who think that the war will be over 'within a few days'. It would be wiser to worry about the chance we still have of losing it if certain high explosives are developed in time. This possibility may, incidentally, be one reason why the Germans are not giving in."

- Rather than heading toward the logical objective of Berlin to topple the German government and beat Soviet forces to the prize, U.S. troops under Generals Patton, Bradley, and Eisenhower rushed straight toward Thuringia. Justifications for this strategy have ranged from preventing Hitler from fleeing south to liberating concentration camps. However, at the very least it seems like an intriguing coincidence that Patton, Bradley, Eisenhower, and other top

Allied officials were personally inspecting the Ohrdruf Truppenübungsplatz military base all together on 12 April 1945 (U.S. forces captured the base on 4 April), only a month after the possible nuclear weapons tests at that site (Section 8.8.12) [Karlsch 2005, p. 218]. Other than photos of the generals and some of the concentration camp victims, none of what must have been numerous detailed written reports about what technologies or documents the U.S. forces found at that and nearby facilities have ever been declassified and released to the public.

- A 31 May 1945 cable from Eisenhower to Washington, D.C. reported: "A laboratory containing equipment and documents related to experimental work on atomic bombs and AA rockets was located near Lofer, E 7399 by Third US Army" (p. 4974). Eisenhower later told *The New York Times* how seriously he regarded the German nuclear program: "My main concern was that the Germans did not get the atomic bomb to use on us" (pp. 5033–5034).

- Indeed, at the end of the war, Allied investigators personally inspected many sites that conducted work related to the German nuclear weapons program, including sites in Germany (Lüneburger Heide, Hillersleben, I.G. Farben installations, numerous locations in Thuringia, etc.), Austria (St. Georgen an der Gusen, Ebensee, Redl-Zipf, Lofer, etc.), Czech territory (Pilsen, Podmokly, St. Joachimsthal/Jáchymov, etc.), and elsewhere (pp. 3670–3677, 4962–4985). Detailed reports on what they discovered and learned about the German nuclear program have never been publicly released.

- In May 1945, the German submarine U-234 surrendered to the United States. It contained 560 kg of uranium oxide (possibly enriched), bomb detonators, other materials, plans, and technical experts that would have shed light on the German nuclear program. Other submarines carried additional relevant materials, documents, and personnel (Section D.14.5). Where are the many tons of documents, prototypes, and other cargo from the U-234 and the other submarines, as well as all of the reports on the German nuclear and other technology programs that the United States compiled in the process of investigating the submarines' cargoes and interrogating their passengers?

- By the end of the war, SS General (and Dr. Ing.) Hans Kammler controlled and knew the details of virtually all German secret weapons research and development programs, including the nuclear weapons program. According to official histories, Kammler died in early May 1945. However, multiple documents in U.S. government archives prove that he surrendered to U.S. forces in May 1945 and was alive and being interrogated by the United States for many months (and perhaps even many years) after the war (pp. 4914–4961). The U.S. government must possess lengthy transcripts or even audio/video recordings of Kammler's interrogations. It would also possess any documents and materials that Kammler had with him when he was captured, or that he was able to direct the Americans to afterward. Kammler's interrogations and documents would almost certainly have provided the United States with considerable detail about the German nuclear program and other very advanced developments. (Albert Speer's capture and interrogation resulted in many shelves full of documents.) How can all of that Kammler material be located and declassified from U.S. government archives?

- When nuclear-related censorship was relaxed somewhat after the U.S. atomic bombings of Japan in August 1945, Allied officials made a stunning admission to *Newsweek* (p. 5022): "Since the surrender of the Nazi armies, Allied officers have revealed that Germany would have been able to strike with atomic bombs by January 1945, if the invasion had not come six months before. The highest Allied officials knew that such explosives could have won the war for the Axis."

- In a 25 August 1945 press release, the U.S. Office of War Information stated that "Germany's inner war secrets" included "experiments with the atomic bomb," that "Germans made significant progress in the development of an atomic bomb," and that not all "of the secrets. . . may be disclosed at this time" (p. 5023).

- A 31 August 1945 U.S. report mentioned "Gerald Klein (Dr.), Dipl.-Eng., Manager of LGW. . . Worked at Peenemünde and later became group director of atomic devices in RLM. At present being used by the British. Evacuated by 'T' Force" (p. 5010). Klein was listed as the manager of "LGW," which was the Luftgerätewerk Hakenfelde A.G., part of the huge Siemens electrical company. If wartime Germany never had atomic devices or even serious plans to make them, as maintained by official histories, why did the RLM or Reichsluftfahrtministerium (Ministry of Aviation) have an entire group dedicated to atomic devices, of which Dr. Klein was the director? Where are the U.K. and U.S. reports on Klein, the organizations named, and the nuclear work?

- A remarkable 14 September 1945 OSS cable revealed (p. 5045): "Our work on this subject is to correlate and cooperate with specially appointed general who has charge of the whole AZUSA [German nuclear] situation and has overall responsibility. . . . On present sub feature of AZUSA about assisting locating German scientists, special general asked to have the information sent only to Calvert, London Embassy, or to Washington. . . . This insures desired maximum security with fewest number persons involved. Copies of any reports to be sent OSS Washington without delay and showing action taken. This subject so tight at this time we are playing very close with special general." Does this OSS cable show that the U.S. started to really appreciate the full extent of the wartime German nuclear program by September 1945, and took steps to limit that knowledge to the "fewest number persons"? Is that why Zinsser's report of a German atomic bomb test was upgraded from Secret to Top Secret in early October 1945 (Section 8.8.10)? Who was the "special general" mentioned in this cable—Leslie Groves or someone else?

- The joint chairs of CIOS, U.S. General Thomas Jeffries Betts, Deputy G-2 of SHAEF, and U.K. Ministry of Supply chief advisor and F.R.S. Professor Reginald Patrick Linstead, wrote a 15 September 1945 final report based on specific discoveries by their CIOS investigators (p. 5030): "Certain items have been omitted because of security considerations. . . Of particular significance were the statements, made by German experts in the rocket and controlled missile field, that much of the priority accorded their work by the German High Command was in anticipation of the use of atomic explosives. These authorities stated that KWI had repeatedly assured Hitler that an atomic explosive would be available for use within a comparatively short time. During the last months of work by the Peenemünde staff, V-weapons were designed with much smaller war-heads. Quite possibly this trend was in anticipation of the successful development of a German atomic explosive." Thus the CIOS chairs directly contradicted the public statements of the Alsos Mission and confirmed that there was indeed a German program to develop an atomic bomb, and that it was far more than a paper design program—its hardware had passed through sufficient development, production, and testing by the end of the war that it was ready or nearly ready to be used in combat.

- In September and October 1945, General George C. Marshall made several noteworthy public statements: (1) “German technological advances such as in the development of atomic explosives made it imperative that we attack before these terrible weapons could be turned against us.” (2) “At the close of the German war in Europe they [U.S. factories] were just on the outer fringes of the range of fire from an enemy in Europe. Goering stated after his capture that it was a certainty the eastern American cities would have been under rocket bombardment had Germany remained undefeated for two more years. The first attacks would have started much sooner.” (3) “It is not hard to predict that supersonic atomic rockets will have a profound influence on any war that ever again has to be fought” (p. 5031).

- T. M. Odarenko, a longtime physicist from Bell Telephone, was one of the senior scientists involved in transferring advanced technologies from Germany and Austria to the United States after the war. He wrote of encountering a large group of refugee nuclear scientists in Austria (pp. 4788–4785): “Contrary to the statements, attributed by the U.S. newspapers to the various U.S. atomic experts, that it “would take the Germans some 100 years to solve the problem of atomic disintegration on an explosive basis” (for the manufacture of bombs), the opinion of the members of the Institute themselves was that, given a supply of radium and uranium, and permitting their return to Vienna, where certain of their materials and equipments are stored, they would be able to “complete their work” in some 3 to 6 months. . . . That these claims of the Institute are not to be disregarded too readily would follow from the fact that Prof. [Charles P.] Smyth spent considerable time with the Institute, revisited them several times, and thought it necessary to insist on the most stringent type of control over the scientific activities of the group, as well as on close individual observations.” Smyth reported to Leslie Groves, and Odarenko’s reports on the nuclear scientists were also forwarded to Groves. The Austrian nuclear scientists were closely monitored and controlled for years by U.S. intelligence and military agencies. For example, the leader of the Austrian group, Georg Stetter, was kept under virtual house arrest by U.S. agents in Austria from 1945 until the 1950s, nearly destroying his career (pp. 4798–4800).

- A large number of Alsos-related documents from Samuel Goudsmit’s files remain classified (pp. 4772–4779). Likewise, some very important German-related files from the Manhattan Project’s Foreign Intelligence Unit and the OSS remain classified and unavailable (pp. 4812–4827) [NARA RG 77, Entry UD-22A; NARA RG 226]. Even Lt. Col. George R. Eckman’s “Final Report on the ALSOS Mission,” written in December 1945, seems to be missing from modern archives (p. 3333). There may be countless other relevant files whose absence is not even noted in the archives.

- There is evidence that Dutch intelligence provided important information about the German nuclear weapons program to the United States during and after the war (pp. 4832–4853). Samuel Goudsmit’s entire folder of Dutch intelligence on the German nuclear program remains classified and unavailable.

- Likewise, there is evidence that French intelligence gave important information about the German nuclear weapons program to the United States (pp. 4854–4855).

- Werner Grothmann stated that the fission fuel and components of at least one German atomic bomb were found and removed from Germany by U.S. forces in 1945 (pp. 5040–5043). An archived card catalog of U.S. intelligence reports on Germany shows that there were postwar reports containing detailed information on the German atomic bomb, including a 2 January

1946 document labelled "Blueprints of Atomic Bomb," a 28 March 1946 report on "Atom Bomb Research in Germany & Influence on Developments in Soviet Russia," a 4 June 1947 report entitled "Atomic Bomb," a 25 July 1947 report on "Atomic Bomb Detonating Plans," and others. The reports themselves are still classified and unavailable to the public (pp. 5074–5075).

- In private, General Leslie Groves wrote a February 1946 secret memorandum revealing (p. 4806): "Government measures to encourage the long term exploitation of German scientists by the United States are desirable, particularly with reference to nuclear physicists and chemists who might be of some service to scientists in this country in the field of atomic energy. . . I suggest, therefore, a fifth category, defined as, those German scientists of outstanding ability in the field of nuclear physics and chemistry who, by their past reputation and present knowledge, would be of more value to the national interest of this country if they could be employed here rather than in any other country. . . However, it is extremely important that these persons be prevented from giving their services to a potential enemy of the United States." In public, though, Groves knowingly and repeatedly made false claims that Germany's nuclear scientists had been few in number and hopelessly backward [Groves 1962].

- At the "Ashcan" interrogation center after the war, Hermann Goering told his Allied interrogators that "Germany was within 90 days of producing its first atom bomb when the war ended" (p. 4894).

- In similar postwar interrogations, Wilhelm Voss, the former director of the Skoda works, told Allied interrogators about the organization and results of the German nuclear weapons program (p. 4914).

- A U.S. Department of Commerce press release praised wartime German scientific accomplishments that were more advanced than those of the United States and that were being transferred to the United States to improve its programs: "Spectacular accomplishments in uranium, nitrogen, oxygen recovery, plastics, nuclear physics and many other fields, have been uncovered in the investigation of the chemicals field alone" (p. 5066).

- In July 1946, the U.S. *Army Air Forces Review* published an article stating, "it is still a matter of scientific conjecture just how many weeks—or days—it might have taken Germany to be ready with her atomic devices for the V-2s" (p. 5038).

- In 1946, U.S. Army Air Forces Colonel George Woods wrote of "Germany's Plans for the 'A-9' with Atomic Bomb": "it is well known that the Germans originally had hoped to have their atomic bomb developments completed by the end of 1944." See p. 5073.

- Top Secret 1946 cables from the U.S. Joint Chiefs of Staff to General Joseph T. McNarney (the military governor of the U.S.-occupied zone of Germany and also the commander in chief of the U.S. Forces of Occupation in Europe) ordered him (pp. 5065–5066): "Except for most cogent reasons you will not permit representatives of nations other than British Commonwealth (excluding Eire) to have access in any U.S. zone of occupation under your jurisdiction to technical information on the following subjects or to related intelligence targets: [...] Applied and theoretical nuclear physics, including design and operation of devices for producing highly energetic particles, and isotope separation." These Top Secret Orders from the highest level were written over a year after the end of the war in Europe, after the U.S.

had had time to investigate wartime German programs in detail, and they specifically noted advanced nuclear-weapons-related work.

- In a 17 August 1946 interrogation, Edmund Sorg described a piloted version of the V-1 cruise missile armed with an atomic bomb (p. 4896).

- In discussing German rockets as weapons in an August 1947 interview, General William L. Richardson said "there is evidence to believe that the Germans intended to utilize an atomic warhead which would have made this weapon extremely deadly" (pp. 5035–5036). General Richardson would have been a highly knowledgeable and very sober source for this information. What "evidence" did he have?

- In a 19 August 1947 intelligence report that is still heavily censored, Edmund Tilley discussed wartime nuclear weapons work at Tucheler Heide in Poland, including the production of ^{235}U and ^{239}Pu and apparently even 1–5 kg fission pits for atomic bombs. According to Tilley, one of the German scientists most directly responsible for that work, "Dr. Niels" (Walter Nielsch?), had already been taken to the United States for interrogation and/or work (p. 4902).

- Many German and Austrian scientists who appear to have been involved in the nuclear program visited or worked in the United States and/or United Kingdom after the war. They may have provided information about wartime German work and aided the U.S./U.K. nuclear programs. Even basic files for some scientists are still not available to the public. For example, virtually the entire "Foreign Scientist Case File" (Paperclip file) of nuclear physicist Otto Haxel has been redacted in response to recent Freedom of Information Act Requests, and Wernher von Braun's Paperclip file is missing entirely. Furthermore, a large number of additional scientists were interrogated in Europe. The complete interrogation reports and all other files on all of these scientists and engineers should be sought and released.

From examples such as those given throughout this appendix, it is clear that there is an enormous amount of information about the wartime German nuclear weapons program that remains classified and/or hidden by various governments. Why is that the case, if the German program was as small and as primitive as government officials and historians have maintained for 75+ years? What is the true history of the German program? What is the true history of Allied knowledge about the German program, both during and after the war? Where is all of the relevant archival and physical evidence stored now?]

D.14.1 U.S. Presidential Intelligence

[Some of the best Allied wartime intelligence on the German nuclear program was centered around Franklin Roosevelt and the top presidential advisors. Most of the actual intelligence is still not available to the public. From the information that is available, it appears that much of this intelligence came from channels other than the Alsos Mission, which was supposed to be the official intelligence investigation of the German program.

As shown on pp. 4699–4700, Vice President Henry Wallace, Vannevar Bush, George Strong, and other top U.S. officials were actively investigating the German nuclear program in 1942 and 1943, but their reports are still classified and unavailable to the public. Why?]

January 8, 1943.

Major General George V. Strong,
Assistant Chief of Staff, G-2,
War Department,
Washington, D.C.

Dear General Strong:

The Vice President, as you know, is interested in the subject which we call S-1. He recently, on his own initiative, made certain inquiries regarding radium production, and I forward a memorandum on this subject which he recently transmitted to me.

This evidence might indicate that increased German activity is not really directed to the production of radium, but to the uranium oxide which makes up a large percentage of pitchblend. The question of whether the ore after treatment in Berlin remains there seems to be a crucial one. If we knew the flow of ore from the Joachimsthal deposit in the last two years, we would know a great deal. The quantities involved are substantial from the standpoint of S-1.

You will remember that we had an indication that there was no unusual activity around some of the principal deposits. It may well be, however, that there is sufficient material available in Germany and Belgium from radium production so that no additional activity at the mines is needed.

I know that your organization was consulted during the preparation of this report, so that you may already have this material. I also note that further material may be sent through this same channel later.

Very truly yours,

Why??? [NARA RG 227, Microfilm M1392, Bush-Conant File Relating to the Development of the Atomic Bomb, https://downloads.paperlessarchives.com, pp. 11,357–11,361.]

Joseph E. Persico. 2001. *Roosevelt's Secret War: FDR and World War II Espionage.* pp. 381–382

The President had sent the rambunctious George Earle, former Pennsylvania governor, former ambassador, and permanent playboy, to Istanbul in 1943 as his eyes and ears. Earle's reports from that den of intrigue had proved a mixed but respectable bag. He had provided FDR with solid, if unwelcome intelligence on what the Russians had done to the Poles in the Katyn forest. He had correctly predicted the German rockets falling on England. But he had overestimated the destruction and underestimated the time for the Germans to rebuild the bombed Ploeşti oil fields. [...]

He fired off a warning to the President on December 5 [1944] that the Germans, already using V-1 buzz bombs and V-2 rockets against England, were about to launch another secret weapon, the V-3, against the American East Coast.

[George Earle's 5 December 1944 report is mentioned in several archival documents, but that report itself does not seem to be available in archives. Can it be located?

Earle's earlier reports on secret activities were correct and highly valuable intelligence. If anything, they underestimated German capabilities, such as their ability to withstand and to repair damage to their oil facilities in Ploeşti, Romania. During his time in Turkey, Earle had close contacts with Wilhelm Canaris, Paul Leverkühn, Franz von Papen, and other highly placed German officials who had inside knowledge of very secret projects.]

Franklin Roosevelt to William Leahy. 7 December 1944. [Franklin Delano Roosevelt Library, Hyde Park, New York. Map Room Files, Box 20. Folder Trips to Warm Springs, Ga. 28 Nov.–8 Dec. 1944]

MR-IN-217 7 December 1944

MEMORANDUM FOR ADMIRAL LEAHY FROM THE PRESIDENT:

In view of message from Lt. Commander Earle 051444 NCR 4414, please tell Joint Staff I am inclined to think Office Civilian Defense and Air Corps and Eastern Frontier of Navy should reconstitute all alert preparations. The telegram is probably a rumor and there may be nothing in it but every precaution should be taken.

RECD 072006Z

Clayton Bissell and Hewlett Thebaud to the Joint Chiefs of Staff. 9 December 1944. Subject: Agreed Joint Evaluation of the Possible Existence of the V-3 Rocket and Probability of Attack against the U.S. [Franklin Delano Roosevelt Library, Hyde Park, New York. Map Room Files, Box 164, Folder Naval Aides. Files: A/16—General Correspondence]

1. The cable from Lieutenant Commander Earle, Naval Attaché, Turkey is probably propaganda and represents a plant by the Germans. There is no reliable information available of German development of a long range rocket other than the V-2.

2. The V-3 may possibly be a rocket of smaller dimensions than the V-2 with a shorter range. It would be possible to launch such a missile from specially designed or modified submarines. Attached is a sketch of a German submarine based in a southern Norwegian port showing a pair of rails extending from conning tower to the bow and terminating at a flat, rectangular surface. The purpose of this is unknown.

3. German attack from Europe of United States cities by long range rockets is deemed impossible now. Small rocket or flying bomb attacks from specially constructed submarines are considered possible. Any such action would be made with propaganda effect rather than material damage as the primary objective.

[The sketch mentioned in this document is on p. 5623.

In this and other documents, Allied intelligence analysts were seemingly puzzled why Germany would go to so much trouble to deliver such a small number of payloads to the United States. They reasoned that a few payloads of conventional explosives would not do much damage to U.S. cities and would only serve a propaganda purpose. The obvious answer, which some intelligence analysts realized but others did not, is that the intended payloads were not conventional explosives. They were probably nuclear weapons as explained in this appendix, or possibly chemical or biological weapons as covered in Appendix A.]

Admiral William D. Leahy. 9 December 1944. Memorandum for the President. [Franklin Delano Roosevelt Library, Hyde Park, New York. Map Room Files, Box 20. Folder Warm Springs, Dec. 9-18, 1944]

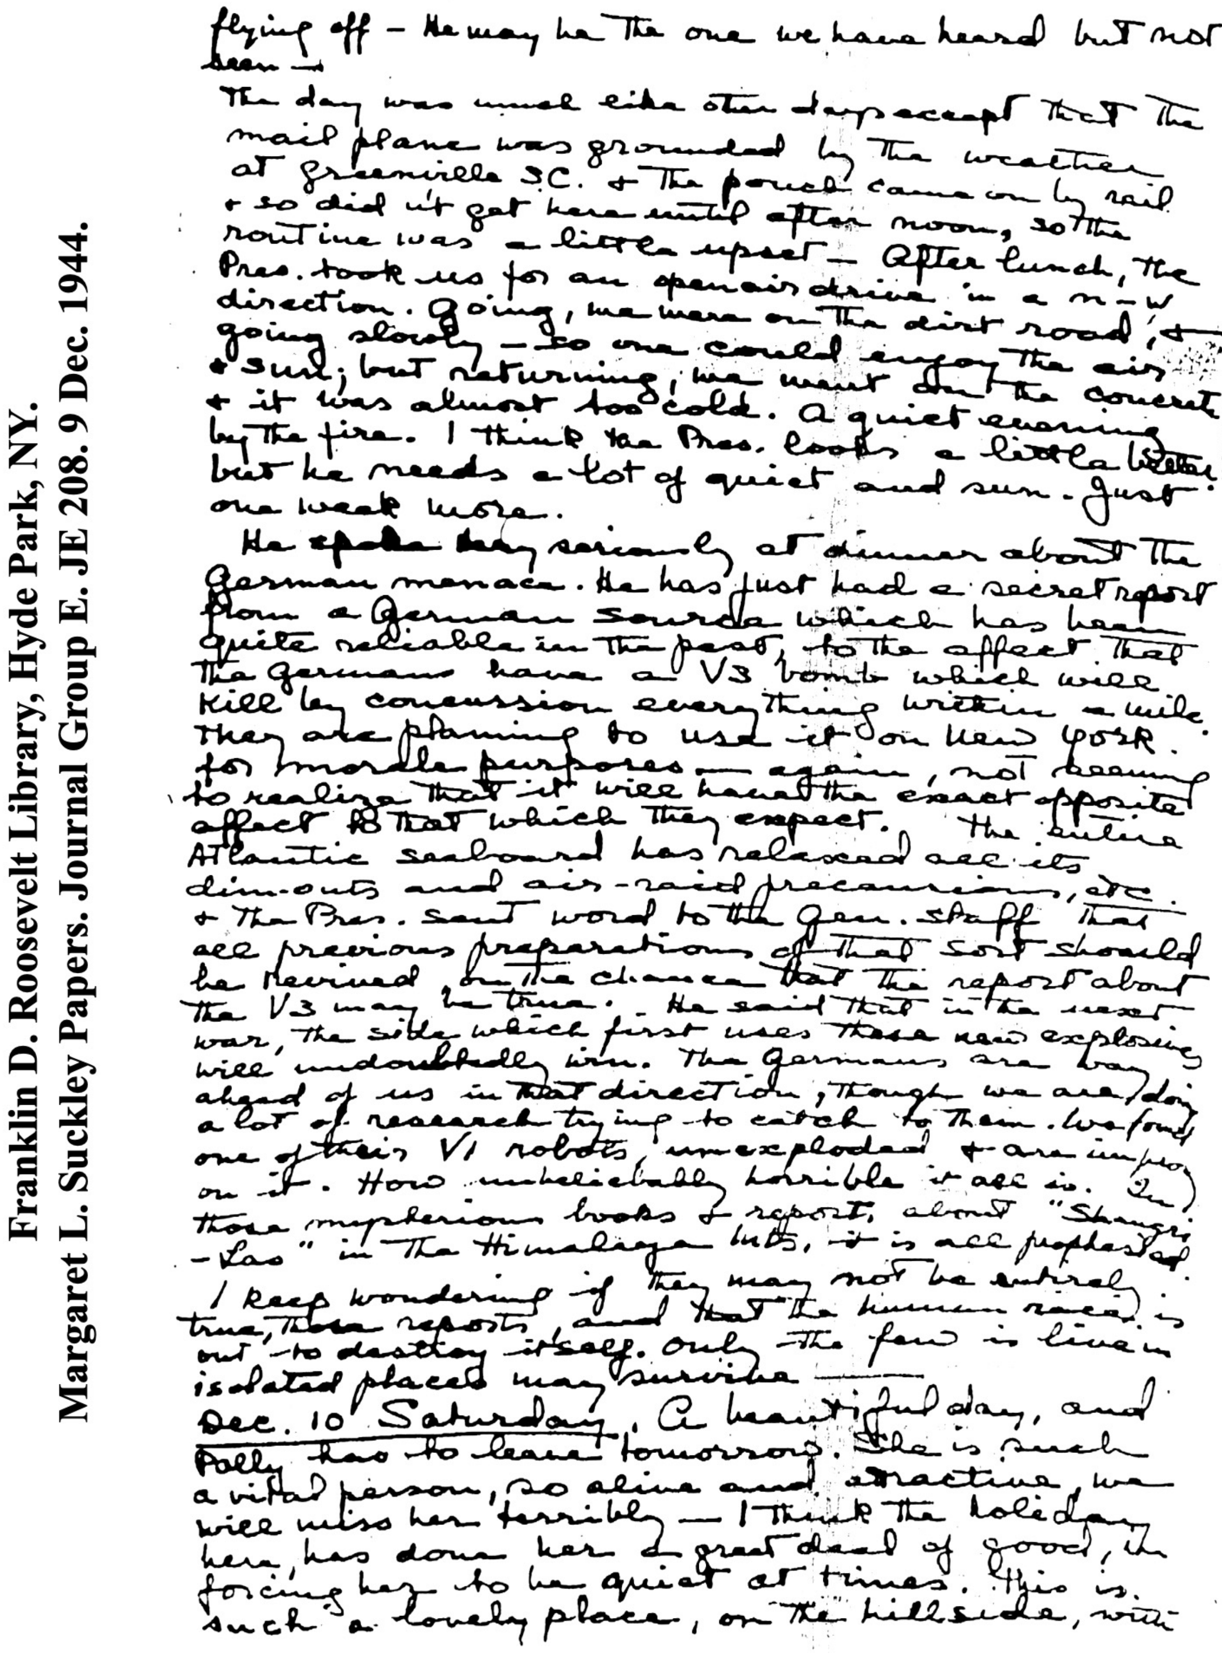
Possibility of V-3 stratospheric bomb attack on U. S. was discussed at a meeting of the Joint Chiefs of Staff yesterday. General Marshall and Admiral King have sent messages to defense commands, sea frontiers and the First Air Force at Mitchell Field ordering precautionary measures taken.

1944 diary of Margaret Suckley, personal secretary of Franklin Roosevelt [Ward 1995, pp. 357–358; Franklin Delano Roosevelt Library, Hyde Park, New York, Margaret Suckley Papers, Journal Group E, 06/30/1944-12/29/1944, Journal Entry 1-253, 9 December 1944].

Dec 9 Friday... A quiet evening by the fire. I think the Pres. looks a little better, but he needs a lot of quiet and sun. Just one week more.

He spoke very seriously at dinner about the German menace. He has just had a secret report from a German source which has been quite reliable in the past, to the effect that the Germans have a V3 bomb which will kill by concussion everything within a mile. They are planning to use it on New York for morale purposes—again, not seeming to realize that it will have the exact opposite effect to that which they expect. The entire Atlantic seaboard has relaxed all its dim-outs and air-raid precautions, etc. & the Pres. sent word to the Gen. staff that all previous preparations of that sort should be reviewed on the chance that the report about the V3 may be true. He said that in the next war, the side which first uses these new explosives will undoubtedly win. The Germans are way ahead of us in that direction, though we are doing a lot of research trying to catch up to them. We found one of their V1 robots, unexploded, & are improving on it.

[Franklin Roosevelt would of course have had access to the very best Allied intelligence on German secret weapons programs, from a wide variety of organizations and sources. His reaction as recorded here appears to have been due at least in part to George Earle's 5 December 1944 report and the flurry of U.S. officials' memos it inspired. However, his reaction also seems to suggest that he had received further information from other sources (the payload of the V-3 was a nuclear weapon, the German nuclear weapons program was way ahead of the U.S. program, etc.). What sources provided the most detailed and accurate information on the true state of the German programs to Roosevelt—Dutch intelligence, French intelligence, Eisenhower's Special Force Headquarters, etc.? Can any remaining classified files that are relevant be located, declassified, and released?]



Franklin D. Roosevelt Library, Hyde Park, NY.
Margaret L. Suckley Papers. Journal Group E. JE 208. 9 Dec. 1944.

flying off — He may be the one we have heard but not seen —

The day was much like other days except that the mail plane was grounded by the weather at Greenville S.C. & the pouch came on by rail & so didn't get here until after noon, so the routine was a little upset — After lunch, the Pres. took us for an open air drive in a n-w direction. Going, we were on the dirt road, & going slowly — so one could enjoy the air & sun; but returning, we went down the concrete & it was almost too cold. A quiet evening by the fire. I think the Pres. looks a little better but he needs a lot of quiet and sun. Just one week more.

He ~~spoke~~ ~~very~~ seriously at dinner about the German menace. He has just had a secret report from a German source which has been quite reliable in the past, to the effect that the Germans have a V3 bomb which will kill by concussion everything within a mile. They are planning to use it on New York for morale purposes — again, not seeming to realize that it will have the exact opposite effect to that which they expect. The entire Atlantic seaboard has relaxed all its dim-outs and air-raid precautions, etc. & the Pres. sent word to the Gen. Staff that all previous preparations of that sort should be revived on the chance that the report about the V3 may be true. He said that in the next war, the side which first uses these new explosives will undoubtedly win. The Germans are way ahead of us in that direction, though we are doing a lot of research trying to catch up to them. We found one of their V1 robots unexploded & are improving on it. How unbelievably horrible it all is. (In those mysterious books & reports about "Shangri-La" in the Himalaya Mts, it is all prophesied.) I keep wondering if they may not be entirely true, those reports, and that the human race is out to destroy itself. Only the few who live in isolated places may survive —

Dec. 10 Saturday. A beautiful day, and Polly has to leave tomorrow. She is such a vital person, so alive and attractive, we will miss her terribly — I think the holiday here, has done her a great deal of good, in forcing her to be quiet at times. This is such a lovely place, on the hillside, with

Figure D.790: 1944 diary of Margaret Suckley, personal secretary of Franklin Roosevelt [Franklin Delano Roosevelt Library, Hyde Park, New York, Margaret Suckley Papers, Journal Group E, 06/30/1944-12/29/1944, Journal Entry 1-253, 9 December 1944].

Enemy Production of Atomic Bombs—Summary, Third Draft. 11 December 1944 [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)]

1. Intelligence indicates that the enemy is working in the project field. It is likely that he has undertaken one or several of the various processes for the production of bombs on a small scale and to have organized an installation equivalent to our project on final utilization. (TAB A).

2. The various methods for the production of U-233, U-235 and Pu-239 have been considered in the light of scientific development, basic materials, and industrial effort required. (TAB B). The liquid thermal diffusion process for production of U-235 on a moderate scale and the pile process using heavy water for the production of Pu-239 on a small scale appear to be the most likely possibilities; the production of U-233 on a useful scale appears to be unlikely. Activities inferred from the intelligence and other reports indicate that these processes could have come into operation during 1943. (TAB C).

3. On the basis of the above analysis it is possible for the enemy to have at least one device in his hands now, but it is improbable for him to have more than three.

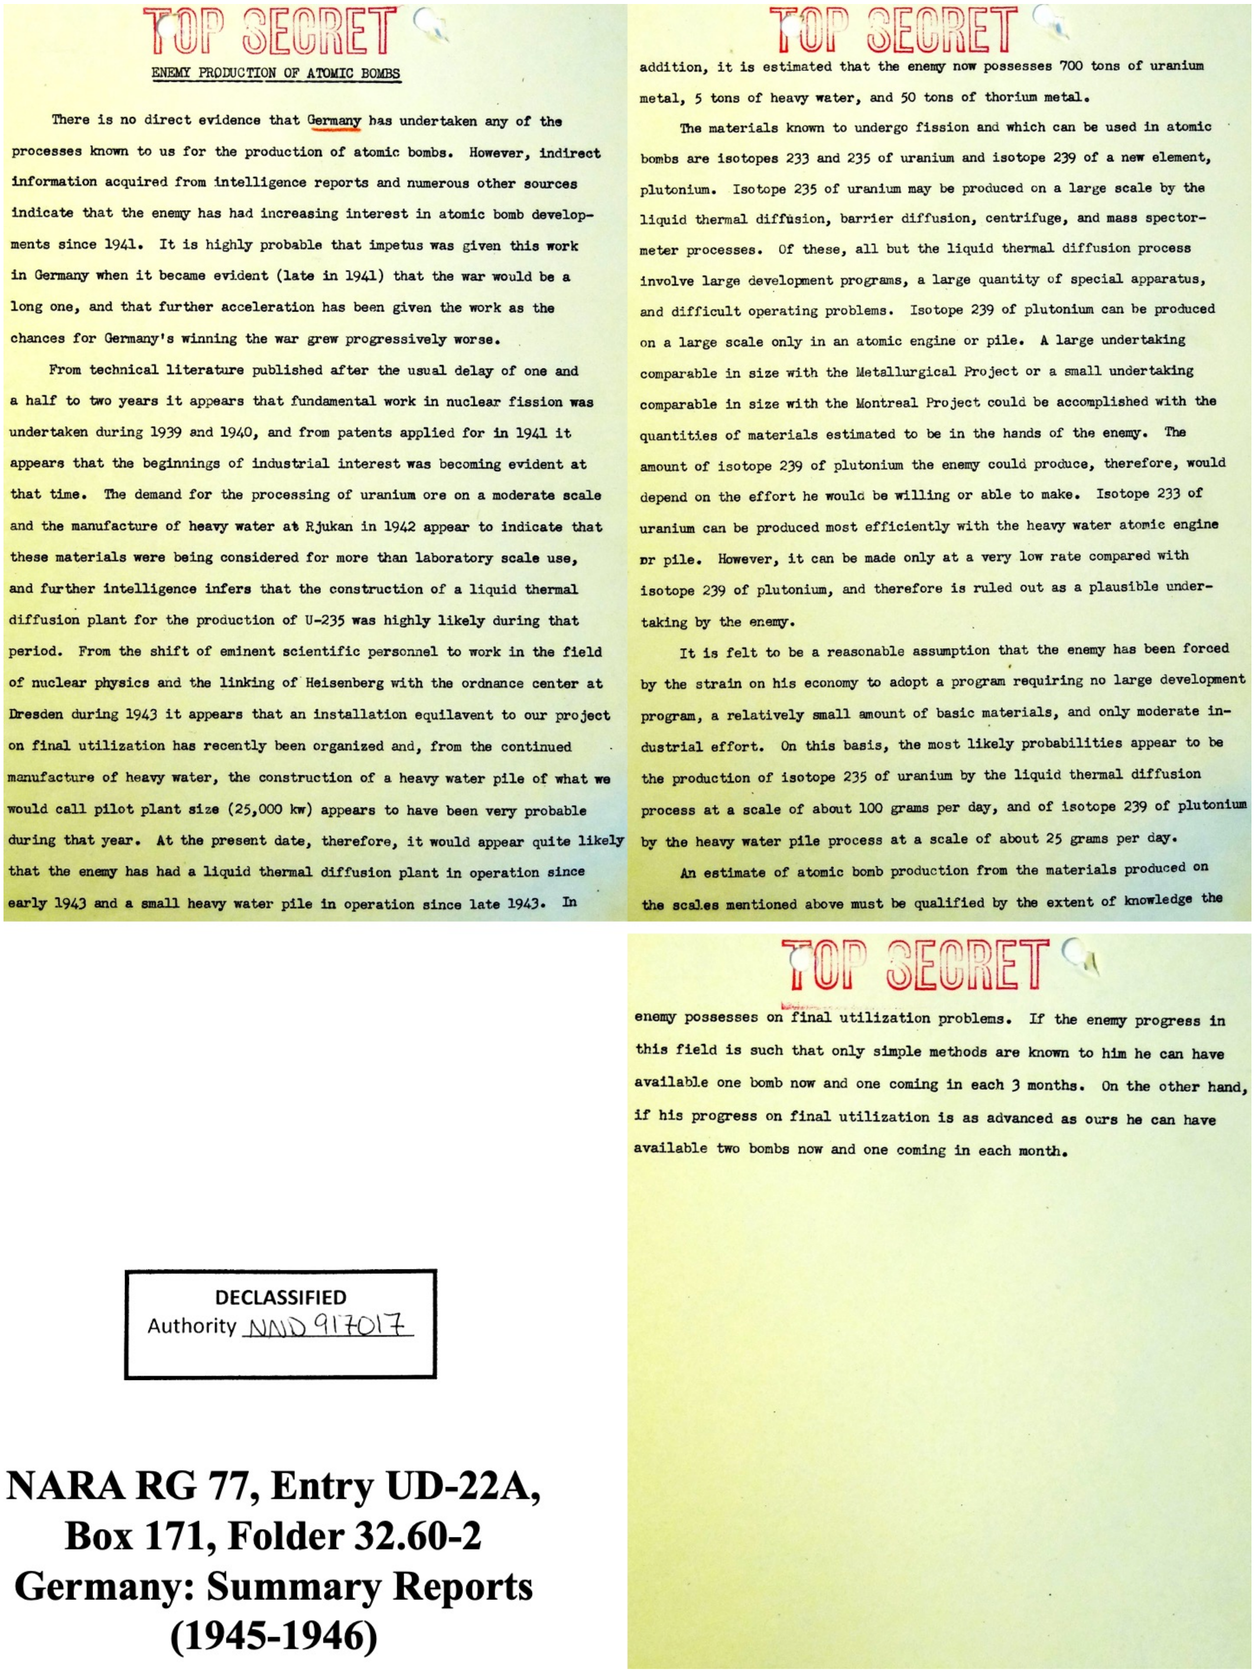
Figure D.792: Enemy Production of Atomic Bombs. 11 December 1944. TAB A, which the report summary said contained intelligence showing that Germany was likely producing atomic bombs, remains classified and unavailable [NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 Germany: Summary Reports (1945–1946)].



TOP SECRET

ENEMY PRODUCTION OF ATOMIC BOMBS

There is no direct evidence that Germany has undertaken any of the processes known to us for the production of atomic bombs. However, indirect information acquired from intelligence reports and numerous other sources indicate that the enemy has had increasing interest in atomic bomb developments since 1941. It is highly probable that impetus was given this work in Germany when it became evident (late in 1941) that the war would be a long one, and that further acceleration has been given the work as the chances for Germany's winning the war grew progressively worse.

From technical literature published after the usual delay of one and a half to two years it appears that fundamental work in nuclear fission was undertaken during 1939 and 1940, and from patents applied for in 1941 it appears that the beginnings of industrial interest was becoming evident at that time. The demand for the processing of uranium ore on a moderate scale and the manufacture of heavy water at Rjukan in 1942 appear to indicate that these materials were being considered for more than laboratory scale use, and further intelligence infers that the construction of a liquid thermal diffusion plant for the production of U-235 was highly likely during that period. From the shift of eminent scientific personnel to work in the field of nuclear physics and the linking of Heisenberg with the ordnance center at Dresden during 1943 it appears that an installation equilavent to our project on final utilization has recently been organized and, from the continued manufacture of heavy water, the construction of a heavy water pile of what we would call pilot plant size (25,000 kw) appears to have been very probable during that year. At the present date, therefore, it would appear quite likely that the enemy has had a liquid thermal diffusion plant in operation since early 1943 and a small heavy water pile in operation since late 1943. In

TOP SECRET

addition, it is estimated that the enemy now possesses 700 tons of uranium metal, 5 tons of heavy water, and 50 tons of thorium metal.

The materials known to undergo fission and which can be used in atomic bombs are isotopes 233 and 235 of uranium and isotope 239 of a new element, plutonium. Isotope 235 of uranium may be produced on a large scale by the liquid thermal diffusion, barrier diffusion, centrifuge, and mass spectormeter processes. Of these, all but the liquid thermal diffusion process involve large development programs, a large quantity of special apparatus, and difficult operating problems. Isotope 239 of plutonium can be produced on a large scale only in an atomic engine or pile. A large undertaking comparable in size with the Metallurgical Project or a small undertaking comparable in size with the Montreal Project could be accomplished with the quantities of materials estimated to be in the hands of the enemy. The amount of isotope 239 of plutonium the enemy could produce, therefore, would depend on the effort he would be willing or able to make. Isotope 233 of uranium can be produced most efficiently with the heavy water atomic engine or pile. However, it can be made only at a very low rate compared with isotope 239 of plutonium, and therefore is ruled out as a plausible undertaking by the enemy.

It is felt to be a reasonable assumption that the enemy has been forced by the strain on his economy to adopt a program requiring no large development program, a relatively small amount of basic materials, and only moderate industrial effort. On this basis, the most likely probabilities appear to be the production of isotope 235 of uranium by the liquid thermal diffusion process at a scale of about 100 grams per day, and of isotope 239 of plutonium by the heavy water pile process at a scale of about 25 grams per day.

An estimate of atomic bomb production from the materials produced on the scales mentioned above must be qualified by the extent of knowledge the

TOP SECRET

enemy possesses on final utilization problems. If the enemy progress in this field is such that only simple methods are known to him he can have available one bomb now and one coming in each 3 months. On the other hand, if his progress on final utilization is as advanced as ours he can have available two bombs now and one coming in each month.

TOP SECRET

TAB B

Methods open to the Enemy

Production processes may be considered under the following headings:

1. U-235 Production
2. Pu-239 Production
3. U-233 Production
4. Partial U-235 production, obtaining U-233, or Pu-239 for final use

1. U-235 Production

Enemy heavy water plays no direct part in this case. The only basic material is uranium, probably in the form of the fluoride or the chloride. The processes used may be the liquid thermal diffusion, barrier diffusion, centrifuge, or electromagnetic.

a. Liquid Thermal Diffusion. This process requires large steam plant facilities and relatively easily fabricated apparatus of a kind that the enemy has had experience with. To raise the material to high concentrations, however, requires tremendous quantities of steam and long equilibrium times.

b. Barrier Diffusion. This process requires an enormous development program on screens, pumps, seals, lubricants, and special materials. It requires also a large amount of steam or electric power, the design, construction and operation of large vacuum systems, and extreme cleanliness of process materials to prevent clogging of the barriers.

TOP SECRET

(TAB B)

c. Centrifuge. This process requires the development of seals, lubricants, and special mechanical equipment on a scale as extensive as that on barrier diffusion. Mechanical perfection of apparatus is required to eliminate extensive maintenance. Manpower requirements for operation are large.

d. Electromagnetic. This process requires a large development program, a large amount of electric power, and a large quantity of specially designed equipment. Mechanical perfection of equipment is necessary to eliminate extensive maintenance. During operation, the equipment requires continuous servicing and replacement of parts.

The simplest of the above listed processes is the liquid thermal diffusion process used with uranium hexafluoride. High concentrations of U-235, however, require a tremendous amount of steam and an exceedingly long time to reach equilibrium.

2. Pu-239 Production

The diverse possibilities for Pu-239 production plants make it worth while to enumerate two routes: one is obvious to the enemy and certain of operation, but rather small in size; the other has even for this country some unsolved problems, but can in principle reach a dangerous scale.

a. Minimal:

This is a plant containing 5 tons of heavy water and about 5 tons of natural uranium. At best, such a plant will yield about 25 grams per day.

b. Maximal:

This is a heavy water seeded plant, with a light water (or even a graphite) reflector. 5 tons of heavy water will maintain 2 such plants, each making some 500 grams per day in 200 tons of uranium (It will be recognized that this is an enormous project, on the scale of the plant at the Hanford Engineer Works)

TOP SECRET

(TAB B)

Schedules:

Rate Grams per day	Uranium Tons	Heavy Water Tons	Time to make first grams	Time to reach full rate
25	5	5	8 Months	10 Months
1000	400	5	12 Months	18 Months

3. U-233 Production

If it is assumed for reasons of final utilization that the enemy is constrained to use U-233 and cannot use Pu-239 (not very likely), he may proceed as follows:

a. Minimal:

A heavy water pile using the assumed 5 tons of uranium may give up to 5 grams per day of U-233, using some 3-5 tons of Thorium in the mantle.

b. Maximal:

At great cost the enemy might convert Pu-239 to U-233 in small devices, limited by the Thorium available and his Pu-239 production rate. In this way he might make 10 to 20 grams per day on the minimal Pu-239 production rate discussed in (2), and as much as 50-100 grams per day in say 20 small Pu-239 plants, each using 1/2 kilo of Pu-239 and producing 3 megawatts of heat. He cannot easily convert all his Pu-239 at the maximal rate with only 50 tons of Thorium.

Some Schedules:

Rate Grams per Day	Heavy Water Tons	Metal Need Tons	Thorium Need Tons	Time for First Gram	Time for Full Rate
5	5	20	5	8 Mos.	10 Mos.
10-20	5	20	5	14 Mos.	16 Mos.
50-100	5	700	50	14 Mos.	22 Mos.

TOP SECRET

(TAB B)

4. Combined Methods

The possibility of using partially-enriched uranium, and finishing the separation by chain methods, is attractive from an engineering point of view. It will, however, not much affect the estimates given here.

Such a possibility frees the enemy from the heavy water limitation on his production, but in the maximal case of 2. (Pu-239 production) the limit has already been set by his metal stock. Heat removal still determines plant size.

Should Pu-239 be unusable for him, he can partially enrich, use a light-water moderator but still have a high leakage, and convert enriched metal to U-233. This a much simpler method for large U-233 production than the two-step chain called maximal in 3. above. He can still make no more than some 100 grams per day in the Thorium he has available. It is true that the options available in this route are very many, and not well-explored in this country.

It should be noted that all but route 1. involve large scale radioactivity, which make possible detection, both physically and from espionage, much more readily than does isotope separation.

Estimate of Enemy Methods

In interpreting the evidence, the experience in this country has been drawn heavily upon. It has been tacitly assumed that the enemy has not improved methods beyond what can be done in this country. Thus it is dangerous to consider the estimates anything but minimum enemy possibilities.

With the above qualifications in mind, the following is a list of the most dangerous enemy possibilities in descending order:

(a) Liquid Thermal Diffusion

(b) Piles of Normal Uranium and heavy water

(c) Centrifuges

The choice of (b) position for piles in spite of the positive evidence of enemy interest is based on the feeling that the known difficulties of utilizing Pu-239 and the large installations required for the production of U-233 would discourage enemy development along these lines. The tardy enemy final utilization effort strengthens the feeling that he could not easily solve this problem. It is believed that the reports on a heavy water pile refer to a pilot plant.

The liquid thermal diffusion method could be used without difficulty to produce metal in 10% concentration. The amount would depend on the quantity of steam producing equipment which the enemy would be willing to divert. The chief difficulty would be the problem of changing from 10% concentration to higher and directly utilisable material.

TOP SECRET

(TAB C)

It is possible only to guess as to how this last step is taken. It will almost certainly be an isotope separation process because transformation of enriched material by a chain reaction demands as much heat removal as transformation of normal material, while isotope separation schemes beginning with enriched product are of pilot plant size.

The following rough tables indicate the time schedule and requirements of the various methods:

PILES

	Rate grams per day	Uranium Need tons	Heavy Water Need tons	Time Schedule from Start of Construction	
				To first grams	To full rate
Minimum: (1) Heavy Water and natural uranium	25	5	5	8 Months	10 Months
Maximum: (2) Heavy water seed, natural uranium and light water	1000	400	5	12 Months	18 Months

(1) A plant of pilot-plant scale.
(2) A plant of Hanford scale.

THERMAL DIFFUSION

Production Rate: 100 g of light metal per day

Concentration	Construction Time[1]	Equilibrium Time[2]	Metal Requirements[3]		Steam MM#/hr	Coal Tons/ hr
			Up to Prod.	At Prod.		
10	18 mo.	5 mo.	14 T	85kg/d	1.4	43
20	18	8	22	88	1.7	50
50	18	13	36	90	1.8	55
60	18	15	40	90	1.9	56
90	18	23	60	91	1.9	57

[1] Including construction of the steam plant.

[2] Taking Naval Research Laboratory data, assuming no improvement.

[3] Shipping 15.5% out of the feed (to 0.6%).

TOP SECRET

(TAB C)

From these tables alone, of course, it cannot be determined what and how much the enemy is doing. However, the following probable picture can be given based on the very likely assumptions (a) that the enemy program was progressively accelerated as the desperateness of their strategic situation became evident and (b) that they were forced by the strain on their economy to adopt a program requiring only moderate industrial effort:

(1) A tenth-scale liquid thermal diffusion plant begun in early 1942, reaching 50% concentration at this time.

(2) A heavy water pile producing Pu-239 at a 25 gram per day level, started in the middle of 1942, and coming into full production in late 1943. Present construction of additional units is possible.

(3) Additional improvised liquid thermal diffusion capacity -- perhaps as much as two-tenths scale--leading to production of 10% material now or in the near future.

(4) Present desperate effort, beginning in early 1943 to solve the final utilization problems and to bridge quickly the gap between 10% and 50% material.

DECLASSIFIED
Authority NND 917017

TOP SECRET

TAB D

Final Production

The utility of the final materials produced depends on the degree to which the final utilization problem is solved. If enemy progress is only as far as the relatively simple gun-method of detonation, it is unlikely he can use Pu-239 at all.* In this case 30 kg of pure material is required.

Under these circumstances an estimate of enemy production of the final device can be listed as follows:

1	25g/day	49-D_2O pile yields	no devices
1	100g/day	LTD @ 50% yields	1 device /10 months
2	100g/day	LTD @ + unknown step to 50% yields	1 device /5 months
		equals:	1 device every 3 months

with the first device now possible.

If the enemy final utilization program is as advanced as ours he may be able not only to utilize Pu-239 but even to construct devices with as little as 7 kilos of Pu-239 or 10 kilos of U-235. Under these conditions the following estimates can be obtained:

1	25g/day	49 D_2O pile yields	1 device/10 months.
3	100g/day	LTD @ 50% (as above) yields	1 device/month
		equals:	1 device every month

with two devices now possible, one from the pile and one from the liquid thermal diffusion process.

---

* The manufacture of U-233 is not considered a practicable means at the probable level of operation of the heavy water pile.

[The following series of memos was apparently initiated by two of the earlier intelligence reports, George Earle's 5 December 1944 report (p. 4701) and J. Edgar Hoover's 8 December 1944 letter (p. 4605), although neither of those reports is included on this microfilm reel.]

Headquarters of the Army Air Forces to Assistant Chief of Staff, G-2, WDGS. 12 December 1944. Subject: Evaluation of Reports of Very Long Range Secret German Weapons Capable of Devastating a Large Area.

1. Based on Allied scientific research and developments, the Germans may have the capability of developing and using a devastating explosive or force.

2. At the present time, rockets are not capable of 2,000 to 3,000 mile flight, and no such development ~~can~~ should be expected in the near future.

3. It is possible that larger rockets with longer range or heavier war-heads than those presently employed are in the course of development by the Germans, and that actual experiments have been conducted with larger rockets.

4. No specific information has been received by A-2 on the existence of any long range German rockets other than V-1 and V-2.

5. The Germans have the capability of launching from a submarine a V-1, a V-2 or a modified version of either.

1. Incl:
Memo for AC/AS, Intelligence fr G-2 dtd 9 November [sic: December] w/2 reports.

W.M.B. to Operational Deputy. 12 December 1944. Subject: Evaluation of German Guided Missiles Reports Requested by G-2.

1. General Hodges is not satisfied with the draft evaluation of reports as requested by G-2. You may wish to assign someone else to it. There follows a rough outline of the approach general Hodges believes desirable.

2. The evaluation should start off with a list of the more important evidence available to us on the existence of some weapon above and beyond the V-1 and V-2. Such things as, to date unexplained sites, such as Watten—prisoner of war reports which have mentioned the existence of vengeance weapons on a vaster scale—newspaper reports. Specific tonnages, speeds, accuracy, etc. including proposed targets of these rumored weapons, should be given. [...]

What is the least amount of presently known explosive which would "level" an area 40 square kilometers? [...]

3. The complete facilities of the Air Staff should be used in gathering evidence for this—Requirements Division, OC&R, General Gross—Dr. Bowles' office—electronics experts—ordnance, et al should be freely consulted. [...]

Memorandum for [blank.] 14 December 1944. Subject: Evaluation Report on New German Guided Missiles.

1. On 9 December 1944, AC of S, G-2 forwarded to AC/AS, Intelligence copies of reports recently received from U.S. Naval Attaché in Turkey and the Federal Bureau of Investigation with a request for evaluation. Subject reports dealt with range, destructiveness and expected date of employment of some new type (V-3, V-4 or V-5) German rocket bomb.

2. Copy of memorandum prepared in response to above request is attached.

3. Brief of memorandum prepared for your information is also attached.

2 Incl.
Incl. 1. Memo to AC of S, G-2
Incl. 2. Brief of Memo to AC of S, G-2

Memorandum for —. 14 December. Subject: Evaluation of Two Reports on New German Guided Missiles.

1. Reports forwarded by Colonel Moses contain information which has been received before from a scattering of OSS, Underground[,] PW interrogations and German propaganda sources. While they add somewhat to available knowledge, they are not to be interpreted as of immediate a significance. [...]

2. An analysis of the intelligence reports and propaganda now being received on V-3 as compared with those which preceded the appearance of V-1 and V-2 suggests very strongly that German efforts are undoubtedly now being devoted to the production of new rocket bombs which will exceed V-1 and V-2 in range or destructive power. However, it is not believed that sufficient progress has been made to make the V-3 or any other new rocket bomb an immediate threat. [...]

11. Capabilities Based on Scientific Information

a. A rocket or a bomb causing devastation to an area of 40 square kilometers would have to be some explosive force such as atomic energy since known explosives are not capable of such effects unless used in excessive quantities.

To devastate a typical British or German area of 40 square kilometers the following amounts of explosive would be required:

Single charge: TNT: 650,000,000 lbs. [...] [approximately 300 kilotons]

b. German capability of putting into use a long range rocket capable of 2,000 and 3,000 mile flight needs to be carefully analyzed by scientists such as Dr. von Kármán. [...]

14 December 1944. Brief of Memorandum Evaluating Two Reports on New German Guided Missiles.

1. Reports supplied by Naval Attaché in Turkey and FBI are not new and have no immediate significance.

2. Reports on V-3, when compared with the flow of intelligence and propaganda on V-1 and V-2, suggest that any improvements on these weapons are in an experimental stage only.

3. [...] It must be concluded that if the Germans were about to employ any such weapon they would now be flooding the Reich with definite claims. Their failure to do so is significant.

4. Based on the capabilities of known explosives a charge of prohibitive size (approximately a half billion pounds) would be required to devastate 40 square kilometers of built-up area. Some other explosive force such as atomic energy might be employed in considerably smaller quantities, if available. [...] At the present time rockets are not capable of such a 2,000 to 3,000 mile flight, but experimentation may ultimately produce such a rocket.

5. While no specific information has been received by A-2 on the existence of any new long range rocket, it is possible that the Germans are now conducting experiments with rockets having longer range and heavier warheads than V-1 or V-2.

[U.S. intelligence analysts estimated that an explosive yield of approximately 300 kilotons would be required to destroy an area of 40 square kilometers, as the German weapon was reported to be capable of doing. That suggests that the weapon was some sort of fusion-boosted fission bomb or hydrogen bomb (Section D.9), instead of a much simpler and smaller fission bomb.

In view of evidence such as that presented in Appendix E, the intelligence analysts appear to have been too hasty in assuming that intercontinental rockets could not have reached an advanced stage of development in Germany at that time.]

D.14.2 Alsos and Other Manhattan Project Intelligence

[A large number of Alsos-related documents from Samuel Goudsmit's files remain classified, as illustrated by some examples on pp. 4772–4779 [NARA RG GOUDS, Entry UD-7420].

Some very important Alsos-related files from the Manhattan Project's Foreign Intelligence Unit also remain classified and unavailable, as shown by the examples on pp. 4812–4827.

Where is George Eckman's missing December 1945 final report on the Alsos Mission (p. 3333)?

There are many proven or likely cases of Leslie Groves or his office censoring and reprimanding independent investigators who uncovered evidence that the German nuclear weapons program was more advanced than had been publicly admitted. See for example:

- Trying (and failing) to keep German nuclear documents out of the hands of other groups of Allied investigators (p. 3287).
- Dr. Richard P. Fischer (p. 3948).
- Caperton Horseley (p. 3970).
- Charles Chamberlain (pp. 4056–4061).
- "An alert and inquisitive reporter" for *Time* magazine (p. 4185).
- Colonel John A. Keck (p. 4187).
- Gordon Young (pp. 4679–4681).
- Commander Herbert Agar (pp. 5017–5018).
- Fritz Lang (pp. 5076–5081).
- Captain Heinz Stoelzel (pp. 5393–5396).

Can more information about these cases of censorship be uncovered? Can other cases of Allied censorship regarding the German program be identified?

Are there other files on the German nuclear program that remain classified, without even a yellow withdrawal notice card to mark where they should be in the NARA files?

Can all of these files be declassified?]

Major Robert R. Furman
P. O. Box 2610
Washington, D. C.

Dear Major Furman:

I am writing, as you asked me to, to mention a few things which our agents in Germany should keep in mind. What I can say is by no means complete and I know that you will supplement it.

Clearly one of the most important points to be investigated is the whereabouts and activities of the men who are regarded as specialists in this field and without whom it would certainly be difficult to carry out a program effectively. In what follows I am assuming that information on this subject will not be available to the agents and that they will, at first at least, have to confine their observations to more or less gross physical facts about the installations.

1. Raw Materials

a. The program can certainly not be carried out in any of its forms without uranium. Stocks of this material were captured by the Germans in Belgium, but they have their own sources in Bohemia. It would be extremely important to know with what urgency and on what scale these sources are being worked. It is doubtful whether there is any other military use for uranium with a high enough priority to explain large scale exploitation of these deposits.

b. Various auxiliary substances may or may not be used in the program, and therefore evidence on these is interesting if positive, but not conclusive if negative. The substances which we in this country have thought profitable to use for pile operation are graphite, heavy water and beryllium. There is little doubt that beryllium could have other military applications, but any large scale attempt to produce metallic beryllium or beryllia in compact form and with high purity would seem to us indicative.

Any production of heavy water which goes beyond a liter or so a month seems to us indicative, although according to our own ideas, a production considerably larger than that of the Norwegian plant would seem to be required for the success of the program. It would be interesting to find out what the output of the Rujkven plant is and where the material is shipped. It

would also be interesting to find out whether there are other sources of heavy water. All methods of obtaining heavy water known to us require large amounts of power, and for adequate production something of the order of a few hundred thousand kilowatts seems likely. The method used in this country does not involve electric power but does involve consumption of a good deal of fuel.

The production of graphite of high purity would also seem to us significant.

2. Plants

a. The nature of the plants involved in producing the material can vary a great deal, as we know by experience in this country. All methods known to us have in common the use of large amounts of power, and it seems doubtful if any significant plant could be operated on this project with less than a hundred thousand kilowatts. Power up to one million kilowatts is not out of the question. The size of the plant depends on the method used, but certainly a plant smaller than one city block looks unlikely. It seems probable that a plant of this kind would be very heavily guarded, that it would be located beyond present bombing range from Britain, and that it would be not too near the Russian frontier. Bohemia again seems likely.

b. If the Germans are operating a production pile they will be operating it where water is plentiful and where the flow from the plant passes either through open country or through country inhabited by an "inferior race" whom they do not mind killing off. A diffusion plant probably requires no remarkable supply of water, although the power would probably be provided hydro-electrically.

c. There is the possibility that work on this program is being carried out by one of the large chemical industries; for instance, I. G. Farben. In this case it would be quite possible to conceal the plant among the other war projects on the grounds of the company. This seems to us rather less likely on grounds of security, but may not be ruled out. Unfortunately, the physical nature of the plant is sufficiently flexible so that external inspection can probably not identify it.

It would probably be profitable for you to consult some of the members of this laboratory who are well acquainted with Axis physicists, and who may also be able to help by their knowledge of the laboratories and the geography. I should like again to assure you that if you can find time to pay us a visit we will do everything we can to be of assistance to you.

Sincerely yours,

J R Oppenheimer

J. R. Oppenheimer

JRO:pd

P. S. In discussions with staff members here two points have been raised which should be called to your attention. One is that the name of Clusius should have been included in the list of German physicists likely to be working on the problem. He was a pre-war expert in certain diffusion methods. We have been unable to apply these successfully in this country, but are not convinced that the Germans may not have followed them up.

The second point is that if agents can be dropped with a certain amount of equipment which they could safely store, of if agents could transmit material to us, then a very good method of detecting a pile would be to investigate the radioactivity of rivers some miles below any suspicious and secret plant. A few cubic centimeters of water from any of these rivers would enable us to find out whether a pile was operating or not. The necessary equipment is rather elaborate and it seems doubtful whether an agent could handle it in Germany or the occupied countries.

Clearly one of the most important points to be investigated is the whereabouts and activities of the men who are regarded as specialists in this field and without whom it would certainly be difficult to carry out a program effectively. In what follows I am assuming that information on this subject will not be available to the agents and that they will, at first at least, have to confine their observations to more or less gross physical facts about the installations.

1. Raw Materials

a. The program can certainly not be carried out in any of its forms without uranium. Stocks of this material were captured by the Germans in Belgium, but they have their own sources in Bohemia. It would be extremely important to know with what urgency and on what scale these sources are being worked. [See p. 3404.] It is doubtful whether there is any other military use for uranium with a high enough priority to explain large scale exploitation of these deposits.

b. Various auxiliary substances may or may not be used in the program, and therefore evidence on these is interesting if positive, but not conclusive if negative. [See p. 4026.] The substances which we in this country have thought profitable to use for pile operation are graphite, heavy water and beryllium. There is little doubt that beryllium could have other military applications, but any large scale attempt to produce metallic beryllium or beryllia in compact form and with high purity would seem to us indicative. [See p. 4096.]

Any production of heavy water which goes beyond a liter or so a month seems to us indicative, although according to our own ideas, a production considerably larger than that of the Norwegian plant would seem to be required for the success of the program. It would be interesting to find out what the output of the Rujkven plant is and where the material is shipped. It would also be interesting to find out whether there are other sources of heavy water. [See p. 4027.] All methods of obtaining heavy water known to us require large amounts of power, and for adequate production something of the order of a few hundred thousand kilowatts seems likely. The method used in this country does not involve electric power but does involve consumption of a good deal of fuel.

The production of graphite of high purity would also seem to us significant. [See p. 4110.]

2. Plants

a. The nature of the plants involved in producing the material can vary a great deal, as we know by experience in this country. All methods known to us have in common the use of large amounts of power, and it seems doubtful if any significant plant could be operated on this project with less than a hundred thousand kilowatts. Power up to one million kilowatts is not out of the question. The size of the plant depends on the method used, but certainly a plant smaller than one city block looks unlikely. It seems probable that a plant of this kind would be very heavily guarded, that it would be located beyond present bombing range from Britain, and that it would be not too near the Russian frontier. Bohemia again seems likely. [See p. 2098.]

b. If the Germans are operating a production pile they will be operating it where water is plentiful and where the flow from the plant passes either through open country or through country inhabited by an “inferior race” whom they do not mind killing off. [See pp. 3874, 3928.] A diffusion plant probably requires no remarkable supply of water, although the power would probably be provided hydro-electrically. [See p. 3755.]

c. There is the possibility that work on this program is being carried out by one of the large chemical industries; for instance, I. G. Farben. In this case it would be quite possible to conceal the plant among the other war projects on the grounds of the company. [See pp. 2089, 3749, 3935, 4443.] This seems to us rather less likely on grounds of security, but may not be ruled out. Unfortunately, the physical nature of the plant is sufficiently flexible so that external inspection can probably not identify it.

It would probably be profitable for you to consult some of the members of this laboratory who are well acquainted with Axis physicists, and who may also be able to help by their knowledge of the laboratories and the geography. I should like again to assure you that if you can find time to pay us a visit we will do everything we can to be of assistance to you.

DATE November 30, 1943
December 23, 1943

TO S. K. Allison DEPARTMENT

FROM P. Morrison DEPARTMENT

IN RE: Report on the Enemy Materials Situation

MUC- PM-14
This document consists of 3
pages and 0 figures
No. 1 of 2 copies, Series B

Purpose

From available publications, it is possible to make an amateur survey of the enemy material supply. There is no doubt that the Army has available many more sources of information which can be subject to more detailed analysis. These sources, however, are not available to us at the Laboratory; it, therefore, seemed of interest for our own information to see what we could find using public sources only.

* * *

1. Metal Supply

It is generally agreed that the enemy has sufficient metal available for the purpose. Estimated amount of uranium in ore visible at Joachimsthal is about 1,200 tons.[1] In addition, it is said around the Laboratory[2] that some 800 tons were in stock at Antwerp. It may be noted that B. Rajewsky of Frankfort a. M.[3] speaks of searching for new radium deposits and for extending veins of known deposits, under government auspices, "to meet the increased wartime demand for radium."

2. Moderators

It can be seen from the figures to be presented here that the German moderator situation is rather like ours, in that none of the three preferred moderators seem totally unavailable, but all involve considerable industrial effort to produce the required quantities.

a. Beryllium

The principle commercial source of beryllium, (in the form of beryl; containing about 12% BeO) are Brazil, Argentina and Madagascar. The output from Argentina runs about 30-40 tons[4] per year of BeO. It would be.interesting to see how much of this has gone into Axis hands. The production of Madagascar, which seemed to supply European consumers preferentially before the war, has been as much as 150 tons per year[5] (1936) and here again it would be useful to find out whether Madagascar supplied considerable beryl to Eurpoe when the island was still in Vichy hands. Known deposits occur in many Axis-held sites, but only two that I can find have been mined in commercial quantities. These were in Austria and Italian Eritrea. Neither of these sites has produced sizeable quantities for the world market before. From these figures one might guess that the Germans could have obtained enough beryllium (of the order of 25-50 tons) from these neutral sources. The matter should certainly be checked, if it has not already been done.

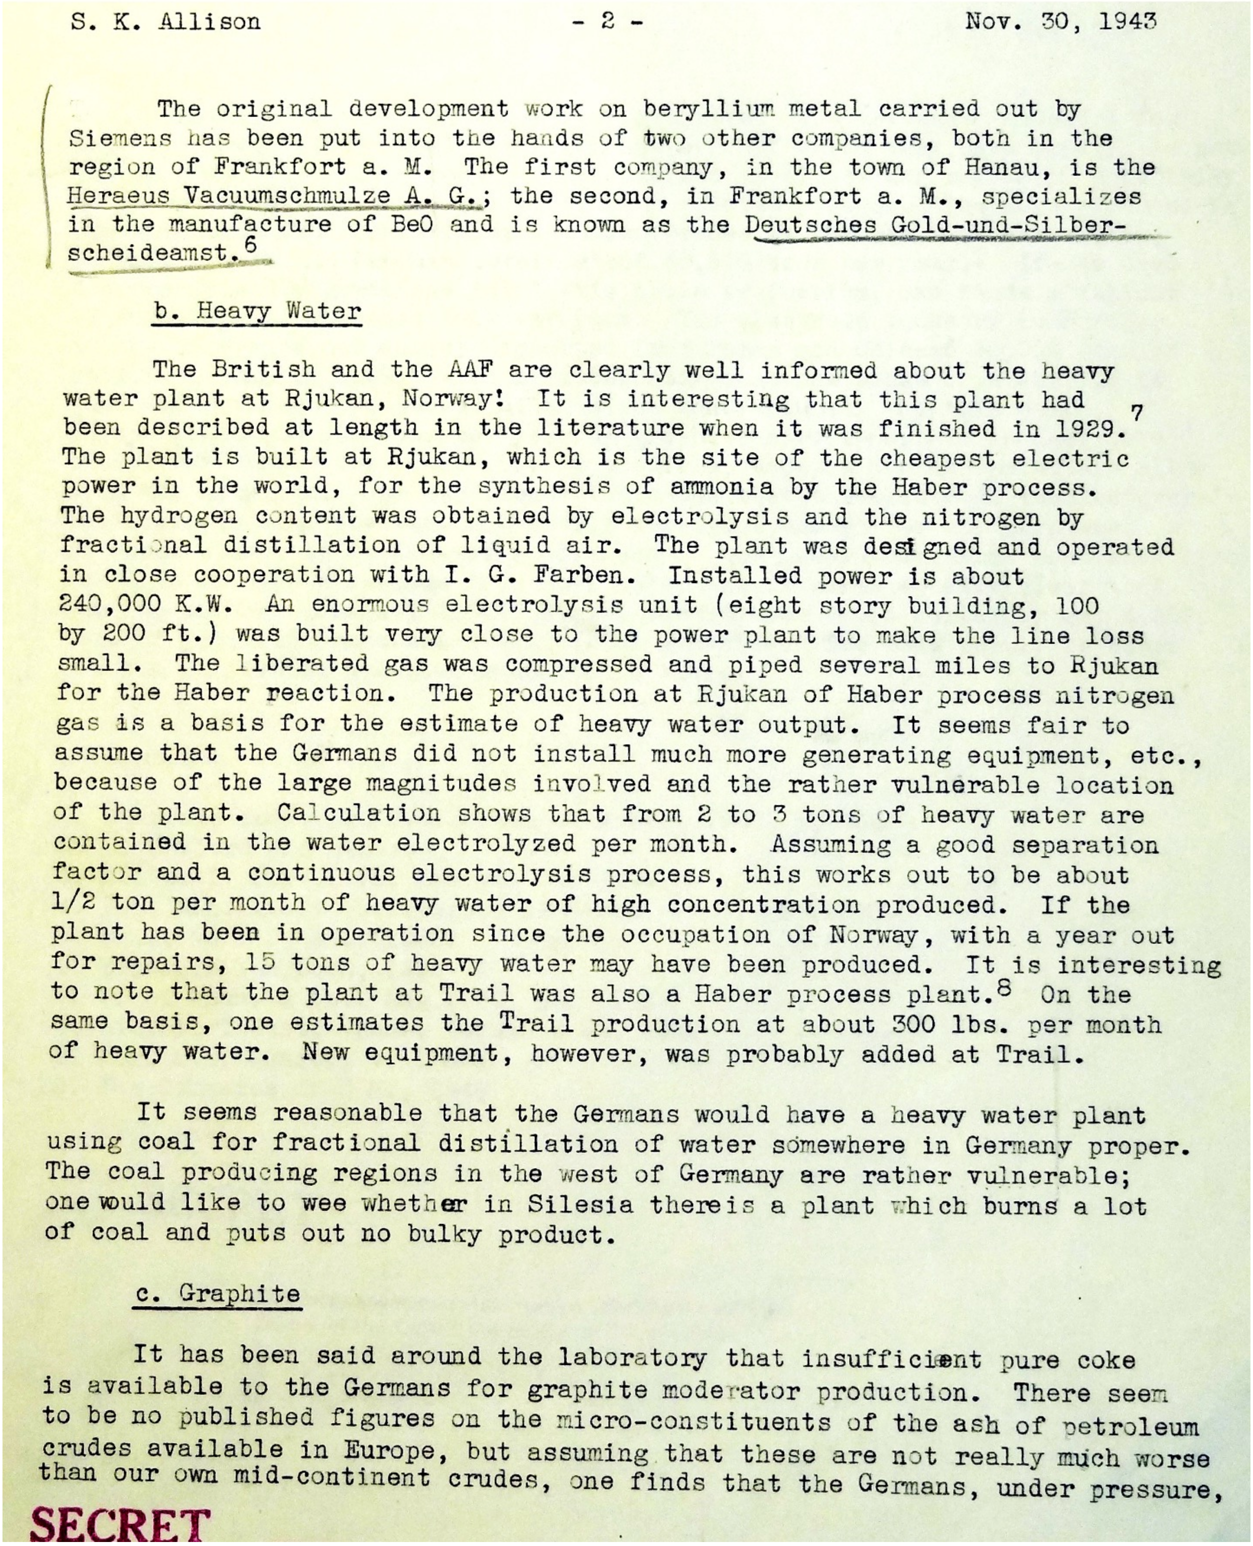
NARA RG 77, Entry UD-22A, Box 170, Folder 32.60-1 GERMANY: Summary Reports (1944)



S. K. Allison - 2 - Nov. 30, 1943

The original development work on beryllium metal carried out by Siemens has been put into the hands of two other companies, both in the region of Frankfort a. M. The first company, in the town of Hanau, is the Heraeus Vacuumschmulze A. G.; the second, in Frankfort a. M., specializes in the manufacture of BeO and is known as the Deutsches Gold-und-Silber-scheideamst.[6]

b. Heavy Water

The British and the AAF are clearly well informed about the heavy water plant at Rjukan, Norway! It is interesting that this plant had been described at length in the literature when it was finished in 1929.[7] The plant is built at Rjukan, which is the site of the cheapest electric power in the world, for the synthesis of ammonia by the Haber process. The hydrogen content was obtained by electrolysis and the nitrogen by fractional distillation of liquid air. The plant was designed and operated in close cooperation with I. G. Farben. Installed power is about 240,000 K.W. An enormous electrolysis unit (eight story building, 100 by 200 ft.) was built very close to the power plant to make the line loss small. The liberated gas was compressed and piped several miles to Rjukan for the Haber reaction. The production at Rjukan of Haber process nitrogen gas is a basis for the estimate of heavy water output. It seems fair to assume that the Germans did not install much more generating equipment, etc., because of the large magnitudes involved and the rather vulnerable location of the plant. Calculation shows that from 2 to 3 tons of heavy water are contained in the water electrolyzed per month. Assuming a good separation factor and a continuous electrolysis process, this works out to be about 1/2 ton per month of heavy water of high concentration produced. If the plant has been in operation since the occupation of Norway, with a year out for repairs, 15 tons of heavy water may have been produced. It is interesting to note that the plant at Trail was also a Haber process plant.[8] On the same basis, one estimates the Trail production at about 300 lbs. per month of heavy water. New equipment, however, was probably added at Trail.

It seems reasonable that the Germans would have a heavy water plant using coal for fractional distillation of water somewhere in Germany proper. The coal producing regions in the west of Germany are rather vulnerable; one would like to wee whether in Silesia there is a plant which burns a lot of coal and puts out no bulky product.

c. Graphite

It has been said around the laboratory that insufficient pure coke is available to the Germans for graphite moderator production. There seem to be no published figures on the micro-constituents of the ash of petroleum crudes available in Europe, but assuming that these are not really much worse than our own mid-continent crudes, one finds that the Germans, under pressure,

S. K. Allison - 3 - Nov. 30, 1943

could manufacture adequate amounts of graphite. The necessary material for this purpose, besides coal tar pitch and oil, of which they have plenty, is petroleum coke. Petroleum coke can be obtained in almost any refinery, especially if it cracks the crude by the Dubbs or a related process. The coke produced in pre-war years from domestic or Rumanian crudes in Austria, Czechoslovakia, Poland, France and Rumania totals about 35,000 tons per year.[9] If one uses American yield figures and total Axis crude production, one finds a maximum of some hundred thousand tons per year. The electrode industry in Europe, mainly in France and Norway, imported from Texas and Chicago 50,000 tons of petroleum coke on 1939.[10] It is noteworthy that one pound of electrode is consumed for each two pounds of aluminum manufactured. On this basis, Europe needs 100,000 tons per year of graphite electrode. It is desirable that these electrodes be as pure as possible, because the ash materials alloy with the aluminum. Our experience indicates that the electrode manufacturers' requirements are, however, not nearly stringent enough for our purposes. It seems clear, as is generally said around the Laboratory, that most electrode graphite in Europe is made from coal coke, but it seems equally clear that barring unknown chemical difficulties, the Germans could certainly get 5,000 tons of petroleum coke-based artificial graphite. The coke supply is there and the artificial graphite industry is there.

SECRET

For many weeks the Nazi Ministry of Propaganda and also the High Command have been announcing their hopes that they will be able to win the war by the use of secret weapons. Part of what they say seems to be about big rocket guns with which to blast London, but another part indicates quite clearly that bombs using atomic power are in a state of preparation.

If one reads the latest pronouncements quoted in the newspapers -- The Chicago Sun and the New York Times -- one can see, according to my impression, beyond any doubt that while the construction of bombs of the type mentioned is under way, the weapon is not completed -- and it looks as if not much material may be available. It is, of course, a bluff if Goebbels says that they want to wait until the right psychological moment occurs. There would be no better moment than just now when German towns are being devastated by air bombardment and when the morale on the home front is starting to crack. These announcements are made to encourage the German home front and also to induce the German General Staff to believe in that secret weapon, because they know that without a miracle they are doomed.

If the German population, and especially the German High Command, were to become convinced that even if theywere to perfect that weapon early enough a more devastating attack by us would follow, they might think twice whether unconditional surrender would not be better.

If that weapon should be available before we are ready, I believe they would strike at London and would then send an ultimatum to the United States, giving her the choice of making peace or having New York, Boston, Washington, etc. suffer the fate of London. If such an ultimatum were to be answered with the promise that we would retaliate with the same weapon, it would be too late and might be regarded as bluff.

I furthermore believe that it is important to prepare the opinion of the American public slowly to the possibility that a terrible secret weapon is in a state of preparation, so that if the Germans use it first the shock would not be too great. I cannot see that damage would be done by a threat in veiled language made by men high in responsible positions here, independently of whether we or the Germans are ready first. There seems to be no doubt that German scientists know that we are working on an atomic power bomb, just as every physicist in the United States knows it and as as I knew it before I joined the Project -- without anyone having to tell me. Of course, nobody knows what progress we have made, and the right kind of announcement would not reveal anything about it.

This document contains information affecting the national defense of the United States within the meaning of the Espionage Act, U. S. C. 50; 31 and 32. Its transmission or the revelation of its contents in any manner to an unauthorized person is prohibited by law.

If one takes into account all the information which is available to us (I have discussed this with some other physicists), my guess would be that the Germans have made use of a P-9 pile, probably surrounded by thorium. The thorium ore, monazite sand, was probably imported years ago from Brazil. Heavy water is made in Norway, and according to indirect information is also made in other places in Germany. Uranium is available from Joachimsthal in Czechoslovakia. The separation

SECRET

SECRET

-2-

of U^{233} from thorium is a chemical problem which is simpler than the separation of 49 from uranium. I certainly cannot imagine why men like Heisenberg and other German scientists should not have seen these possibilities.

The pronouncements which President Roosevelt and Winston Churchill made several times in regard to gas warfare are the kind of psychological warfare of which I am thinking. I am convinced that the facts mentioned above should be brought to the attention of the high ranking men who have the responsibility to judge whether the kind of psychological warfare mentioned is worth while.

You asked me in a communication dated December 7th to indicate my attitude towards your proposal that the Government should at this time make a veiled threat to Germany concerning our potential use of atomic power. I am giving you my views in the following.

I am not in favor of making such a veiled threat at the present time, but I believe that this question will have to be kept constantly in mind and that it might be of very great importance to make a clear announcement just a short time before the Germans are actually using radioactive poisons or their first atomic bomb. I shall therefore in the following try to write down some points of view which appear to me to be relevant.

1. It seems to me that on the basis of the information which is available thus far and on the basis of our knowledge of the ways in which things are done in Germany we have to assume that we had lost, by the middle or at the latest at the end of 1940, our initial advantage in knowledge which we had in 1939. We have to further assume that intensive work (comparable to the work in the early days of the Metallurgical Laboratory early in 1942) was started in Germany in the spring of 1940. We have further to assume that after the fall of Stalingrad many leading men in Germany will have begun to look upon atomic power as the only means to win the war for Germany and have therefore urged the German government to put behind this work a great industrial effort.

In the circumstances, our best hope to beat the Germans in this field lies in the possibility (and I should not be too optimistic about this either) that the German industrial effort put behind this work has been kept in moderate bounds due to the fact that a visible demonstration of the power of an atomic bomb was necessarily lacking until such a bomb had actually been constructed.

In view of this hope I should hesitate to advocate an announcement concerning our work since such an announcement would be seized upon in Germany by those who favor a further expansion of the German work and who at the present time might be opposed by skeptics within the German government.

2. A veiled threat at the present time, while it might do harm as stated above, would probably do little good. In order to do some good the threat would have to be very explicit and specific. An announcement in order to be really useful should achieve the following purposes:

(a) It should impress the population of the Allied countries so that if the first German atomic bomb explodes over London or if the Germans

Metallurgical Laboratory

Dr. James Franck -2- December 8, 1943

force their way into Switzerland by terrorizing them into submission through a demonstration of radioactive poisons, people should know that this is only a temporary setback and that within a reasonably short period we shall be ready to strike back. This effect could, however, only be achieved if we were willing to disclose the general nature of our work, its scope, and time schedule and if we were ready to make a counter demonstration, if not concerning the bomb then at least concerning radioactive poisons. It does not seem that at present it would be advisable or even possible to make a statement which would serve this purpose and such statements which we might at present be in a position to make would most probably sound like a bluff and be very close to a bluff in fact.

(b) It should destroy in the German General Staff the last remaining hope of German victory. In order to achieve this again something more than a bluff is needed. It is quite true that this point is a very important one and that it might shorten the war quite considerably. However, if one is allowed to draw conclusions from the experience of the first World War and the collapse which took place in October 1918, one has to say that there were three factors which brought about that collapse, of which the mental state of the German General Staff is only one. It is true that another factor, the factor of war weariness, is probably as strong in Germany at present as in October 1918. But concerning the third factor the situation is very different. In October 1918 the people who were tired of the war believed to know what was in store for them if the army quit fighting. Wilson's Fourteen Points were generally known and were considered by many as a reasonable basis for the postwar world. Therefore we had a situation in which small groups of determined men could start an upheaval, could count on the benevolent neutrality of the general population, and the General Staff, aware of the fact that they could not win the war in any case, was reluctant to advise strong measures for suppressing the uprisings.

At present the situation is very different. We have not given a picture of the postwar world which could reassure the general public in Germany that even though their present political institutions will be destroyed their everyday non-political life will go on more or less normally. Until the general public in Germany sees some sort of outlines for the postwar world in which they will have to go on living, there will be no successful uprisings whether or not the German General Staff believes that the hope for victory is gone. It follows that any announcement for the primary purpose of robbing the German General Staff of its last hope for victory would have to be correlated with an announcement of our postwar plans if our aim is to bring about a German collapse prior to an actual destruction of the German armed forces.

Since these are clearly political considerations, facts concerning which we have little information such as the willingness of the British and Russian governments of defining the postwar world at the present time must also be taken into account. Therefore I feel inclined to leave the mental state of the German General Staff completely out of consideration and to restrict my proposals to making renewed efforts for the purpose of learning something about the German preparations. If we are able to foretell the time of the first German attack which uses atomic power within a period of months or so, then we could advise the government when and what kind of statement should be released in order to diminish the panic which will most likely follow the appearance of a new weapon of this type.

Dr. Franck asked me to comment on his memorandum of December 7 (MUC-JF-112) to you.

I heartily agree with the main points of Dr. Franck's memorandum. Since we are apparently in the midst of a development which goes ahead as fast as possible, not much point remains in maintaining secrecy on the same level as before.

The question remains as to how far one might go at present in lifting the secrecy of the Tu project. The best way to indicate this, that I could think of, was to write down the text of a paragraph which could be inserted into a declaration. Obviously, the following can serve only as an indication of the extent to which one could and should go in such a declaration according to my opinion.

"We are not scared by the threat of secret weapons. We know of the rocket gun that has been developed in Germany. We also know that by means of what our scientists call chain reaction, large amounts of radioactive materials can be prepared. We are prepared against the use of these, which are, besides, prohibited by international agreements. We also know that extremely powerful explosives can be prepared by similar means, but their manufacturing is very expensive both in terms of money and in terms of raw materials so that we do not devote much effort in this direction and do not think that the enemy does. We are ready to retaliate if any of these weapons, or maybe some others, are used against us".

IN RE:

This document consists of 1 pages and 0 figures
No. 1 of 3 copies, Series A

With reference to the discussion that we had last Saturday with Fermi and again on Monday, I would like to suggest the formation of a Committee which should make plans to put into effect if and when our enemies make first use of the weapons which we are trying to develop. This Committee should make plans for action within the DSM projects and also for information to be given to the public should the need arise. In considering each of these objectives it must bear in mind the possibility of either radioactive or explosive action.

DSM Projects Considerations. As typical of the questions which might be considered one may mention the need of altering plans so that radioactive poisons might be produced or of concentrating on the rapid production of 49 or 25, discontinuing production methods that do not seem likely to bear fruit rapidly. It is conceivable that in an emergency operating crews for the electromagnetic separators could be supplied from the professional personnel of the Metallurgical Laboratory and other parts of the project. It is conceivable that one Hanford pile should be built with early possible simplification instead of the three now planned. Perhaps the whole K-25 project should be scrapped.

Public Information. In preparation for the possible use of either radioactive or explosive bombs, plans should be drawn up for informing the public as to what protective action could be taken, what the general nature of the problem is, and possibly something about our own state of preparation. Such information bulletins,which would presumably be broadcast and published when the need arose, should be kept on file and constantly revised in terms of new information.

Needless to say, the above are the crudest kind of suggestions but perhaps will serve as a reminder of the desirability of discussing this possibility with the General.

I have a copy of a memo addressed to you by Mr. Franck on December 7. That the recent declarations of the enemy propaganda are not 100 percent bluff seems to be proved by the information that has leaked out as to their substantial interest in the production of heavy water. I do not find that we have elements to guess whether their efforts are at present in the direction of radioactive warfare or of high explosives. I am personally inclined to consider the first as a more immediate possibility, but I believe that we should be aware that the probability of the second alternative is not to be neglected entirely.

The policy that the laboratory should follow to best serve the national interest in these conditions clearly involves the speeding up of our program. Perhaps we should try to get something ready even without attempting to put the production on a very large scale as first result. It might be desirable also to devote more attention than has been done so far to the possibilities of the use of radioactive poisons and to clarify our ideas as to the policies to be followed in case of an enemy attack in this direction.

I do not have a clear feeling whether or not it would be wise at the present moment to enter the kind of psycological warfare that Franck advocates. If the enemy knows enough of our development to be aware that a very considerable effort is spent in this direction, no propaganda statement could be of much effect on the enemy leaders, and presumably could be kept a secret from the people if the leaders decide that this is desirable. On the other hand, I agree with Franck that in case of an enemy attack, some previous declaration that we are about ready to retaliate might make the shock on our public opinion less severe.

DRAFT

14 January 1944

Report to Chief of Staff on "X" Day

1. Identify the type of explosion that has occurred as one that could be caused by TA product.

2. Disclose to the best of your knowledge the maximum number of such charges the enemy can have on hand for use.

3. Suggest counter measures until similar explosives are completed and ready for use.

   a. Immediate checking of all areas bombed for presence of radioactive substances of harmful nature.

   b. Detection devices, sampling of water and air in Germany.

   c. Control of air over principal targets.

   d. Destruction of rocket emplacements.

   e. Consideration for civilian defense.

   f. Dispersion of materials, troops, and command.

   g. Bombing of possible targets, such as power plants, centers for shientific research.

   h. Double caution at TA project against sabotage.

4. Give facts on American production of the TA product and availability of product for use.

29 February 1944

Meeting with Dr. Oppenheimer - 22 February 1944

1. The necessity for knowing the description and personal traits of seven German scientists was discussed. These were:

Heisenberg
von Weiszacker
Clusius
Flugge
Strassman
Bothe
Dickel

Security was emphasized.

2. Dr. Oppenheimer told all he knew of Heisenberg, von Weiszacker and Bothe. He knew nothing of the others.

3. In a conference with Dr. Tolman, Dr. Oppenheimer and Major Furman, it was decided that:

a. Further information could be obtained from Bethe, Teller, Weisskopf, von Newman, Freish.

b. For security reasons it was decided to discuss these German scientists with Bethe only.

3. Bethe reiterated details on Heisenberg. He added his knowledge of Bothe, von Weiszacker, Flugge. He knew nothing of Strassman, Dickel or Clusius.

4. Suggestions were made as to people in the United States who knew these seven men, i. e., Franck and DeBye.

5. It was decided that:

a. Additional information would be obtained from others in the laboratory without causing undue interest. This information will be sent as it becomes available to Major Furman.

b. Snapshots of all German scientists would be forwarded to Furman. These would be copied and returned.

SECRET

SECRET

Date and place of photograph and names of individuals would be given where possible.

6. It was recommended that Dr. Compton be advised through Peterson of our desire for photographs.

Second Meeting with Oppenheimer and Tolman

1. The letter written to Furman by Oppenheimer on was reviewed and the information obtained to date was related and evaluated. The 700 tons and activity at Czech mines were mentioned.

2. The main thoughts that came out of the meeting were:

a. British no longer aggressive in getting positive information.

b. That in many minds uranium and explosives are linked together.

c. In light of shipments of electrical equipment to Manchuria, movements of German technical men to Manchuria, Japan should be watched.

d. Uranium movement should be watched.

Meetings with Dr. Tolman

1. It was decided that any information on bombs in intelligence reports which might be of use to Parsons would be screened by Dr. Fine.

2. Dr. Lauritzen Taylor may be a useful man to do field work on detection devices in England.

SUMMARY OF IMPORTANT INFORMATION

Received between
1 April and 30 April 1944

General

Recent information has not changed the general picture and has indicated continued German interest in research and development. Heisenberg's name is prominently in the foreground. Scattered reports suggest the possibility of an operating plant possibly near Dresden.

The activities of this office in April have been largely in the field of organizing agencies to look for and forward information of importance. The new Scientific Mission was approved by the Chief of Staff. The review of literature on the diffusion and centrifuge methods was accomplished. The District Counterintelligence officers were organized to handle positive reports. The G-2 and OSS representatives in the various countries surrounding enemy-occupied Europe were conducting investigations with results interesting to this office. Further air tests were made of detection instruments.

Norwegian Production of Heavy Water

Norwegian production of heavy water at some of the Rjukan plants has dropped to zero after the last bombing. Fifty casks of heavy water on ten railroad cars were sent to the bottom as they were being ferried at Tinnsjoen. Heavy water production is estimated at about 40% of its former amount. Another report announces that both production and experimental work has stopped.

Mr. Bach Wiig has been made chairman of A/S Norsk Hydro. A German representative of I. G. Farben, a Mr. Ilgner, was recently in Norway and approved of a plan which involves excluding heavy water production at Norsk Hydro. Ilgner is supposed to have expressed the opinion that the Allies have bombed very few German factories supplying purely civilian needs. According to present rumor, only fertilizer for Norwegian use will be made by Norsk Hydro, and the Allies are said to have promised not to bomb the plant.

German Research

It is reported that at the University of Dresden under the supervision of the Ministry of Supplies is working a group of chemists, engineers and professors under Dr. Heisenberg. This group includes Von Laue. Various reports have been received indicating that Dresden is the heart of the German development of secret weapons. Heisenberg's name has been mentioned in information received from separate sources.

A report has been received showing interesting war-important research activities with radium in a town near Joachimstahl, Czechoslovakia. It is quite clear from the report that the technical personnel have been given a government responsibility to safeguard the health of radium workers at Joachimstahl and perhaps the other nearby newer radium mines. This activity is again linked with Heisenberg's name and the possibility of secret weapon development.

A Finnish informant reports that a big electric plant about 100 miles northeast of Dresden is receiving large heavy water shipments. Such a location could be in the brown coal region on the River Oder.

Every effort has been made to get more information on the activities in and around Dresden which includes the not too distant radium mines at Joachimstahl. This locality appears to be a probable center of research and development work in which we are interested. Dresden is also an interesting location for those agencies interested in airplane production, rockets, guided missiles, etc. More concrete evidence of Dresden's importance is available to them. While they have expressed a desire to bomb Dresden, it appears to be well outside the effective bombing range at the present time.

Dr. Gentner visited Switzerland about 1 May 1944 and reported facts concerning the operations of cyclotrons at Heidelberg and Paris. Heavy water was reported available to Jolliot, Bothe and Gentner for experimental purposes.

The damage as a result of bombing has disorganized the Kaiser Wilhelm Institute for Chemistry at Berlin-Dahlem. Particulars concerning the destruction were available. Reports indicated that reconstruction has already commenced. Another report indicated that research work in high explosives formerly conducted in Berlin had been transferred to Sackingen in Baden.

We have had three independent pieces of evidence indicating that the Reichspost is interested in neutron research. One report indicates that Flügge has left Hahn to go to work for the Reichspost.

Literature research has uncovered the German interest in obtaining patents for their diffusion method. The Auergesellschaft is mentioned.

DRAFT

9 May 1944

Press Release in the Event of Use of Tube Alloy by the Enemy.

1. News account of actual use by enemy citing its effect upon property and lives, comparing it with the effect of HE projectiles and noting any latent dangers, if any.

2. The nature of the substance. How and where the raw materials are found and refined, the rareness of the materials, the difficulty in manufacture, in assembling, in filling the missile for use.

3. The probable use by the enemy, maximum capacity of plants, number of units per month, expense involved, possible targets.

4. What to do: Disregard stories of of super weapon, do not spread stories of possible catastrophic effects, particularly those mentioning terms like "red death" and other meaningless terms of a frightening nature. Civilian Defense will indicate measures to be taken promptly. Army officials are fully informed.

5. What the United States has developed, equal production,top capacity in production, no time has been lost, every priority has been given to the work, Science is at the front, every qualified man has been trained for this specialized work.

IN RE: Comments on Requirements (SAM 4R 168)

1. Supplies and Auxiliary Equipment

The fluorination and Hex producing plants, while not large, may be sufficiently unusual to stand out in the neighborhood. It would be good to have a little more detailed estimate of what supplies would be shipped to the plant (tank HF, fluorspar, or whatever) and what sort of chemical equipment might be feasible there. Also, what firms would most probably engage in such activity.

2. History of the Plant

It is perfectly true that it is difficult to identify these plants from photos alone, but one cannot help thinking that the growth of these plants must have made an imprint for some distance around. For example, both the LTD and K-25 plants contain miles of piping with a great deal of steam fitting and pumping activity. This would certainly imply an oil refinery or large chemical synthesis plant, of which so many have been built in Germany. Yet out of this plant there is no arrangement for bulk transport of freight cars of rubber or tank cars of oil or any large scale production. This contrast can hardly have escaped railroad workers, operating personnel, and even construction workers. If we have any way to secure information from these groups, it would seem worth while pursuing. Especially an LTD plant into which so much coal pours and out of which nothing comes for almost a year should cause wonder. The centrifuge plant is also an odd one. Here one finds thousands of identical units installed with considerable care by fine machinery firms (could we have a guess on which ones are the most likely) and again no product.

3. Vulnerability

SAM 4R 168 emphasises the need for uninterrupted operation of these plants. The necessity for tight systems is well known to everyone. It seems clear that such a plant, from which the enemy can hope for victory, will be extremely well guarded, since a rather small but expert raid, like that on the dams, would shortly ruin it. The question then comes as to what policy the enemy is most likely to follow to make his plants secure against bombing, if he began building the plants two years or so ago. This question should have a most probable answer, obtained from people who have watched the efforts of the Germans to move their industry east, and to conceal industrial production. LTD plants are essentially steam plants which are normally rather conspicuous. What we need is an estimate of how much effort the enemy would make to conceal these plants and to locate them in areas believed at that time safe against our bombing.

Industrial Requirements of Separating Plants

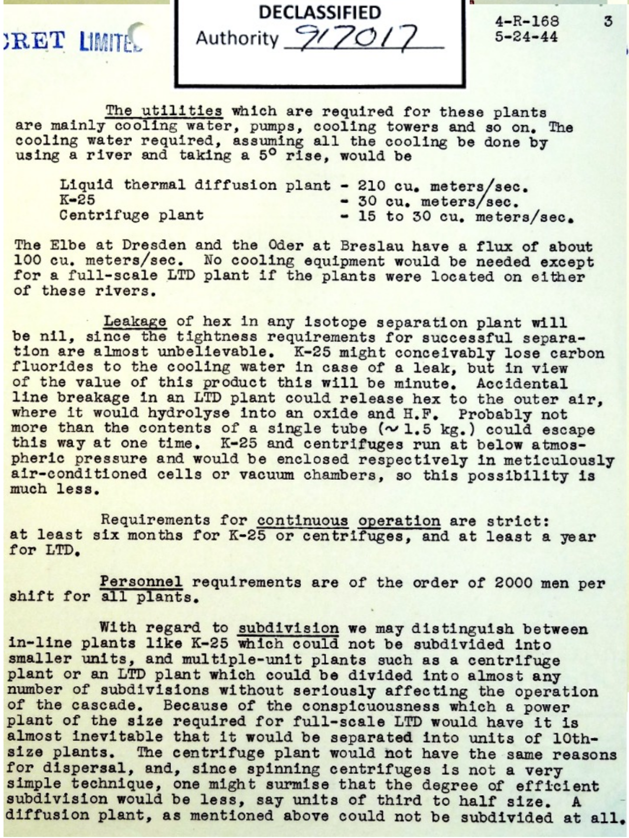
Karl Cohen

I. General Requirements of Separating Plants.

We will take as our unit the production of 1 kg. of light metal per day at a concentration of 10% or higher. So far as material and energy requirements are concerned the purity of the product is of very little concern; the mole fraction of the product above 10% effects practically nothing but the equilibrium time of the plant. A plant producing 1 kg. of light metal per day will be referred to as a full-scale plant, and one producing 100 grams of light metal per day as a 10th-scale plant.

The requirement of metal depends on the relative difficulty of producing metal compared to building more stripping section of the plant. In the early stages of our calculations we considered that it would be necessary to strip out 50% of the available light metal from the feed. As we became more skilled in the production of hex, and more cognizant of the difficulties of building separating plants, the amount of stripping dropped first to 30% and then finally to 10% where it is now. However, it must be emphasized that this decision is based on our own supply of metal and our own facilities for producing hex and may not necessarily apply to the Germans. If they should be short of ore they might decide to strip considerably more than we do. Accordingly, we give figures for necessary metal production on two bases; 10% stripping and 30% stripping. These figures will be pretty sure to bracket the actual values. Assuming 10% stripping there is required 1.4 tons per day of metal, or 2.0 tons per day of hex as feed to a going plant. Assuming 30% stripping, the corresponding figures are 0.5 tons per day of metal or 0.7 tons per day of hex. The charge of material in process is about 30 tons of metal for a liquid thermal diffusion plant (45 tons of hex) and about 4 tons of metal (6 tons of hex) for K-25 or centrifuges.

The power requirements for full scale plants differ with the particular type of plant. The K-25 plant at site X has a power plant of 200,000 kw. on site and requires 75 tons of coal per hour. A centrifuge plant on the present design would require about the same amount, but this could probably be improved by better design by a factor of 2. A liquid thermal diffusion plant would require a boiler house consuming 550 tons of coal per hour. All of these plants thus require rather enormous power plants which could not easily be hidden.



RET LIMITE

4-R-168 3
5-24-44

The utilities which are required for these plants are mainly cooling water, pumps, cooling towers and so on. The cooling water required, assuming all the cooling be done by using a river and taking a 5° rise, would be

Liquid thermal diffusion plant	- 210 cu. meters/sec.
K-25	- 30 cu. meters/sec.
Centrifuge plant	- 15 to 30 cu. meters/sec.

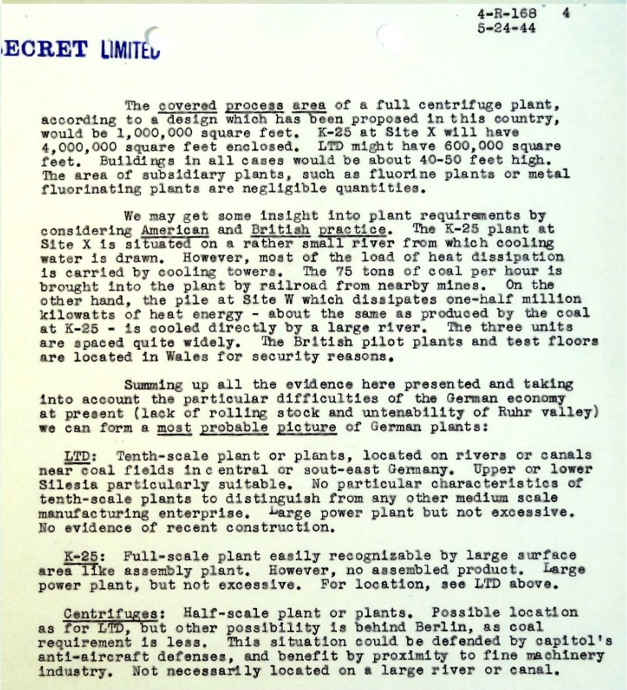
The Elbe at Dresden and the Oder at Breslau have a flux of about 100 cu. meters/sec. No cooling equipment would be needed except for a full-scale LTD plant if the plants were located on either of these rivers.

Leakage of hex in any isotope separation plant will be nil, since the tightness requirements for successful separation are almost unbelievable. K-25 might conceivably lose carbon fluorides to the cooling water in case of a leak, but in view of the value of this product this will be minute. Accidental line breakage in an LTD plant could release hex to the outer air, where it would hydrolyse into an oxide and H.F. Probably not more than the contents of a single tube (~1.5 kg.) could escape this way at one time. K-25 and centrifuges run at below atmospheric pressure and would be enclosed respectively in meticulously air-conditioned cells or vacuum chambers, so this possibility is much less.

Requirements for continuous operation are strict: at least six months for K-25 or centrifuges, and at least a year for LTD.

Personnel requirements are of the order of 2000 men per shift for all plants.

With regard to subdivision we may distinguish between in-line plants like K-25 which could not be subdivided into smaller units, and multiple-unit plants such as a centrifuge plant or an LTD plant which could be divided into almost any number of subdivisions without seriously affecting the operation of the cascade. Because of the conspicuousness which a power plant of the size required for full-scale LTD would have it is almost inevitable that it would be separated into units of 10th-size plants. The centrifuge plant would not have the same reasons for dispersal, and, since spinning centrifuges is not a very simple technique, one might surmise that the degree of efficient subdivision would be less, say units of third to half size. A diffusion plant, as mentioned above could not be subdivided at all.



ECRET LIMITED

4-R-168 4
5-24-44

The covered process area of a full centrifuge plant, according to a design which has been proposed in this country, would be 1,000,000 square feet. K-25 at Site X will have 4,000,000 square feet enclosed. LTD might have 600,000 square feet. Buildings in all cases would be about 40-50 feet high. The area of subsidiary plants, such as fluorine plants or metal fluorinating plants are negligible quantities.

We may get some insight into plant requirements by considering American and British practice. The K-25 plant at Site X is situated on a rather small river from which cooling water is drawn. However, most of the load of heat dissipation is carried by cooling towers. The 75 tons of coal per hour is brought into the plant by railroad from nearby mines. On the other hand, the pile at Site W which dissipates one-half million kilowatts of heat energy - about the same as produced by the coal at K-25 - is cooled directly by a large river. The three units are spaced quite widely. The British pilot plants and test floors are located in Wales for security reasons.

Summing up all the evidence here presented and taking into account the particular difficulties of the German economy at present (lack of rolling stock and untenability of Ruhr valley) we can form a most probable picture of German plants:

LTD: Tenth-scale plant or plants, located on rivers or canals near coal fields in central or sout-east Germany. Upper or lower Silesia particularly suitable. No particular characteristics of tenth-scale plants to distinguish from any other medium scale manufacturing enterprise. Large power plant but not excessive. No evidence of recent construction.

K-25: Full-scale plant easily recognizable by large surface area like assembly plant. However, no assembled product. Large power plant, but not excessive. For location, see LTD above.

Centrifuges: Half-scale plant or plants. Possible location as for LTD, but other possibility is behind Berlin, as coal requirement is less. This situation could be defended by capitol's anti-aircraft defenses, and benefit by proximity to fine machinery industry. Not necessarily located on a large river or canal.

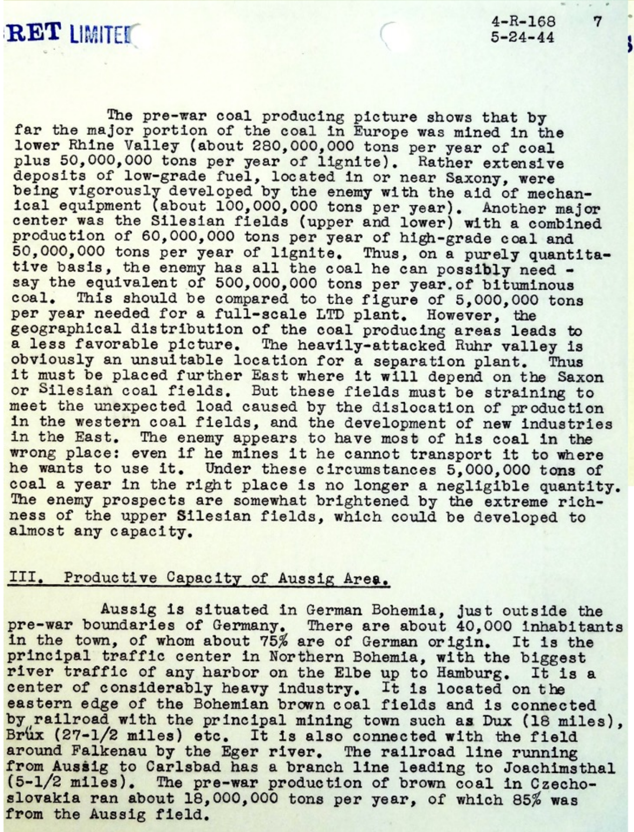
It should be remarked that German lignite is low quality fuel, which when mined is about 50% water, and has about one-third the heating value of good bituminous coal[2]. The Bohemian lignite is better, with about one-half the calorific value of bituminous coal. Lignite can, however, be burned as mined in special equipment.

[2] H. Wesche, "Die Brennstoffe" (Enke, Stuttgart 1936)
M. Dolch "Die Brennstoff u. Ohre Industrien" (Akad.Verlag,Leipzig 1932).



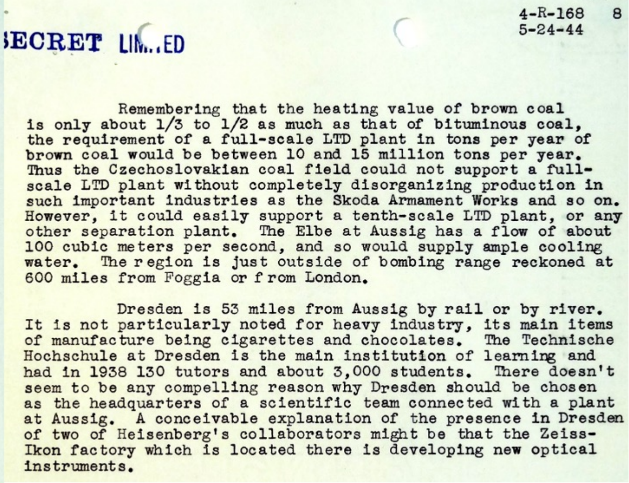
RET LIMITED

4-R-168 7
5-24-44

The pre-war coal producing picture shows that by far the major portion of the coal in Europe was mined in the lower Rhine Valley (about 280,000,000 tons per year of coal plus 50,000,000 tons per year of lignite). Rather extensive deposits of low-grade fuel, located in or near Saxony, were being vigorously developed by the enemy with the aid of mechanical equipment (about 100,000,000 tons per year). Another major center was the Silesian fields (upper and lower) with a combined production of 60,000,000 tons per year of high-grade coal and 50,000,000 tons per year of lignite. Thus, on a purely quantitative basis, the enemy has all the coal he can possibly need - say the equivalent of 500,000,000 tons per year.of bituminous coal. This should be compared to the figure of 5,000,000 tons per year needed for a full-scale LTD plant. However, the geographical distribution of the coal producing areas leads to a less favorable picture. The heavily-attacked Ruhr valley is obviously an unsuitable location for a separation plant. Thus it must be placed further East where it will depend on the Saxon or Silesian coal fields. But these fields must be straining to meet the unexpected load caused by the dislocation of production in the western coal fields, and the development of new industries in the East. The enemy appears to have most of his coal in the wrong place: even if he mines it he cannot transport it to where he wants to use it. Under these circumstances 5,000,000 tons of coal a year in the right place is no longer a negligible quantity. The enemy prospects are somewhat brightened by the extreme richness of the upper Silesian fields, which could be developed to almost any capacity.

III. Productive Capacity of Aussig Area.

Aussig is situated in German Bohemia, just outside the pre-war boundaries of Germany. There are about 40,000 inhabitants in the town, of whom about 75% are of German origin. It is the principal traffic center in Northern Bohemia, with the biggest river traffic of any harbor on the Elbe up to Hamburg. It is a center of considerably heavy industry. It is located on the eastern edge of the Bohemian brown coal fields and is connected by railroad with the principal mining town such as Dux (18 miles), Brüx (27-1/2 miles) etc. It is also connected with the field around Falkenau by the Eger river. The railroad line running from Aussig to Carlsbad has a branch line leading to Joachimsthal (5-1/2 miles). The pre-war production of brown coal in Czechoslovakia ran about 18,000,000 tons per year, of which 85% was from the Aussig field.



SECRET LIM..ED

4-R-168 8
5-24-44

Remembering that the heating value of brown coal is only about 1/3 to 1/2 as much as that of bituminous coal, the requirement of a full-scale LTD plant in tons per year of brown coal would be between 10 and 15 million tons per year. Thus the Czechoslovakian coal field could not support a full-scale LTD plant without completely disorganizing production in such important industries as the Skoda Armament Works and so on. However, it could easily support a tenth-scale LTD plant, or any other separation plant. The Elbe at Aussig has a flow of about 100 cubic meters per second, and so would supply ample cooling water. The region is just outside of bombing range reckoned at 600 miles from Foggia or from London.

Dresden is 53 miles from Aussig by rail or by river. It is not particularly noted for heavy industry, its main items of manufacture being cigarettes and chocolates. The Technische Hochschule at Dresden is the main institution of learning and had in 1938 130 tutors and about 3,000 students. There doesn't seem to be any compelling reason why Dresden should be chosen as the headquarters of a scientific team connected with a plant at Aussig. A conceivable explanation of the presence in Dresden of two of Heisenberg's collaborators might be that the Zeiss-Ikon factory which is located there is developing new optical instruments.

PLANT DESCRIPTION: 49 PRODUCTION

SECRET

P. Morrison

May 31, 1944

MUC- PM-45
This document consists of 4
pages and 0 figures
No. 1 of 5 copies, Series A

General:

It is fair to preface this account with a personal estimate that the enemy is not likely to be engaged in full-scale 49 production. He is likely to have made a chain-reactor, probably even to pilot-plant scale, but little more. The reasons for this estimate have been given elsewhere. The possible methods of construction for a chain-reacting plant are very diverse, much more so than for any of the other types of plant. We cannot exclude the enemy's using a method very different in detail from the ones here implied. This report restricts itself, however, to the general features of plants which from U.S. experience appear simplest and most feasible under the enemy's conditions.

Scale and size of installation:

Enemy production of one device per month is a dangerous scale for us; he could secure nearly decisive effects starting only now, since six months or more remain before we reach one device. This will be referred to as military scale; it amounts to a power dissipation of about 400 megawatts (Mw)--about equal to two Hanford units. This is about one third kilo per day of product. Generally speaking, this plant would be a medium-size manufacturing installation, much smaller than the giant HEW plant, or the full-scale LTD plant, described in SAM4-R-168 by Cohen. Even half-scale here, however, is a dangerous plant, if it entered early enough into production.

Material needs:

With the best practical cooling schemes, military-scale units require at least 40 T of uranium, almost certainly as metal, held in the plant. Continuous economic operation requires 1-2 T/d of new metal. Note that the production of five devices on this basis will use at least 200 T of metal, or more probably 300 T of uranium content as ore or oxide. The metal could be recovered in years to come, but the 49 process is actually not more economical in uranium needs on a wartime basis than the isotope separation processes, unless 49 proves to make a much smaller final device.

The most probable second special material is P-9. For military-scale, the enemy needs at least 30 T, and probably upwards of 60 T, of this most expensive material. This requires burning 3 to 5 million T of German coal for steam. P-9 production must have been carried out by the use then of a total boiler capacity burning more than 1 million T/yr. of coal. This will have been done in a low-pressure steam installation at some other chemical or heating plant or plants, and does not represent an excessive burden on enemy fuel resources.

Other materials, notably concrete, will appear in the section on plant appearance. Normal industrial apparatus for the process industries, heat exchangers, pipes and fittings, stainless steel pumps and tanks, make up the list. Considerable heavy materials--Pb bricks, large iron blocks in 100 T lots--might also be expected. Graphite in 100 T lots is also probable.

SECRET

- 2 -

Utility needs and transport:

Local steam plant at the site, together with outside power lines, must deliver around 150 Mw of energy (heat and power) with at least 30 Mw of local mechanical stand-by power, available at all times. This implies a medium-sized power plant, with an ordinary smokestack and barge or railroad facilities for 500 to 1000 T of coal a day: more, if no large power lines and substations are at the site.

Cooling water needs are most conspicuous. The site is likely to be beside a large tributary or a principal river. At least 50,000 gpm of water will be needed for all purposes. Either large cooling towers (one for each unit, some 50' on an edge) or river pumping facilities out of all proportion to the coal consumed and the smoke generated by the stacks will be found. It is likely that large reservoirs, probably covered concrete basins, will be installed, as well as high tanks holding several times 10^4 gallons of water. If the site is near a river, it is likely that a large water filtration and treatment installation covering as much as a hundred thousand square feet will be seen. If the plant is not by a river, well-isolated cooling towers or spray ponds must exist.

Usual industrial rail facilities, without signs of bulk output or input once construction is complete, are needed.

Personnel - safety and security:

A thousand men per shift is a fair estimate of the personnel. Special safety and security precautions are likely. Unusual hazards are presented; men will be barred from areas where there is no visible danger, neither heat, high tension, nor vapors. Some personnel will wear instruments as a safety means. Routine blood counts and periodic medical examinations may be made. Some small and specially-guarded store houses or laboratories will be found. The plant will not be an urban one; the site will not be directly up-stream from a large town.

Accidents:

Possible radiation burns and enforced absences of some personnel for anemic conditions may occur. A few instances of pieces of equipment being removed into an isolated area or even buried, some interest in samples of stack gas or river water, may be reported.

Physical detection of such a plant from planes or from river water samples is very probable.

Academic and commercial connections:

Experts from the KWI in Berlin and in Frankfort a. M., connected with the laboratories of Heisenberg and Rajewsky should be visitors or permanent employees. Material suppliers are very likely the Auergesellschaft in Berlin, and the Degussa in Frankfort a. M. The plant construction was probably done by Degussa or I. G., with contact with the academic circles noted above.

SECRET

SECRET

- 3 -

Sub-division or combination:

The military-scale plant might be divided into three or four separate units. More likely is the existence of one site of military scale, with some duplication of structures at one site of a square mile or two near a river.

We tend to discount a full-scale plant working combined with a separations unit.

Physical appearance:

The most probable military scale plant looks like this: A river-side site, not very close to a city, on which is situated a medium-scale industrial establishment. Water treatment and cooling provisions bulk large in comparison with other structures at the site. Unusual features include one or several similar structures about 100' on a side and 50-100' high, which are reasonably heavily built and may even resemble large concrete tanks. These are supplied with much water by near-by large pump houses. There is near each such unit a low and very massive concrete structure of similar area, or, alternatively, each unit is connected by a heavy underground or surface railway or by a water-filled canal with a single very massive concrete structure of somewhat larger size. Isolated water and material storage tanks are visible, unless below ground. Large ventilation plants, probably with tall stacks, not accompanied by any sign of furnaces, are to be expected at each massive concrete building. In general, water, ventilation and internal transport facilities are out of proportion to the other process buildings, which tend to be of massive construction. Total roof area is under a half million feet. No heavy loads are brought into or out of the site, though they may be moved around the site. Ground reports and even careful photo-reconnaissance should identify such a plant more easily than one of the separation type, apart from physical means of detection. It must not be forgotten that extensive concealment of the main units by underground construction is possible, and even quite attractive for the main units. Auxiliaries, especially the water-cooling system, must still be left free to the air, or to a river. With effort, however, this medium-size enterprise could be almost completely concealed from aerial cameras.

Economic geography:

Security from bombing and sabotage and plenty of pure, cold, cooling water will alone determine the site. Transport of material is no consideration. The upper stretches of the Danube (or its large tributaries, as the Inn,) the Elbe, and the Oder seem the most likely bets. It is admitted that cooling towers might be used at a site not close to a large river. The plant will surely be in a German region. The plant is reasonably vulnerable to bomb hits, while personnel and material transport offer no large-scale problems for enemy industrial and rail facilities. Water and safety are the prime objectives.

It would be of great value to obtain an opinion from someone familiar with the enemy's methods of plant concealment and relocation. He could estimate to what trouble the enemy will go to hide such a plant, and where, say two years ago, the Germans would have placed a plant to protect it from our bombers.

SECRET

SECRET

- 4 -

Timing and "strategic" estimates:

This sort of plant contains three to five independent units, each using considerable P-9. The development of the site should have begun in 1940, and an operating pile plant may have existed as early as 1941, long before military-scale was reached. The bulk of construction might have been done then, in 1941-42, while full operation is unlikely before middle 1943, unless he has a huge P-9 capacity for which we have no evidence. These are guesses based on P-9 needs and general conclusions from the enemy literature (especially the technical Al cross-section work of middle '42--see survey report P.) The enemy is given full credit for starting large scale effort in early 1940, one year after fission discovery. By 1941 he was making P-9 at some 10 to 20 T per year. All these times are clearly sheer guesses.

The whole 49 possibility is made unlikely by the difficulty of utilization of product and by German industrial eminence in more normal chemical lines. The general impression of the plant description here given is that this is a plant we could with effort find and destroy, but it is not a plant likely to exist in Germany.

It is true that the slowness of construction assumed is largely due to the expensiveness of P-9. The enemy might with effort use graphite, but then his metal needs and general scale go up almost to HEW levels, a less likely state of affairs. That he is in any case reasonably slow is fortunately demonstrated by the one sure fact that we have to this date felt no bombs.

We have had a request from Dr. Morrison to send you some account of what sort of installation, equivalent to Y, the Germans might have or need. We have discussed this matter informally with you in the past and the present statement is only for the record.

1. The answer to this question is complicated to the point where it may be useless by the fact that the program of Y is a fairly ambitious one and that it may be paralleled in Germany, but that a possible program making less advantageous use of material and requiring a much greater production schedule could be carried out with much more meager facilities and less talented personnel.

plutonium

2. In general we should say that any program involving the use of 49 would have as indispensable parts a large chemical and metallurgical group, a group working on nuclear physics experimentally, some strong theoretical advice, and an ordnance program, not necessarily very extensive but involving unconventional ordnance problems and at least one proving ground. We should doubt whether even with modest objectives and reasonably long time scale effective use could be made of 49 by an installation with a personnel under 200, and our estimate of the time needed for the development of the necessary methods would be at least two years from the foundation of the organization, and at least six months from the time when macroscopic amounts of 49 would be available.

plutonium

U-235

3. In the case of an organization devoted exclusively to the application of 25 and operating along conservative lines we should again expect a group of experimental nuclear physicists, strong theoretical advice, and a metallurgy and engineering group which might operate with conventional means, but which would undoubtedly need a proving ground of some kind. For this problem we believe that a

Subject: Enemy Activity.

MEMORANDUM to Major General L. R. Groves

1. Up until lately there were no signs of government interest in nuclear research except in ways and at laboratories which did not seem adequate for the "Y" problems. Recent reports (Reichspost Laboratory, alternative Kaiser Wilhelm Institute at Bisingen, implied connection of Heisenberg with German Ordnance Research at Dresden) indicate that a high priority government-sponsored project which is involved not with production but with nuclear research, using the top German nuclear physics personnel, may be now underway. There seems to be strong evidence for a German "Y" project, which appears to have begun early in 1943. The reports do not exclude the possibility that they understood the fundamentals of the "Y" problem before then.

2. Enemy production of explosives devices by piles at a dangerous level appears to be very unlikely. This is based partly on the evidence of late beginning of serious activity by nuclear physicists, and partly on the great cost and conspicuousness of sizable production by this means. There is, however, good evidence of small-scale pile operation. It is possible that the enemy is producing 25 by LTD. Critical examination of this method shows that the enemy could produce at a rate of, say, 1/4 kilogram per day without noticeable strain or the need for large installations.

Philip Morrison and Karl Cohen. 31 July 1944. Appraisal of Enemy Bomb Production. [NARA RG 77, Entry UD-22A, Box 168, Folder 203.11—Tech. Countermeasures + RW—1943–1944]

APPRAISAL OF ENEMY BOMB PRODUCTION

Summary

Recent evidence essentially confirms our earlier general statements on enemy bomb production. The reports now at hand lead us to conclude:

1. A German "Y" project has been underway since early 1943. [Project Y = Los Alamos, i.e., production of nuclear bombs.]

2. A D_2O pile is in operation, but we do not believe that this is on production level.

3. It is implied that a separation method is operating at a production level, for it is surely improbable that the enemy will organize a utilization group without something to use.

We include a time schedule, and a technical discuss of the probable means employed.

Enemy production of devices can be as high as:

1. 1 device every 3 months—on the assumption that 30 kg of material are required per device.

2. 1 device every month—on the assumption that 10 kg of material are required per device.

In either case the first completed device could be in enemy hands now.

[Morrison and Cohen then spent several pages of their 31 July 1944 memo explaining their assumptions and calculations that led to these estimates. See pp. 4743–4744 for photos of the complete memo.

U.S. Manhattan Project scientists wrote a number of memos that proposed various scenarios by which Germany could be pursuing a nuclear weapons program that would be consistent both with what little information Allied intelligence had from Germany and also with the scientific requirements of U-235/Pu-239/U-233 production that the Manhattan Project scientists had learned firsthand. The memos shown here are just a few examples.

The basic conclusion of all of these memos was that as far as Allied intelligence and the inherent requirements of nuclear physics could tell, it was entirely possible (although certainly not proven) that Germany could be producing enough U-235, Pu-239, and/or U-233 for nuclear weapons.]

APPRAISAL OF ENEMY BOMB PRODUCTION

Summary

Recent evidence essentially confirms our earlier general statements on enemy bomb production. The reports now at hand lead us to conclude:

1. A German "Y" project has been underway since early 1943.
2. A D_2O pile is in operation, but we do not believe that this is on production level.
3. It is implied that a separation method is operating at a production level, for it is surely improbable that the enemy will organize a utilization group without something to use.

We include a time schedule, and a technical discussion of the probable means employed.

Enemy production of devices can be as high as:

1. 1 device every 3 months - on the assumption that 30 kg of material are required per device.
2. 1 device every month - on the assumption that 10 kg of material are required per device.

In either case the first completed device could be in enemy hands now.

Account of Enemy Development From Present Information.

Enemy work on this problem dates from early 1939 when nuclear fission was discovered. Even before this he had a background of work on isotope separation. During the first two years of the war (September 1939–September 1941) his effort was not well centralized. There was little dislocation of scientists; there was no widespread scheme of draft deferment. A rather extensive program on fundamentals was carried out by several research groups, and many necessary results obtained. Strong interest was shown from the start by the Kaiser Wilhelm Institute in both nuclear properties and separation techniques. We know this mainly from the literature which was published in 1943 after a typical delay of two years. During this period Heisenberg moved to the important post of Director of the KWI for Physics. In September 1941 he told Bohr that he had been fully occupied with TA work in the two preceding years. Patents published in 1941 show industrial interest in the problem.2)

Throughout 1942 it appears that interest was maintained in the heavy water production from Rjukan, and within Germany on separation methods as well. 3) 4) The Reichspost, the government agency with the best reputation

2) Auer Patent DRP
3) British Rjukan Intelligence
4) Jensen to Bohr

for scientific research, was considering cyclotron construction at this time.4)

The next well-established date for us is late in 1942, when we are informed that the Wehrmacht asked that the uranate stockpile be transferred from Belgium to Germany.5) The same intelligence implies that German metal processing had started, since the accompanying request for use of Belgian plant can best be interpreted as a need for additional facilities.

From the need for large quantities of uranium at the end of 1942 we conclude that plant construction was well under way by this time. This conclusion fits well with the evident realization in Berlin in early 1942 that the war was going to be long.

In 1943 we have a series of indications of the establishment of a utilization project. Flügge, Pose and Von Ardenne were reported to have undertaken work for the Reichspost6) directing three high tension laboratories. A laboratory was established at Bisingen (Wurtemberg) for Heisenberg's KWI group6) which is reported to have a cyclotron.

Jordan, who is a confirmed Nazi, and who was associated with the rocket development station at Peenemunde, is now (1944) working with Heisenberg on the TA project.7) Another link between TA work and ordnance is Heisenberg's association with the Ordnance center at Dresden.8)

A German general, with enough knowledge of American development to know of our proposed helium-cooled pile, spoke recently of having seen a small amount of material, 100,000 times more potent than dynamite, which he believed was obtained from uranium and heavy water.9)

We summarize the schedule which appears most probable to us:

1939	Fundamental research: all methods
1940	Fundamental research: all methods
1941	Beginnings of industrial-scale interest
1942	Begin construction of large scale plant, continue heavy water production, secure metal supplies
1943	Begin operation of plant, initiate serious effort, small scale production reached, perhaps also with a D_2O metal pilot plant.
1944*	Plant operation continues: 10% material in production, step from 10% up in process.

Estimate of Enemy Methods

In interpreting the evidence at our disposal, we have drawn heavily on our own experience in this country. It has been tacitly assumed that he has not improved methods beyond what we know can be done. Thus it is dangerous to consider our estimates anything but minimum enemy possibilities.

4) Jensen to Bohr
5) Statements of Jensen to Bohr (inter alia)
6) Gentner statement to Swedish physicist
7) Meitner, Hahn and Von Laue to Mrs. Bohr
8) MA Istanbul
9) OSS report from Lisbon July 1944

*We add our opinion of the 1944 schedule at this point for completeness. The reasoning supporting this view follows.

SECRET

-3-

With the above qualifications in mind, the following is a list of the most dangerous enemy possibilities in descending order:

(a) Liquid Thermal Diffusion
(b) Centrifuges
(c) Piles on Normal U

The choice of (c) position for piles in spite of the positive evidence of enemy interest is based on the feeling that the known difficulties of utilizing 49 and the large installations required for the production of 23 would discourage enemy development along these lines. The tardy enemy "Y" effort strengthens the feeling that he could not easily solve this problem. It is our belief that the reports on a D_2O pile refer to a pilot plant.

The LTD method as we know it could be used without difficulty to produce metal in 10% concentration. The amount would depend on the quantity of steam producing equipment which the enemy would be willing to divert. The chief difficulty would be the problem of changing from 10% concentration to higher and directly utilisable material.

We can only guess about how this last step is taken. It will almost certainly be separation because transformation of enriched material by a chain reacion demands as much heat removal as transformation of normal material, while separation schemes beginning with enriched product are of pilot plant size.

The following rough tables indicate the time schedule and requirements of various methods:

PILES

	Rate	Metal Need	D_2O Need	Time Schedule from start of construction To first grams	 To full rate
D_2O + U (minimum(1))	25g/d of 49	10T held + 30T/yr	5-10T	12 months	14 months
D_2O seed + U + H_2O (maximum(2))	1500g/d of 49	700T (6 mo. prod.)	5-10T	16 months	22 months

(1) A plant of Montreal—essentially pilot-plant—scale

(2) A plant of Hanford scale

SECRET

SECRET

-5-

From these tables alone we cannot, of course, determine what and how much the enemy is doing. However we can give a fairly probable picture based on the following very likely assumptions:

(a) That the enemy program was progressively accelerated as the desperateness of their strategic situation became evident.

(b) That they were forced by the strain on their economy to adopt a program requiring only moderate industrial effort.

Such a picture would be:

(1) A tenth-scale LTD plant begun in early 1942, reaching 50% concentration at this time.

(2) A heavy water pile producing 49 at a 25g/day level, started in the middle of 1942, and coming into full production in late 1943. Present construction of additional units is possible.

(3) Additional improvised LTD capacity—perhaps as much as two-tenths scale—leading to production of 10% material now or in the near future.

(4) Present desperate effort, beginning in early 1943 to solve the "Y" problem and to bridge quickly the gap between 10% and 50% material.

Final Production

The utility of the product of these plants depends on the degree to which the "Y" problem is solved. If enemy progress is only as far as the relatively simple gun-method of detonation, it is unlikely he can use 49 at all.* In this case 30 kg of pure material is required.

Under these circumstances we can derive the following estimate of enemy production of the final device:

1	25g/day	49-D_2O pile yields	no devices
1	100g/day	LTD @ 50% yields	1 device/10 months
2	100g/day	LTD @ 10% + unknown step to 50% yields	1 device/5 months

equals: 1 device every 3 months

with the first device now possible.

If the enemy "Y" program is as advanced as ours, he may be able not only to utilise 49 but even to construct devices with as little as 7 kilos of 49 or 10 kilos of 25. Under these conditions we obtain the following estimate:

1	25g/day	49 D_2O pile yields	1 device/10 months
3	100g/day	LTD @ 50% (as above) yields	1 device/month

with two devices now possible, one from the pile and one from LTD.

*We have eliminated the transformation to 23 as a practicable means at his scale.

SECRET

August 1, 1944

TO: R. R. Furman

FROM: P. Morrison

It seems now sensible to make all possible technical preparations against the possible enemy employment of a final device. I should like to make two proposals which carry out my conversation earlier this week:

1. A significant feature of our estimate of enemy capabilities is now the possibility of his success at the Y level. Collaboration on a more or less day to day basis with someone familiar with the fundamental nuclear problems and with the details of the ordnance problems of the Y group should be made possible for Cohen and myself. It is my understanding that you consult leading personnel at Y, but I should prefer to see some such detailed work as was done last weekend at Washington begun by an individual with Y background. If it is absolutely necessary for security reasons, this individual can work independently from the two of us, but he should have access in detail to the source material and to our reports. It seems to me that both Oppenheimer and Alvarez have too great responsibilities to be spared even on a part time basis. They can surely suggest someone who would meet the need.

2. There are a number of technical possibilities which will enable us to derive information from and perhaps anticipate the use of an enemy device.

a) The device will probably not operate on contact. This implies some timing arrangement which, while not unusual for artillery, has apparently not been employed on aerial bombs or on the robot planes. Can we expect to see enemy experimentation or proving tests with such timed explosions, perhaps even over our territory if pilotless means are to be employed? What other ordnance lines could be followed in an effort to gain information on enemy progress? What place has their advanced rocket knowledge and their unfamiliar propellant materials?

b) Actual enemy employment of such a device will provide a chance for us to guess his capacity and the nature of his plant. It would be desirable to know (1) the amount of material employed, (2) the efficiency of utilization, and (3) the nature of the material. From an outsider's point of view, I would expect that such data could be obtained from observation of the area of effectiveness, from collection of samples and their analysis by mass spectrograph or alpha counting (differential or otherwise). The fission product activity to alpha activity ratio would also help. It seems clear that Y not only can estimate whether such experiments are feasible and how they should be done, but also take the responsibility of providing personnel and equipment on a stand-by basis.

Dear Opje,

I have been interested in the remote detection of explosions involving some thousands of tons of TNT. Major Furman has recently informed me by telephone that Seismic methods for such detection are unsatisfactory. It was impossible for him to supply me with the conditions governing this conclusion. I am, therefore, writing to your laboratory for any information which you may have on these problems. It would be very nice if you could send this material directly to me. If, however, this does not seem consistent with best security procedure, it would be just as satisfactory if you would assure me that these details have been considered in reaching the conclusions of which Major Furman spoke. Essentially, my point in writing is to make sure that the conditions for the experiment have been fully set forth. Here are some questions:

1) Against the background of normal seismic and micro-seismic disturbances, over what terrain and with what instrumentation can 10,000 ton explosion be detected? The answer to this question will be a function of the degree of coupling between explosive and the earth. It would be nice to have the limiting cases.

2) In the case of no ground coupling, can such an explosion be detected by low frequency acoustical measures such as the hot wire microphone or an equivalent instrument? Again, what are the background and distance limitations?

3) Should such an event be accompanied with a proportionate amount of activity, what elapsed time would permit of the best localization by air and group samples? Also what upper limit can be set to the elapsed time before air sample detection becomes impractical? I think here of long delays of the order of months.

If your laboratory can supply me with these answers or simply with a statement that the conclusions on the problem have been transmitted to the proper people, I should be quite grateful.

My best regards to everyone, especially to Pete and Kitty.

Yours,

P. Morrison

Chicago, 80, Illinois

Dear Phil:

Thank you for your letter of August 26th. I shall do my best to answer your questions although clear-cut answers which will apply to all likely conditions are in most cases impossible.

1. Ground shock may be estimated from the following facts: If the charge is set off at the surface of the earth, about 20% of the energy goes into the ground. Some of this is used in crater formation, but you will not be far off in taking this figure as an instantaneous energy release for computing seismic signals. In the context in which you are interested there certainly will be many signals from other sources which may be comparable in intensity to the one you are looking for. The one you are looking for will be distinguished by an abnormal length. If the charge is set off 100 feet above ground the energy that goes into the ground is only a few tenths of a percent. If it is set off 1000 feet below ground practically all the energy will go into the earth. It is easy to calculate the amplitude and duration of the pressure pulse from a point source of energy liberated in the ground and this is left as an exercise to the reader.

2. Detection of air blast is probably possible at distances of the order of 100 miles. Here again two precautions are necessary; The wave you are looking for will be distinguished from wind by a sharp front and from the blast from smaller, nearer explosions, by great length. The microphone in which the back surface of the chamber is rigid and is not coupled to the diaphragm and in which the natural frequency of the diaphragm is high, will give a faithful record of such a pulse. The length of pulse to be expected at 100 miles is several seconds. The over pressure is some hundredth's of a pound, and as far as we know the front should be very steep. This method of observation is probably the least affected by the circumstances which you will not know.

3. It is impossible without knowing the details of the set-up to predict what will happen to the activities. With

little surrounding matter and set off well above the ground, they may, and probably will, reach the stratosphere. If a good deal of matter is heated up and carried out by the hot gases, mushrooming may occur as it does with ordinary explosions at a height of some 10,000 feet. What happens after that will depend on the wind and weather. There will probably be a rain.

4. Neutrons are, of course, completely out for remote detection and so are Gamma rays.

In view of the nature of your interest and responsibility I see nothing inappropriate in providing you with such meager information as we have. I am, however, sending a copy of this letter to Lt. Colonel Lansdale so that he may be aware of the extent of the information which you have received.

With all warm regards,

Sincerely yours,

J. R. Oppenheimer

2 December 1944

MEMORANDUM TO DR. KARL A. COHEN:

Subject: Extension of Information.

I have, by now, been able to complete the information given us by the source which became available in October 1943. There are two points of interest:

1. The source is unfortunately not able to state explicitly what kind of diffusion was implied by Jensen in the conversations of 1942. It is the impression of the source, however, that half a dozen methods were being investigated, including membrane diffusion and thermal diffusion in both phases. Many other schemes were also involved. The picture which was conveyed at that time was not one of engineering development along a production line, but rather of an extensive research program intended to turn up any possible simple methods, even though they might require a long time in the laboratory stage. Whether sincere or not, our source's informants gave him the impression of working on a post-war effort.

Since that time, of course, as we ourselves have been lead to believe, there has been, no doubt, an enemy re-evaluation of the entire picture. It is fair to conclude that every known method is accessible to the enemy, at least in the laboratory stage.

2. Our source assures me that a heavy water chain was initiated in late 1942. He states further that Harteck and his co-workers not only were concerned about increasing the Rjukan production, but that also they made vague references to the existence of a large distillation plant inside Germany. The reliability of these impressions is, of course, not large.

The recently published statements of Hevesy and the article of the last issue of TIME are strongly indicative of general interest and understanding of the difficult problems of assembly. I propose the following rather speculative argument to which I would like your comments: The enemy has at present no very large production of 25, and a quite small one of 49. He is, therefore, interested in utilizing a minimum amount of material, and of doing that quickly. To this end he has begun to investigate the less straight-forward methods of assembly, simply because they promise results with a minimum of material. On this basis we may expect action from him at any time, even though it will not be in decisive amount. The complex assembly methods which are not necessary for 25 may still be of interest to him, even though we believe 25 his main production, simply because of the great shortening of his time schedule which they make possible.

ADDRESS REPLY TO
2101 CONSTITUTION AVENUE
WASHINGTON, D. C.

January 8, 1945

SECRET Limited

To: Major R. R. Furman
From: W. A. Shurcliff and P. C. Fine
Subject: Brief appraisal of (A) German TA Status, and
(B) Alsos Strassburg Mission.

Explanation: This brief appraisal was requested by you on 5 Jan. 1945.

Part A Brief Appraisal of German TA Status

What We Know: On the basis of Preliminary study of Alsos material alone, we can state with at least moderate assurance that:

German nuclear physicists have been working on the theory of fission piles, as part of a program having high priority.
"Large scale" experiments (probably on piles or pile segments) have been carried out near Berlin.
In at least one (unspecified) phase of nuclear physics, technical problems have been mentioned as more pressing than the scientific questions.
Germany considers nuclear physics to be very important; she has set up an agency reporting directly to Goering to work in this field; she has kept her best physicists at work in this field; she has released some scientifically-qualified men from the army to help out.
On the other hand, in at least one university (Strassburg, in Alsace), the nuclear physics equipment has been mediocre and security has been poor.

What We Do Not Know: We know virtually nothing about:

German research on fission bombs and atomic poisons.
Any methods Germany may have for producing enriched U, or 49, or 23.
Any stores Germany may have of enriched U, or 49, or 23.
The extent of German industry's activity in this field.
Germany's familiarity with our program.
(We guess that Germany has not placed her greatest emphasis on military applications; we guess that she has stressed development of power piles and that she lags behind us even here; we guess that she is by now convinced that USA is interested in military uses in this war.)

Part B Brief Appraisal of Alsos Strassburg Mission

The Alsos Strassburg Mission did an excellent job in promptly locating and seizing the principal quarters and remaining scientists, and in looking through the remaining files and promptly forwarding to USA the more interesting items, - all despite great handicaps. The material thus obtained has been extremely interesting. It may be that in future cases of this kind the Germans will not leave so many documents around and it will then be necessary to obtain information to a large extent by questioning captured scientists and by examining laboratory equipment.

We understand that the Mission had inadequate quarters, inadequate office equipment, and no photostating equipment in their Paris office or in the field.

January 10, 1945

Mr. Karl Cohen
P. O. Box 41 - Station J
New York 27, New York

Dear Karl,

I have delayed in answering your letter of December 14 partly to settle my own thoughts and partly to watch the events in Belgium. I am ready now to act on a premise very different from the one on which we based our planning this fall in Washington. If then we made the guess that the Germans might resist no longer than one or two months, now we should expect them to fight on their frontiers, east and west, at least into late summer. If Major Smith and the other responsible officers will accept this interpretation of the news, it is clear that a fresh start is needed for the whole work.

We have at present, a working organization in the theater; we have absolutely certain intelligence of the enemy interest and of his possession of raw materials; we have some results (which I do not know) from interrogation of enemy targets. I believe we should begin this year with the intention of going all out for positive intelligence. If we need new contacts with other agencies, if we need more personnel, if we need a re-evaluation of schedules and possibilities, let us get them. Certainly the burden of this work will fall on the people in the theater; I should like to see Furman, Goudsmit, and Smith make these plans together.

For my own part, I am most anxious to hear from the other side. By now, there should be a feeling in ALSOS of what the problem is like. Insofar as I am supposed to aid in evaluation of the enemy progress, I feel not very competent without conversation with our people overseas.

The direct preparation of counter-measures looks somewhat less important to me now than it did before I got to Y. There are two reasons: The construction of small-scale devices is capable of more variants than I had thought, which makes more costly and less reliable the possible counter-measures; more important, the damage done by a few devices is not so great as I had believed. Taken together, these imply that many schemes are simply not worth while. Two general measures, however, still appear to me to be of the highest importance, and are still feasible in a matter of months: These are (1) the preparation of an adequate medical and control organization, on a skeleton basis, directed against the radiological hazards of a device, and (2) the formulation of a policy, with its implementation worked out on paper, of what to do the day the Germans drop a gadget. They have already claimed the use of atomic bombs in the recent break-through, according to the newspapers here, and there has been no reaction. This may indicate that we need not worry about the matter, that routine censorship will handle it, but I am sure that a real bomb will have a bigger impact than those dropped simply by the DNB. At any rate, we should come to some decision, and there is not much time.

Page 2.
To: Mr. Karl Cohen

January 10, 1945

It is clear that few really technical matters are involved in all this. We have mainly to make up our own minds, and to act. If I can be of any help, I should be glad to come to Washington, preferably after the 22nd of January. Especially if someone is in town from the theater, would I like to come.

Even if it is not thought worthwhile to have a conference at this time, I will prepare a detailed account of what I would like to see done, both on the side of positive intelligence and on the counter-measures.

There are too many loose ends and false starts in this work now. The enemy is still capable of offensive action, and clearly has won himself many months of time, while we have considered him beaten. This situation is a dangerous one for our peace of mind, if for nothing else. If I can help by coming to Washington for a few days, I am your man.

Yours,

Phil

P. Morrison

To: Major General Clayton Bissell, Assistant Chief of Staff, G-2, U. S. Army, Washington, D. C.

1. Up to the present I have, as you know, had two men attached on temporary duty to the Alsos Mission for the purpose of exploiting particular targets in the European Theater of Operations. When Strassbourg was captured there was discovered through the aid and cooperation of the Alsos much evidence that proved that Germany is making a real effort in the field in which I am interested. As a result many and widespread sites are now known, each of which demands thorough exploitation by specially qualified personnel.

2. The evidence gathered at Strassbourg also showed that among the many targets pertaining to our particular field there are two areas of especial importance. The first area comprises the city of Berlin and the surrounding country within a radius of fifty miles. The second area comprises the country around Bisingen-Hechingen in the Black Forest in southwest Germany. To exploit these two areas efficiently with the present staff of Alsos would be an impossible drain on its personnel and equipment. Accordingly it is recommended that there be added to the Alsos Mission a qualified group whose duties will be exclusively limited to those special targets which will affect this project. This group will, of course, be under the command and administration of the Alsos Mission for operations in the field.

3. Our experience with the work of Alsos has been very satisfactory. The personnel has gained invaluable experience in securing scientific intelligence data and it is felt that full advantage would be taken of Alsos' experience.

4. It will be necessary to increase table of organization and table of equipment of Alsos. It is therefore requested that a staff study similar to the one herewith attached be approved so that Alsos will be able to function properly.

Major F. J. Smith
P. O. Box 2610
Washington, D. C.

Dear Major Smith:

It goes without saying that the report of the recent material which you sent me last week was much the most interesting document I have read for some time. I am quite eager to have a chance to look over the original material myself. It turns out that in the next two or three weeks the work here is such that I feel quite willing to come to Washington at your convenience. If you will let me know a week or so before you want me to leave for the East, I shall be there. I would appreciate it if Karl could arrange to be in Washington for at least a day or two while I am there; I think we will have a good many things to talk over at such a meeting.

My strongest impression from the material was, like yours, one of relief and optimism. The documents raise a good many questions, however, the most important one of which is - what about a bomb? There are references to this objective, but no sign of organization or technical work toward it. As a long shot, I will guess right now that there is such work but that the Strassbourg Group were not involved. This is the most important question I should like to try to settle by examining the documents. I hope there are available reports of interrogation of the targets.

I shall expect to hear from you soon setting a date for my coming East.

With best wishes.

Yours,

P. Morrison

U.S.
Morrison

22 February 1945

Dear Frank:

I am quite sorry to have missed talking with you in Washington. You will see from the reports which I have written and which will no doubt be presented as a joint report from Cohen and me, how convinced I am that the remarkable success of the Alsos visit to Strassbourg has felieved us of most necessity to worry about the possible military implications of enemy work against us. I do not want to appear inconsistent with my previous emphasis on not underestimating the enemy, but the nature of this material leaves very little doubt that while he has made an intelligent, competent application to the problem he is certainly a good two years behind.

I count upon you to help Sam and Alsos to continue the job they have done, especially if we at last occupy a large amount of enemy territory. It is even more certain that the enemy has made substantial progress in the field and has in his possession the fundamental information which can cause great harm in future years than we have ever believed before. To this end Wardenburg's and Goudsmit's facilities and their support and enthusiasm must be increased and maintained. I am sure this is consistent with the policy of your office but I would like to add my opinion just as an additional point. If you would like any further work from me on the problem of German targets, I should as always be very glad to help you.

With best regards,

PM

Monthly Intelligence Summary February 1945

4. Tailfingen

A paper discovered in the Strassburg investigation bore a letterhead indicating that the present address of KWI für Chemie is now located at Tailfingen approximately 20 miles S-SE of Hechingen. Air photos of Tailfingen have been obtained but revealed no evidence of such an institution. This of course does not preclude the possibility of the institute being there.

5. Oberndorf am Neckar.

A report was received stating that new weapons that had not yet been employed are being made at OBERNDORF am NECKAR. Significance was attached to this report because of the adjacency of Oberndorf to the Hechingen area. Air photos and Interpretation Reports covering this area reveal no new construction or that there were aircraft catchment wires strung across the Neckar at this locality as was first reported. No further action is being taken in regard to the area for the present.

6. REICHSPOST.

An A.D.I.K. Report states that the REICHSPOST RESEARCH GROUP formerly located in Berlin Tempelhof has been widely dispersed and that one large branch is now located at KLEIN-MACHNOW. A target dossier on Klein Machnow (near Berlin) is being prepared and will be included in our target list.

7. Saalfeld-Thüringia.

A report dated 19 April 1944 was received from OSS stating that a new weapon is being manufactured in an underground factory at SAALFELD-THURINGIA, Germany. The report added that experimental laboratories formerly in Berlin have been transferred to STRASBOURG and installed in a hospital there. The casings and tubings for the weapon were reported to be manufactured in the mechanical workshops in Bitschwiller (Haut-Rhin). Some significance is attached to this report because of the fact that a laboratory of interest to us has been discovered in a hospital in Strasbourg. Air coverage of the Saalfeld area has been obtained and is now being studied.

8. Tegernsee.

As a result of a report that a second Forschungstelle has been established at TEGERNSEE, aerial photos of the place were obtained. Nothing to indicate T A activity was observed in these photos, but the possibility of such activity at Tegernsee is not precluded by this.

Monthly Intelligence Summary February 1945

9. Heidelberg (I.G. Farben)

A P/W is reported to have stated that an elaborate "atom-smashing" apparatus is in operation at the I.G. Farben plant in Heidelberg. Major Furman has arranged for further interrogation of the P/W.

10. Leitmeritz.

An ungraded report indicated that the production of precision instruments for V-3 is being carried on by the Germans in the town of LEITMERITZ in Sudetenland. According to this report, a large volume of electric power is being directed to the factory. A power survey and aerial coverage of the area have been obtained and are being forwarded to General Groves' office for review.

11. LEHESTEN.

An OSS report states that possible manufacture of long range projectiles is being carried on in a semi-underground installation about 1.5 K.M. north of Lehesten in Germany. T A interest in the report arises from the fact that Siemens and Halske are said to be in charge of the plant, and a reference to the breaking down of water by electrolysis at this site. Aerial coverage has been requested.

III T A INFORMATION FROM OTHER SOURCES

1. C.S.D.I.C.

P.W. Oberjäger Ahlbrecht was interrogated by a British Army officer. The discussion was directed to the manufacture and use of "heavy water" by the Germans. P.W. stated that there exists a Reich Research Council headed by Staatsrat ESSER (this is believed to be phonetic spelling and to probably refer to A. Esau.) P.W. is familiar with the heavy water plant at Norsk Hydro but says the Germans do not really need it as they have sufficient electrolysis in Germany. P.W. stated that he was told by a person in authority that the whole importance of heavy water had collapsed.

This information is not thought to have especial significance and the P.W. people do not believe the prisoner to have anymore information than this.

IV MATERIALS

1. Auergesellschaft.

Because of what is believed to be the improbability of our gaining possession of the X materials thought to be stored at Auergesellschaft,

TOP SECRET

Figure D.841: Monthly Intelligence Summary for February 1945 [NARA RG 77, Entry UD-22A, Box 168, Folder 202.3-1 LONDON OFFICE: Combined Intell Rpts.].

Gerard P. Kuiper to Frederick E. Terman. 13 March 1945. [University of Arizona Libraries, Special Collections, Gerard P. Kuiper Papers, Box 57, Folder 15, ALSOS Mission (1), 1945, p. 61. https://speccoll.library.arizona.edu/collections/gerard-p-kuiper-papers]

[...] One is again surprised to see quotations from U.S. senators who think that the war will be over "within a few days". It would be wiser to worry about the chance we still have of losing it if certain high explosives are developed in time. This possibility may, incidentally, be one reason why the Germans are not giving in. Few people here [in Alsos] expect an immediate collapse.

[By late 1944, Samuel Goudsmit seemed convinced that there was no German nuclear weapons program. This letter shows that even in mid-March 1945, shortly before the end of the war, Gerard Kuiper and other members of Alsos were still deeply concerned that there was indeed a German nuclear weapons program, and that it was on the verge of deploying a final product. What information had Kuiper or other members of Alsos discovered themselves or learned from others?]

TOP SECRET

Monthly Intelligence Summary For April, May, June, 1945 (Continued)

d. From his present location, St. Wolfgang, near Salzburg, the King has been in constant touch with his homeland, and has received visits from practically all of the ranking political leaders of all parties.

e. Considerable popular support is evident for a recent proposal made at a meeting of the Socialist Party that CROWN PRINCE BAUDOUIN, LEOPOLD'S 15-year old son, should succeed and that PRINCE CHARLES should remain Regent until BAUDOUIN becomes of age.

f. The reasons for popular disapproval for the King's return appear to be:

1. His record in war.
2. His second marriage.
3. The popularity of the Prince Regent.

Popular feeling does not seem to be directed against the monarchical form of government but merely to LEOPOLD as monarch.

2. Material.

a. Union Miniere du Haut Katanga, Brussels, Belgium has been requested to purchase from Henricot Company two tons of Ferro-Uranium, which they are reported to have on hand.

b. All of the Stassfurt material, approximately 1215 tons, has arrived in London where it is being prepared for shipment to the states.

3. Miscellaneous.

A Special Detention Center was set up in Belgium where our guests were kept for six weeks after which they were brought to England where they are now living.

II BRITISH.

1. Political.

British Scientists including some with knowledge of TA were invited to a celebration of the 220th Anniversary of the Founding of the Soviet Academy of Science. After discussion with this office, the British forbade eight of their scientists to attend. Inasmuch as these eight men had already accepted, the last minute restriction resulted in a distinctly unfavorable reaction which found its way into the newspapers and on the floor of Parliament. The Russian Press also commented on this. Other than the publicly voiced objections, however, no repercussions have been noted. The following named British Nuclear Physicists were invited to the celebration:

TOP SECRET

nthly Intelligence Summary For April, May, June, 1945 (Continued)

2. Scientific.

The 220th Anniversary of the Soviet Academy of Sciences was attended by a delegation from Czechoslovakia.

3. Material.

A survey of the mines at St. Joachimstahl was conducted by Captain DAVIS and Mr. GATTIKER. It was determined that the annual output of "X" oxide is approximately 15 tons with excellent prospects for continued yield at this rate for another ten years.

V FRENCH.

1. Political.

a. Arrangements were made with ATC, Paris, for our Paris office to receive a daily list of all French civilians booking passage at Paris, Lyons, Dijon and Marseille terminals of the North Africa and Middle East lines.

b. At the request of Major SMITH, a representative of this office met Dr. Bertrand L. GOLDSCHMIDT on his recent arrival in London. Dr. GOLDSCHMIDT was advised that the services of this office were at his disposal and was also given the address of our Paris office.

c. Pierre AUGER is working with the Centre National de Recherche Scientifique where he is concerned with reorganization of scientific teaching.

d. The French newspaper "Humanite" announced that the following persons were invited to attend the 220th Anniversary of the founding of the Soviet Academy of Science:

AUGE (believed to be AUGER); LEMOINE; MAURAIN; LANGEVIN; JOLIOT CURIE; Emile BOREL; Elie CARTAN; August CHEVALIER; Josef PERES; Andre MASON; Eugene AUBEL; Rene AUDUBERT; Camille BLOCH; Maurice CAULLERY; Jaques CHAPELON; Maurice FRECHET; Pierre GRASSE; Jaque HADAMAR; Irene JOLIOT CURIE; Jaques NICOLLE; Francis PERRIN; Jaques TREJOUEL; Henri LAUGIER; Charles LAURENT; Albert (?DEMOLON); Maurice LEMANCHE.

LANGEVIN will ill and did not attend. JOLIOT and his wife did attend and from newspaper accounts it appears they took an active part.

TOP SECRET

Monthly Intelligence Summary For April, May, June 1945 (Continued)

velopment, a program was initiated by this office to determine in detail the extent of German Espionage against TA in the states including the names of persons who may have been used as agents in such an undertaking. In order to co-ordinate this program, conferences were held with X-2 Branch, OSS and the Legal Attache, American Embassy, London, the two agencies who bear the ultimate responsibility for determining the German Intelligence picture. Arrangements were made so that this office will be notified when any German Intelligence personnel of possible TA interest are picked up.

At this writing several Germans have been interned who may be presumed to have information of value to this office. Most notorious of these are KALTENBRUNNER, Chief of the Reichs Sicherhriyd Hauptamt and SKORZENY, one of his most important aides, who is believed to have directed sabotage operations. Both of these men have been subjected to prolonged interrogation by both American and British authorities. A report of these interrogations is still in process of being prepared and will be furnished to this office upon completion. Included in the interrogation of these men was a list of questions submitted by this office designed to ascertain if they possess any knowledge of TA significance.

2. FRIEDRICH OLMES.

Friedrich OLMES is a young German who came into favor with HITLER, KALTENBRUNNER and SKORZENY as the result of inventing an important anti-tank weapon. Upon interrogation, he claimed to have assisted SKORZENY in preparation for sabotage against Russia but not against the U.S. He also evidenced some knowledge of German TA efforts and claimed that he had discussed the subject with HITLER who said that,"The Germans led the world in TA and that the Americans had arrived at the theoretical solution but had not solved the practical problems." Of particular interest was OLMES' statement that information on American TA was obtained by German scientists through friends in Switzerland and Sweden. He named the persons from whom he acquired the information and an effort is now being made to locate them for interrogation. OLMES also named several persons who, according to him, had been engaged in dispatching agents to the states. These men are being hunted and will be interrogated when found.

3. GEORGE MICHAEL ERTL.

ERTL was arrested May 14 by SCI in Munich. He was a civil employee of SD Leitabschnitt Munich, Amt VI in which capacity he was responsible for Economic and Technical Information on Foreign Countries. Later he was transferred to Amt III Cl where he was responsible for Technical Science - Technical University arming and research work.

b. The French Press states that France now has a "Sixieme Bureau" which is in constant touch with French scientists. The French paper "SAMEDI SOIR" describes a machine used by the Sixth Bureau which keeps French scientists abreast of scientific developments in all subjects. The machine appears from its description to be an elaborate mechanical library.

2. Scientific.

a. A French newspaper stated that a Research Service has been organized by Jean PERRIN and Henri LANGIER and is now in the hands of JOLIOT-CURIE. This article bemoans the fact that very limited funds are at the disposal of this service and that the researchers are represented by a "poor team of scientists" whose labor is not honestly rewarded and whose status has not been clarified.

VI GERMAN

1. Intelligence.

a. During a conversation with Lise MEITNER in Sweden, one of the informants of this office was given a letter from MEITNER to be delivered to Prof. HAHN. MEITNER was under the impression that HAHN was at Tailfingen. In the letter MEITNER criticizes HAHN for his failure to oppose the Nazi regime.

Major RITTNER has asked that this letter not be delivered because he fears it would have such a psychological effect on HAHN as to create a difficult problem in connection with detaining him. The letter has not been delivered.

but a later one referring to the 1st was - So the damage was done. S

b. American authorities are reported to have seized the 700 room German Patent Office in Berlin and found "almost all" the patent records intact. These patents are now being catalogued and as soon as the cataloguing is complete a representative of this office will conduct a search for TA patents.

c. Dr. GOUDSMIT submitted a report dated 10 August in which he stated that the use of the atomic bomb has resulted in renewed confidence of the German people in HITLER as they now think he was not lying when he promised them some terrible weapon which would end the war. GOUDSMIT also states that he considers it unfortunate that HAHN and STRASSMAN were not named as the discoverers of uranium splitting, because since the whole scientific world knows that they are the discoverers, he fears that the omission might be misconstrued as having some sinister purpose.

d. The Guests have now been installed in a house in England where they are under constant technical supervision. Copies of the reports have been studied here and forwarded to Washington. The following conclusinns have been drawn from a study of these reports:

VIII SWEDEN

1. Intelligence.

a. An agreement was concluded between the foreign ministers of Sweden and Belgium providing for an exchange of goods under which Sweden will supply wood pulp, ball bearings, timber and iron ore in return for industrial diamonds, steel goods, coke and non-ferrous ores. This agreement was reported in Daily Digest of World Broadcasts.

b. The 220th Anniversary of the Russian Academy of Science was attended by five Swedish scientists headed by Professor SVEDBERG. According to monitored broadcasts, the Swedes were much impressed both by the accomplishments of Soviet science and by the fact that the Russians were so frank and open in exhibiting their discoveries to scientists of other countries.

2. Publicity.

Swedish newspapers carrying publicity about the atom bomb were forwarded to Washington.

IX CENSORSHIP.

a. The wives of H. SHEARD and D. J. LITTLER, who were working at "Y" at the time, signed the notice of censorship of incoming and outgoing mail at that establishment on 9 July 1945.

b. The Paris edition of "STARS AND STRIPES" for 1 July 1945 contained an article headlined "Nazi Progress In Atomic Field Veiled by U.S." Investigation revealed that this censorship violation resulted from negligence on the part of a censor. The body of the article contained only slight and insignificant reference to atomic weapons. The censor was admonished by Col. MERRICK, his superior officer.

c. At the request of Col. CONSODINE this office has subscribed to the following British scientific publications:

"Proceedings Of The Royal Society"
"Proceedings Of The Physical Society"
"Nature"
"Proceedings Of The Cambridge Philosophical Society"
"Transactions Of The Farraday Society"
"Philosophical Magazine"

These magazines are being hastily scanned in the London Office upon receipt and then forwarded to Washington.

d. On 6 August 1945, the first atomic bomb was dropped on Hiroshima in Japan. Two days previous to this the London Office was advised that the bomb would be used in the next few days. Captain DAVIS was immediately dispatched to the continent in order to control undesirable publicity from ALSOS and also to carry instructions to Pierre

WIRTZ, Karl	Goettingen	Nuclear physics	B
*ZIMMER, Dr.	Berlin-Karlshorst	Bio-physics	B

(Asterisks denote men who have been invited to work in Russia but have declined.)

2. Any of these men becomes an important intelligence target whenever it appears that his services have been sought by any other nation. Any attempts to recruit these scientists should be reported in detail; especially the name and German address of the man, exactly what he is being recruited for, where he would go, and all inducements offered. This information should be forwarded by the quickest means possible.

3. The following is a list of German scientists known to be working in the USSR at the invitation of the Russians.

ARDENNE, Baron Manfred von: Germany's foremost builder of cyclotrons. Taken to Russia June 1945; now reported in Taupse on Black Sea. Rating: A.

HERTZ, Prof. G.: Partially Jewish; non-Nazi. Went to Russia in June 1945 with 25 assistants. Rating: A.

MIE, Dr.: Nazi; physicist. Arrived Moscow July 1945. Rating: C.

RIEHL, Prof. N.: Non-Nazi; Director of Research for the Auergesellschaft AG Oranienburg, Berlin. Radio chemist. Went to Russia June 1945. Rating: A.

STEENBECK, Dr.: Nazi; atomic physicist and rheotron expert. Arrested by Russians and sent to Moscow in September 1945. Rating: A.

THIESSEN, Prof. P. A.: Former Director Kaiser Wilhelm Institute for physical chemistry. Taken to Russia in October 1945 with two assistants and VON ARDENNE. Rating: B.

VOLMER, Prof. M.: Non-Nazi; physical chemist. In Russia with HERTZ. Rating: A.

4. The activities of these men are of the greatest interest, as are those of any other men who may be added to the list. If any of these men returns to Germany information as to his whereabouts should be forwarded at once.

5. The names and activities of engineers and other technical experts possibly connected with atomic research also become of great intelligence interest when such men are known to be working for other nations or to have been successfully recruited or even approached by another nation. Full details are required.

[This is the final version of a list that was created and distributed by the Alsos Mission. There was a similar but separate list for Austrians such as those Georg Stetter's group—see the following pages. If the U.S. government truly believed that these scientists knew and accomplished so little during the war, why were they so concerned about what these scientists might tell or do for other countries that wanted to develop nuclear weapons?

In some respects this list shows a remarkably detailed knowledge of wartime German nuclear work, including many relatively obscure scientists. In other respects this list reveals areas of ignorance about the wartime German nuclear program. It underestimates the importance of some people. For example, it assigns the lowest value (C) to Diebner, who appears to have been instrumental in running the nuclear program, and gives a B to Jensen, who went on to win a Nobel Prize for his nuclear work. It also omits a number of important people.]

Todos M. Odarenko. FIAT 63. ***Activities of the Second Institute of Physics of the University of Vienna.*** **[The original German version of this report is G-345.]**

[See document photos on pp. 4786–4787.]

1.0 Introduction.

The material presented here on the activities of the Second Physics Institute of Vienna University was obtained from Prof. Stetter, as the result of my visit to Thumersbach and to Zell-am-See between October 10 and 13, 1945. The primary purpose of the visit was to establish the contribution of the Institute to the atomic work on the so-called "Uran-Motor" project, and to determine the work of the Institute on radiation absorption materials. Two days were used for interviews with Prof. Stetter and his associates, at the end of which a series of reports were obtained, the English translation of which is attached herewith, as Appendix I.

Although some of these reports, and additional documents, were removed from the Institute earlier by Prof. Smyth of the Alsos Mission, the reports obtained were translated and are released herewith as a matter of record. The original German reports were turned over to the Naval Intelligence Division, Navy Department, Washington, D.C.

2.0 General Observations on the Institute and its Work.

2.1 The Institute.

The Institute, with its present component parts, was the largest and the most important research organization in Austria. Before the war, it was involved primarily in the so-called pure research. During the war, it became engaged in certain special problems, of which the Uran-Motor project was one. In addition, the problems relating to the radar field, high frequency development work on testing equipment and the radiation absorption materials, received a certain amount of attention. A very brief review of these activities is undertaken below. A series of the reports prepared by the members of the Institute is attached for a more searching study.

2.2 Work in Nuclear Physics.

Not having been intimately connected with the work on atomic energy release, I am not in a position to fully evaluate the importance of the Institute's work in this field. The significance of the work of the Institute, from the point of view of the potential utilization of its research, was very sketchily discussed in my reports on "Atomic Bomb Research in the Russian Zone of Czechoslovakia", dated October 26, 1945, and on "Problems of Displaced Scientists Now Residing in the American Zone of Austria", dated October 26, 1945.

Contrary to the statements, attributed by the U.S. newspapers to the various U.S. atomic experts, that it "would take the Germans some 100 years to solve the problem of atomic disintegration on an explosive basis" (for the manufacture of bombs), the opinion of the members of the Institute themselves was that, given a supply of radium and uranium, and permitting their return to Vienna, where certain of their materials and equipments are stored, they would be able to "complete their work" in some 3 to 6 months. Some small scale experiments were claimed to be performed successfully by the Institute before the end of the war in Europe.

That these claims of the Institute are not to be disregarded too readily would follow from the fact that Prof. Smyth spent considerable time with the Institute, revisited them several times, and thought it necessary to insist on the most stringent type of control over the scientific activities of the group, as well as on close individual observations. Perhaps equally significant are the indications of the substantial interest of the Russians in several members of the Institute.

Incidentally, the following list of materials was obtained from Prof. Stetter, as held in Vienna by Prof. E. Haschek of the Vienna University: a mass-spectrograph, amplifiers, oscillographs, an X-ray equipment, various testing devices for work on nuclear physics, 200 kg. of Wolfram, some Beryllium, Heavy water, 500 kg. of Lead, a small quantity of Uranium, (most of the Uranium had been removed by the Russians from the laboratories of the University).

As a result of the forced idleness, the group has occupied itself with the problems of Uranium split-up on a considerably more concentrated basis than they were able to do in Vienna. They also managed to attract the attention to this problem of other members of the scientific body in the region around Zell-am-See. I am inclined to think that, given an opportunity, such as their return to Vienna, and some sort of inducement, the Institute would concentrate on this problem to the exclusion of other activities, with a good chance of success.

2.3 Radiation Absorption Material.

This problem, and the contribution of the group to it, was discussed in a separate report on "Radar Camouflage-Radiation Absorption Material".

[Georg Stetter and his fellow Austrian researchers were heavily involved in both the wartime fission and fusion programs (pp. 3372–3375, 4330–4345, 4784–4800, 4992).

The information from Odarenko was forwarded directly to Leslie Groves—see pp. 4794–4795.

"Prof. Smyth" was Charles P. Smyth, a Princeton chemistry professor and member of the Alsos Mission. He should not be confused with his brother Henry DeWolf Smyth, a Manhattan Project physicist who wrote the August 1945 "Smyth Report" that gave public information about the U.S. atomic bomb program.

As a result of the reports of Odarenko and Smyth, the Austrian nuclear scientists were closely monitored and controlled for years by U.S. intelligence and military agencies. For example, Georg Stetter was kept under virtual house arrest by U.S. agents in Austria from 1945 until the 1950s, nearly destroying his career (pp. 4796–4800).]

I am inclined to think that, given an opportunity, such as their return to Vienna, and some sort of inducement, the Institute would concentrate on this problem to the exclusion of other activities, with a good chance of success.

2.3 Radiation Absorption Material.

This problem, and the contribution of the group to it, was discussed in a separate report on "Radar Camouflage-Radiation Absorption Material".

2.4 Radar and Radio Frequency Work.

Figure D.856: Longtime Bell Telephone physicist Todos M. Odarenko interviewed Georg Stetter and some of his group members soon after the war and wrote, “Contrary to the statements [by Goudsmit...] that it ‘would take the Germans some 100 years to solve the problem of atomic disintegration on an explosive basis’ [...] the opinion of the members of the Institute themselves was that [...] they would be able to ‘complete their work’ in some 3 to 6 months.” [FIAT 63]

Todos M. Odarenko. 26 October 1945. Problem of Displaced Scientists Now Residing in the American Zone of Austria. [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)]

1. This memorandum is prepared for Col. R. M. Osborne, Chief of FIAT, and Dr. H. P. Robertson, Chief of Scientific and Technological Branch of FIAT, upon their request to point out certain problems arising out of the presence of a very large group of displaced German and Austrian scientists, now residing in and around Zell-am-See, south of Salzburg, Austria. [...]

3. The total number of scientists is not known to the undersigned. It was variously estimated for him by the officers of G-2 and OSS in Salzburg as being between 150 to 250 individuals. They come from the high institutions of learning originally located in Berlin, Insbruck, Graz, Wien, Dresden, etc. A complete list of the evacuated organizations might be in the hands of OSS, Salzburg, or in the hands of Education, Religion, Muniment and Fine Art Office of the military government of Salzburg. [...]

6. Among these evacuees there is a very large group of capable scientists who worked in the field of nuclear physics and chemistry and who have been carrying this work with such facilities as they have been able to assemble. There are two (or possibly more) institutes which were directly involved before the end of the war in a secret German project called “Uranmotor” whose purpose was to split uran atoms in order to obtain a powerful source of intra-atomic energy. It is apparent that the end result of this work is a method of obtaining an explosive release of atomic energy, or atomic bomb. The two groups definitely identified with the Uranmotor project are Kaiser Wilhelm Institute and Institut für Neutronenforschung. Professor Stetter, Professor Mattauch, Professor Thirring, Dr. Schintlmeister, Dr. Jentschke, Dr. Ortner, Dr. Ing. F. Focke are some of the names reported to the undersigned to have been directly involved in the project and capable of completing it as soon as the opportunity will present itself.

7. The undersigned spent a day with one of these groups, namely Professor Stetter and his men. He was assured that the work on the project reached the state before the end of the war when small scale experiments were completed and were quite satisfactory. The present status is that if given an opportunity to return to Vienna, where certain equipment and raw materials were left (and are still intact in the hands of Professor E. Haschek, Poltzman Gasse S, Wien IX) and given a supply of uran, the project could be completed in three to six months with the available personnel and equipment.

8. Professor Smyth of the Alsos Mission visited the region and Professor Stetter’s group three times (last on August 14, 1945) and spent considerable time with them. It is reasonable to assume that he is fully cognizant of the significance of the experience and qualification of the group, since his recommendation to OSS in Salzburg was to keep the group under a “constant and strict survey”. [...]

10. It must be also kept in mind that because of the decision of the United States not to share the secrets of atomic explosion with other nations, there is an ever increasing desire on the part of certain nations to arrive at the solution of the atomic disintegration problem by an independent method. The undersigned has some information indicating that USSR has a large scale research organization with the best of German scientists working on the problem and expect the solution shortly. They are also reputed to be anxious to get certain of the men now in Austria to join their organization. Thus, it would appear that a careful consideration must be given promptly to the disposition and utilization of the scientific personnel in Austria. It has been repeatedly stated to the undersigned by the occupational officers in Austria that the final decision on the disposition of the displaced scientists in Austria must come from the highest quarters in USFET, and that if the decision does not come soon enough it might come too late. [...]

CONFIDENTIAL October 26, 1945

PROBLEM OF DISPLACED SCIENTISTS
NOW RESIDING IN THE AMERICAN ZONE OF AUSTRIA

1. This memorandum is prepared for Col. R. M. Osborne, Chief of FIAT, and Dr. H. P. Robertson, Chief of Scientific and Technological Branch of FIAT, upon their request to point out certain problems arising out of the presence of a very large group of displaced German and Austrian scientists, now residing in and around Zell-am-See, south of Salzburg, Austria.

2. These scientists were assembled in the American occupied zone of Austria by the process of evacuation of whole laboratories or small groups of scientists by the various G-2 and OSS Branches, and sometimes by the officers of the military units in the area, from the zones now occupied by USSR, Great Britain and France. The undersigned understands that in certain cases the evacuation from the neighboring zones was carried hurriedly and without necessary authorization, and that it is possible that even now a complete list of the scientists so transferred to the American Zone might not be fully complete.

3. The total number of the scientists is not known to the undersigned. It was variously estimated for him by the officers of G-2 and OSS in Salzburg as being between 150 to 250 individuals. They come from the high institutions of learning originally located in Berlin, Insbruck, Graz, Wien, Dresden, etc. A complete list of the evacuated organizations might be in the hands of OSS, Salzburg, or in the hands of Education, Religion, Muniment and Fine Art Office of the military government in Salzburg.

4. Since these men were removed to their present locations primarily for a subsequent scientific and technological exploitation and are controlled by military intelligence groups, no direction has been established for their scientific activities. For this reason these have been scheduled and carried on in a somewhat arbitrary manner by the individual displaced groups. At this moment there is a rather free exchange between the groups of their problems, of their methods of attacking the problems and of the communal use of such equipment as has been salvaged during the evacuation or built by the evacuees subsequently.

Figure D.857: Todos M. Odarenko. 26 October 1945. Problem of Displaced Scientists Now Residing in the American Zone of Austria. [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)]

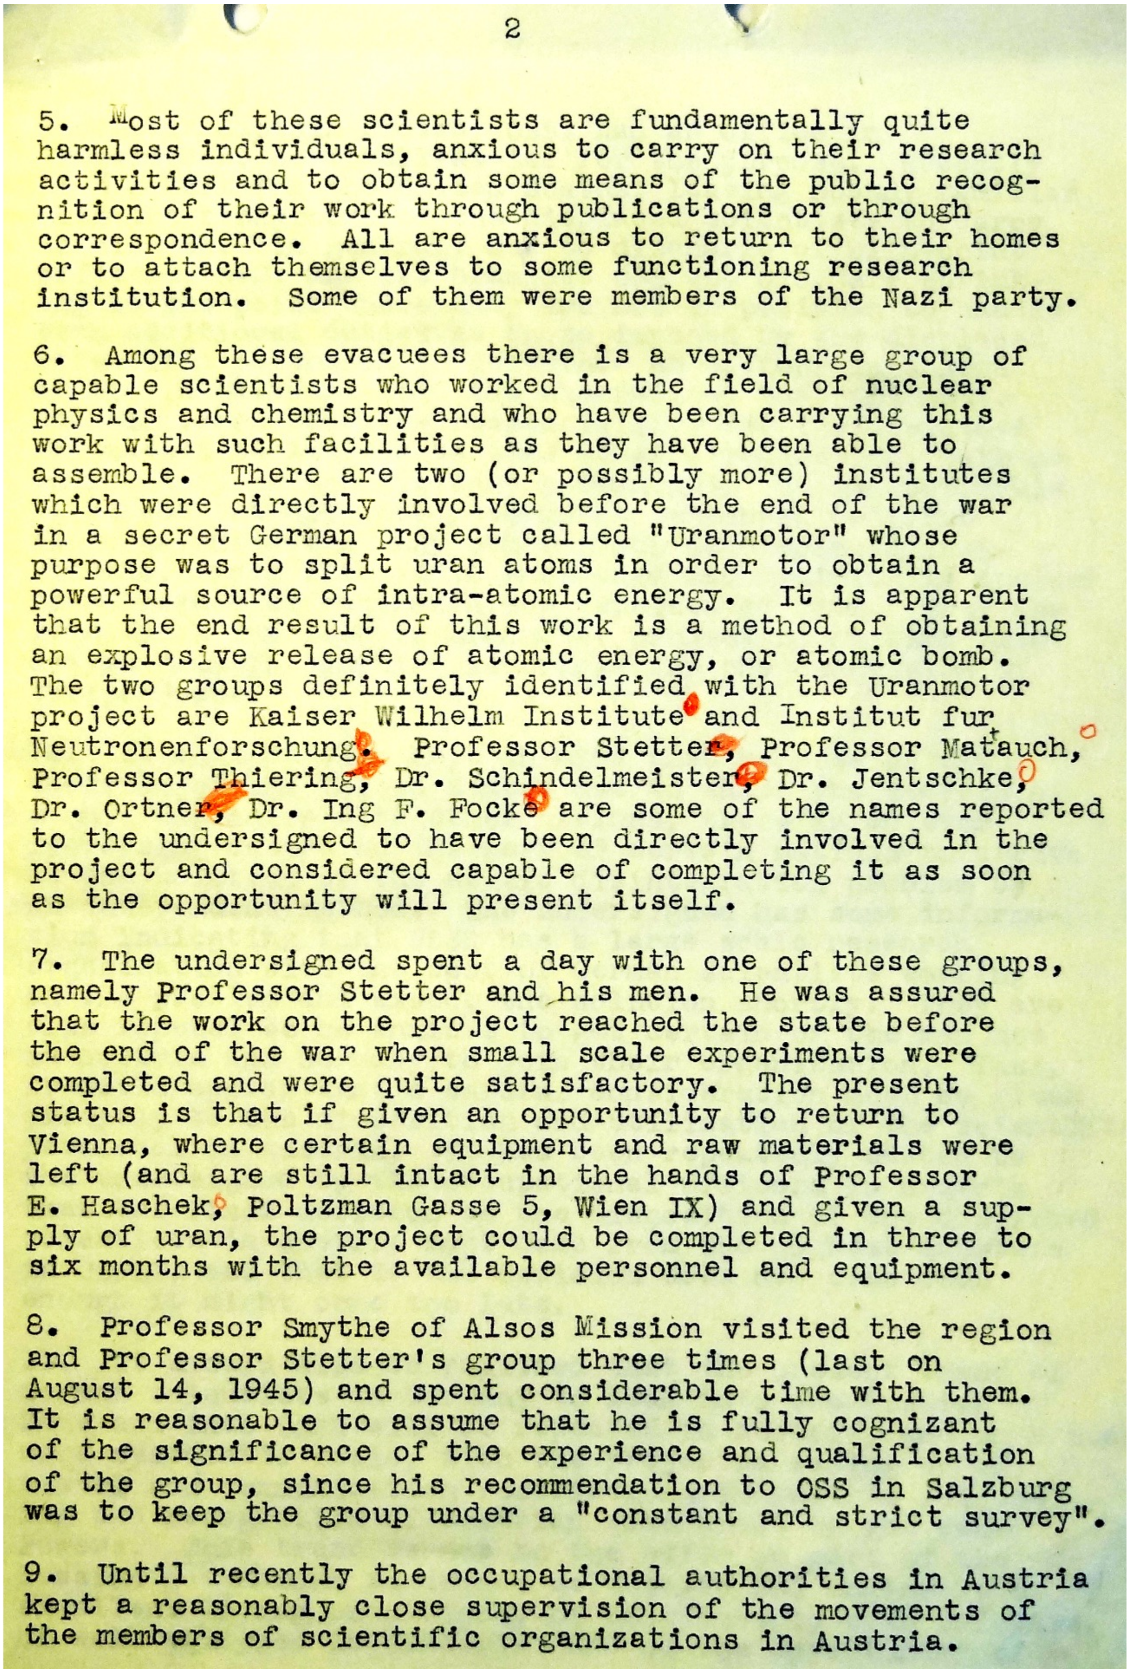
Authority NND 917017

NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45-Dec 45)



2

5. Most of these scientists are fundamentally quite harmless individuals, anxious to carry on their research activities and to obtain some means of the public recognition of their work through publications or through correspondence. All are anxious to return to their homes or to attach themselves to some functioning research institution. Some of them were members of the Nazi party.

6. Among these evacuees there is a very large group of capable scientists who worked in the field of nuclear physics and chemistry and who have been carrying this work with such facilities as they have been able to assemble. There are two (or possibly more) institutes which were directly involved before the end of the war in a secret German project called "Uranmotor" whose purpose was to split uran atoms in order to obtain a powerful source of intra-atomic energy. It is apparent that the end result of this work is a method of obtaining an explosive release of atomic energy, or atomic bomb. The two groups definitely identified with the Uranmotor project are Kaiser Wilhelm Institute and Institut fur Neutronenforschung. Professor Stetter, Professor Mattauch, Professor Thiering, Dr. Schindelmeister, Dr. Jentschke, Dr. Ortner, Dr. Ing F. Focke are some of the names reported to the undersigned to have been directly involved in the project and considered capable of completing it as soon as the opportunity will present itself.

7. The undersigned spent a day with one of these groups, namely Professor Stetter and his men. He was assured that the work on the project reached the state before the end of the war when small scale experiments were completed and were quite satisfactory. The present status is that if given an opportunity to return to Vienna, where certain equipment and raw materials were left (and are still intact in the hands of Professor E. Haschek, Poltzman Gasse 5, Wien IX) and given a supply of uran, the project could be completed in three to six months with the available personnel and equipment.

8. Professor Smythe of Alsos Mission visited the region and Professor Stetter's group three times (last on August 14, 1945) and spent considerable time with them. It is reasonable to assume that he is fully cognizant of the significance of the experience and qualification of the group, since his recommendation to OSS in Salzburg was to keep the group under a "constant and strict survey".

9. Until recently the occupational authorities in Austria kept a reasonably close supervision of the movements of the members of scientific organizations in Austria.

Figure D.858: Todos M. Odarenko. 26 October 1945. Problem of Displaced Scientists Now Residing in the American Zone of Austria. [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)]

3

A certain Captain Hudson, OSS, had an office in Thumersbach, near Zell-am-See for the purpose. Recently he has left for the United States, leaving nobody familiar with the background of the displaced scientists to carry on his job. In general, due to discharge of high-point officers, G-2, and its branches OSS and CIC, are shrinking to the point where they are not in position to handle such additional duties as those imposed by the displaced scientific personnel in Austria. An officer in charge of OSS in Salzburg told the undersigned that OSS must, and will, transfer the responsibility for the displaced scientists in Austria to some other organization, perhaps some branch of the military government. It is reasonable to expect the military government personnel to treat these scientists as any other group of displaced individuals, since scientific knowledge and training in nuclear field cannot be requested nor expected of them. Thus the scientists involved in Uranmotor project might find themselves soon in position favorable for the completion of the project.

10. It must be also kept in mind that because of the decision of the United States not to share the secrets of atomic explosion with other nations, there is an ever increasing desire on the part of certain nations to arrive at the solution of the atomic disintegration problem by an independent method. The undersigned has some information indicating that USSR has a large scale research organization with the best of German scientists working on the problem and expect the solution shortly. They are also reputed to be anxious to get certain of the men now in Austria and Germany to join their organization. Thus, it would appear that a careful consideration must be given promptly to the disposition and utilization of the scientific personnel in Austria. It has been repeatedly stated to the undersigned by the occupational officers in Austria that the final decision on the disposition of the displaced scientists in Austria must come from the highest quarters in USFET, and that if the decision does not come soon enough it might come too late.

11. It should also be realized that the present trend of German scientists in Germany to leak into the Russian Zone and into USSR will be repeated in Austria, and on a much more systematic scale, with the projected easing up of travel and communication restrictions in Austria following the recognition of Austrian government by the Four Powers. This trend is due to the offer on part of the Russian government to German scientists and engineers of excellent living conditions, of unbelievably high salaries, of well equipped laboratories and of the opportunity of

Figure D.859: Todos M. Odarenko. 26 October 1945. Problem of Displaced Scientists Now Residing in the American Zone of Austria. [NARA RG 77, Entry UD-22A, Box 167, Folder 32.12-2 GERMANY: Personnel (Jan 45–Dec 45)]

4

carrying on their research and development work. Of these the last offer is perhaps the strongest desire and need of the displaced scientists. The present policy of the United States occupational authorities is the exact opposite to that of USSR in all respects, and is a great deal weaker than the working arrangements now in operation in the remaining two zones.

12. In the light of the above it is recommended that the problem of disposition of the displaced scientists in Austria, and particularly of those involved in the Uranmotor project, be considered promptly at a sufficiently high level of the occupational authorities in the ETO, that a definite policy be formulated which recognizes fully the existing conditions, trends, commitments and declarations, that a specific directive be issued forthwith with reference to a special method of handling of the Uranmotor experts and that a permanent body be established for carrying out both the fundamental policy and the specific directives. It seems clear that such a body must consist, or at least include, scientists capable of properly evaluating the present and potential significance of the activities of the displaced scientists in terms of their contribution to war potentials and to the industrial and scientific reconstruction of Austria.

Subject: Problem of Displaced Scientists in American Zone of Austria.

MEMORANDUM to Major General L. R. Groves

1. A recent report from JIOA "concerning certain problems arising out of the presence of a very large group of displaced German and Austrian scientists" in the American zone of Austria is substantially as follows:

a. These scientists were evacuated - in some cases with whole laboratories - to the American Zone in Austria by various G-2 and OSS branches and sometimes by the military units in the area from zones now occupied by Russia, Great Britain, and France. The list may not be complete because it is understood transfer often took place without authorization and hastily; but it is variously estimated that they number about 150-250. They are said to have come from "high institutions of learning" in Berlin, Dresden, Granz, Innsbruck, Vienna, etc. It is possible a complete list of them is in the hands of OSS, Salzburg or at the Education, Religion, Monument & Fine Arts office of the Military Government in Salzburg.

b. Their scientific activities are without direction: work is done in a rather arbitrary manner; there is free exchange of information concerning problems, methods of experimenting, and "communal use of such equipment" as was salvaged during the evacuation or as was built by the evacuees since.

c. Most of them are harmless; anxious to carry on their research and to obtain recognition of it through publication or correspondence and desirous of returning home and becoming members of "functioning research" institutions again. Some were Nazis.

d. Among them there is a very large group of capable nuclear physicists and chemists who have been working with make-shift equipment. Profs. STETTER, MATTAUCH, THIERING, Drs. SCHINDELMEISTER, JENTSCHKE, ORTNER, and F. FOCKE are names of some of them reported to have been connected with German research on a "Uranium Motor" project before war's end conducted by Kaiser Wilhelm Institute and the Institute for Neutron Research. They are reported capable of completing the work as soon as the opportunity arises. STETTER and his group assured ODARENKO that German research had progressed to where small-scale experiments were completed and satisfactory. If they could return to Vienna - where certain equipment and raw materials were left (and still intact in hands of Prof. E. HASCHEK,

Poltzman Gasse 5, Vienna IX) - and given a supply of uranium, they could complete their work in three to six months with available personnel and equipment.

e. Prof. SMYTHE of Alsos Mission evidently is fully aware of their qualifications because he recommended to OSS that they be kept under "constant and strict survey."

f. Discharge of high-point officers of G-2, OSS and CIC makes it impossible for those remaining to take on the added duties connected with these displaced scientists. OSS in Salzburg has said responsibility for them will be transferred to some other organization - perhaps the Military Government - in which case it is to be supposed they will be treated as any other group of DP's. Consequently, these scientists may soon find themselves in a position favorable for completing their work.

g. The Russians are reported to be anxious to get certain men now in Austria and Germany to work for them. It seems therefore that PROMPT AND CAREFUL ATTENTION MUST BE GIVEN TO THESE PERSONS. Occupation authorities have said repeatedly that final disposition of them must come from USFET and that if a decision isn't made soon, it will perhaps be too late.

h. It is feared "that the present trend of German scientists in Germany to leak into the Russian zone and into USSR" will also occur in Austria but more systematically because of alleviation of travel and communication difficulties. This trend is attributable to the exceedingly alluring offers of the Russians. On the other hand, the present policy of OUR occupation authorities is the exact opposite of Russia's in all respects and a great deal weaker than the set-up in the other two zones.

2. A copy of the original report is being forwarded to Lt. Col. H. K. Calvert.

CROSS REFERENCE SHEET

MAIN SUBJECT: INCOMING TOP SECRET CABLE

CLASSIFICATION NUMBER: 205.2

TO: WAR DEPARTMENT FOR WDGID

DATE OF COMMUNICATION: 23 November 1946

FROM: CG USFET Frankfurt Germany

BRIEF SUMMARY:

See below

CROSS REFERENCE NUMBERS:

10.10

10/10

Following cable received from United States Forces Austria:

"Subjects are Professors George Stetter and Willibald Jentschke, noted Austrian nuclear physicists presently in our custody at Zell Am See, Austria. Both names appear on the United State Forces Europen Theater 90 name denial list. During October Doctor Garin alias engineer Samsanov, a Russian civilian, visited the wife of Doctor Jentschke on several occassions in her Vienna home. He stated that he was aware of the fact that her husband was under contract to the United States but felt that he would reconsider and accept employment in Moscow. Although Garin's offers were very generous, Mrs. Jentschke declined them.

"Garin implied during the conversations that the Moscow Research Institute was somewhat disappointed in the work Schintlmeister was doing. (Schintlmeister was an assistant to Stetter and Jentschke and is presently in Moscow). To substantiate this it is the opinion of several noted professors at the University of Vienna that Schintlmeister, although an outstanding nuclear physicist is not capable of progressive research in atomic energy without collaboration of Jentschke and Stetter with whom he has always been teamed. We believe that the Russians will vigorously attempt to secure the services of Stetter and Jentschke and although they are outspoken anti-Communistic, they obviously have a natural and exceptionally keen scientist's desire to continue their work and will eventually accept an attractive Russian offer. We

C O N F I D E N T I A L

TOP SECRET

CARDED

- 2 -

also fear the possibility of their being contracted in our (Lipmed Russian) agents and kidnapped as was Schintleister.

"It is therefore, urged that special consideration be given this case and that subjects be removed from the American Zone in Austria to prevent their falling into Russian hands."

Stetter and Jentshke and families are being moved to Landshut without delay. Recommend they be shipped to the United States under project PAPERCLIP for denial purposes. Your approval requested soonest.

Figure D.863: Georg Stetter was kept under virtual house arrest by U.S. agents from 1945 until the 1950s [NARA RG 77, Entry UD-22A, Box 174, Folder 10.10. Austria Personnel].

Discussion with Hagood on attached subject of Stetter and Jentschke revealed the following:

a. Legal procedure of "farming" out foreign scientists on Paperclip has yet to be ironed out – an answer may be expected after a Conference Wed., 4 Dec.

b. When "a" above has been ironed out, a War Department Agency will have to be found to sponser the men. Then

c. An organization will have to be located who will hire them.

Both Stetter and Jentschke are rated "B" on our denial list which makes them rather important, since the "A" category is quite small.

I think every effort ought to be made to keep them from falling into the Russian laboratories.

Attached are the sheets from the Russian Summary which give the history of Sch., Jent., Stetter, and Garin.

CIC

Jentschke worked on cross sections of uranium energies and masses of fission products and neutron absorption cross sections of uranium. Note his work on energies of fission products better than MED work up to end of war.

Stetter worked with Jentschke and also on fission with fast neutrons (the bomb problem).

These are both good men and must not go to the Russians. I'd bring them over here or finance them in Germany.

FROM: (Name, organization, building) Hank | DATE | TEL.

AGASF FORM 895
1 OCT 1945
16—46173-1 ☆ U S GOVERNMENT PRINTING OFFICE

REMARKS

Stetter and Jenschke have excellent reputations During the war they worked on

a. cross sections of uranium to neutrons particularly at high energies (the bomb problem)

b. absorption cross sections of uranium toward neutrons

c. energy and masses of fission products of uranium and ionium (Note this work is better than any corresponding MED work through the end of the war on this particular subject.

These men are definitely worth keeping out of Russian hands, and I think every effort should be made to do so, even to bringing them to this country.

Hank

4 Col. Free			SEE ME
			SIGNATURE

REMARKS

Granted that it is essential to keep them away from the Russians, the first question that comes to my mind is:

1) how is it that the Russians have such easy access to them?

This leads to question No. 2:

2) Landshut is in Bavaria but not such a heck of a distance from Zell-am-See. Would these yodlers be any safer THERE than they are.

3) If we don't want them in the USA (which is another matter), why don't ~~we~~ play safe and ~~shoot~~ send as far west in our zone as possible – or perhaps into the British Zone if that seems better and if John Bull, Esq. doesn't object.

Zell am See Section
Date: 9 April 1946

Subject: Members of the Physics Institute II of the Vienna University (Zweites Physikalisches Institut)

SUMMARY OF INFORMATION:

Reference is made to letter, dated 21 January 1946, from Hq. Rainbow University, 42nd Infantry Division, Subject: "Civilian Scientist Groups in Kreis Zell am See", and to MOIC, Land Salzburg Detachment, CIC, Zell am See Section, dated 9 April 1946, Subject: "SCHINTLMEISTER Josef, Dr., Scientist".

The Institute, together with a large part of its scientific equipment, had been moved from Vienna, IX, Boltzmanngasse 5, to Thumersbach, Bezirk Zell am See, in March 1945, according to Professor Dr. Georg STETTER, head of the Institute in Vienna, who was in charge also in Thumersbach.

Reports obtained from him, giving brief personal data on the members of the Institute and containing detailed information on the research work completed and contemplated by Subject Institute as well as a list of the members of the Institute and their present location, are attached to the original and file copies of this report.

On 7 January 1946 the scientific equipment was shipped badk to Vienna on instructions from Major SELKE, USFA Education Officer, according to Dr. BIBERSCHICK Walter, member of the Institute.

Dr. STETTER stated that the attached reports had been submitted to IOSS, G-2, USFA, last year. As yet no word had been received from the American authorities on further research assignments.

SUBJECT: STETTER Prof. Dr. Georg (20th Bi-Weekly Report)

FROM : CIC, Land Salzburg Section, Zell am See Subsection

TO : Chief, CIC, Land Salzburg Section

1. Subject is currently residing at the Park Hotel, Thumersbach, Bezirk Zell am See, with his wife. His daughter is attending school in Innsbruck, French Zone, Austria.

2. Recently Subject started to write a book on Nuclear Physics (Kernphysik), however, he is having difficulties as he does not have access to a library.

3. Subject's work on the device to remove dust from the air in coal mines is currently at a standstill as he does not have money to build a final model. A copy of the report Subject sent to the Salzburg Land-Government concerning his tests is attached to this report as Appendix "A".

4. Except for the fact that his rheumatism is apparently getting worse, even under treatment in Salzburg, Subject appears to be in a cheerful state of mind.

4. REPORT OF FINDINGS

On 26 October 1953, Informant 1063 submitted the following information to this Office:

On 22 October 1953, Informant interviewed Prof. Dr. Georg STETTER at the First Physical Institute of the University of Vienna, concerning STETTER's atomic energy patents. STETTER stated that he owned no patents concerning atomic energy and that he did not contemplate applying for any. STETTER further stated that he had worked with nuclear physics during World War II, but that his notes and papers were seized by the Soviets in 1945 and that he had not worked with nuclear physics since 1945. STETTER is currently employed as head of the First Physical Institute of the University of Vienna and experimenting with dust particles. (C-3)

On 29 October 1953, the files of this Region were examined, concerning Georg STETTER and revealed the following information:

A/R V-34833, STETTER, Dr. Georg, dated 20 March 1953, reveals that STETTER accepted a position at the University of Vienna as head of the First Physical Institute. (C-3)

A/R V-33629, dated 23 January 1953, Subject: "STETTER, Georg", reveals that STETTER was flown to Vienna on 26 October 1952 for the purpose of arranging employment at the University of Vienna. (B-3)

STETTER is listed in numerous files of the Region as a prominent Austrian scientist and a former member of the NSDAP who was removed from his position as head of the Second Physics Institute at the University of Vienna because of NSDAP membership. STETTER is also listed on the Austrian Objective List of the JIOA. (C-3)

Notes to Aid in the Discussion with Dr. Vannevar Bush
Concerning the Captured German Scientists

WAC

July-Aug '45.

DECLASSIFIED
Authority 917017

I. PERSONNEL

A. The following German nuclear physicists are at present being secretly detained in a house on the outskirts of London:

Prof. Max von Laue
Prof. Otto Hahn
Prof. Werner Heisenberg
Prof. Walther Gerlach
Dr. Paul Harteck
Prof. C. F. von Weizsacker
Dr. Karl Wirtz
Dr. Kurt Diebner
Dr. Erich Bagge
Dr. Horst Korsching

B. The Scientists were secured around 1 May of this year during the Hechingen operations.

II. ITINERARY SINCE CAPTURE

A. Since their capture they have been moved as follows:

1. Hechingen to Rheims, 1 May 1945
(They were furnished ample quarters here and in the same house in which von Papen had been detained)

2. Rheims to Versailles, 7 May 1945
(Their billet here was considered unsatisfactory as complete segregation was impossible from other captured German scientists)

3. Versailles to Le Vesinet (suburb of Paris), 11 May 1945
(The scientists were pleased with this location. They occupied themselves by working in their rooms, or exercising.

4. Le Vesinet to Huy, Belgium, 4 June 1945
(Here they were located in a large chateau)

5. Huy to London, 3 July 1945 (Travel performed by air)
(They were moved here for reasons of security. It was felt that tighter security from outside influences could be maintained in England than Belgium. These living quarters are more than ample, they are isolated, have better rations than POWs, and their present location affords us the opportunity of monitoring their conversations which should aid in making the decision regarding their final disposition.)

TOP SECRET

TOP SECRET

III. REASON FOR DETENTION

A. Security

In view of our impending operations, security was the initial and remains the paramount reason for their detention. Any publicity on TA, either foreign or domestic, at this critical period would be detrimental to overall security. This action is in alignment with the treatment accorded to other important German scientists who are being held for interrogation.

B. Fear of their falling into French hands

We have long been afraid of these scientists falling into the hands of the French inasmuch as they represent enough combined talent to carry on work of utmost importance. France's very great interest in these men and their work has been evidenced on more than one occasion. The main incidents proving this are:

1. Joliot dispatching a French scientific party to the Hechingen area, which is still occupied by French troops.

2. After their capture Joliot inquired from an Alsos scientist the whereabouts of Heisenberg and his party, at which time he made the statement that he would like to find them in order that they might be put to work for France.

3. There is a possibility that should Joliot have gained control of the scientists prior to his recent trip to Moscow, they might have been used as a bargaining power with Russia.

C. Fear of their falling into Russian hands

At the time of their capture Anglo-American authorities were negotiating with Russian authorities for the permission for intelligence teams to enter each other's zone. The possibility of such an agreement left detention of the scientists the only means to prevent full interrogation by the Russians.

Russia's interest in soliciting the goodwill and services of German scientists has been clearly indicated. Professor Sauerbach, the former German Minister of Health, who was captured by the Russians, has made repeated broadcasts from Berlin relating the kind treatment the USSR has bestowed upon the German technical classes. The only interpretation that can be made is that they are trying to entice men of this caliber into their zone. In another incident, Dr. Hasche a member of the American intelligence team TIIC, ran into a nuclear physics laboratory near Munich staffed by some twenty-four scientists of whom half were from Vienna. These individuals were taken into custody by the American Army but most of them elected to go to Berlin into Russian custody as it was their impression that the Russians were going out of their way to attract German scientists of this type.

TOP SECRET

- 2 -

TOP SECRET

Monitored conversations of von Weizsacker and Heisenberg have indicated their leanings toward Russia.

IV. TREATMENT OF THE SCIENTISTS SINCE THEIR CAPTURE

A. The handling of the scientists since their capture has been solely by TA personnel, under the policies set forth by this office in accordance with the directives for handling POWs as established in the Theater. Their accommodations have been more than ample as indicated by providing four German POWs who act as orderlies. The scientists are furnished reading material in the form of newspapers, technical journals, and novels. Free access to the grounds of the estate is permitted. Their families have been notified that they are safe, however, from a security standpoint, free exchange of mail has not yet been permitted. In general the difficulty of communication and transportation has been the curtailing factor. At Diebner's request we moved his family, along with some of his furnishings, outside of the territory to be occupied by the Russians; this incident took considerable work and time.

V. MORALE AND ATTITUDE TOWARDS GREAT BRITAIN AND THE UNITED STATES

A. The group has settled down well at their new location outside London but are becoming more and more restive. The question of their families is causing them the greatest concern. Most of the monitored conversations indicate they are pleased with the treatment they are receiving, but are completely mystified about their future.

VI. CHARACTER SKETCHES OF CAPTURED SCIENTISTS

von Laue
A shy mild mannered man. He cannot understand the reason for his detention. He has been extremely friendly and is very well disposed to England and America.

Hahn
A man of the world. He has been the most helpful of the professors and his sense of humour and common sense has saved the day on many occasions. He is definitely friendly disposed to England and America.

Heisenberg
He has been very friendly and helpful and is, it is believed, genuinely anxious to cooperate with British and American scientists although he has spoken of going over to the Russians.

Gerlach
Has a very cheerful disposition and is easy to handle. He appears to be genuinely co-operative.

Harteck
A pleasing personality and has never caused any trouble. His one wish is to get on with his work. As he is a bachelor, he is less worried than the others about the conditions in Germany.

TOP SECRET

- 3 -

TOP SECRET

Diebner
Outwardly very friendly but has an unpleasant personality and is not to be trusted. He is disliked by all the others except Bagge.

von Weizsacker
A diplomat. He has always been very friendly and co-operative and it is believed he is genuinely prepared to work with England and America but he is a good German.

Wirtz
An egoist. Very friendly on the surface but cannot be trusted. It doubt whether he will co-operate unless it is made worth his while.

Bagge
A serious and very hardworking young man. He is completely German and is unlikely to co-operate. His friendship with Diebner lays him open to suspicion.

Korsching
A complete enigma. He appears to be morose and surly. He very rarely opens his mouth. He has, however, become more human since his arrival in England.

VII. POST-WAR DISPOSITION OF CAPTURED SCIENTISTS

A. After impending operations are completed we will have several alternatives open to us, none of which can wisely be decided at this time. These alternatives appear to be:

1. Release them from custody and permit them to return to Germany. This would inevitably result in their working either for the Russians or the French. Both are desirious of their services and such action would materially enhance their efforts.

2. Move them and their families to America for employment on the American job with the ultimate aim of their becoming citizens. In monitored conversations some of them have indicated they would like to establish citizenship in other countries; most all have acquiesed to either working in England or America.

3. Return them to the Anglo-American Zone in Germany to continue their work under our supervision but without our assistance. We would merely control their work.

Figure D.868: William A. Consodine and A. E. Britt. August 1945. Notes to Aid in the Discussion with Dr. Vannevar Bush Concerning the Captured German Scientists [NARA RG 77, Entry UD-22A, Box 168, Folder 202.2 LONDON OFFICE: Combined Intell Disc.].

Henry Maitland Wilson to John Anderson. 26 October 1945 [TNA FO 800/565].

ANCAM 453 26th October 1945

TOP SECRET AND PERSONAL.

Your CANAM 453.

Following for Sir John Anderson from Field Marshal Wilson.

I saw Groves yesterday morning and found him very difficult to move on this question. He seems completely convinced

(a) that all but one or two of the Group would certainly try to go to Russia

(b) that if they did they would be of the greatest value to the Soviet Government and

(c) that even if they did not go to Russia voluntarily some would almost certainly be kidnapped. (Groves alleged that there have been one or two cases of kidnapping of scientists already by the Russians in the American zone).

On the second point (b) he expressed the view that as a Group they were superior in all-round ability to the Group which had started the New Mexico laboratory.

2. Groves asked me whether it was not possible to treat some or all of these men as war criminals. I replied in the negative but he pressed for confirmation of this. Secondly, he asked whether it was not possible for some or all of them to be offered jobs in the United Kingdom. He asked to be assured on this point and said that in the meantime he would explore the possibility of employing them in the United States, though he did not seem to be very optimistic.

3. Groves is being very unreasonable on this question, but I do not quite follow what is to be gained by taking the matter up with the State Department; who will merely consult the War Department. My inclination would be to give Groves a week to reply about the opportunities in the United States. If there is no result we should then tell him that there are no grounds on which we can legally justify their continued detention (if this is indeed the case) and that we have no alternative to sending them back to the zones in Germany from which they came, in order to join their families. But I do not think that it would be right that we should do this unless, at the same time, special instruction were given to our security forces to pay special attention to these men with the object of preventing them escaping either to the Russian occupied zone or to Berlin. I see no reason why such instructions should not be issued.

[See photos on pp. 4804–4805. Field Marshal Henry Maitland Wilson was chief of the British Joint Staff Mission to Washington, DC (JSM Washington) from 1945 to 1947. In this lofty official capacity, he met with Leslie Groves on 25 October 1945 and reported it in this Top Secret encrypted cable the next day. His cable was addressed to Sir John Anderson, who was the chair of the U.K. Advisory Committee on Atomic Energy, as well as to several other top advisors in the British government.

Leslie Groves said the German scientists held at Farm Hall "were superior in all-round ability to the Group which had started the New Mexico laboratory" and were "of the greatest value," and he wanted to either employ them or prosecute them as war criminals. See also the 20 February 1946 memorandum from Groves below. These private admissions by Groves demonstrate that his public statements denigrating the German nuclear scientists and their work were knowingly false. If German nuclear scientists had not done anything of consequence during the war, Groves would not have had any reason to believe they were superior to the Manhattan Project scientists. Likewise, if German nuclear scientists had not done anything of consequence during the war, Groves would not have had any possible grounds on which to consider prosecuting them as war criminals.]

TNA FO 800/565

Figure D.870: Leslie Groves said the German scientists held at Farm Hall "were superior in all-round ability to the Group which had started the New Mexico laboratory" and were "of the greatest value," and he wanted to either employ them or prosecute them as war criminals [TNA FO 800/565, Henry Maitland Wilson to John Anderson, 26 October 1945].

John Weckerling. 6 February 1946 secret memorandum. [**NARA RG 319, Entry NM3-47B, Box 991, Folder Implementation, General Policy & History**]

MIL 920 6 February 1946

MEMORANDUM FOR THE COMMANDING GENERAL, ARMY SERVICE FORCES:

SUBJECT: Plans for Extended Exploitation of OVERCAST Personnel

1. In the event that governmental policies are promulgated that will permit long-term exploitation of German scientists with inducements such as legal status in the United States, possible transfer of families, patent protection, etc., it is desirable that the War Department be prepared to take immediate advantage of such a policy. It is requested that you submit lists of scientists, in the following categories, whose indefinite stay in this country appears to be in the national interest[...]

Leslie Groves. 20 February 1946 secret memorandum. [**NARA RG 319, Entry NM3-47B, Box 991, Folder Implementation, General Policy & History**]

20 February 1946

MEMORANDUM FOR THE COMMANDING GENERAL, ARMY SERVICE FORCES:
THRU: Chief, Personnel Division, Office Chief of Engineers.

SUBJECT: Plans for Extended Exploitation of OVERCAST Personnel.

1. Reference is made to memorandum for the Commanding General, ASF, subject as above, dated 6 February 1946, from Brigadier General John Weckerling, WDGS, MID G-2, reference MIL 920.

2. Government measures to encourage the long term exploitation of German scientists by the United States are desirable, particularly with reference to nuclear physicists and chemists who might be of some service to scientists in this country in the field of atomic energy.

3. There are a number of German scientists who might well be included for the policies and procedures set forth in reference memorandum. However, they do not fall within any of the categories listed in paragraph 1 of that memorandum. The atomic bomb was created without the direct exploitation of any German scientists. I suggest, therefore, a fifth category, defined as, those German scientists of outstanding ability in the field of nuclear physics and chemistry who, by their past reputation and present knowledge, would be of more value to the national interest of this country if they could be employed here rather than in any other country. A list of the men falling within such category is given below. In order for you to place them in the proper priority group, I have included a brief critical analysis of their relative merit. It should be borne in mind that strong opposition will be encountered in placing these men in American institutions best fitted to exploit their efforts. The Manhattan District does not want them because of obvious security reasons. However, it is extremely important that these persons be prevented from giving their services to a potential enemy of the United States.

PROFESSOR OTTO HAHN

He is one of the greatest living chemists in the field of radioactivity, and winner of the 1944 Nobel prize in Chemistry for the discovery of the fission of uranium. Hahn is not known to have been a Nazi and is apparently well disposed to both England and America.

PROFESSOR MAX VON LAUE

He never actively worked on the German nuclear physics project. However, he is or has been well disposed toward America. His son is presently in the United States Army and was formerly at Princeton. Von Laue is noted in the field of physical chemistry and X-ray diffraction as a top flight man. He is over seventy years of age.

PROFESSOR WALTHER GERLACH

Gerlach is an experimental atomic physicist of considerable ability but is a thorough Nazi and served as Goering's deputy in charge of the German atomic energy effort in its later stages. He is reported to feel like a defeated general because of the failure of the German nuclear project and has discussed suicide. He is not believed sympathetic to other countries but is essentially a German nationalist.

PROFESSOR W. HEISENBERG

He is a theoretical nuclear physicist, a Nobel prize winner and probably the present German leader in physics. He is particularly known for his work in quantum mechanics and nuclear theory. Although Heisenberg may not have been an active Nazi he is a patriotic German. It is conceivable that some persuasion might be necessary as he may desire to take his chances in Germany or England.

PROFESSOR P. HARTECK

He is a famous physical chemist who seems to have what has been characterized as an "American approach" to atomic energy problems, i.e.—he demonstrated a competence in the engineering phases of the work. He is not believed to have any profound political sympathies but has confined himself to his research work.

PROFESSOR C. P. VON WEIZSACKER

He is a first-class physicist and astro-physicist quite interested in philosophy and certain philosophical implications of his work. He is an opportunist and son of a diplomat. He is not believed to be a Nazi.

DR. K. WIRTZ

He is an experimental physicist, comparatively unknown prior to the German atomic energy project but the author, while on the project, of a number of worthwhile reports, particularly on pile theory. Wirtz is the sort who will go to another country if offered what he considers good terms.

DR. E. BAGGE

He is a fairly young, reasonably competent, experimental physicist who has done considerable work on isotope separation. Bagge is of humble origin, a serious, hard-working, completely German nationalist. He might work for another country.

H. KORSCHING

He is a rather obscure physicist who has done good work on isotope separation on the German energy project. He was probably a Nazi.

K. DIEBNER

He was Gerlach's administrative assistant on the German atomic energy project. He is not a particularly well known physicist although he has a pretty good grasp of the German project.

FREDERICK WEYGAND

He is a chemist and biologist and not a physicist. He is believed to be anti-Nazi and has been cooperative with American authorities. He has until recently been located in an American P/W camp. He has recently written the Rockefeller Foundation and requested a position with them.

DR. WERNER MAURER

He has been, until recently, in an American P/W camp but is presently on his way back to Germany. Maurer is a relatively young physicist who did considerable experimental work in Joliot's laboratory in Paris after the German occupation. He is unquestionably a reliable Nazi in addition to being an able young physicist.

DR. RUDOLPH FLEISCHMANN

He was, until recently, in an American P/W camp. He is a first-rate physicist formerly head of the Physical Research Division of the Medical Institute of the University of Strassburg and is generally considered to be an extreme Nazi. His particular field has centered around the application of induced radioactivity in the field of biological research.

PROFESSOR FRITZ G. HOUTERMANS

Houtermans is of Dutch extraction, grew up in Austria, lived in Germany until 1933 when he left because of the Nazi Party and worked at Cambridge University in England. He subsequently went to Kharkov, Russia, where he worked at the Kharkov Physico-Technical Institute. In 1937, as he was preparing to leave Russia, Houtermans, according to his own statement, was arrested by the NKVD on vague charges of counter-revolutionary activity for Germany. As a result of the intervention of Dr. R. A. Millikan of Cal. Tech., he was released in 1940 after preparing what he claims was a false confession of technical espionage which he framed in such a manner as to be obviously scientifically fallacious, but which satisfied the NKVD, who exiled him to Germany in spite of his requests not to be sent there. In Germany, Houtermans says he was immediately imprisoned by the Gestapo but was released after questioning as to why he had left Russia.

Houtermans' connection with the German nuclear physics project was not great, although he was in close contact with von Weizsacker and von Ardenne and worked with the latter on a cyclotron. Houtermans' official position was with the PTR (German Bureau of Standards) at Ronneburg, Thuringen, where he worked with counter-tubes. He was the first man in Germany to propose the fissionability of plutonium and wrote several memoranda on the subject, but little attention was paid to him in Germany.

L. R. GROVES,
Major General, U.S.A.

[Publicly, Leslie Groves agreed with Samuel Goudsmit's statements that the wartime German nuclear program was very small and very primitive, had never considered plutonium, and had never even tried to produce a fission bomb. Privately, Groves wrote this secret memorandum admitting that the German program had recognized the potential of plutonium very early on, had done "considerable work" on uranium isotope separation, and had a number of "nuclear physicists and chemists who might be of some service to scientists in this country in the field of atomic energy." Groves also warned that because of those scientists' "present knowledge," "it is extremely important that these persons be prevented from giving their services to a potential enemy of the United States."

This document also shows that in addition to the ten nuclear scientists who were held at Farm Hall, a significant number of German nuclear scientists were taken to the United States for extended interrogations in "American P/W camps." How many scientists were interrogated? Where are the reports on their interrogations? What did Groves learn from those interrogations or other intelligence sources that convinced him to write this secret memo, which contradicts what Groves and Goudsmit publicly asserted?]

Walter Trinks. Undated but probably summer 1945. [NARA RG 319, Entry A1-134B, Box ??, Folder XE098301 Trinks, Walter]

Dr. Walter Trinks
Int. No. 8-3448-M-AA
7th Coy.

TO THE AMERICAN COMMAND OF THE INTERNMENT CAMP? CIC-STAFF.

When I was imprisoned at Bad Aibling an American officer in an address asked German scientists and specialists to present themselves. Having presented myself I was told to give further written information on my altuition [education] and my career. Having been transferred to this camp I could not do so. I am a Physicist and have been employed with the OKH [Oberkommando des Heeres] until the end of the war in the research dept. of the office for arms [Heereswaffenamt] as referee for the physics of explosions and blasting. The tasks of that dept. included:

1st Research of physical phenomena at the explosion

2nd Augmentation of and defense against the effect of blasting materials through physical methods

3rd Research of difficulties and troubles.

4th The replacement of valuable raw materials.

During the war the principal labor was dedicated to the principle of hollow charges and its use in armour breaking amunition as F-I-7,5 cm grenade, HL(ABC), 10 cm G.Hl, rifle grenade, Panzerfaust and Panzerschreck, Panzerhandgrenade, Redcap, Magnetic H 3 and H 15.

At the end of the war I was occupied with experiments for producing extreme high pressures and temperatures, extreme velocities (up to 15 km/sec) and heavy swingings of the air [shock waves]. The practical use of these researches comprises:

1st for the war: the defense against V-weapons super- and atomic bombs by destroying them before they reach their target and the initiation of atomic bombs.

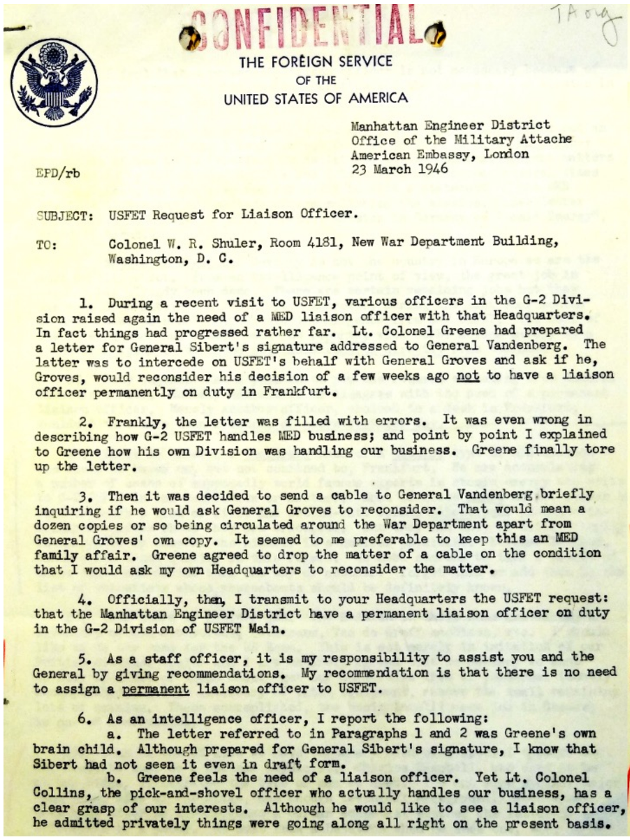
2nd for peacetime: the producing of artificial diamonds and the enriching of minerals and materials.

3rd for purely scientific research of special molecules and atoms under extreme pressures and temperatures.

I esteem these researches to be important and promising and therefore ask to be allowed to prosecute them at the service of the U.S.A.

[See document photos on pp. 4258–4259. Due to the number of English spelling and capitalization mistakes, this document appears to have been written in English by Trinks himself, not translated by a native English speaker. For ease of understanding, I have corrected most of the document's English mistakes in the above transcription.

Trinks was imprisoned by the U.S. Army from June 1945 to June 1946, and he informed them that "At the end of the war I was occupied with experiments for... the initiation of atomic bombs." Where are the detailed reports on his interrogations and everything he told U.S. officials about his wartime work? What exactly did he work on after the war, and for whom?]



CONFIDENTIAL

THE FOREIGN SERVICE
OF THE
UNITED STATES OF AMERICA

Manhattan Engineer District
Office of the Military Attache
American Embassy, London
23 March 1946

EPD/rb

SUBJECT: USFET Request for Liaison Officer.

TO: Colonel W. R. Shuler, Room 4181, New War Department Building, Washington, D. C.

1. During a recent visit to USFET, various officers in the G-2 Division raised again the need of a MED liaison officer with that Headquarters. In fact things had progressed rather far. Lt. Colonel Greene had prepared a letter for General Sibert's signature addressed to General Vandenberg. The latter was to intercede on USFET's behalf with General Groves and ask if he, Groves, would reconsider his decision of a few weeks ago not to have a liaison officer permanently on duty in Frankfurt.

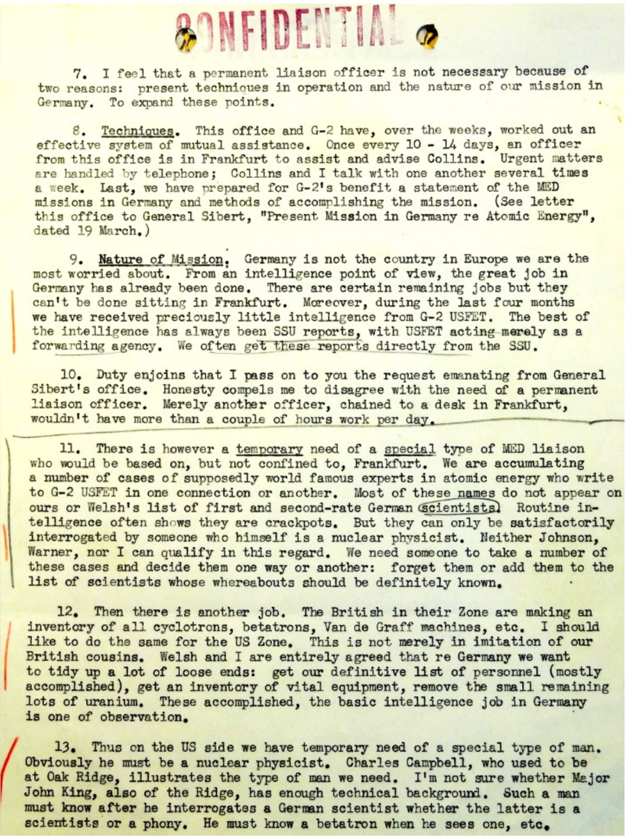
2. Frankly, the letter was filled with errors. It was even wrong in describing how G-2 USFET handles MED business; and point by point I explained to Greene how his own Division was handling our business. Greene finally tore up the letter.

3. Then it was decided to send a cable to General Vandenberg briefly inquiring if he would ask General Groves to reconsider. That would mean a dozen copies or so being circulated around the War Department apart from General Groves' own copy. It seemed to me preferable to keep this an MED family affair. Greene agreed to drop the matter of a cable on the condition that I would ask my own Headquarters to reconsider the matter.

4. Officially, then, I transmit to your Headquarters the USFET request: that the Manhattan Engineer District have a permanent liaison officer on duty in the G-2 Division of USFET Main.

5. As a staff officer, it is my responsibility to assist you and the General by giving recommendations. My recommendation is that there is no need to assign a permanent liaison officer to USFET.

6. As an intelligence officer, I report the following:
a. The letter referred to in Paragraphs 1 and 2 was Greene's own brain child. Although prepared for General Sibert's signature, I know that Sibert had not seen it even in draft form.
b. Greene feels the need of a liaison officer. Yet Lt. Colonel Collins, the pick-and-shovel officer who actually handles our business, has a clear grasp of our interests. Although he would like to see a liaison officer, he admitted privately things were going along all right on the present basis.



CONFIDENTIAL

7. I feel that a permanent liaison officer is not necessary because of two reasons: present techniques in operation and the nature of our mission in Germany. To expand these points.

8. Techniques. This office and G-2 have, over the weeks, worked out an effective system of mutual assistance. Once every 10 - 14 days, an officer from this office is in Frankfurt to assist and advise Collins. Urgent matters are handled by telephone; Collins and I talk with one another several times a week. Last, we have prepared for G-2's benefit a statement of the MED missions in Germany and methods of accomplishing the mission. (See letter this office to General Sibert, "Present Mission in Germany re Atomic Energy", dated 19 March.)

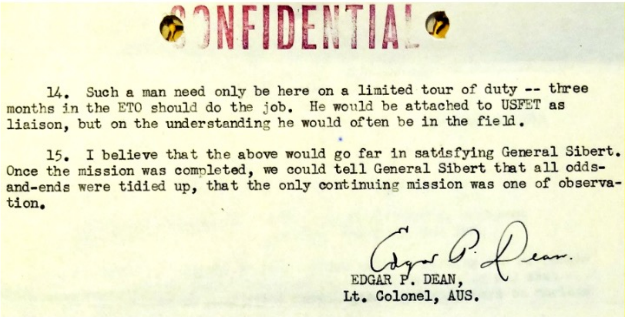
9. Nature of Mission. Germany is not the country in Europe we are the most worried about. From an intelligence point of view, the great job in Germany has already been done. There are certain remaining jobs but they can't be done sitting in Frankfurt. Moreover, during the last four months we have received preciously little intelligence from G-2 USFET. The best of the intelligence has always been SSU reports, with USFET acting merely as a forwarding agency. We often get these reports directly from the SSU.

10. Duty enjoins that I pass on to you the request emanating from General Sibert's office. Honesty compels me to disagree with the need of a permanent liaison officer. Merely another officer, chained to a desk in Frankfurt, wouldn't have more than a couple of hours work per day.

11. There is however a temporary need of a special type of MED liaison who would be based on, but not confined to, Frankfurt. We are accumulating a number of cases of supposedly world famous experts in atomic energy who write to G-2 USFET in one connection or another. Most of these names do not appear on ours or Welsh's list of first and second-rate German scientists. Routine intelligence often shows they are crackpots. But they can only be satisfactorily interrogated by someone who himself is a nuclear physicist. Neither Johnson, Warner, nor I can qualify in this regard. We need someone to take a number of these cases and decide them one way or another: forget them or add them to the list of scientists whose whereabouts should be definitely known.

12. Then there is another job. The British in their Zone are making an inventory of all cyclotrons, betatrons, Van de Graff machines, etc. I should like to do the same for the US Zone. This is not merely in imitation of our British cousins. Welsh and I are entirely agreed that re Germany we want to tidy up a lot of loose ends: get our definitive list of personnel (mostly accomplished), get an inventory of vital equipment, remove the small remaining lots of uranium. These accomplished, the basic intelligence job in Germany is one of observation.

13. Thus on the US side we have temporary need of a special type of man. Obviously he must be a nuclear physicist. Charles Campbell, who used to be at Oak Ridge, illustrates the type of man we need. I'm not sure whether Major John King, also of the Ridge, has enough technical background. Such a man must know after he interrogates a German scientist whether the latter is a scientists or a phony. He must know a betatron when he sees one, etc.

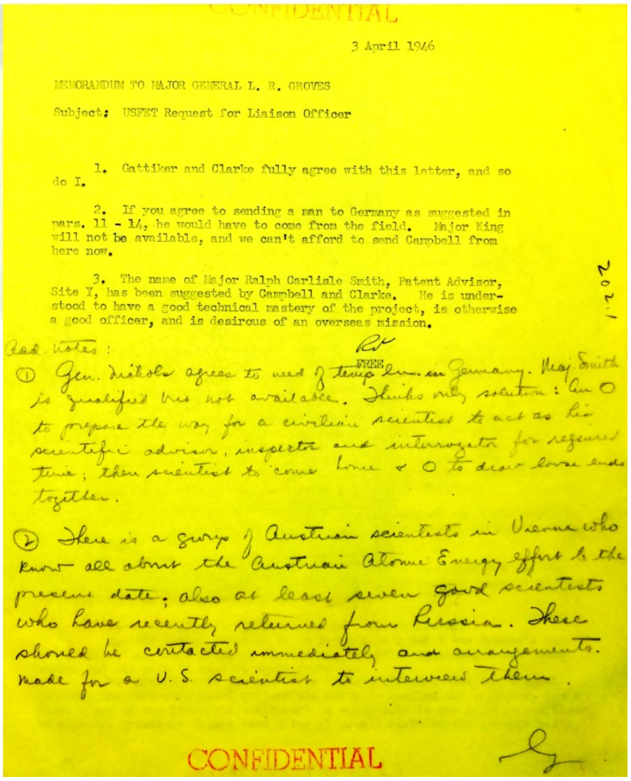


CONFIDENTIAL

14. Such a man need only be here on a limited tour of duty -- three months in the ETO should do the job. He would be attached to USFET as liaison, but on the understanding he would often be in the field.

15. I believe that the above would go far in satisfying General Sibert. Once the mission was completed, we could tell General Sibert that all odds-and-ends were tidied up, that the only continuing mission was one of observation.

Edgar P. Dean
EDGAR P. DEAN,
Lt. Colonel, AUS.



CONFIDENTIAL

3 April 1946

MEMORANDUM TO MAJOR GENERAL L. R. GROVES

Subject: USFET Request for Liaison Officer

1. Gattiker and Clarke fully agree with this letter, and so do I.

2. If you agree to sending a man to Germany as suggested in pars. 11 - 14, he would have to come from the field. Major King will not be available, and we can't afford to send Campbell from here now.

3. The name of Major Ralph Carlisle Smith, Patent Advisor, Site Y, has been suggested by Campbell and Clarke. He is understood to have a good technical mastery of the project, is otherwise a good officer, and is desirous of an overseas mission.

202.1

RF
FREE

Add. Notes:

① Gen. Nichols agrees to need of temp. man in Germany. Maj. Smith is qualified but not available. Thinks only solution: An O to prepare the way for a civilian scientist to act as his scientific advisor, inspector and interrogator for required time; then scientist to come home & O to draw loose ends together.

② There is a group of Austrian scientists in Vienna who know all about the Austrian Atomic Energy effort to the present date; also at least seven good scientists who have recently returned from Russia. These should be contacted immediately and arrangements made for a U.S. scientist to interview them.

- REGION 3

FEDERAL RECORDS CENTER
MILITARY RECORDS BRANCH
Alexandria, Virginia

February 12, 1958

In Reply Refer To: 3MC

Honorable Alan Dulles
Director
Central Intelligence Agency
Washington 25, D. C.

Dear Mr. Dulles:

In the fall of 1946 I transferred the Foreign Intelligence Unit from the Manhattan Engineer District to your predecessor organization the Central Intelligence Group.

With the prospective dissolution of the MED I felt, as did General Vandenberg, that this was in the best interests of the United States. This unit took with it certain files which were then necessary for its operation This was done despite my belief, which was concurred in by the Secretary of War that these papers would ultimately belong in the special file which was being set up for retention in the War Department.

This file was established to preserve the papers which were likely to be of historical value. Many of these were and must remain highly secret. The file though abbreviated is quite complete. I feel that it would be most advantageous if the papers, which are of historical value, taken by CIA in 1946 could now be returned to this file. They would be kept together and would be available to your agency for official use if you should ever desire such access. I imagine that they are no longer of any current value in your operations.

Prior to the establishment of this file as a permanent collection the provisions for its safeguarding and for restricting its use were approved personally by the then Chief of Staff, General Eisenhower. The file is now in the custody of the Military Records Branch, Federal Records Center, in Alexandria, Virginia. This Center is under the jurisdiction of the Archivist of the United States and access is governed by an agreement between the Archivist and The Adjutant General of the Army. The MED file however is not open to use by anyone except with my prior approval or that of The Adjutant General acting for the Chief of Staff of the Army.

As I am leaving Washington this week on a vacation trip out of the country I would request that your reply be sent to me in care of Mr. Sherrod East who is Chief of the Military Records Branch in Alexandria. If you agree to my proposal he, or one of his designees, would be the one to whom any papers would be physically delivered. He has seen this letter.

With very best personal wishes,

Sincerely

LESLIE R. GROVES
Lieut. Gen. USA, Ret.

P.S.
My permanent address to which I will return about March 12th is c/o Remington Rand, One Atlantic Street, Stamford, Conn.

~~CONFIDENTIAL~~

CENTRAL INTELLIGENCE AGENCY
WASHINGTON 25, D. C.

27 FEB 1958

Lt. General Leslie R. Groves
c/o Mr. Sherrod East, Chief
Military Records Branch
Federal Records Center
Alexandria, Virginia

Dear General Groves:

Your letter of 12 February 1958 (3NC) to Mr. Dulles has been passed to this office for direct reply since the records requested are presently in our custody.

Most of the records transferred from the Manhattan Engineer District to this Agency have been retired to our permanent record center located outside the Washington area. However, action has been commenced to recover these records and they will be transferred to the Military Records Branch of the Federal Records Center as you requested.

I anticipate that identification, recovery, preparing receipts and the actual transfer will require about three weeks to accomplish.

If we can be of further assistance, please feel free to call upon us at any time.

Very truly yours,

Herbert Scoville, Jr.
Assistant Director

Manhattan Project Files in CIA

Reference is made to General Groves' letter to Mr. Dulles relative to return to the MED collection of certain files now in custody of CIA. Mr. Horal, code 143, extension 3487, called me today to say that these files amounting to 5 or 6 cubic feet were being prepared for return in records center card-board boxes at the rate of one box per week. The first such shipment will arrive by courier March 26, addressed to Chief, Military Records Branch, attention: Mr. Nigh. During the next week Mr. Horal will be available should any question arise concerning this matter between 12 and 1 P.M. and on Friday. I have concurred in his suggested arrangement for transmitting the files. The contents of each box will be arranged according to a list of contents contained therein, which list should be checked, receipted and a copy returned to the sender as promptly as possible.--SE

cc: Mr. Nigh

D.14.3 Dutch Intelligence

[Dutch intelligence appears to have provided information about the German nuclear weapons program to the United States both during and after the war.

During the war, Dutch citizens interacted with German programs in several ways:

- Many scientists and institutions in the Netherlands worked directly on German programs; Philips Laboratory in Eindhoven was a good example [CIOS III-1; CIOS VI-26, 27; CIOS X-13; CIOS XI-10; CIOS XII-22]. For more information see pp. 4314–4318.
- Many Dutch citizens worked in Germany or in other German-controlled territories as anything from paid research staff to slave laborers (pp. 4846, 4853).
- Some Dutch scientists were recruited by Germany to spy on its behalf; the Cellastic spy ring was one example [[Goudsmit 1947, pp. 37–46; Klinkenberg 1971; Van Calmthout 2018, pp. 129–148].

In all of those Dutch-German interactions, there would have been the opportunity for Dutch citizens who were secretly opposed to Germany's war effort to gather information on German secret weapons programs and to forward that information through a network of like-minded individuals to Dutch resistance leaders in the Netherlands or in exile.

Among other connections between the United States and the Netherlands, Alsos members Samuel Goudsmit and Gerard Kuiper were Dutch and had excellent contacts in the Dutch scientific community.]

Nazis' Secret Weapon Declared One of Horror; Wipe Out Civilization. *Indiana Evening Gazette* (Indiana, Pennsylvania). 30 March 1945 p. 1. https://newspaperarchive.com/indiana-evening-gazette-mar-30-1945-p-1/

PORTLAND, Ore., March 30—(AP)—A member of the Dutch underground declared today the Nazis do have a secret—and deadly effective—weapon.

Jacob van Berkel, here under auspices of the Netherlands Information Bureau, told an interviewer the European front is now a race between victory for the Allies and Germany's resort to the ultimate weapon—"so powerfully destructive it is almost inconceivable."

"The new weapon, a tiny gadget which could be placed in a rocket bomb, may be launched with complete effectiveness against the continental United States," Van Berkel said.

He declared the Germans are saving it for a last stand, probably in the Bavarian Alps. "They are confident that their secret weapon will wipe out civilization and save them at the very end."

Van Berkel—fictitious name to hide his identity from the enemy—gave no details, except to say that the weapon does not involve poison gas. He said that while Allied officials know of the weapon, they do not know in what form it might be launched.

The 27-year-old economist, who has made 60 secret trips through Germany in the last four years, said the weapon was discovered by espionage agents.

[This story was also reported in many other newspapers such as:

The Evening Independent (St. Petersburg, Florida) 30 March 1945 p. 8. https://news.google.com/newspapers?id=cwNQAAAAIBAJ&sjid=DlUDAAAAIBAJ&pg=2700,2575615

“Jacob van Berkel” was a pseudonym used by Anthony van der Steenhoven (unless that was a pseudonym too). According to files in the Dutch National Archive (pp. 4834–4849), van der Steenhoven was born in 1917 and worked for the Philips Laboratory in Eindhoven 1937–1944 as a secretary for the management.

During the war, van der Steenhoven also began secretly working for the Dutch resistance. He used his official position to travel to laboratories and industrial sites throughout the Netherlands, Belgium, Germany, Austria, Czechoslovakia, and Poland, gathering information on German activities, including work on nuclear weapons and delivery vehicles for them. His intelligence collection was aided by the facts that the Philips Laboratory was producing nuclear technology and collaborating with other organizations throughout German-controlled Europe, and that huge numbers of conscripted Dutch laborers worked at industrial sites throughout German-controlled Europe. Van der Steenhoven then reported what he had learned to his contacts in the Dutch resistance, the Dutch government in exile in London, British intelligence, OSS, and France.

In late 1944, the Dutch government in exile sent van der Steenhoven to the United States on a lecture tour to raise awareness and support. Although van der Steenhoven was supposed to talk about generalities of living in German-controlled Europe, and he largely did so, in some of his public presentations he briefly alluded to the German work on nuclear weapons and their delivery vehicles. After such a lecture in Boston, van der Steenhoven ended up having a lengthy private discussion with Gerard Kuiper, a member of Alsos. Van der Steenhoven’s allusions to German nuclear weapons attracted the attention of a number of journalists, and through the resulting newspaper articles the disapproving attention of the U.S. government (probably censors from Leslie Groves’s office). During his months in the United States, van der Steenhoven even wrote a book giving more details about the German nuclear weapons program, but due to pressure from Philips Laboratory (likely concerned about their public image) and perhaps also from Leslie Groves’s office, the book was never published, and van der Steenhoven was sent back to Europe in summer 1945.

This warning from a highly knowledgeable member of the Dutch resistance that Germany was on the verge of launching an intercontinental nuclear attack that would be strong enough to win the war was highly consistent with information from a number of independent sources. See for example pp. 4638, 5022, 5031, and 5073.]

Anthony van der Steenhoven. 2 April 1945. Report regarding secret weapon [Nationaal Archief (Den Haag), Ministerie van Buitenlandse Zaken 1945–1954, Blok Z36, Toegang 2.05.117, Inv. nr. 25010.]

[See document photo on p. 4836.]

RAPPORT BETREFFENDE GEHEIM WAPEN

In Duitschland kreeg ik in 1943 bericjten van Duitsche bronnen betreffende het in vergevorderd stadium zijnde onderzoek naar het gebruik van de zoogenaamde atoom splitsing van Uraan in een wapen.

Verschillende Duitschers, z.g. ingewijden, gaven hier hoog over op. Het kwam ongeveer hier op neer dat als dit wapen eenmaal in een bruikbaren vorm gebracht kon worden Duitschland in enkele klappen al haar vijanden zou kunnen vernietigen. Ik begon hier aan te werken en kreeg inderdaad de bevestiging dat verschillende Duitsche laboratoria hiermede druk bezig waren. Einde 1943 vloog een geheel laboratorium in de buurt van Berlijn in de lucht en later hoorde ik van een secretaresse uit de Privatkanzlei des Führers dat dit iets met het geheime wapen te maken had. Een officier die bereid was mij meerdere inlichtingen te verschaffen sneuvelde helaas ontijdig. Het een en ander meldde ik later aan O.S.S. maar over de eigenaardige houding van 0SS hoef ik nu niet meer te spreken, ik kreeg sterk de indruk dat men of, hierover reeds voldoende wist, of mij niet serieus nam. In de Ambassade sprak ik hierover zoowel met Dr. van Houten als met den Schout-bij-nacht. Gezien echter de houding van OSS, was ik wat huiverig geworden om dingen als belangrijk voor te stellen dus zal ik het waarschijnlijk wel terloops genoemd hebben.

REPORT REGARDING SECRET WEAPON

In Germany in 1943 I received messages from German sources regarding the advanced stage of research into the use of the so-called atomic fission of uranium in a weapon.

Several Germans, so-called insiders, spoke highly of this. It basically came down to the following: if this weapon could once be brought into a usable form, Germany could destroy all her enemies in a few blows. I started working on this and indeed received confirmation that several German laboratories were busy working on this. At the end of 1943, an entire laboratory flew into the air near Berlin and later I heard from a secretary at the "Privatkanzlei des Führers" that it had something to do with the secret weapon. Unfortunately, an officer who was prepared to provide me with more information was suddenly killed. I later reported some things to the OSS, but I no longer need to talk about OSS's peculiar attitude; I got the strong impression that they either already knew enough about this or did not take me seriously. In the Embassy I spoke about it with Dr. van Houten and also with the Rear Admiral. However, given OSS's attitude, I had become a little hesitant to present things as important, so I probably mentioned it in passing.

In Boston ontmoette ik Prof. Kuiper, die mij hiernaar vroeg en nadat hij zich als G 2 geidentificeerd had vertelde ik hem wat ik wist, hetgeen hij zeer belangrijk vond aangezien het zijn gegevens volkomen bevestigde. Helaas was ik niet in staat hem te vertellen of het reeds in bruikbaren vorm bestond hetgeen hen verontrustte aangezien volgens hem G. 2 dit ook niet wist. Hij was van meening dat het zeer wel mogelijk was dat als zij het konden gebruiken het zeer zeker ook tegen de United States aangewend zou kunnen worden. Sinds Boston heb ik er toen af en toe melding van gemaakt in den vorm zooals getelegrafeerd. Niemand had hier blijkbaar bezwaar tegen, en het merkwaardige is dat verschillende malen interviewers mij man en paard reeds noemden waardoor ik den indruk kreeg dat het een publiek geheim was. Verdere inlichtingen gaf ik nooit. Nu en dan gebruikte ik het als gedeelte van een interview om den indruk van mijn andere indrukken te versterken namelijk: denk er aan, niet te optimistisch, de oorlog is morgen nog niet over!

Hierbij de “clipping” van het geheele bewuste interview hetgeen dus op de gebruikelijke wijze door den interviewer geinterpreteerd en aangedikt, en een andere “clipping” van het “secret-weapon” gedeelte wat aldus afgedrukt natuurlijk een verkeerde indruk geeft.

Salt Lake City 2 April 1945

In Boston I met Prof. Kuiper, who asked me about this matter and after he identified himself as G-2, I told him what I knew, which he considered very important given that it completely confirmed his own information. Unfortunately I was unable to tell him whether it already existed in a usable form, which worried them given that G-2 (according to him) did not know this either. He believed that it was entirely possible that if they could use it, it could certainly be used against the United States. Since Boston, I have occasionally reported about the subject in the form as telegraphed. Apparently no one objected to this, and the strange thing is that several times interviewers already called me man and horse, which gave me the impression that it was an open secret. I never provided any further information. Occasionally I used it as part of an interview to reinforce my other impressions, namely: remember, don’t be too optimistic, the war won’t be over tomorrow!

Here is the “clipping” of the entire interview in question, which is interpreted and enhanced by the interviewer in the usual way, and another “clipping” about the “secret-weapon” part, which of course gives a wrong impression when printed in this way.

Hearing of: van der STEENHOVEN Anthony, born 28 October 1917 in DORDRECHT, by profession secretary management N. V. Gloeilampenfabrieken PHILIPS in Eindhoven, last living Hertogstraat 30 in EINDHOVEN, who left the Netherlands on 24 September 1944, arrived in England on 29 September 1944, was discharged from the R.V.P.S. on 17 October 1944 and reported here on 31 October 1944. [...]

On 16 February 1944 in Hilligersberg married Cornelia BERGER, born 23 November 1922 in Hilligersberg, living Hertogstraat 30 EINDHOVEN. [...]

I received my primary education in Dordrecht. In June 1935 I obtained my final diploma A at the H.B.S. in Dordrecht. Then I studied at the Economic School in Rotterdam until May 1937.

Through the intervention of my father, who was an acquaintance of the director of the Holland America Line, I sailed for 4 months as an apprentice mate on the MAASDAM. After that I studied at home and also worked in my father's business. In November 1937 I got a job at the N. V. PHILIPS in Eindhoven as an assistant correspondent with a two-year course abroad. When this course was finished in 1940, I was asked to go to Germany to organize the amplifier division in Berlin.

Ik kreeg deze opdracht van den heer KETEL, personeelschef en ook van den heer KAMSTRA, die destijds personeelschef was. In werkelijkheid was echter mijn opdracht om oogen en ooren open te zetten. Ik vertrok dus naar Berlijn, alwaar ik op 23 Januari 1941 arriveerde. Ik werd geplaatst op de Philipsfabrieken als chef van de afdeeling versterkers. Ik begon met het organiseeren van de civiele verkoopafdeeling, doch na 2 maanden werd de verkoop verboden en mocht alleen onder zeer speciale omstandigheden daarvan worden afgeweken. Intusschen was ik lid geworden van de plaatselijke Amerikaansche kerk en -club. Ik werd bevriend met den Amerikaanschen dominee Stewart HERMAN, doordat wij gemeenschappellijk kennissen hadden in de Vereenigde Staten van Amerika. Bovendien werd ik lid van den inmiddels door de Gestapo opgeheven Nederlandsche club “Nederland en Oranje”, alwaar iederen Donderdagavond bijeenkomsten plaatsvonden. Op die bijeenkomsten ontmoette ik den Heer MILLENAAR van het Zweedsche Gezantschap, die daar zat ter behartiging van de Nederlandsche belangen in Duitschland. Hij was vroeger werkzaam op het Nederlandsche Gezantschap, doch was bij het uitbreken van den oorlog door den Gezant aangewezen om in Berlijn te blijven. MILLENAAR en ik werden spoedig bevriend en er ontstond samenwerking op groote schaal, hetgeen beteekende het onderhouden van zijn contacten in Nederland, (Dit had hoofdzakelijk plaats met den heer MEES van de N. V. Philips, wonende te Rotterdam) en het verstrekken van alle mogelijke hulp in Duitschland zelf, zooals het bezoeken van studenten en arbeiders in ziekenhuizen en werkkampen enz, hetgeen ik op mij nam en deed. Hierbij was veel handigheid vereischt. Ik bleef ca. 3 jaar in Berlijn en had veel moeilijkheden. Ik reisde geregeld op en neer naar Nederland. Ik ben 2 keer aan de grens en 2 keer in Duitschaldn aangehouden, doch telkens vrijgelaten, zonder resultaat voor de Duitschers. Intusschen werkte ik ook voor de K.L.M. als tusschenpersoon tusschen Berlijn en PLESMAN en hied mij bezig met brievensmokkelarij enz. Op 24 December 1943 keerde ik definitief naar Nederland terug. Nadien heb ik in Januari en Februari 1944 nog eenige reizen heen en terug naar Berlijn. Ik was den laatsten tijd nog wel bij N. V. Philips in dienst, doch deed niets.

I received this assignment from Mr. KETEL, chief of staff, and also from Mr. KAMSTRA, who was chief of staff at the time. In reality, however, my assignment was to open eyes and ears. So I left for Berlin, where I arrived on 23 January 1941. I was placed at the Philips factories as head of the amplifier division. I began to organize the civil sales department, but after two months sales were prohibited and could only be deviated from under very special circumstances. Meanwhile, I had joined the local American church and club. I became friends with the American pastor Stewart HERMAN, because we had mutual acquaintances in the United States of America. In addition, I became a member of the Dutch club “Netherlands and Orange,” which had been disbanded by the Gestapo, where meetings were held every Thursday evening. At these meetings I met Mr. MILLENAAR of the Swedish Legation, who was there to represent Dutch interests in Germany. He used to work at the Dutch legation, but at the outbreak of war had been assigned by the envoy to stay in Berlin. MILLENAAR and I soon became friends and there was cooperation on a large scale, which meant maintaining his contacts in the Netherlands, (This mainly took place with Mr. MEES of N. V. Philips, living in Rotterdam) and providing all possible help in Germany itself, such as visiting students and workers in hospitals and work camps etc., which I took on and did. This required a lot of skill. I stayed in Berlin for about 3 years and had many difficulties. I regularly traveled back and forth to Holland. I was stopped twice at the border and twice in Germany, but each time I was released without any result for the Germans. In the meantime I also worked for the K.L.M. as an intermediary between Berlin and PLESMAN and was engaged in letter smuggling etc. On 24 December 1943 I returned to Holland for good. In January and February 1944 I made several trips to Berlin and back. I was employed by N. V. Philips lately, but did nothing.

Op 21 September 1944 kwam ik te EINDHOVEN in contact met Majoor WATERSCHOOT VAN DER GRACHT van de Amerikaansche dienst O.S.S. Hoe die mij kende weet ik niet. Hij vroeg mij of ik hem over Duitschland in wilde lichten, hetgeen ik voor zoover dit in mijn vermogen lag deed. Hij stelde mij voor terug te gaan naar Duitschland, zoogenaamd als een soort gevluchte N.S.B.er, hetgeen echter niet door kon gaan, omdat ik op de zwarte lijst van de N.S.B. stond. Dat ik in Duitschland geen moeilijkheden heb ondervonden was min of meer het gevolg van het feit, dat ik het hoofd van de Gestapo van het Philipsconcern, genaamd Majoor LIESE, goed kende. LIESE had een vreeselijken hekel aan de N.S.B. LIESE was volgens mij goed en is na de laatste beruchte aanslag op HITLER (Goerdelaffaire) door de Duitschers doodgeschoten. LIESE wist niet wat ik deed, doch was de meening toegedaan, dat ik een harde werker van N. V. Philips was.	On 21 September 1944 in EINDHOVEN I came into contact with Major WATERSCHOOT VAN DER GRACHT of the American service O.S.S. How he knew me I do not know. He asked me to inform him about Germany, which I did as far as I could. He suggested that I return to Germany, supposedly as a kind of N.S.B. [Dutch National Socialists] refugee, but this could not be done, because I was on the black list of the N.S.B. I could not go. That I encountered no difficulties in Germany was more or less due to the fact that I knew the head of the Gestapo of the Philips concern, named Major LIESE, well. LIESE had a dreadful dislike for the N.S.B. LIESE was good, in my opinion, and was shot dead by the Germans after the last infamous attack on HITLER (Goerdel affair). LIESE did not know what I did, but was of the opinion that I was a hard worker for N. V. Philips.
WATERSCHOOT stelde mij toen voor mij per parachute in Berlijn neer te laten hetgeen ik als zelfmoord beschouwde, aangezien ik te goed in Berlijn bekend ben en daarvan de moeilijkheden kende.	WATERSCHOOT then proposed to me to drop me by parachute in Berlin, which I considered suicide, since I am too well known in Berlin and knew its difficulties.
In December 1943 had ik te BERLIJN van den Gestapoagent, Inspecteur LANGE, die goed was en in contact stond met MILLENAAR, de tip gekregen Duitschland te verlaten, aangezien mijn activiteiten te verdacht werden.	In December 1943 I had been tipped off in BERLIN by the Gestapo agent, Inspector LANGE, who was well and in contact with MILLENAAR, to leave Germany, since my activities were becoming too suspicious.

WATERSCHOOT stelde mij vervolgens voor naar STOCKHOLM te gaan om door tusschenkomst van mijn contacten weer contact op te nemen met MILLENAAR, hetgeen ook weer niet door kon gaan vanwege het gevaar voor MILLENAAR. Tenslotte werd mij voorgesteld, dat ik met de bezettende Amerikaansche troepen BERLIN zal binnenrukken om door mijn contacten de zaak zoo vlug mogelijk voor elkaar te brengen. Intusschen zou ik dan in LONDEN moeten afwachten tot het zoover zou zijn en inmiddels rapport uitbrengen over mijn bevindingen van het laatste jaar. Dit laatste voorstel is door mij aangenomen. Ik ben thans echter door het Nederlandsche Ministerie van Buitenlandsche Zaken aangezocht om onder de naam van Jacob van BERKEL een propagandatour door de Vereenigde Staten van Amerika te maken.

Op 24 September 1944 vertrok ik per jeep naar BRUSSEL. Op 26 September 1944 met een Amerikaansch vliegtuig van BRUSSEL naar PARIJS en vandaar op 29 September 1944 met een Amerikaansch vliegtuig naar LONDEN, op laatstgenoemde reizen vergezled van WATERSCHOOT. Na mijn aankomst in LONDEN bezocht ik gedurende die week op 30 September den Minister BURGER (een overbuurman van mij in Nederland), die onmiddellijk den heer F. van 't SANT opbelde. Die week heb ik zonder medeweten van de Engelsche autoriteiten in LONDEN rondgezworven. Op 2 October 1944 had ik weer een onderhoud met den Minister BURGER en op 3 October 1944 met den Minister President GERBRANDY. Van 5 tot 17 October 1944 ben ik verhoord geworden in de R.V.P.S. Op laatstgenoemden datum werd ik afgehaald door een Amerikaansch officier. Op 18 October 1944 had ik een onderhoud met den heer HAARSMA DE WIT, secretaris van den Minister-President GERBRANDY, de laatste Gezant in BERLIJN, die mij mededeelde, dat ik mij bij Minister KLEFFENS moest vervoegen en dien ik op 23 October 1944 bezocht. Ik werd toen aangenomen voor de propagandatour in Amerika. Op 28 October 1944 ben ik ontvangen bij Prinses JULIANA en op 31 October 1944 bij H. M. de KONINGIN.

WATERSCHOOT then proposed to me to go to STOCKHOLM to get back in touch with MILLENAAR through my contacts, which again could not take place because of the danger to MILLENAAR. In the end it was suggested to me that I go into BERLIN with the occupying American troops in order to get things done as quickly as possible through my contacts. In the meantime I would have to wait in LONDON until the time would come and in the meantime report on my findings of the last year. This last proposal was accepted by me. However, I have now been asked by the Dutch Ministry of Foreign Affairs to make a propaganda tour through the United States of America under the name of Jacob van BERKEL.

On 24 September 1944, I left by jeep for BRUSSELS. On 26 September 1944 with an American airplane from BRUSSELS to PARIS and from there on 29 September 1944 with an American airplane to LONDON, accompanied by WATERSCHOOT on the latter trips. After my arrival in LONDON on 30 September, I visited Minister BURGER (a neighbor of mine in Holland), who immediately called Mr. F. van 't SANT. That week I wandered around LONDEN without the knowledge of the English authorities. On 2 October 1944 I had another meeting with Minister BURGER and on 3 October 1944 with Minister President GERBRANDY. From 5 to 17 October 1944 I was interrogated in the R.V.P.S. [Royal Victoria Patriotic School] On the latter date I was picked up by an American officer. On 18 October 1944 I had a meeting with Mr. HAARSMA DE WIT, Secretary to Prime Minister GERBRANDY, the last Envoy to BERLIN, who informed me that I had to report to Minister KLEFFENS, whom I visited on 23 October 1944. I was then accepted for the propaganda tour in America. On 28 October 1944 I was received by Princess JULIANA and on 31 October 1944 by Her Majesty the Queen.

Daar ik verwachtte in moeilijkheden te zullen komen in verband met het feit, dat ik niet door een officieele instantie van Nederlandsche zijde was gehoord geworden, heb ik U op aanraden van Hugo KLEIN van den Voorlichtingsdienst, dien ik in Netherlands House ontmoette, opgebeld en om een onderhoud verzocht. Mijns inziens was het ook veel beter geweest, dat de Amerikaansche autoriteiten mijn geval niet geheimzinnig behandeld hadden en mij den officieelen weg hadden laten volgen.	Since I expected to get into trouble because I had not been heard by an official Dutch authority, I called you on the advice of Hugo KLEIN of the Information Service, whom I met in Netherlands House, and asked for an interview. In my opinion it would have been better if the American authorities had not treated my case secretively and had let me follow the official route.
Ik ben officieel door Minister KLEFFEN aangenomen met ingang van 3 November 1944.	I was officially hired by Minister KLEFFEN effective 3 November 1944.
De N.S.B.ers die ik kende in EINDHOVEN zijn inmiddels opgeruimd.	The N.S.B.ers [Dutch national socialists] I knew in EINDHOVEN have in the meantime been cleared out.
Verdere bijzonderheden kan ik U niet mededeelen.	I cannot give you any further details.
CONCLUSIE: v. d. STEENHOVEN maakt een gunstigen indruk, doch doet erg gewichtig. Mijns inziens is na dit verhoor moeilijk na te gaan of deze man politiek betrouwbaar is. Daarvour zouden nadere informaties moeten worden ingewonnen.	CONCLUSION: v. d. STEENHOVEN makes a favorable impression, but acts very pompous. I think that after this interrogation it is difficult to ascertain whether this man is politically reliable. Further information should be obtained.
Londen, 16 Januari 1945.	London, 16 January 1945.
De wachtmeester tit. der Kon. Marechaussee,	The appointed sentry of the Royal Military Police,
(H. van den BERG).	(H. van den BERG).
OPMERKING: Weer een van de gevallen de Nederlandsche instanties volkomen onkundig waren van de aankomst van een Nederlander. Na opname in de R.V.P.S. werd van andere Engelandvaarders vernomen, dat v.d.S. zich daar bevond en later was hij weer op mysterieuze wijze verdwenen.	NOTE: Another of the cases the Dutch authorities were completely unaware of the arrival of a Dutchman. After being admitted to the R.V.P.S., it was learned from others knowledgeable about England that v.d.S. was there and later he had mysteriously disappeared again.

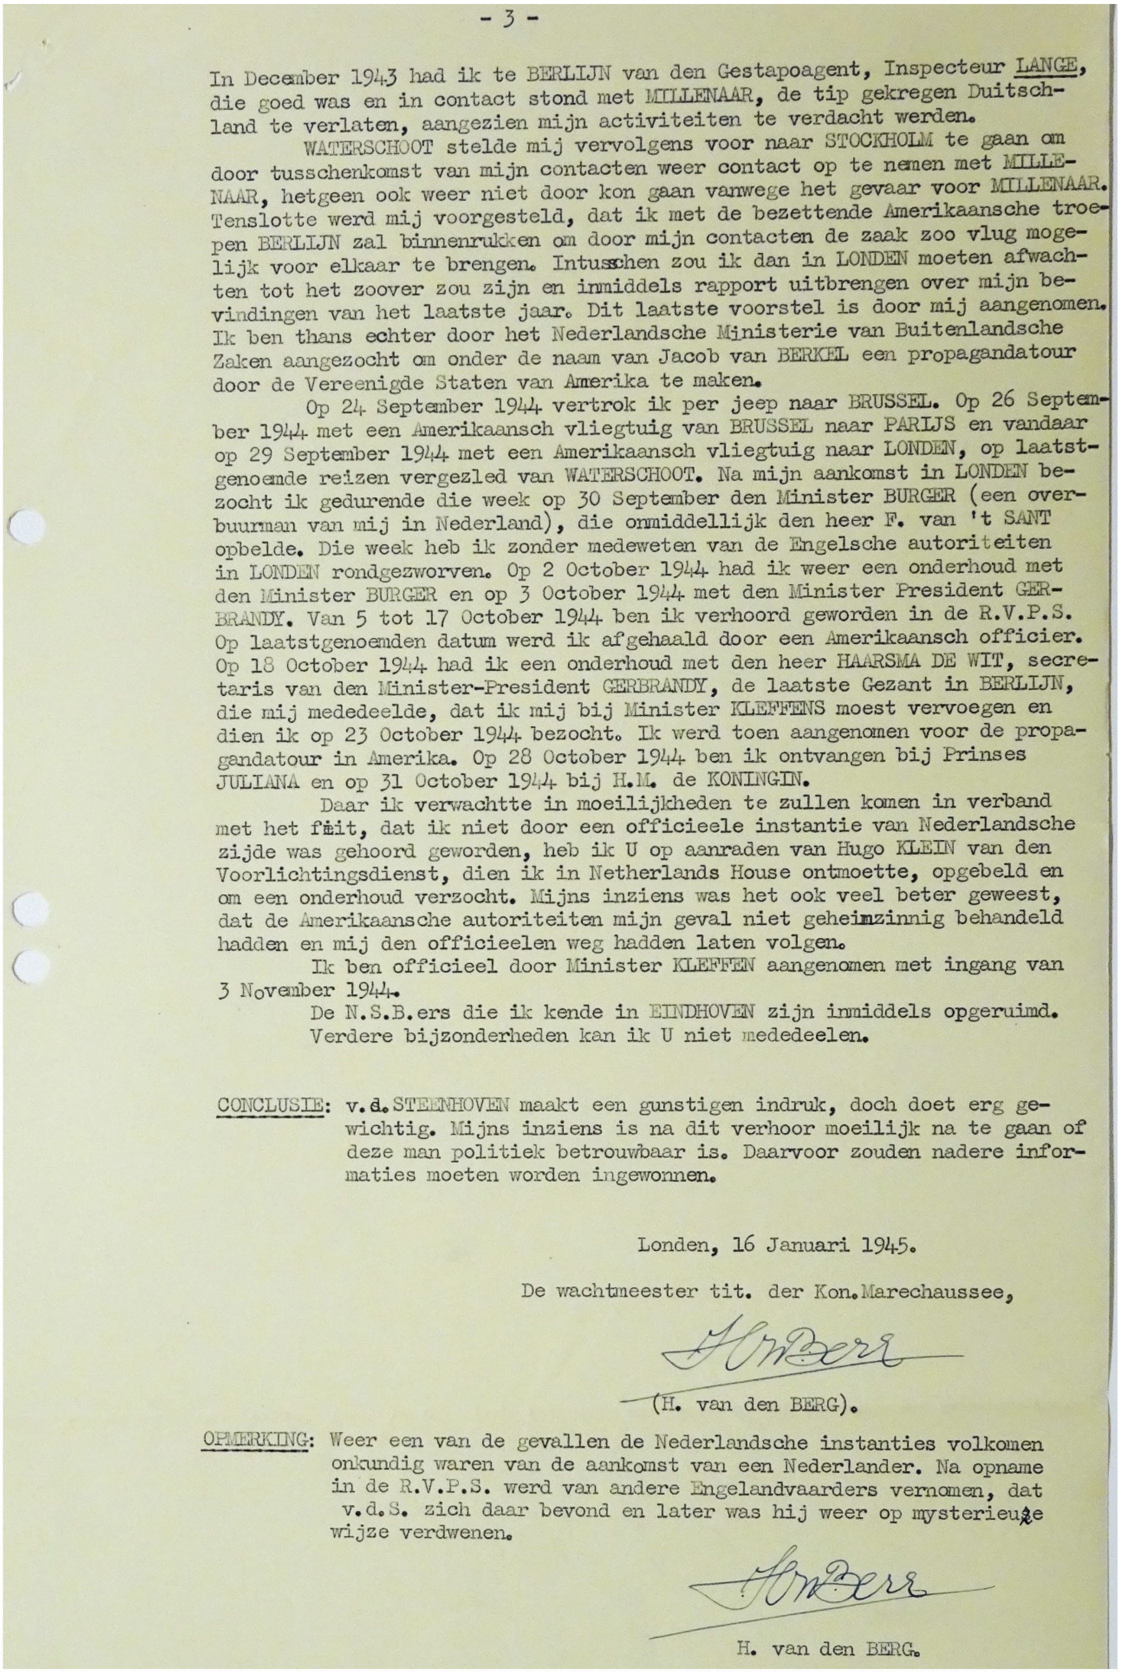
Toen in 1940 deze cursus was afgeloopen werd ik eind 1940 aangezocht om naar Duitschland te gaan om in Berlijn de versterkersafdeeling te organiseeren. Ik kreeg deze opdracht van den heer KETEL, personeelschef en ook van den heer KAMSTRA, die destijds personeelschef was. In werkelijkheid was echter mijn opdracht om oogen en ooren open te zetten. Ik vertrok dus naar Berlijn, alwaar ik op 23 Januari 1941 arriveerde. Ik werd geplaatst op de Philipsfabrieken als chef van de afdeeling versterkers. Ik begon met het organiseeren van de civiele verkoopafdeeling, doch na 2 maanden werd de verkoop verboden en mocht alleen onder zeer speciale omstandigheden daarvan worden afgeweken. Intusschen was ik lid geworden van de plaatselijke Amerikaansche kerk en -club. Ik werd bevriend met den Amerikaanschen dominee Stewart HERMAN, doordat wij gemeenschappelijk kennissen hadden in de Vereenigde Staten van Amerika. Bovendien werd ik lid van den inmiddels door de Gestapo opgeheven Nederlandsche club "Nederland en Oranje", alwaar iederen Donderdagavond bijeenkomsten plaatsvonden. Op die bijeenkomsten ontmoette ik den Heer MILLENAAR van het Zweedsche Gezantschap, die daar zat ter behartiging van de Nederlandsche belangen in Duitschland. Hij was vroeger werkzaam op het Nederlandsche Gezantschap, doch was bij het uitbreken van den oorlog door den Gezant aangewezen om in Berlijn te blijven. MILLENAAR en ik werden spoedig bevriend en er ontstond samenwerking op groote schaal, hetgeen beteekende het onderhouden van zijn contacten in Nederland,(Dit had hoofdzakelijk plaats met den heer MEES van de N.V. Philips, wonende te Rotterdam)en het verstrekken van alle mogelijke hulp in Duitschland zelf, zooals het bezoeken van studenten en arbeiders in ziekenhuizen en werkkampen enz, hetgeen ik op mij nam en deed. Hierbij was veel handigheid vereischt. Ik bleef ca. 3 jaar in Berlijn en had veel moeilijkheden. Ik reisde geregeld op en neer naar Nederland. Ik ben 2 keer aan de ~~geren~~ grens en 2 keer in Duitschaldn aangehouden, doch telkens vrijgelaten, zonder resultaat voor de Duitschers. Intusschen werkte ik ook voor de K.L.M. als tusschenpersoon tusschen Berlijn en PLESMAN en hield mij bezig met brievensmokkelarij enz. Op 24 December 1943 keerde ik definitief naar Nederland terug. Nadien heb ik in Januari en Februari 1944 nog eenige reizen heen en terug naar Berlijn. Ik was den laatsten tijd nog wel bij N.V. Philips in dienst, doch deed niets.

Op 21 September 1944 kwam ik te EINDHOVEN in contact met Majoor WATERSCHOOT VAN DER GRACHT van de Amerikaansche dienst O.S.S. Hoe die mij kende weet ik niet. Hij vroeg mij of ik hem over Duitschland in wilde lichten, hetgeen ik voor zoover dit in mijn vermogen lag deed. Hij stelde mij voor terug te gaan naar Duitschland, zoogenaamd als een soort gevluchte N.S.B.er, hetgeen echter niet door kon gaan, omdat ik op de zwarte lijst van de N.S.B. stond. Dat ik in Duitschland geen moeilijkheden heb ondervonden was min of meer het gevolg van het feit, dat ik het hoofd van de Gestapo van het Philipsconcern, genaamd Majoor LIESE, goed kende. LIESE had een vreeselijken hekel aan de N.S.B. LIESE was volgens mij goed en is na de laatste beruchte aanslag op HITLER (Goerdelaffaire) door de Duitschers doodgeschoten. LIESE wist niet wat ik deed, doch was de meening toegedaan, dat ik een harde werker van N.V. Philips was.

WATERSCHOOT stelde mij toen voor mij per parachute in Berlijn neer te laten, hetgeen ik als zelfmoord beschouwde, aangezien ik te goed in Berlijn bekend ben en daarvan de moeilijkheden kende.

In December 1943

Figure D.894: H. van den Berg. 16 January 1945. Hearing of: van der STEENHOVEN Anthony [Nationaal Archief (Den Haag), Ministerie van Justitie Bureaus Kabinet en Juridische Zaken van de Afdeling Politie (1932-) 1945–1952 (-1968), Blok J36, Toegang 2.09.107, Inv. nr. 931].



- 3 -

In December 1943 had ik te BERLIJN van den Gestapoagent, Inspecteur LANGE, die goed was en in contact stond met MILLENAAR, de tip gekregen Duitschland te verlaten, aangezien mijn activiteiten te verdacht werden.

WATERSCHOOT stelde mij vervolgens voor naar STOCKHOLM te gaan om door tusschenkomst van mijn contacten weer contact op te nemen met MILLENAAR, hetgeen ook weer niet door kon gaan vanwege het gevaar voor MILLENAAR. Tenslotte werd mij voorgesteld, dat ik met de bezettende Amerikaansche troepen BERLIJN zal binnenrukken om door mijn contacten de zaak zoo vlug mogelijk voor elkaar te brengen. Intusschen zou ik dan in LONDEN moeten afwachten tot het zoover zou zijn en inmiddels rapport uitbrengen over mijn bevindingen van het laatste jaar. Dit laatste voorstel is door mij aangenomen. Ik ben thans echter door het Nederlandsche Ministerie van Buitenlandsche Zaken aangezocht om onder de naam van Jacob van BERKEL een propagandatour door de Vereenigde Staten van Amerika te maken.

Op 24 September 1944 vertrok ik per jeep naar BRUSSEL. Op 26 September 1944 met een Amerikaansch vliegtuig van BRUSSEL naar PARIJS en vandaar op 29 September 1944 met een Amerikaansch vliegtuig naar LONDEN, op laatstgenoemde reizen vergezled van WATERSCHOOT. Na mijn aankomst in LONDEN bezocht ik gedurende die week op 30 September den Minister BURGER (een overbuurman van mij in Nederland), die onmiddellijk den heer F. van 't SANT opbelde. Die week heb ik zonder medeweten van de Engelsche autoriteiten in LONDEN rondgezworven. Op 2 October 1944 had ik weer een onderhoud met den Minister BURGER en op 3 October 1944 met den Minister President GERBRANDY. Van 5 tot 17 October 1944 ben ik verhoord geworden in de R.V.P.S. Op laatstgenoemden datum werd ik afgehaald door een Amerikaansch officier. Op 18 October 1944 had ik een onderhoud met den heer HAARSMA DE WIT, secretaris van den Minister-President GERBRANDY, de laatste Gezant in BERLIJN, die mij mededeelde, dat ik mij bij Minister KLEFFENS moest vervoegen en dien ik op 23 October 1944 bezocht. Ik werd toen aangenomen voor de propagandatour in Amerika. Op 28 October 1944 ben ik ontvangen bij Prinses JULIANA en op 31 October 1944 bij H.M. de KONINGIN.

Daar ik verwachtte in moeilijkheden te zullen komen in verband met het feit, dat ik niet door een officieele instantie van Nederlandsche zijde was gehoord geworden, heb ik U op aanraden van Hugo KLEIN van den Voorlichtingsdienst, dien ik in Netherlands House ontmoette, opgebeld en om een onderhoud verzocht. Mijns inziens was het ook veel beter geweest, dat de Amerikaansche autoriteiten mijn geval niet geheimzinnig behandeld hadden en mij den officieelen weg hadden laten volgen.

Ik ben officieel door Minister KLEFFEN aangenomen met ingang van 3 November 1944.

De N.S.B.ers die ik kende in EINDHOVEN zijn inmiddels opgeruimd.

Verdere bijzonderheden kan ik U niet mededeelen.

CONCLUSIE: v.d.STEENHOVEN maakt een gunstigen indruk, doch doet erg gewichtig. Mijns inziens is na dit verhoor moeilijk na te gaan of deze man politiek betrouwbaar is. Daarvoor zouden nadere informaties moeten worden ingewonnen.

Londen, 16 Januari 1945.

De wachtmeester tit. der Kon.Marechaussee,

H v Berg

(H. van den BERG).

OPMERKING: Weer een van de gevallen de Nederlandsche instanties volkomen onkundig waren van de aankomst van een Nederlander. Na opname in de R.V.P.S. werd van andere Engelandvaarders vernomen, dat v.d.S. zich daar bevond en later was hij weer op mysterieuze wijze verdwenen.

OK will change 2nd page

RH: How long did you spend in Germany?

J. van B: Well, Mr. Harkness, more than three years if we do not count the time I traveled around in other German-occupied countries.

RH: Did you see many Allied air raids there?

J. van B: Oh, yes, almost more than I could bear. I think in Berlin alone about forty-eight.

RH: When were you in Berlin last?

J. van B: The enemy would like to hear that answer too; it might help them with their counter-espionage work, so let's just say, quite recently.

RH: How much of the city was still standing when you left?

J. van B: I'd estimate about 25% slightly damaged, 25% severely damaged, and the rest totally wrecked.

RH: What was life like in Berlin?

J. van B: If you ask me you can't call that life any more, at least in comparison to life in England, and especially over here. You sleep if you can, you wake up if you're alive, you eat if you can get it, you go to your work if you can get there, you come to your home in the evening if it is still there, and that's about all.

I don't want to exaggerate .... Life was comparatively normal inside Germany until the end of 1943 ....Everything was rationed, and the

486

PAGE 2 PAGE 2

JvB: system worked .... But since the Allied big-scale air offensive -- added to the loss of their occupied territory, the Nazis have had to cut their rations.... Now, compared to the way Americans are living, it is like a hog to a man.

RH: If things are that bad, how do the Germans feel about the war by now and how can they possibly fight on so vigorously?

J. van B: Their great fear of extermination is one of the reasons, especially fear of Russia. I do want to say this: It's not the allied demand for unconditional surrender; the Germans have absolutely no illusions about that. It would be the same even if we offered them other conditions. In their papers and speeches they always refer to the fourteen points of Wilson. The German leaders won't let the people forget that in World War One -- when we held out Woodrow Wilson's fourteen points as a basis for the peace -- that nothing came of ~~it~~ them ... So even if we promised them a soft peace, it wouldn't make any difference.

No, far more important is their optimistic view of allied disunion. This gives them every day new courage to fight on. The average German is convinced of the fact that if they can hold on a little longer the allies are going to fight each other. As we say in Holland, it is good fishing in troubled water for the Germans -- or so they think at least.

RH: That's enough to make us stop and think before we get into squabbles with our allies.

J. van B: Yes. I firmly believe that inter-allied dissension costs allied lives.

PAGE 2a PAGE 2a

J. van B: You wouldn't believe it, but every time a prominent American makes a speech attacking Britain or Russia, or Pravda writes an article criticizing some American or British leader, the Germans headline it in their papers. Dr. Goebbels has found that sort of thing to be the best tonic for German morale.

RH: Did you see any signs of a German underground?

J. van B: For more than three years I've been looking for it, but I could not find any organized resistance, as you find it in the occupied countries. Of course there are a lot of talkers--gripers, you'd call them here--but

PAGE 3 PAGE 3

J.van B: they actually do almost nothing.

RH: You don't think there are many "Good Germans" left, then?

J.van B: No, if there have ever been really good Germans, as we understand it, really democratic I mean, there are very very few left.

RH: How did the "foreign underground" work in Germany? I realise you can't tell the details, since it is still operating; but tell us what you can.

J.van B: Well, this is indeed very hard to answer, but here is a rough outline: We tried to make contacts with other foreign underground people and Germany was a very good placeto do that. In some ways it was easier to work in Germany then in the occupied countries, because in Germany they didn't expect an underground to develop among foreign workers, at first.

RH: How did you utilize the contacts you made?

J.van B: For one thing, there was an organization to get slave-workers home again, and this worked fine. And, of course, we did real intelligence work, the results of which were transmitted via France for instance, to our allied countries.

RH: You visited some of the other occupied countries, did you not?

J.van B: Yes I did. At different times I visited Poland, Czechoslovakia, Austria, and Belgium, as well as Holland.

as
RH: Were the people of those countries/bitter against the Nazis as the Dutch are?

J.van B: This was not easy to judge, but I think I can say that I found nowhere such stubborn resistance as in Poland and Holland. We should not forget

PAGE 4 PAGE 4

J.van B: that Pöland's suffering began in 1939, and the amount of butchery and suffering there was perhaps greater than in any other country.

RH: How did you get to travel to Poland, Czechoslovakia, Austra, and such places?

J.van B: Well, I provided myself with the necessary papers, and please don't ask me how; I stepped on the train and got there and back again, as you see.

RH: You make it sound so simple!

J.van B: It wasn't always that simple/ It's just that I can't tell you all the details. I speak German with hardly any accent, and that was a big help.

RH: What about conditions in Occupied Holland?

J.van B: Conditions there are disastrous. I heard not long ago a German officer say: "What [illegible] do we care whether 2 millions, or 5 millions of Dutchmen are going to die, we shall win this war!" And they really act as if this is their guiding principle. I saw them looting the very last bits of food out of private houses. Mind you not only the SS or Gestapo did this, but all the Germans. Since the allied armies came to a stop, a great part of Holland has been flooded. The/ Germans have looted all means of transportation, so the big cities have been cut off from most of their supplies. Also the anti-German railroad strike is still on, in spite of German threats and persecution. If you try to get food from the farmers on the outskirts of the towns, the Germans take your bicycle. There is very little water, no heating and no electricity because there is no coal. Disease epidemics and starvation are setting in. In Amsterdam there is a typhus epidemic. Potato peels are sold there as food but even they are hard to get—and if this were not enough,
the men
they take all/they can trace for slave work in Germany. If you stick

PAGE 5

~~xaxx~~
J.van B: your nose out of the door, even, you are a lost man. The next thing you know you are in Germany.

RH: Tell me, how dies it feel to be liberated? You just had that experience in S September, when Southern Holland was freed, didn't you?

Yes, —
J.van B: After what I told you about Holland, you can imagine that I still can hardly believe my good fortune at being a free man again. It is marvelous especially for me to be in your fine country, to meet such friendly people and at last to be able to tell everybody the truth about Germany.

RH: I have read a lot about the food shortages in liberated Holland. Are conditions getting better now? ~~Thexmainxthingxtoxthexdutchxisxtoxbexliberated.~~

J.van B: The main thing to the Dutch is to be liberated. Of course, this feeling doesn't give you the necessary amount of calories, but it is marvelous to see how everybody tries to help, and slowly conditions are improving now.

Memorandum to Dr. de Beus: March 31st, 1945

Dr. Slotemaker telephoned me at my home last night regarding the Van Berkel situation. He had already discussed the matter with the Ambassador and I told him that I would be at the Embassy this morning to discuss it further with the Ambassador, if he should so desire, and with you. I suggested two things to Slotemaker before he took action in cancelling the remainder of van Berkel's lecture tour. These were:--

1) A telegram to van Berkel asking him to telegraphically reply as to whether or not he mentioned "a new secret German weapon" in his address and if the press reports of such a mention were, therefore, substantially correct?

2) If correct, whether he received such information since arriving in the United States or had possessed it upon arrival?

3) If he possessed this information on arrival why he had witheld it from responsible Dutch authorities in the United States, including the Director of the Netherlands Information Bureau, which arranged his lecture tour?

It seemed to me that Dr. Slotemaker would have to have more than a newspaper report upon which to act in order to insure a basis of fairness for his action.

Monday Denver.

Jay Jerome Williams

Voor dossier.

Ontvangen telegram van Van Berkel door het N.I.B. dd. 2 April '45

"Made same statement in Boston. Do not know whether press always quoted me alright but doubt it. Source old, but renewed in Boston; spoke about it with Embassy, but did not stress it specially it being a public secret. My former employers did seem very interested. I told you about my peculiar experiences in London and did not want to make myself important. This is my statement literally: "They have a secret weapon on their sleeve; the Allies know exactly what it is but not exactly of they can bring it in a practical form; it is not gas". On question whether it can be used against U.S.A. reporter in Portland seemed convinced himself. I started "I do not know but scientists here seem to be convinced". Source new and I will give you complete details. How about my wife."

April 3rd, 1945

Herewith I wish to inform you that on March thirtieth the following wires were dispatched in connection with the press reports on the interview given by Mr. Jacob van Berkel. The reason why everything was not mentioned in one telegram is explained by the fact that I considered it necessary to take immediate action after receiving the first information about the press reports and the request made by Paramount Pictures.

The first two telegrams were sent via Mr. Sanders in San Francisco and the third and fourth were addressed directly to Mr. van Berkel--

A. "ACCORDING TO PRESSREPORTS VANBERKEL TOLD INTERVIEWER THAT A NEW SECRET WEAPON WILL BE USED SHORTLY BY GERMANS STOP PLEASE CONTACT VANBERKEL IMMEDIATELY AND INSTRUCT HIM MY BEHALF WITH COMPLETE AUTHORIZATION AMBASSADOR TO STOP ABSOLUTELY SPEAKING ABOUT THIS SUBJECT"

B. "PLEASE INSTRUCT VAN BERKEL IMMEDIATELY APPEARANCE NEWSREEL NOT ALLOWED"

C. "CONNECTION YOUR INTERVIEW ABOUT SECRET WEAPON AND MY WIRES PLEASE SEND ME IMMEDIATELY COMPLETE WRITTEN REPORT ABOUT THIS INTERVIEW AND YOUR STATEMENTS"

D. "BESIDES WRITTEN REPORT WHICH REQUESTED IN OTHER WIRE PLEASE WIRE ME IMMEDIATELY FOLLOWING FIRST WHETHER YOU QUOTED CORRECTLY IN STORY AS PUBLISHED IN PRESS SECOND IF CORRECTLY YOUR SOURCE OLD OR NEW THIRD IF CORRECTLY WHY YOU DID NOT INFORM EMBASSY OR MYSELF FOURTH IF INCORRECTLY WHAT YOU REALLY STATED"

Netherlands Embassy
Washington, D.C.

Attention: Dr. J. G. de Beus

486

-2-

In answer to B, I received the following telegram--

"REFUSED ALREADY THREE DAYS AGO BECAUSE THEY INSISTED ON FULL FACE PICTURE-VANBERKEL"

To C and D I received the following--

"MADE SAME STATEMENT SINCE BOSTON DO NOT KNOW WHETHER PRESS ALWAYS QUOTED ME ALRIGHT BUT DOUBT IT FOLLOWING EXPERIENCES SOURCE OLD BUT RENEWED IN BOSTON SPOKE ABOUT IT WITH EMBASSY BUT DID NOT STRESS IT SPECIALLY IT BEING A PUBLIC SECRET MY FORMER EMPLOYERS SEEMED NOT TO BE VERY INTERESTED IN STOP I TOLD YOU ABOUT MY PECULIAR EXPERIENCES IN LONDON AND CONSEQUENTLY DID NOT WANT TO MAKE MYSELF IMPORTANT AND THIS RIDICULOUS STATEMENT IS LITERALLY QUOTE THEY HAVE A S.W. ON THEIR SLEEVE THE ALLIES KNOW EXACTLY WHAT IT IS BUT NOT EXACTLY IF THEY CAN BRING IT IN A PRACTICAL FORM IT IS NOT GAS UNQUOTE ON QUESTION WHETHER IT CAN BE USED AGAINST USA REPORTER IN PORTLAND SEEMED CONVINCED HERSELF I STATED QUOTE I DO NOT KNOW BUT SCIENTISTS HERE SEEM TO BE CONVINCED UNQUOTE SOURCE NEW AND ILL GIVE YOU COMPLETE DETAILS STOP HOW ABOUT MY WIFE --VANBERKEL"

Finally I am enclosing copies of three items carrying the story which appeared in the NEW YORK DAILY NEWS, THE TIMES AND THE BOSTON HERALD. These are only a selection--I call your attention especially to the caption on the Boston Herald"DUTCH ENVOY SAYS NAZIS KEEP DEADLY SECRET WEAPON FOR END". In addition to the AP story which was published throughout the country, it was repeated on the air.

Following up a few telephone conversations with Dr. de Beus, I confirm herewith that I arranged by telephone with Mr. van Berkel that he will return to New York from Denver,where he is at the moment, in order to clarify and discuss this matter. I expect him here this week. It will then be possible to determine whether the lectures already arranged should be cancelled and if so, what explanation should be given in order to avoid undesirable repercussions, since cancelling such an extensive prearranged trip is a serious decision.

I confirm here the suggestions made over the telephone by Dr. Ries to Dr. de Beus that the State Department be informed that Mr. van Berkel denies that he gave the statement as was published, quoting Mr. van Berkel(see his wire), and informing them that this statement as published cannot, moreover , be considered as having an official character.

Orange City, Iowa.

My dear Lt. Thomson:

I was very glad to receive your letter of the 17th inst. from which I see with pleasure that you share the high opinion that is generally held of the talks that were recently given in this country by Jacob van Berkel, whose real name, by the way, is Anton van den Steenhoven.

He told me a short time ago that he hopes to go on European leave in the near future, and that he may return to the United States. If these plans materialize, arrangements for his future lectures will not be made by me but I am forwarding a copy of your letter to the proper authorities with the request to communicate with you in the event Mr. Van den Steenhoven can resume his lecturing activities in this country.

Thanking you for communicating with me, I am

Yours sincerely,

J. A. Schuurman
Consul General

May 25th, 1945

In connection with the teletype message I received in San Francisco on May fifteenth from Dr. de Beus, I can report on my conversation with Mr. Pelt concerning Mr. van Berkel's position in London after he returns from this country as follows:

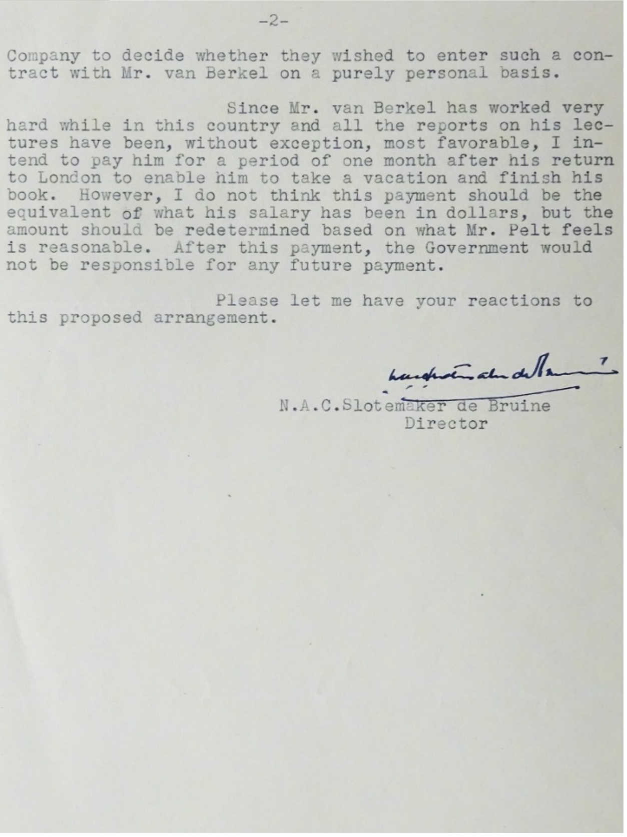
Mr. Pelt takes the position that since Mr. van Berkel will not be working for the Netherlands in England, he cannot include his salary in the London budget,--moreover, he has never been on Mr. Pelt's payroll. In view of these facts, Mr. Pelt sees no reason why he should ask the Netherlands Government to increase his budget to cover Mr. van Berkel's salary.

I discussed the matter also with the Minister of Foreign Affairs, who informed me that Mr. van Berkel was sent to this country on a special assignment for a limited period, and as soon as the assignment has been completed, there is no reason for keeping him on the Government's payroll. It was mentioned that Mr. van Berkel might go back to Philips.

It is my understanding that Mr. van Berkel is to leave this country in the beginning of June. As he informed me, he has a contract with the Crowell Publishing Company to write a book on his experiences, in which he will bring out the fact that at that time the Germans were preparing already for World War III. One of the editors of the Crowell Publishing Company came to see me and mentioned that it was this feature which made a contract with Mr. van Berkel attractive. I pointed out during this conversation that I could not assume any responsibility for the contents of Mr. van Berkel's book,and that it was entirely up to the Crowell Publishing

Netherlands Embassy
Washington,D.C.

Attention: Dr. J. G. de Beus



-2-

Company to decide whether they wished to enter such a contract with Mr. van Berkel on a purely personal basis.

Since Mr. van Berkel has worked very hard while in this country and all the reports on his lectures have been, without exception, most favorable, I intend to pay him for a period of one month after his return to London to enable him to take a vacation and finish his book. However, I do not think this payment should be the equivalent of what his salary has been in dollars, but the amount should be redetermined based on what Mr. Pelt feels is reasonable. After this payment, the Government would not be responsible for any future payment.

Please let me have your reactions to this proposed arrangement.

TELEPHONE: COLUMBUS 5-6216

June 5th, 1945

In answer to your letter of June first, #P-1762, I confirm that I am indeed in favor of Mr. van Berkel returning to this country later on for further lecturing. So far he has accomplished much and, after a stay in Holland where he would obtain new impressions and additional information, he would be able to still do much for our cause here.

However, it is an open question as to whether the American authorities will allow him to return, but this need not be gone into at the moment. If it is decided that he is to return, I suggest he not return under the auspices of the Netherlands Government if it can be arranged otherwise. Were this necessary for formal reasons, it should be made clear that the Netherlands Government will not pay his salary or expenses--for instance, American Relief for Holland might take this on.

I have informed the Acting Director of the Netherlands Government Information Bureau in London of the arrangements whereby I intend to pay Mr. van Berkel's salary for one month after his return to England.

[illegible]

N.A.C.Slotemaker de Bruine
Director

Netherlands Embassy
Washington,D.C.

Amice:

Enclosed herewith I am sending you a copy of my letter of May twenty-fifth to the Embassy, #502804SB/CRS, together with a copy of the Embassy's reply, #P-1762,of June first.

Mr. van Berkel is scheduled to leave the United States around the middle of June, and I hereby authorize you to pay him one month's salary after his arrival in England. The amount should be the equivalent of salary paid in England to a First Lieutenant(married), and our account is to be charged with this.

As you will see from the enclosed correspondence he has done an excellent job lecturing here. I need not go into all the details here, which at times caused us quite a headache, especially the attitude taken by the American authorities, but will discuss all this when I see you.

Figure D.901: Jacob Kistemaker was one of the developers of uranium gas centrifuges; his code name "Oliver" (bottom left) appeared on a postwar list of other U.S./U.K. intelligence sources [NARA RG 77, Entry UD-22A, Box 169, Folder British Liason]. Kistemaker's wartime work and allegiances are rather murky [Goudsmit 1947, pp. 37–46; Klinkenberg 1971; Van Calmthout 2018, pp. 129–148]. How much did he know and reveal about the wartime German nuclear program?

Col. J. H. De Boer
Netherlands Government
Arlington House
London W 1, England

Dear De Boer:

I have had some dealings with the Netherlands Attaché in Paris and recently received a cable from them asking some important information. I now received a letter from Rosbaud in which he mentions that the colonel in question has been dismissed. I would appreciate getting some more information about this and would like to know who is taking his place.

I hear that you are staying [in] England. I had a very interesting trip on the continent. I returned straight from there to the States in October [1945] and had to give up my plan to spend a couple of weeks in England. [...]

[Jan Hendrik de Boer (Dutch, 1899–1971) was a physical chemist who was closely connected with the Dutch and German scientific communities. He was apparently one of the leaders of a Dutch spy network that obtained information on the wartime German nuclear program. The Manhattan Project contacted him in 1944 via Samuel Goudsmit (p. 4398).

Paul Rosbaud (Austrian, 1896–1963) worked as a metallurgist in Germany but secretly provided information on the German nuclear program to U.K. and U.S. intelligence.

Samuel Goudsmit's entire folder of Dutch intelligence on the German nuclear program [NARA RG GOUDS, Entry UD-7420, Box 3] remains classified and unavailable 75+ years after the war ended (Fig. D.902). Why is that the case, if the German nuclear program said to be so small and ineffective?]

Dutch Aide Seized as Spy in Prague. *New York Times* 29 August 1948.

Police Say He Confessed and Named Foreign Superiors—Czech Group Also Accused

[...] The police disclosed that Leonardus Bartolomeous van Dam, described as investigation officer at the Netherlands Embassy, had been taken into custody together with a group of Czechoslovaks.

Mr. van Dam confessed to police, according to an official announcement, and gave the names of Netherlands officials who instructed him to carry on military and political espionage in Czechoslovakia. The same official announcement said several important documents were found on him and that these seriously implicated other subjects of Netherlands in espionage in Czechoslovakia. The documents, according to the statement, reveal the methods of the foreign intelligence service in question and the tasks laid down of its agents to execute.

Dutch officials told the United Press that Mr. van Dam was attached to the Netherlands Ministry of Social Affairs and did not have diplomatic immunity. He had been collecting death certificates and other data on Dutch slave laborers under the German occupation in Czechoslovakia. [...]

[Leonardus Bartholomeus van Dam (1917–1983; https://www.tracesofwar.com/persons/65909/Dam-van-Leonardus-Bartholomeus.htm) was a very important Dutch spy working for the resistance and reporting to the Allies during the war, and from this report he apparently continued to spy on German technologies and sites after the war.

Even for at least three years after the war ended, Dutch intelligence continued to collect information on wartime German secret weapons programs that had been conducted in Czech territory (and elsewhere), and on how the advanced technology left over from those programs was being exploited by Russian and Czech military forces. That seems to be another indicator of how advanced and how strategically important the wartime German programs were.

Can files detailing the wartime German secret weapons programs, as well as their postwar investigation and exploitation, be located in Dutch archives and released to the public now?]

D.14.4 French Intelligence

[In a fashion highly analogous with Dutch intelligence, there is evidence that French intelligence may have provided information about the German nuclear weapons program to the United States during and after the war.]

Rodney P. Carlisle, ed. 2005. *Encyclopedia of Intelligence and Counterintelligence.* New York: M.E. Sharpe. p. xxi.

c. 1940
Jacques Bergier of the Red Orchestra network helps establish French MARCO POLO group which gains information about German atomic program under Werner Heisenberg and the development of the V-1 and V-2 rockets.

Présidence du Gouvernement Provisoire de la République Française. 30 April 1945. No. 205/2. English translation. [Document courtesy of Andreas Sulzer]

Source: Commandant CHIGOT

Origins: Interrogation of repatriates of the Reprisal Camp of MAUTHAUSEN, particularly the following:

MARCO POLO whose correct name is not known, but is probably known to the D.G.E.R.

RABATE, member of the Communist Party, whose wife is Communist Municipal Councilor in Paris.

Information received indicates that the Germans started on 22 April the massacre of the 80,000 men and women interned in this camp.

These massacres would be completed before the arrival of Russian troops.

Mr. BURCKARDT sent a message, by a convoy leaving for MAUTHAUSEN, to the German commander of the camp, warning him that he would be held responsible if these massacres continued.

It would seem necessary to intervene by force, or if that is impossible to parachute arms and ammunition in order to at least permit these men to defend themselves before being killed.

The Germans have removed from MAUTHAUSEN the Spanish Communists and the Austrian anti-Nazis, dressed them in SS uniforms, and placed them on the bridge of LINZ to be massacred by the Russian troops.

In Block VI of the camp at MAUTHAUSEN is M. Jacques BERGIER, a great specialist on the splitting of the atom.

The Germans have given him a false identification as a Polish Jew; it is requested that everything humanly possible be done to find M. J. BERGIER and to save him regardless of cost.

Jacques Bergier. 1977. *Je Ne Suis Pas Une Legend.* Paris: Retz. pp. 131–132.

Le convoi qui m'emmenait de Sarrebruck arriva à Mauthausen dans la soirée du 2 avril 1944. [...]

Personnellement, je n'ai quitté le camp que le 19 mai 1945, car avant d'être rapatrié par avion, il me fallait régler un certain nombre de problèmes d'importance vitale pour l'avenir. J'avais en effet reçu des confidences, *in articulo mortis*, donnant la solution d'importantes affaires de trahison et il convenait d'en avertir immédiatement le gouvernement français afin qu'il procède à l'arrestation des coupables, ce qui fut fait. Je possédais aussi des renseignements sur de nouvelles armes allemandes et sur les endroits où l'on pouvait soit les trouver à l'état de prototype, soit se procurer la documentation les concernant. Près de huit cents kilomètres de microfilms sur les armes secrètes ont été ainsi découverts.

The convoy that took me from Saarbrücken arrived in Mauthausen on the evening of 2 April 1944. [...]

Personally, I did not leave the camp until 19 May 1945, because before being repatriated by plane, I had to solve a number of problems of vital importance for the future. I had indeed received confidences, at the moment of death, giving the solution of important treason cases and it was necessary to immediately inform the French government so that it could arrest the guilty parties, which was done. I also had information on new German weapons and where they could be found in prototype form or where to obtain documentation about them. Thus nearly eight hundred kilometers of microfilm on secret weapons have been discovered.

[Jacques Bergier had a scientific background, like many others who were sent to the underground Gusen facilities that were part of the St. Georgen-Gusen-Mauthausen camp system [https://www.jewishgen.org/databases/Holocaust/0117_Mauthausen-Gusen-Death-Book.html]. From the available documentation and Bergier's own writings, it is very unclear what work he did at Gusen, but it may have been related to his knowledge of nuclear physics. The fact that even the scientific prisoners at Gusen were issued false identification papers suggests an extreme level of security about the work that was conducted there.

From the available documentation, Bergier and his associates appear to have provided valuable information about German technologies to Allied intelligence, both during and after the war. That suggests that at least parts of those technologies were being developed at Gusen. However, it is quite unclear just what the technologies or the information were.

Can additional relevant documents be located and released from French, U.S., or other archives? Where is the "nearly eight hundred kilometers of microfilm on secret weapons"?]

AMERICAN EMBASSY
OFFICE OF THE MILITARY ATTACHÉ
1, GROSVENOR SQUARE, W. 1
LONDON, ENGLAND

17 April 1945

Subject: Secret Weapon Experiments In "German Redoubt".

To : Major F. J. Smith, Room 5119, New War Dept. Bldg., Washington, D. C.

On 14 April 1945, at 1034 hours, the French Telegraph Service broadcasted the following which is thought to be of interest to your office:

"German border: Somewhere in the "German redoubt", there are reported to exist great underground laboratories where scientists and technicians have been ordered by Hitler personally to go on with experiments with new secret weapons. The Fuehrer feverishly follows their work. The weapons are said to include 'V6', the famous atomic bomb. They had already vainly tried to work on this in the thick-walled, windowless casemates discovered in Strasbourg. They contained a special apparatus for producing an electric arc of enormous power, which was used for researches in the disintergration of matter. In addition to reserves already accumulated, the laboratories in the 'redoubt' are still producing gas. One of these gases is harmless in the open air, but becomes toxic by contact and chemical combination with the substances in the intake tube (cartouche) of gasmasks, meant to neutralise the action of other gases."

Figure D.904: After the war, France hired many Germans who had worked on the nuclear weapons program (e.g., pp. 2069, 4921, 5698), such as engineer Saur, who had expertise in mechanical and electrical engineering and had constructed non-nuclear components of "atomic bombs" for "V projects" (missiles) from 1940 to 1943 [Archives of the French Army Ministry of Defense, courtesy of Norberto Lahuerta].

D.14.5 German and Japanese Submarines

[In May 1945, the German submarine U-234 surrendered to the United States and was found to be carrying a large and diverse cargo of high-tech materials (including uranium), prototypes, plans, and scientific experts originally intended for Japan. Details of that cargo and how it was ultimately used by the United States remain very mysterious, despite the efforts of a number of investigators [e.g., Brooks 1992, 2002; Grunden 2005; Gutzeit 2001; Hirschfeld 1991; Hirschfeld and Brooks 1996; Hydrick 1998, 2016; Naujoks and Nelson 2002; Scalia 2000; Sellwood 1956; Robert K. Sutton. 2021; Trevethan 1999; Wilcox 2019; *Boston Globe* 1993-07-27; NYT 1995-12-31].

Note that a number of other German and Japanese submarines evacuating materials, documents, and personnel from Germany were also captured or sunk by Allies, or made it through to countries such as Japan and Argentina; details of what those submarines carried are even less clear than for U-234.]

Wolfgang Hirschfeld, Chief Radio Operator of U-234. Wolfgang Hirschfeld and Geoffrey Brooks. 1996. *Hirschfeld: The Story of a U-Boat NCO 1940-1946.* Annapolis, Maryland: Naval Institute Press. pp. 198–200, 216–217. [Hirschfeld's spelling, Falk, has been corrected to Falck in the passage below.]

The most important and secret item of cargo, the uranium oxide, which I believe was highly radioactive, was loaded into one of the vertical steel tubes one morning in February, 1945. Two Japanese officers were to travel aboard *U-234* on the voyage to Tokyo: Air Force Colonel Genzo Shosi, an aeronautical engineer, and Navy Captain Hideo Tomonaga, a submarine architect who, it will be recalled, had arrived in France aboard *U-180* about eighteen months previously with a fortune in gold for the Japanese Embassy in Berlin. I saw these two officers seated on a crate on the forecasing engaged in painting a description in black characters on the brown paper wrapping gummed around each of a number of containers of uniform size. At the time I didn't see how many containers there were, but the Loading Manifest showed ten. Each case was a cube, possibly steel and lead, nine inches along each side and enormously heavy.

Once the inscription *U235* had been painted on the wrapping of a package, it would then be carried over to the knot of crewmen under the supervision of Sub-Lt Pfaff and the Boatswain, Peter Schölch, and stowed in one of the six vertical mineshafts.

I asked Tomonaga what the lead cubes contained, and he said, 'It is the cargo from *U-235*. That boat is no longer going to Japan.' When I enquired at the 5th Flotilla Office, they told me that *U-235* was a small Type VII training U-boat which had never been earmarked for operations outside the Baltic. So I knew that Tomonaga had lied to me. I mentioned all this to Lt Cdr Fehler that evening, but he told me not to bring up the subject again with the Japanese. Recently I was informed by the naval historian Professor Jürgen Rohwer that the nuclear material had been requested, probably in the military attaché code, at the end of December, 1944, or very early in 1945. The Japanese Military Attaché in Berlin, Kigoishi, organized the transport of the material with the German authorities and from the quayside at Kiel had watched the loading of the ten cases of uranium oxide into *U-234*. This seemed to me to confirm that the uranium oxide was of a nature which rendered it of especial value to the Japanese.

When the loading of *U-234* was finished it was estimated that the total weight of the cargo was 260 tons.

[...] The eleven passengers boarding in Germany were the two Japanese, Lt Cdr Richard Bulla, a specialist in air-sea cooperation, who was also the First Lieutenant, and the following eight;

> Colonel Fritz Sandrath (Luftwaffe); former head of Bremen AA defences.
>
> Colonel Erich Menzel (Luftwaffe): technical aide to the Air Attaché, communications
>
> Lt Cdr Heinrich Hellendorn (Navy); specialist in naval AA gunnery.
>
> Captain (Eng.) (S) Heinz Schlicke (Navy, honorary rank); radar, infra-red and direction finding scientist.
>
> Lt Colonel Kai Nieschling (Luftwaffe): Nazi military judge.
>
> Captain Gerhard Falck (Navy): specialist in shipbuilding and design.
>
> August Bringewald: Senior Messerschmitt engineer, Me 262, Me 163 and rocketry.
>
> Franz Ruf: procurement specialist for Messerschmitt.

[Did U-234 carry additional technical experts not listed here? See p. 4891.]

The final passenger was to board in Norway. Nieschling, the judge, was going to investigate allegations against Embassy staff implicated in the Sorge spy scandal and to keep an eye on other passengers during the voyage. The two Japanese, Nieschling and Falck slept in the deck below the NCO's quarters while all remaining passengers slept where they could.

The US National Archive has now declassified a document under reference *373/3679/Box 22/FOLDER OP-16-Z Day File 1/1/45.* This is a memorandum concerning the interrogation of Judge Nieschling. No Memorandum regarding the interrogation of Captain Gerhard Falck has ever been released.

Personally I saw very little of Falck who never socialized except with the Judge.

In the Memorandum [...] Nieschling said that 'the meaning behind the ore' was known to Gerhard Falck, who had taken some secret courses before he boarded *U-234* and was to be chief technician on all naval matters in Tokyo under Admiral Wenneker.

On the afternoon of 25 March, 1945, squatting low in the water from all the fuel, ammunition, provisions, and cargo she had aboard, *U-234* dieseled out of the U-boat basin into the Förde.

[... After surrendering to the USS *Sutton*:] The *Sutton* dropped anchor outside the harbour of Portsmouth, New Hampshire, on the glorious morning of 19 May, 1945. [...]

The ten specialists were driven off to a secret destination. We located them all after the war with the exception of Captain Gerhard Falck. Possibly, like Peter Schölch, our Boatswain, and Lt Pfaff, who loaded and unloaded the uranium cases, he accepted US citizenship in exchange for his silence. But as Judge Nieschling said, Falck knew everything about the uranium oxide, and he probably knew too much for his own good. His eventual fate after he disappeared into the abyss on 19 May, 1945, remains a mystery.

[Gerhard Falck was apparently the resident expert on the uranium and how to use it. Note that he was closely guarded during the voyage and mysteriously vanished after it. In the publicly available transcripts of his May–July 1945 interrogations by U.S. authorities, the uranium is never mentioned [NARA RG 38, Entry UD-38, Box 13]. Can transcripts of his interrogations about the uranium be located, declassified, and released? Could his prior history and connections in Germany be traced?

Heinz Schlicke may have been in charge of detonators for fission implosion bombs, as shown in the documents on p. 4882.

Captain Johann Fehler recounted the general details of U-234's voyage to the British naval journalist Arthur V. Sellwood. Fehler said the submarine carried over 260 tons of important cargo, but otherwise he was remarkably close-lipped about the details of that cargo, even over a decade after the war [Sellwood 1956, p. 137].

The U.S. National Archives appears to have only seven small boxes of information from or about the U-234's cargo [NARA RG 38, Entry UD-16, Boxes 3–8 and RG 38, Entry UD-38, Box 13]. Where are the over 260 tons of documents, prototypes, and other cargo from the U-234, as well as all of the information the United States compiled in the process of analyzing them?

Where is all the cargo and documentation for at least five other German submarines filled with high-tech cargo that were captured at the end of the war (p. 4892)?]

18 May 1945

MEMORANDUM FOR:
Captain Herbster
Deputy Commander Northern Group

Subj: Publicity on surrender of U-234.

At 1745 yesterday (Thursday, 17 May) I received from Captain George W. Campbell, Deputy Director of Public Relations, Navy Department, a telephone message stating that ComInch now authorizes me to permit press, radio and photographic coverage of the arrival of the U-234 at Portsmouth tomorrow morning with these two exceptions:

1. No press interviews with the prisoners will be permitted.

2. No press representatives will be permitted to go aboard the U-boat.

In response to questions, Captain Campbell stated that press and radio representatives and photographers may be taken in small craft to view and record the arrival of the U-boat at the buoy in Portsmouth Harbor, that photographs of this event may be taken but that it probably will be impracticable to arrange for photographs of the prisoners ashore. (Captain Campbell did not say such photographs were not to be permitted, providing circumstances made them feasible).

? definite confirmation

In short, Captain Campbell said we would handle the U-234 just as we have been handling press coverage of the preceding 3 U-boats, except that there will be no press interviews with the prisoners.

Lieut. Comdr. Allan Keller, PRO, CESF, informed me he had received similar instructions last night from Captain Campbell, who informed him that Admiral McCann would call Admiral Leary last night and confirm the instructions.

N. R. Collier

Jack H. Alberti to John L. Riheldaffer. 22 May 1945. Subject: U-234. [NARA RG 38, Entry UD-38, Box 13, unlabelled folder]

1. The cargo of this U-boat consisting of some eight tons of documents, one ton of diplomatic mail and approximately 210 tons of miscellaneous cargo including numerous explosives, fuses, prototypes of radar, etc., is stowed in steel tubes fitted into the mine shafts of the boat. It is believed that the documents are not stowed in separate shafts but together with other cargo. The Portsmouth Navy Yard intends to unload these tubes and forward them "as is" to their destination. It is believed possible that some of these tubes contain hydrostatic scuttling charges designed to blow up the tubes in case of jettisoning. The tubes are sealed shut and will have to be opened with an oxyacetylene torch. Instructions are requested as to whether or not these tubes are to be opened at Portsmouth for segregation of their contents or if they are to be shipped to Washington unopened.

U-234, U-805, U-873. Undated but apparently late May 1945. [NARA RG 38, Entry UD-38, Box 13, unlabelled folder]

U-234

U-234, a type XB boat under Fehler, left Kristiansand on 14 April 1945[...] She carried 240 tons of cargo for Japan including one ton of diplomatic mail. While in transit she made or received no attacks. The ship's ciphers and papers were jettisoned, Fehler saying this was done by orders of Bdu. [...]

U-805

Interrogation of crew of U-805 reveals she left Kiel 10 February and Trondheim on 17 March. [...] After receipt of surrender orders, the commanding officer destroyed the envelope containing the special CO code, Kartenschluessel and Kurzsignal heft. Commanding Officer and second watch officer will be sent Washington for further investigation. [...]

U-873

U-873, commanded by Steinhoff, left Kristiansand about 1 April[...] All ship's papers and code machines were destroyed. In her ballast tanks was stowed a cargo of mercury and optical glass, and she was originally scheduled for Japan voyage instead of U-234. [...]

Figure D.910: U.S. Navy Secret Dispatch 151716. 15 May 1945 [NARA Boston RG 181]

Captain Johann Fehler [Sellwood 1956]

[p. 137] The fitting-out of our U-boat proved interesting enough, and more complicated than we had thought. The packing side of it was extremely tricky, for some of the cargo was extremely sensitive to condensation, and every drum had to be thoroughly sealed before being cased in a protective skin of chemicals. Command now wanted us to carry an increased quota: this time we used reserve torpedo cylinders as containers . . . cutting deep into our diving tanks in order to stow them.

Finally our submarine was almost bursting at the seams. We had managed to take on board over two hundred and sixty tons of cargo!

[p. 195] The Yanks had left a strong guard on the *U-234* to supervise Bulla and his men. Now the buzz went round the *Sutton* that one of the Americans had been shot in the stomach. The Captain sent for me and I arrived at his cabin a very worried man, wondering what the hell had gone wrong, and which of my boys had fired the blasted bullet. It turned out, however, that there had been no quarrel. The guard had been accidentally shot by his own pal. They had been fooling around with a pistol in the W/T locker. He was badly wounded, but our [German] doctor was looking after him until a U.S. warship, equipped with an operating theatre, arrived. [...]

At first I bewildered. Then I got annoyed. I had handed over a U-boat not a kindergarten.

Jack H. Alberti to John L. Riheldaffer. 22 May 1945. Subject: Report on Events at Portsmouth Navy Yard in Connection with the Surrender of German Submarines U-234, U-805, U-873 and U-1228. [NARA RG 38, Entry UD-38, Box 13, unlabelled folder]

I. LOOTING

The usual extensive looting by boarding parties from the DE's had taken place. In the case of the USS SUTTON, which captured the U-234, interrogators were able to board the destroyer and examine the "souvenirs". Items of possible intelligence interest were removed, but the great majority of souvenirs were left in the hands of the ships' crews. There was no looting of prisoners about the USCG ARGO or aboard the tugs ENSEMORE and YAKIMA.

Because of the need of the presence of one of the interrogators, Lt. Cdr. Hatton, aboard U-234 until her docking, the passengers aboard this U-boat were accompanied to the Portsmouth Naval Prison on arrival by interrogators Lt. Maxwell and Mr. J. H. Alberti. These passengers were personally searched by these two interrogators.

The crew of the U-boat and their baggage were searched in the cell block by Marine guards in the presence of five or six Marine officers and at least two U.S.N. Medical Officers attached to the prison. Practically all items of value, such as watches, rings, decorations, wallets, even those containing personal photographs, etc. were looted from the prisoners. In some instances where enlisted men had taken watches from prisoners, these watches were taken from the enlisted men by Marine officers who retained them as souvenirs. This action has had a most detrimental effect on interrogation of the crew and jeopardizes the willingness to cooperate on the part of those members of the crew retained aboard the U-boats.

After the departure for Washington of the passengers, accompanied by Lt. Maxwell, the presence of Mr. Alberti was required aboard the U-boat. [...]

Looting aboard the U-boats at the dock has been carried on in a very large scale, both by members of the naval working party aboard and the Marine guard establishment. [...]

II. SAFETY OF THE CAPTURED GERMAN U-BOATS

All four U-boats carried large quantities of liquor. [...]

On the morning of 20 May, Lt. Ewald of Op-20-G boarded U-234 and found U.S. Naval ratings drunk aboard. At various times on 20 and 21 May, U.S. Naval ratings were found asleep in the bunks while on duty in U-234. [...]

The captain of the U-234, while complaining to interrogating officers about the looting of the personal effects of his crew and himself, mentioned that he was all the more indignant at this treatment considering that all he had to do was to pull a lever and everyone of his mine shafts would have been emptied of their contents. [...]

[Jack Alberti, though an American himself, gave extremely unflattering descriptions of the behavior of the Americans who received this submarine, which had made such a remarkable journey to deliver over 260 tons of the world's most advanced technologies.

Johann Fehler also described in detail widespread conduct among the receiving American forces that was highly unprofessional, unethical, and uneducated [Sellwood 1956].

The "extensive looting" that was "carried on in a very large scale" (in Alberti's words) makes it even more difficult to reconstruct exactly what information and items were carried by the submarine and its personnel.]

U.S. Navy Secret Dispatch 222115. U-234, Disposition of. 23 May 1945. [NARA Boston RG 181]

Desire following accomplished cargo U-234... All material after rendering safe by mine disposal personnel placed safe stowage and inventory list sent CNO who will give shipping instructions and will control access to and disposition of all cargo due to vital importance to Pacific War.

[See document photo on p. 4871.]

Lt. Best. 24 May 1945. Report of Interrogation: PW: NIESCHLING, Kay. [NARA RG 38, Entry UD-38, Box 13, Folder U-234]

Veracity:

The following is believed reliable.

Report: Regarding "URANIUM OXIDE" and other CARGO aboard U-234:

P/W does not know anything in particular about this ore, but only heard that it was valuable and that it was to be exchanged for some other valuable ore that the Germans needed.

Lt. PFAFF was the man responsible for loading the U-Boat.

The meaning behind the ore would, according to P/W be known by the technician Fregattenkapitan FALCK (Commander). The latter also knows magnetic problems, Naval mine problems, Naval building problems. He also took some secret courses before he boarded the U-Boat. Was to be chief technician on all naval matters under Admiral WENNECKER.

Captain FEHLER as commander of the U-Boat should also know something about the ore.

It may be important to contact a man named Korvettenkapitan BECKER (Lt. Commander), living in KIEL-WIG, who was a member of the Marine Sonderstabzweigstelleheimat. (Special Naval Home Sub-station Branch).

This man traveled to the various factories in NUERNBERG and others in South Germany. He was responsible for contacting the various agencies regarding what and how much was to be included in the cargo.

The Marine Attache Abt. in Berlin Oberkommando, Referat Japan under Captain zur see "SOUCHON" decided together with the Japanese just what the most important things were that should be included in the cargo. The latter's assistant a Korvettenkapitan von KROSIGK (Lt. Commander) also should know the details.

Figure D.911: U.S. Navy Secret Dispatches [NARA Boston RG 181]

U.S. Navy Secret Dispatch 262151. Subject: Mine Tubes, Unloading of. 27 May 1945. [NARA Boston RG 181]

Interrogation Lt Pfaff second watch officer U-234 discloses he was in charge of cargo and personally supervised loading all mine tubes.

Pfaff prepared manifest list and knows kind documents and cargo in each tube.

Pfaff states long containers should be unpacked in horizontal position and short containers in vertical position.

Uranium oxide loaded in gold lined cylinders and as long as cylinders not opened can be handled like crude TNT.

These containers should not be opened as substance will become sensitive and dangerous.

Pfaff is available and willing to aid unloading if RNEDT desires.

Advise.

[See photo on p. 4873. Lt. Pfaff, the German naval officer in charge of loading the U-234's cargo, specifically informed the U.S. Navy that the uranium oxide was stored in many separate, sealed, gold-lined cylinders. Moreover, he told the U.S. Navy that the uranium oxide could be dangerous if the cylinders were opened and it were mishandled, just as TNT would. Pfaff's warning suggests that the uranium might have been capable of starting a neutron chain reaction if the cylinders were opened and gold shielding no longer separated the individual pieces of uranium from each other.

Gold is very resistant to chemical corrosion, and it is extremely dense, which makes it good at shielding neutrons or other radiation. Unenriched uranium oxide is not dangerously radioactive and would require no special shielding or packaging. Furthermore, unenriched uranium oxide could not form a critical mass and initiate a neutron chain reaction no matter how much was brought together and how it was mishandled, so there would be no need to package it into many separate, sealed, gold-lined cylinders and issue warnings about it being dangerous and explosive if mishandled.

On the other hand, storing small quantities of uranium in many separate, sealed, gold-lined cylinders would be exactly the right approach for handling weapons-grade, highly enriched uranium. When the United States produced and shipped weapons-grade, highly enriched uranium from Oak Ridge to Los Alamos, it did in fact divide the uranium into many separate, sealed, gold-lined containers, as documented on pp. 4874–4875.

Of course, there are many possibilities. Maybe all of the uranium oxide cargo of U-234 had been highly enriched, in which case 560 kg would provide enough for a shockingly large arsenal of $\sim$10–100 fission bombs, depending on their size and design. Perhaps the uranium oxide had been somewhat enriched, but not yet to weapons-grade levels. Maybe different batches of the uranium oxide had been enriched by different amounts. Perhaps the uranium oxide was unenriched or only somewhat enriched but had been neutron-irradiated inside a functioning fission reactor somewhere in the Third Reich, which would have made it highly radioactive and also a good source for extracting plutonium-239 that had been produced in the process. One might imagine other possibilities as well. Thus it is very important for future archival researchers to find historical documents that will answer these questions.]

Oak Ridge National Laboratory. Operations start and shipments begin.

[The uranium transported on the U-234 was stored in many separate, gold-lined cylinders. As described below, highly enriched uranium was transported from Oak Ridge to Los Alamos in many separate, gold-lined cylinders. There was no need to transport unenriched uranium in such an elaborate fashion.]

The first successful shipment from Y-12 served also to demonstrate that the concept of a production factory was basically in place. The process included the full sequence of events required to take uranium ore and process the material to the final special end product of uranium 235 suitable for shipment by courier.

A most unusual method was used to transport this extremely valuable material. It was carefully packaged in a small room in the center of Building 9733-1. Then the material was placed in gold-lined nickel containers about the size of coffee cups. Two of these containers were placed in a briefcase size container and the container strapped to an Army Lieutenant's arm. He was dressed in a suit to look like a salesman and along with a couple of other Army personnel also dressed as salesmen, was driven to Knoxville where he boarded a passenger train to Chicago.

At Chicago, the courier transferred his case to yet another Army Lieutenant also dressed as a salesman who took the material on to Los Alamos. A new set of escorts were assigned to this new courier and the original group returned to Oak Ridge by way of Knoxville.

In *The New World*, by Richard G. Hewlett and Oscar E. Anderson Jr., the following description is provided regarding the transportation of uranium-235 from Y-12 to Los Alamos.

> "Transporting the precious material to Los Alamos involved all the melodrama of an undercover operation.
>
> "Since air travel seemed too risky, the Army shipped the product by rail. The containers of uranium tetrafluoride were placed in special luggage. At 10:30 a.m. on specified days, armed couriers wearing civilian clothes took the shipments to Knoxville in an unmarked Chevrolet sedan with Tennessee license plates. At 12:50 p.m., the couriers left for Chicago in a private compartment aboard the 'Southland.'
>
> "Arriving in Chicago the next morning, the Oak Ridge couriers were met by Chicago couriers who boarded the Santa Fe 'Chief' for the long ride west. The next day at 2:10 p.m., a car from Los Alamos met the train at Lamy, a way station in the New Mexico desert. There was some danger that conductors, porters, and station attendants might come to recognize the couriers no matter how hard they tried to make themselves inconspicuous, but train transportation was cheap and relatively safe."

That "special luggage" mentioned in the book was a briefcase-type container with two coffee-cup-sized gold-lined nickel containers. The "briefcase" was strapped to the arm of an Army lieutenant who was dressed to look like a salesman.

This method of shipment kept folks in Knoxville asking, "What's going on over there at Y-12?" They saw trainload after trainload of building materials going to Oak Ridge, but they never saw anything being shipped out because they did not expect the product to be shipped in something as small as a briefcase.

Here's another story that shows the value placed on the uranium 235. The entire Y-12 production of U-235 prior to the dropping of the bomb Little Boy passed through room 22 of Building 9733-1. At one time, there were bars on the windows and a guard was posted outside the door to protect the output of Y-12's calutrons. The material was processed in one kilogram batches.

Twenty-four karat gold trays weighing about four pounds were used to process the material. The first batches were ground by hand using a mortar and pestle made of nickel. After the grinding operations, the workers had to check under their fingernails to be sure the material had not accumulated there.

The coffee-cup-size nickel cylinders used to transport the U-235 were made by a group in the Y-12 shops headed by Jack Case, Y-12 plant manager from 1967 to 1982 and namesake of the Jack Case Center. They were gold plated in Slack's Plating Shop in Knoxville. Johnsson was driven to Knoxville to deliver and pick up the cylinders by one of Y-12's Motor Pool drivers (a Mrs. Justice).

The filled cylinders were delivered to Captain Lloyd Zumwalt, who was located in an office two blocks from Building 9733-1. When the captain found out they were walking with cylinders containing U-235, he instructed those delivering it to, "Call for a car. If you got run over it would be a mess to dig up the ground to recover the uranium but in a car it would be all in one place."

U.S. Navy Secret Dispatch 292045. Subject: U-234, Cargo Information. 30 May 1945. [NARA Boston RG 181]

Lieut Comdr Karl B Reese USNR, Lieut (JG) Edward P McDermott USNR and Major John E Vance CE USA [Corps of Engineers, United States Army] will report to commandant May 30th Wednesday in connection with cargo U-234.

It is contemplated that shipment will be made by ship to ordnance investigation laboratory NAVPOWFAC Indian Head Maryland if this is feasible.

[See document photo on p. 4877.

John Vance worked for the Manhattan Project and would have been an ideal person to facilitate the transport of the uranium from the U-234 to the Manhattan Project. The uranium was temporarily stored at Indian Head, Maryland, along the way.]

Joseph Mark Scalia. 2000. *Germany's Last Mission to Japan: The Failed Voyage of U-234.* Annapolis, Maryland: Naval Institute Press. p. 233.

35. Interview, Pfaff with Wilcox, 24 February 1995. Pfaff recalled that once the welders opened the cylinders, he noticed "a tall civilian... with a large hat" examining the boxes. Because the stranger was rather conspicuous, Pfaff inquired as to his identity and was told that he was "Oppenheimer". Only later, as a prisoner of war in Louisiana, did he realize that the man with the large hat might have been J. Robert Oppenheimer, director of the Manhattan Project. While it cannot be confirmed that the man Pfaff saw was Oppenheimer, the physicist was in the vicinity during late May and early June 1945. He was in Washington to attend a meeting with Henry Stimson, James F. Byrnes, and Gen. Leslie Groves and the Interim Committee; that he would travel to southern Maryland to examine a captured German stock of uranium oxide is not out of the realm of possibility.

[Karl Pfaff also described the same incident with Oppenheimer when interviewed in: Andreas Gutzeit. 2001. *U-234: Hitler's Last U-Boat.* Film. Washington, D.C.: Story House Productions.]

Figure D.914: U-234 German cargo manifest and English translation, both listing 10 cases totaling 560 kg of uranium oxide [NARA RG 38, Entry UD-16, Box 4, Folder Manifest of U-234].

William J. Broad, Captured Cargo, Captivating Mystery. *New York Times* 1995-12-31 p. A22.

Historians have quietly puzzled over that uranium shipment for years, wondering, among other things, what the American military did with it. Little headway was made because of Federal secrecy. Now, however, a former official of the Manhattan Project, John Lansdale Jr., says that the uranium went into the mix of raw materials used for making the world's first atom bombs. At the time he was an Army lieutenant colonel for intelligence and security for the atom bomb project. One of his main jobs was tracking uranium.

Mr. Lansdale's assertion in an interview raises the possibility that the American weapons that leveled the Japanese cities of Hiroshima and Nagasaki contained at least some nuclear material originally destined for Japan's own atomic program and, perhaps, for attacks on the United States.

[...] But Mr. Lansdale, the former official of the Manhattan Project, displayed no doubts in the interview about the fate of the U-234's shipment. "It went to the Manhattan District," he said without hesitation. "It certainly went into the Manhattan District supply of uranium."

[John Lansdale wrote or received many of the memos on the German nuclear program in the Manhattan Project's files [NARA RG 77, Entry UD-22A]. He stated unequivocally to the *New York Times* that the U-234's uranium cargo went to Oak Ridge ("the Manhattan District supply of uranium"), and he presumably would have been in a good position to know that. It makes perfect sense that the U-234's uranium would go to Oak Ridge, regardless of its state of enrichment. Its precise composition could be tested much more thoroughly and easily at the Oak Ridge laboratory than in the field at the Portsmouth Navy Yard. If the U-234's uranium was unenriched, it would have gone into the general stockpile of uranium awaiting enrichment by Oak Ridge's K-25 gaseous diffusion plant and Y-12 calutrons. If the uranium was somewhat enriched, it would have been sent to the calutrons for further enrichment. Even if it were highly enriched, it would been inspected and repackaged, and likely would have had its chemical form altered (at that time, the United States preferred to ship highly enriched uranium as uranium tetrafluoride, not uranium oxide) before it was sent on to Los Alamos.

I spent several days searching Oak Ridge's 1945 files at the NARA Atlanta archive, including detailed files of uranium shipments received at Oak Ridge, weekly enrichment reports from the gaseous diffusion plant and the calutrons, and records of enriched uranium shipped out of Oak Ridge. As Carter Hydrick first pointed out [Hydrick 1998, 2016], there was a significant increase in the output of highly enriched uranium from the calutrons beginning in mid-June 1945, but that appears to have been due to the first moderately enriched uranium from the gaseous diffusion plant being forwarded to the calutrons at that time, not the arrival of the U-234's uranium. In fact, I could find no records whatsoever of the U-234's uranium entering Oak Ridge or being processed there. Perhaps I overlooked those records among the vast collection of files, or maybe they are stored elsewhere, or perhaps they are still classified. Alternatively, maybe the U-234's uranium was officially entered into the record books as something else, for example by falsely labelling it as a shipment of uranium oxide from the Belgian Congo, a batch of uranium that had already been partially enriched by Oak Ridge's gaseous diffusion plant, or some other such subterfuge.

Again, hopefully future archival researchers can dig even more deeply into these mysteries and finally find some answers.]

[In addition to the uranium, the following documents suggest that detonators from the U-234 submarine, as well as passenger Heinz Schlicke's knowledge of those detonators, may have been useful for the U.S. plutonium implosion bombs.]

Dr. Delmar Bergen, former director of the nuclear weapons program at Los Alamos National Laboratory [Hydrick 2016, pp. ix–xi].

I began my career at Los Alamos in the summer of 1957, directly involved in nuclear weapons work, which remained the case until my retirement. I started as a staff member working on nuclear weapon design, and eventually was promoted to Director of the LANL (Los Alamos National Laboratory) Nuclear Weapons Program. Other assignments included serving as a consultant to the Assistant Secretary of Defense for Atomic Energy, and as a consultant to the US delegation developing the protocols for the Short and Intermediate Range Missile Treaty between the U.S. and the U.S.S.R.

[...] I would like to stress two points that I believe materially change the important history of the birth of the Nuclear Age as we know it:

First, it is my view as a physicist, based on documentation provided here in *Critical Mass* that the effort the Germans put into preparing and shipping the 560 kilograms of uranium oxide surrendered on board the German submarine U-234, was enriched in the isotope U235. In other words, it was enriched to create a nuclear weapon. [. . .]

The second material information you should take note of, I believe, is that the contributions to the Manhattan Project of the surrendered U-234 did not stop there. I believe the surrender of U-234 had impact on the development of the implosion device—the plutonium bomb dropped on Nagasaki—as well.

I was well acquainted with the development of the implosion device and the difficulties our scientists experienced in developing a detonation system that would give a proper spherical implosion. This concern kept the entire group on edge until the famous Trinity Test in New Mexico proved it to be successful... Surprisingly, as the date of the test approached, last-minute improvements in the firing system reduced their concern enough about the reliability of the detonation system...

I was never told how the details of the improvements came about, but it was during this period that the passengers on board U-234 were debriefed and it was learned that one in particular, the scientist Heinz Schlicke, had knowledge of fast operating energy transfer systems. The rapid and consistent release of electrical energy was a key part of the problem the LANL scientists were experiencing triggering the detonators with the simultaneity necessary to achieve a clean spherical implosion. There apparently is no written unclassified record available to provide us with what may have come from the debriefing of Heinz Schlicke but this we do know, over the summer months after his capture and the surrender of U-234 the confidence in the detonation system greatly improved, and the production of uranium for the gun weapon increased significantly.

Jack H. Alberti to John L. Riheldaffer. 24 May 1945. Subject: U-234. [NARA RG 38, Entry UD-16, Box 4, Folder Manifest of U-234]

The following information has been obtained from P/W Leutnant Menzel of the Luftwaffe, passenger on U-234.

1. The two after mine shafts of the forward line of six mine shafts amidships contain the personal baggage, documents and other property belonging to General Kessler, Col. von Sandart and Leutnant Menzel, in addition to some other cargo.

2. The Captain of U-234, Kapitänleutnant Fehler, and the II.W.O., Leutnant Pfaff (believed at Fort Meade), and the engineer of the boat (retained aboard U-234), between them, know most about cargo stowage and can be of great assistance in identifying it, as well as in proper and safe unloading.

3. In the U-Raum of U-234 there are two steel chests, marked Erich Menzel. These contain 15 rolls of secret films and all documents concerned with Menzel's mission.

4. U-843, C.O. Kapitänleutnant Herwartz, arrived in Norway from Japan about 10 April. She was sunk on her way to Kiel and two survivors were rescued by the Germans.

5. U-864, C.O. Kapitänleutnant Wolfram, was to go to Japan. She was sunk off Bergen with two Messerschmidt experts on board. Lt. Col. Stepp of the Luftwaffe and Baurat Wahlfeldt, the high-frequency expert, who were to sail on this boat were not aboard and remained in Horten.

6. The packages for Dr. Schlicke, one of the passengers, and contained in one of the tubes are marked "TONI". Dr. Schlicke knows about the infra-red proximity fuses which are in some of these packages. He warns that they must be handled with the utmost care as they may either explode or be irreparably damaged if handled improperly. Dr. Schlicke knows how to handle them and is willing to do so.

7. Fregattenkapitän Falck states that in addition to the mine shafts there are containers with cargo and documents inside the fuel tanks.

8. General Kessler, who was going to Japan to relieve General von Gronau, had originally planned to go to Japan via Northern Norway in a Junkers 290. Although this plan was abandoned in his case, it is possible that others went to Japan in this manner.

9. An empty envelope, found in the passport of Col. von Sandrat, is inscribed on the outside to the effect that it originally contained 1500 Swiss Francs. Since General Kessler only claims to own 1500 Swiss Francs, and since only 1800 francs have been recovered, 1200 francs must still be scattered among the souvenir hunters at Portsmouth, and this is on the assumption that none of the other passengers had any Swiss Francs.

[From information that is currently available, U-234's cargo apparently included a wide variety of advanced detonator technologies, and Heinz Schlicke was an expert on those and many other technologies. Although only infrared detonators were mentioned as an example in the above document and the next document, the other technologies may have included exploding bridgewire detonators such as would be especially useful for implosion bombs. Erich Schumann appears to have referred to exploding bridgewire detonators in his description of German implosion bombs (p. 4241).]

Secret dispatch from Commander of Naval Operations to Portsmouth Naval Yard. Subject: POW and fuses from U-234. 25 May 1945. [NARA Boston RG 181]

Lt (JG) H E Morgan, Lt (JG) F M Abbott, Ens F L Granger with Dr Schlicke POW in custody leaving Anacostia noon Friday via plane. This party expert in bomb disposal and proximity fuses and being sent to assist in securing certain infra red proximity fuses important BUORD [Navy Bureau of Ordnance] and in cargo U-234. Fuses when secured to be returned Washington custody above party.

[See document photo on p. 4871.]

First lecture given by Dr. Schlicke at the Navy Department. 19 July 1945. [NARA RG 38, Entry UD-38, Box 13, Folder U-234]

After Dr Schlicke completes his lecture he will be available for questions that people ask. But we will kindly ask you not to ask any questions during the lecture and after the lecture Mr Alvarez will sit at the table and the person who wishes to ask a question is asked to come forward so that we can get in the microphone and keep a record of all the questions and answers. Thank you.

[For more information on some of Schlicke's U.S. lectures, see AFHRA B1975, frames 1325–1495.]

Luis W. Alvarez. 1987. *Alvarez: Adventures of a Physicist.* New York: Basic Books. p. 137.

The gamma-ray records proved less definitive than we had hoped but helped the implosion design. I cleaned up some loose ends in detonator design. By April 1945 that work had moved on to engineering, and I was again unemployed.

[...] Normally a new weapon is proof fired at a proving ground before it's used in combat. We had only one U-235 weapon, however, every atom of which had been run twice at enormous expense through the Oak Ridge calutrons, and as of July 1945, there would be about one plutonium bomb a month, the first of which would have to be used up in a static test to make sure the Fat Man implosion system worked as we predicted it would.

[Note from this passage that Alvarez had been directly involved in the design of the detonators for the U.S. implosion bomb, was available for additional assignments by April 1945, and recognized there was still uncertainty about whether the implosion bomb detonation system would work as intended. From the document on p. 4739, Alvarez was also directly involved in U.S. intelligence efforts to analyze the progress of the German nuclear weapons program. Thus if U-234, Heinz Schicke, or Allied discoveries of German nuclear weapons components in Europe (p. 4241) did in fact provide improved detonators for an implosion bomb, Alvarez would have been an ideally qualified person to assign to apply them to the U.S. bomb.]

Pam Fessler. 18 August 2008. Former GIs Spill Secrets Of WWII POW Camp. National Public Radio. https://www.npr.org/templates/story/story.php?storyId=93649575 [See also: https://www.npr.org/templates/story/story.php?storyId=93640350 and https://www.npr.org/2008/08/18/93635950/breaking-the-silence-of-a-secret-pow-camp]

Amid the shade trees, swings and picnic grounds at Fort Hunt Park just outside Washington, D.C., there are few traces of the site's top-secret military past. But for the GIs who were stationed there during World War II, the park is alive with memories of what it had been: an interrogation camp for nearly 4,000 mostly German prisoners of war.

The park, then code-named P.O. Box 1142, was where the military elicited crucial information from top enemy officers and scientists. It also was where the United States had a clandestine program to help American POWs escape.

Until recently, much of what occurred at P.O. Box 1142 was unknown. Many who participated went to their graves without revealing—even to their families—what they'd done. The buildings were razed after the war. And many documents about the camp were destroyed in an effort to conceal its existence.

The National Park Service, which now runs Fort Hunt Park, is trying desperately to capture some of this history before it disappears. It has conducted more than 40 oral interviews with vets who had been stationed there.

One GI who worked at P.O. Box 1142 was John Gunther Dean, a young American soldier singled out while in basic training because he seemed well-suited for the intelligence operation. Dean, now 82, recalls how he was summoned to the Pentagon, where an Army officer asked him if he knew how to speak German.

"And I said, 'Yeah, I speak German like a native,'" says Dean.

His family, which was Jewish, had fled Germany in the late 1930s. When everyone else at Fort Belvoir—a U.S. Army base in Virginia—was sent overseas, Dean was handed a nickel and a phone number and then mysteriously dropped off in the middle of Alexandria, Va.

"There was a drug store. I went in, called the number and they said, 'Dean, you stay outside and we'll pick you up in a staff car.' And they drove me up towards Mount Vernon and that's how I ended up at Fort Hunt. It must have been end of November, early December 1944," he says.

George Mandel, now an 84-year-old professor at George Washington University, also ended up at P.O. Box 1142 during the war.

Mandel says when he was there, things looked quite different than they do today. There were prison barracks and buildings where American soldiers would interrogate Nazi and other enemy prisoners. About 4,000 high-ranking prisoners passed through the camp.

"My job was to interrogate scientifically trained and experienced Germans who had been sent to this country by the military," says Mandel. He knew German and had a chemistry degree.

But he admits that at age 20, he was naïve in the face of some of the Third Reich's top scientists.

"One of them was a person who worked on enriching uranium, and I didn't know why anybody would want to enrich uranium. I mean, what does this have to do with anything?" he says. "And so my job was to find out what he was doing and how it was being carried out, and then I reported this to the Pentagon."

It was part of a U.S. effort to learn what the Germans were up to. The prisoners were asked about troop movements, scientific advances and anything else that could help the Allied cause.

For years, Mandel, Dean and others kept quiet about P.O. Box 1142 because they had been sworn to secrecy. The operation has since been declassified, but many records were lost, which is why the veterans' stories are so important to the park service.

For Chief Ranger Vincent Santucci, it's like trying to glue together a broken vase—with some important pieces missing.

"Many of the archives were destroyed directly after the war. And so if we didn't have the opportunity to speak with these men and capture their stories, much of it may have been lost forever," Santucci says. [...]

One of those Dean befriended was German engineer Heinz Schlicke, who developed infrared fuses that could be used to trigger an atomic bomb. Schlicke was brought to P.O. Box 1142 after the U-boat on which he and other scientists were fleeing Germany for Japan was surrendered in 1945.

Schlicke's time at Fort Hunt was part of Operation Paperclip, a secret effort to bring hundreds of top German scientists—and their expertise—to the U.S. before the Russians got their hands on them. Dean says he and Schlicke played tennis and rode horses.

"It took quite some time before he was willing to cooperate. The war had ended in Europe and at that point, he said, he's willing to help us, but his wife was at that point in what was in the Russian zone," says Dean.

Dean was eventually sent to Europe to find Schlicke's wife and two small children and to reunite the family. Schlicke ended up working in the U.S. for the remainder of his life.

[See also p. 2045.

At least some of the surviving records from Fort Hunt are at NARA RG 165, Entry 179. Those and any other relevant records should be searched thoroughly.

Are there detailed reports of the interrogations of German-speaking prisoners who described uranium enrichment, atomic bomb fuses, or other nuclear-related work?

What are the names of the 4,000 German-speaking prisoners who were interrogated at Fort Hunt?

What all did the United States learn from them?]

Robert K. Sutton. 2021. *Nazis on the Potomac: The Top-Secret Intelligence Operation That Helped Win World War II.* Philadelphia: Casemate. pp. 74–75.

[George] Mandel's special expertise was chemistry, but, in time, he became comfortable asking questions about more technical issues, such as German jets and jet engines. In short order he became one of the experts on jets at Fort Hunt. Once he learned about the technical capabilities, flight characteristics, speed, and everything else about German jets, he came to the chilling conclusion that had the Nazis developed these machines at the peak of their manufacturing capabilities, the war could well have ended very differently. These airplanes were far superior to anything the Allies had in the air. [...]

One German scientist described his responsibility of enriching uranium. Mandel would later say that he could not understand why anyone would bother to enrich uranium, but as he probed deeper, he learned that the Germans had been working on developing a nuclear bomb. This was critical information that needed to be passed along to the Pentagon—immediately! [...]

While interrogating another scientist, Mandel learned about proximity fuses. The Allies had developed proximity fuses—which could detonate an explosive shell when it was close to or in the proximity of a target for maximum effect—but the Pentagon wanted to better understand the German uses of the devices. Mandel discovered that the German development of these devices was further advanced than those in the United States.

[Johann Gunther Dienstfertig (1926–2019) was born in Breslau, moved to the United States in 1939, and became much better known as John Gunther Dean. As a native German speaker who was drafted into the U.S. Army, he was assigned to obtain information from German prisoners of war at Fort Hunt and was also sent on a mission to Europe after the war. In multiple interviews, he stated that POWs from the U-234 as well as other German personnel captured earlier provided information about the German nuclear program, and that the German nuclear program was highly advanced. He spent most of his career as a high-ranking diplomat working around the world on behalf of the U.S. government.]

Ambassador John Gunther Dean. Interviewed by Charles Stuart Kennedy. 6 September 2000. p. 19. https://www.jimmycarterlibrary.gov/sites/default/files/pdf_documents/assets/documents/oral_histories/project/Initial_Interview_Part_One.pdf

DEAN: [...] For the next two years, I served at Post Office Box 1142, Alexandria, Virginia. I was sent to Europe at one point, but I always remained part of "Post Office Box 1142."

Q: Was this OSS?

DEAN: It was military intelligence. The OSS colleagues with whom I worked lived in a mansion on the road to Mount Vernon. I went to Fort Hunt, also a stop on the Mount Vernon Highway, about 5 minutes from our OSS friends. Today, at Fort Hunt, you can see nothing that existed during the war. I took my wife there, 30 years later. There is nothing there except some areas designated "Off Limits". During my military career, I could wear most anything I wanted—civilian clothes, military clothes (but I was a little young guy at 18 to pose as an officer). In 1944, I heard for the first time the word "atomzertrummerung" meaning splitting of the atom. Few people had ever heard about it until one year later.

Fort Hunt Oral History. P.O. Box 1142. Interview with John Dean by Brandon Bies. 2 October 2007. https://www.nps.gov/museum/exhibits/fohu_oral_history/transcripts/Fort%20Hunt_NPS_PO%20Box%201142_JDean.pdf
[There are also many other enlightening interviews of former Fort Hunt interrogators at this website https://www.nps.gov/museum/exhibits/fohu_oral_history/index.html]

[p. 22:] BB: So, these room conversations, the listening in that you would do—does any particular room conversation stand out, do you remember any time—

JD: One of them was, and I heard it for the first time, the word [speaks German], the splitting of the atom. Now, whether this is recorded; I don't—did I push the button? But I knew, was my uncle Otto Stern [...] had worked in Germany with Hahn and people like that, and he was fleeing and he went to the States. He got the Nobel Prize in 1948 in physics, so I knew the word [speaks German]. I know nothing of how you get to that, and I'm not at all a scientist, but I knew that's the time you press the button, because that was of major interest to the United States. [...]

[pp. 23-24:] JD: I just turned the damn stuff in; I don't remember. We all turned the stuff in, and we were told not to talk much about the thing. But then they used us younger guys—I was used because Heinz Schlicke, when he came, he was young, sports-oriented, and he wanted—we wanted to be nice to him. So somebody had to go and do things with him; so I did. He was a nice guy—he was Nazi—yes, he was a good Nazi, and he was at Peenemünde; so what? My job was to see what he could do for the United States. And I was told to do this. [...]

[p. 30:] JD: [...] At 1142, there was no pressure. There was psychological power being used. We put a stoolpigeon in because this guy was knowledgeable on atomic energy. [...]

[pp. 42–44:] JD: What happened with the—in January of 1945, the war was going badly for the Germans. Hitler sent U-boat number 234 to help the Japanese allies. You have the documentary. Now, how we got involved is we got it after these people came to 235, and it was the following—that we—that a—this submarine was on its way to Japan, and it had, we were told, mercury for $300 million, which was a number so extraordinary in 1945, but it wasn't. It was actually uranium oxide on there, and the captain was Captain Fehler. It had a German four-star general on it, and if I reached back, I'd give you the name somewhat.

BB: Was it Kessler?

JD: It—

BB: Ulrich Kessler?

JD: It was an air force general.

BB: And Luftwaffe. Yeah, that's Ulrich Kessler.

JD: And it was—and it was two colonels—Japanese colonels who committed hari-kari because—and then there was our friend Heinz Schlicke on there. Now, that U-boat was on its way and got as far—as I remember it—as far as Uruguay and was then supposed to go—you have to remember at that point, in May of 1945, Japan was very much still in the war. The atomic weapons—we had—we weren't using it and may not have had it, and the Germans had been very far advanced on atomic energy. Hahn—Professor—was it Hahn or whatever—was the head of it, and that's where my uncle came in—Otto Stern was—he had been down—but these guys—the Jewish people left and fled, you know, okay. So, when this boat surrendered, 234, the two Japanese committed hari-kari because Fehler said, "I will only surrender to the Americans." All I know that—at that point, these guys came—some of these guys came to P.O. Box 1142, and it took quite some time, to be very frank, for Heinz Schlicke to come around to working with us and the willingness to work with us, and it was only later that I was sent with prisoners who were being sent back to Europe, and I was put on a ship, and I went back, and I delivered these guys, and everything was so well planned, I was in luck. In Normandy, it was pretty normal, and at that point I was asked to go to Kiel, British zone, and there I was told that—that since I'd known Schlicke that I should go and get his wife and two kids. Everything was worked out. [... I]t was in South Hampton, I believe, somewhere on Long Island that they first put him, and he worked with us, and he gave us the secrets of infrared we didn't have, and he then stayed with his wife and children in the United States, and he died last year—

BB: Right.

JD: —and Schlicke was a good Nazi. He had worked in Peenemünde[....]

[pp. 54–57:] BB: Okay. Do you—again, realizing completely that your views were that of an 18 and a half year old, do you have a feeling or any sense that anything at all that went on at 1142 somehow assisted the American nuclear program, the atomic program?

JD: It definitely did. Definitely we had people who knew something about it. Now, I am not at that level, but they probably told them who the names were, and what level they were at and something like that. You see, that is what they could find out. But they didn't have the bomb yet. But they were close, because they sent that stuff over to the Japanese. [...]

BB: Okay. Were you aware of any operations going on outside of 1142 up in Boston? Now we're at a place called Fort Strong in Long Island in Boston.

JD: No, sir. [...]

BB: Getting a little bit—well actually, while we're on that subject of other locations, how about a place called Pine Grove Furnace up in Pennsylvania? [...] This would've been a location where it was kind of used as a holding facility for prisoners prior to them coming to 1142.

JD: No, sir. [...]

BB: Are you familiar with another camp similar to 1142 on the West Coast? [...] It was called Camp Tracy. It was in Byron Hot Springs, California. It also had a P.O. Box number. It was P.O. Box 751.

[Fort Hunt was just one of several interrogation facilities. Are the complete lists of POWs and the interrogation transcripts from all of these facilities at NARA RG 165, Entry 179 or elsewhere?

What details of the German nuclear program were learned from the occupants of the U-234 submarine?

What details of the German nuclear program were learned from other POWs who mentioned "the splitting of the atom"?

How did all of that information aid the U.S. nuclear program?]

~~SECRET~~ December 18, 1945.

To Dr. S.A.Goudsmit

head of the military intelligence mission for Germany.

Dear Dr. Goudsmit,

Nearly one year ago you have interrogated me several times and have inspected my Departement of Physics and our whole Institut. At your suggestion I was treated gentlemanlike, and I intended to behave myself gentlemanlike. I was verry gratefull to you for your care and likewise to your deputy for his especial care during my stay in the hospitals in Paris. My distinguished esteem for U.S. has not been influenced by the war. Arrived in American custody I was trustfull and in the following time I believed to have gained trust too. I think that my sincere and cooperative attitude was made evident in the interrogation camp near Washington D.C. especially to Capt. Berger.

I have to conceal nothing about my scientific work and nothing about my personal affairs. I guess you could verify in the mean-time the correctness of my statements and suppose you know now from Mr. Gerlach that he as „Bevollmächtigter für Kernphysik" has declared basic research as „kriegswichtig" and that I was occupied by such basic research, though more in preparatory than in accomplishing state.

~~SECRET~~

CLASSIFICATION CANCELLED
AUTHORITY: DOE-DPC
BY L.D. SULLIVAN, DATE:
3/27/86 H.R.Schmidt

Moreover I assume you have now an idea of the conditions prevailing since 1933 in Heidelberg where I was working and further suppose you know from my private notices or from Mr. Bothe and from Mr. Freudenberg too that the „party" has prevented my admission to the „Dozentur" by reason of political untrustworthiness till the beginning of 1937. My fundamental attitude is today the same as one year ago and as at much earlier times and quite similar as my father's during all his ~~f~~ life.

Now I should like to express what I wrote in a letter of August 22, 1945 to the commanding officer of this PW-camp. (Ft. Geo. G. Meade): I am scientist and all my interest is belonging to the science (physics). The farereaching tasks of science exceed limits of nations and extend to the future. I am in the age of best efficiency and there are lying before myself important scientific tasks.

Since June 2, 1945 applying repeatedly in vain to see any officer (or scientist), informed about my affairs I suppose these affairs can be handled only on a higher level and it seems me that something is to be cleared.

From a newspaper I came to know your military position. Therefore I write now too you as scientist applying to grant me an occasion to see you or a commissioner of you

Yours respectfully

R. Fleischmann

Robert A. Carr. October 1949. How German Experts Aid Our Research. *Army Information Digest* 4:10:15–19.

[...] By 1 September 1949—ten years after Hitler's attack on Poland—many changes had been wrought in the life of Dr. [Wolfgang] Finkelnburg. Now 44, he lives with his wife and two-year-old son at Fort Belvoir, where he is employed by the United States Government as a research expert in light and radiation sources. He also is a research consultant on atomic physics; and his textbook on the subject is currently on the press of the leading American publisher.

Dr. Finkelnburg's activities in the field of pure science are not confined to the seclusion of the laboratories at Fort Belvoir. During the past two years he has lectured at Ohio State, New York and Northwestern Universities; Massachusetts Institute of Technology, Bell Telephone and Brookhaven National Laboratories; and before the Society of Motion Picture Engineers. For many months, he has carried a heavy schedule of classes, teaching atomic physics in extension classes conducted by Catholic University at Fort Belvoir.

Dr. Finkelnburg is only one of about 500 [the actual total was far larger] outstanding German scientists and technical experts whose talents are being utilized by the United States, to help maintain our position of world leadership in scientific research and development. Under this far-reaching program, known as Project Paperclip, German experts are brought to the United States. Here they are provided with facilities for research in electronics, supersonics, guided missiles and jet propulsion. They pioneer in the vast realms of chemistry, physics, metallurgy, engineering, synthetic fuels, environmental protection, and the like. Some are doing advanced work in medicine, including the design of artificial limbs and prosthetic appliances. Nearly all of the technical services of the Armed Forces are now employing these scientists; and a few have been made available to civilian industry.

Among Dr. Finkelnburg's associates at the Engineer Research and Development Laboratories are Dr. Alexander Smakula, a specialist on optics, formerly with the Zeiss Company [p. 1282]; Dr. Werner K. Weihe, electronics researcher who was formerly chief of the Zeiss electrotechnical laboratories [p. 1152]; and Dr. George Hass, formerly on the faculty of the Technical University of Danzig, who is now doing research in optics and in other aspects of physics [p. 2757].

Although the idea of capitalizing on the knowledge and skills of German scientists had been conceived early in World War II, it was not until the summer of 1945 that a firm plan could be put into operation. However, immediately after VE day, we acquired our first German experts by chance, as part of a drama that had the earmarks of a movie thriller.

In obedience to Allied orders, Nazi submarines in every sector of the world were to surface, report their positions, and display a black flag in token of surrender. Among the submarines docking at the Portsmouth (New Hampshire) Navy Yard was the U-234, one of Germany's largest U-boats, a minelayer of the latest type. Here was a haul! This sub was not on an ordinary errand. She carried Hitler's last, most valuable gift to his Japanese ally. Her compartments were filled with treasure—platinum and mercury, blueprints by the thousands, samples of the newest electronic tubes and other inventions, uranium oxide of a high degree of purity, and a rich human cargo—ten of Germany's leading scientific and technical experts. [Does this mean that U-234 had additional technical experts not listed on p. 4859?]

It was intended that these men should carry on in Japan the newest research projects which the increasing fury of the war had prevented Germany from realizing. The group included Lieutenant General Ulric Kessler, the former head of the *Luftwaffe Flieger Korps*; Dr. Gerhardt Falck, one of the top designers in the German Bureau of Ships; and August Bringewald, the star production engineer of the Messerschmitt Works, carrying with him blueprints which would enable him to set up a complete plant for construction of the latest Messerschmitt jet aircraft in Japan.

Some of these men were placed on special military projects, and later were returned to Germany. Several are still employed at Army, Navy, and Air Force research centers, where they continue their work under Government supervision. Today, Bringewald is employed at Wright-Patterson Air Force Base, and Dr. Falck has returned to Germany.

Among the cream of German scientists now working for the Armed Forces are the former director of Germany's air-to-ground and ground-to-air missiles projects; eminent V-2 and remote control specialists; the former research directors for Junkers and Zeiss; and some of Germany's leading parachute experts and aeronautical engineers.

From the beginning, the process of screening German scientists for admission to this country has been thorough. Even before the European phase of World War II ended, technical teams of the military services were surveying major plants and research organizations in Germany. They catalogued the names of thousands of Germans engaged in research; and they forwarded many thousands of scientific documents and reports to Washington for study by our technical experts. Commercial teams followed the military, analyzing the progress of German commercial research, locating the leading experts. Finally, a panel of top-notch German specialists was assembled and was directed by the Theater Commander to compile a list of all German scientists and technical specialists. This roster contained the names of 24,000 Germans, ranging from world-acknowledged experts to lesser technical specialists.

From all these sources, the military services, in cooperation with other interested Government agencies, made the final selection. The dominant factor in each case was the ability of the scientist to make an "otherwise unobtainable" contribution to American military research and development. Every using agency was required to certify that the skills and experience offered by the German could not be obtained from an available American scientist. [...]

Hundreds of millions of dollars and from two to ten years of research time, it is estimated, have been saved by the program. Out of the experience of the German scientists has come a knowledge of the many blind alleys to be avoided, thus narrowing the fields to be explored.

MAJOR ROBERT A. CARR, Inf., is on the staff of the Security Review Branch, Office of Public Information, Department of Defense. He was formerly Public Information Officer for the Department of the Army on Project Paperclip.

[One of the U-234 passengers that the above article named, Gerhard[t] Falck, had some sort of nuclear expertise, which this article did not mention [p. 4870]. This article also carefully avoided mentioning another U-234 passenger, Heinz Schlicke, who may have had knowledge related to nuclear components [pp. 4881–4880]. Even the main scientist featured in this article, Wolfgang Finkelnburg (who was not a passenger on U-234), focused on fission reactors for much of his postwar career, so he likely had some nuclear-related wartime experience that was never explicitly named.

More broadly, the above article—written directly by the U.S. Army—openly admitted that German scientists were up to a decade ahead of the U.S. during the war and that in postwar U.S. programs, the German scientists were making enormous contributions in a wide variety of fields that were beyond the capabilities of U.S. scientists.

Where in current archival files is this list of 24,000 German names? That would be even more extensive than the Osenberg list of 15,000 names.]

Operation LUSTY. January 1946. [AFHRA C5098 electronic version p. 586.]
http://www.indianamilitary.org/FreemanAAF/OperationLusty/OperationLusty-s.pdf

A casual remark made by a technical engineer, who stated that he had recently been offered a position in Japan, led to his being thoroughly interrogated for significant technical information. As an aside, and what he probably considered a relatively unimportant incident, he stated that less than a month ago, about the middle of April, ten submarines heavily loaded with the latest German equipment relative to aerial warfare, were dispatched from Kiel to Japan. When Lt Col. O'Brien was thus informed he immediately advised the Directorate of Intelligence, USAFE, who in turn notified the Japanese Intelligence Section of SHAFE. A cable was then dispatched to all commands.

In every theater of war, all vessels in ports and at sea were notified, and one of the biggest searches ever undertaken during the war for submarines was initiated. What route they had taken, whether they had gone alone or together, no one knew. But so extensive was the search and so carefully was it executed by warships of all Allied nations, that by the end of June, six of these ten submarines had been captured intact, some a relatively short distance away from their bases, others perilously close to Japan.

[What technologies were on the U-234 submarine, in terms of its cargo, documents, and the knowledge of its passengers and crew?

What technologies were on other submarines (both German and Japanese) that evacuated materials and personnel from Germany?

What technologies were evacuated from Germany by other means—aircraft, smuggling across borders, etc.?]

DECLASSIFIED

SUMMARY OF INFORMATION
June and July

Pertinent details have been obtained confirming research activities in German laboratories up through 1942. Various scientists are mentioned in reports concerning research activities on uranium fission, some of the names appearing for the first time in this connection. Those mentioned are: Batie, a French scientist reported to be acquainted with secret bomb development involving uranium fission; Jardon (JORDAN ?) who left Peenemunde to work with Heisenberg, Von Weizsacker who recently visited Madrid and Lisbon, contacting scientists in both cities; Von Laue, Gentner, Heisenberg, Bothe, Hahn, Flügge, Jolliot, Von Ardenne, Meitner, Traubenberg, Retzler, Maurer.

The Physics Institute at Leipzig was destroyed by bombing and the Institute at Berlin Dahlem was damaged although the laboratories are still operating. All Institutes have reserve laboratories in the country, however, some of which are reported at the following locations: Hirshberg, Forschungstelle in Wurtemberg, Feldberg (underground laboratory), Bisingen (Heisenberg Institute having a cyclotron). The Siemens plant is reported to have an atomic physics laboratory. It has been proposed that the Nils Bohr Institute at Copenhagen be transferred to Germany.

The primary interest of the Reichspost in nuclear physics is indicated in continued reports of its activities. Information has also been received that the Reichspost has installed three high tension laboratories.

Heavy water has been sold to Swiss scientists by I.G. Farben who procured the production from Rjukan, Norway and evidently are the agents for heavy water in Germany.

No sign of unusual activity during the war is apparent in air photographs of Joachimstahl and Schoenficht.

Persistent reports are being received disclosing the existence of a reprisal weapon of an unorthodox type. It has also been reported that the power of a large air torpedo was to be derived from uranium but that this idea has been given up for the war.

The Japanese have announced that they too have discovered the effects of fission and have also said that Germany was working on the project. The interchange of technical information between Japan and Germany is being accomplished by means of submarine, surface ships, the Siberian railway and by air.

NARA RG 77, Entry UD-22A, Box 171, Folder 32.60-2 GERMANY: Summary Reports (1945–1946), Summary of Information June and July [1944]

D.14.6 High-Level Interrogations

[Many high-level German military and political officials who would have known a great amount about the German nuclear program were captured and interrogated at length by the United States and/or United Kingdom. Available documents show that those officials did indeed discuss the German nuclear program, although currently available declassified documents do not reveal most of the details that those German officials provided.]

Nazis' A-Bomb 90 Days Late, Says Goering. *Chicago Daily Tribune.* 26 January 1946 p. 10.

Germany was within 90 days of producing its first atom bomb when the war ended, Hermann Goering, former Luftwaffe chief, told his jailers at an American army prison in Mondorf, Luxemburg.

Authority for this statement is former Tech. Sgt. Robert Bock, 1203 S. 57th St., Milwaukee, who was warden of "Ashcan" prison, where Goering and other top flight Nazis were questioned for 100 days prior to the trails at Nuernberg, Germany.

"Goering told me Germany had made extensive progress in the use of the element uranium as a source of destructive atomic power, and that he had plans for an atomic anti-aircraft grenade which would have crumpled the wings of every plane within one kilometer (5/8 of a mile) of its bursting point," Bock asserted.

But Goering believed America would have defeated Germany even if the Nazis had developed the atom bomb, Sgt. Bock said.

[Nuclear weapons could have been employed in a variety of ways during the war. One possible tactical application would have been as an anti-aircraft weapon, such that one nuclear weapon exploded in the air might conceivably destroy an entire formation of Allied bombers. Since Hermann Goering was the head of the Luftwaffe, that application would have been most significant to him.

As the single most talented, most utilized, and most secretive native German-speaking interrogator in the investigation of German scientific programs by the United Kingdom (and by collaboration, the United States), Edmund Tilley (1892–1966) gained a deep knowledge of German programs to develop nerve agents (below), fission bombs (pp. 4902–4903), manned V-1 cruise missiles armed with fission bombs (pp. 4896–4897), a 6-ton H-bomb (pp. 4350–4359), advanced rockets (pp. 5762–5763) and goodness knows what else. Can all of the files related to Tilley's interrogations, reports, and knowledge be located and declassified?]

Dan Kaszeta. 2020. *Toxic: A History of Nerve Agents, from Nazi Germany to Putin's Russia.* London: C. Hurst. pp. 66–68, 74, 318.

Edmund Tilley played a pivotal role in the history of nerve agents because of his skills as a German-speaking interrogator. He spoke German with native fluency, having been born in Marburg in 1892 where his father was an English lecturer and ran a series of language schools.[5]

Edmund Tilley was in the US by the time of World War I, but his father and brothers were interned by the Kaiser's government. After studying at Union College in Schenectady, New York, Edmund spent time as a language and dramatics teacher, at both Union College and in Istanbul at Robert College, which was and is an elite private high school. A generation of the political and economic elite of Turkey may have been taught English by Tilley. By 1937, his mother's obituary lists him residing in England,[6] yet even then he was something of an enigma as he is missing from all records other than an immigration form completed when he visited relatives in the USA, listing a modest house in North London as his current address.

Due to his fluency in German, Edmund became involved in intelligence work with the British Army. The beginnings of his war service are also a bit of a mystery. The Army records show him being made a second lieutenant in the Intelligence Corps in the autumn of 1940, shortly after it was formally re-established. At forty-eight, he made for an old lieutenant. From 1940 through 1943 he either did little of note or it was very secret. One suspects the latter. Tilley could mimic most regional German accents and it is highly likely that these talents were not squandered. A book on wartime espionage in Persia makes a single tangential reference to Edmund Tilley being in Egypt in November 1943. He was part of the intelligence services and assigned to the Combined Services Detailed Interrogation Centre, in Maadi, Egypt. Special Intelligence Middle East's director, Brigadier Maunsell, described Tilley in his memoirs:

> By far the best interrogator we had in SIME: a gentle person, paranoically [sic] devoted to duty and a crashing bore! Major Tilley succeeded in breaking down our most difficult suspect, where all others had failed.[7]

He is described as one of the intelligence service's "most expert interrogators" who, after a full month of interrogation, broke a hardened German spy named Hans Merz and cracked another in thirty minutes.[8] Details of his remaining service in the Middle East and Mediterranean theatres is largely still a secret, but whatever Tilley did, it was worthy enough for him to appear in a picture shaking hands with King George VI in Italy in 1944.[9] Tilley was mentioned in dispatches for his work in Egypt and toward the end of the war was assigned to FIAT.

After the D-Day invasions, the liberation of Europe was no longer a planning effort but an operational one. Tarr, Tilley, and their team headed to the field, arriving in Paris shortly after it fell to Allied forces. They followed the Allied advance all the way to Germany, often only a few days behind British, American, and Free French forces. [...]

The archives are replete with both summary and detailed interrogation reports by Edmund Tilley. It is abundantly clear that he could persuade Germans of any rank or position to talk. No doubt some of this was through his native fluency. He knew every regional accent and famously once rumbled a German spy by telling him, quite correctly, that his accent was from Altona, outside of Hamburg. By the time Tilley was chasing scientists, he had years of interrogation experience with prisoners in the Middle Eastern and Mediterranean theatres. He had interrogated hundreds, if not thousands, of Germans before he even set foot in Germany towards the end of the war. [...]

Edmund Sorg. 17 August 1946. Betrachtungen über die bemannte V 1 im Zusammenhang mit Atomenergie. [TNA FO 1031/57]

Betrachtungen über die bemannte V 1 im Zusammenhang mit Atomenergie.

Bei der Durcharbeitung der Interrogation vom 16.8.46 habe ich folgende Gedankengänge über die Verwendung der bemannten V 1 in Zusammenhang mit Atomenergie erwogen:

Die Betrachtung der in viele Millionen Menschen gehenden Verluste und ungeheuren Materialzerstörungen, die ein moderner Angreifer im Laufe mehrerer Jahre verursacht, zwingt zu der Überlegung, welche Möglichkeiten gegeben sind, einen Angriffskrieg und damit diese Verluste und Schäden zu verhindern.

Jedes sich mit Angriffsabsichten tragende Land ist durch Vernichtung einer verhältnismässig kleinen Zahl von Punkten, die für den Angreifer lebenswichtig sind, schlagartig zu lähmen. Es sind dies, wie allgemein bekannt, z.B. Werke der Energiewirtschaft (Kohle, Elektrizität), der Öl Förderung, Aufbereitung und Lagerung, Kunstbauten des Verkehrs, Schlüsselindustrien der Rüstungswirtschaft, Schlachtschiffe u.s.w. Die Zahl dieser verwundbaren Stellen ist zwar bei den einzelnen Staaten verschieden, liegt aber zahlenmässig bei allen im Bereich der praktischen Einwirkungsmöglichkeit. Es liegt ebenfalls im Bereich der Möglichkeit, die kleine Zahl Menschen zu finden, die als internationale Polizeitruppe—als Flugzeugführer einer bemannten V 1—jederzeit bereit sind, eine Bedrohung des Weltfriedens durch sofortige Vernichtung der oben erwähnten lebenswichtigen Punkte des angreifenden Staates zu verhindern.

Reflections on the manned V 1 in the context of atomic energy.

In working through the interrogation of 16.8.46, I thought about the use of manned V 1 in connection with atomic energy:

The consideration of the losses in many millions of people and immeasurable material destruction caused by a modern attacker in the course of several years compels us to consider the possible ways of preventing an attack and thus to prevent these losses and damage.

Every country with hostile intentions could be immediately paralyzed by the destruction of a relatively small number of places that are vital for this aggressor. As is well known such places are for instance the factories for the production of energy (coal, electricity); the oil production, processing, and storage industries; engineering infrastructures for transport; key sectors of the armament industry; battleships; etc. The number of these vulnerable places may differ in each nation, but is numerically in a range that makes a practical intervention possible. It is also within the realm of possibility, to find the small number of people necessary to establish an international police force—pilots of manned V1—ready at any time to stop a menace to world peace by the immediate destruction of the vital places of an aggressive nation of the kind mentioned above.

Eine verbesserte bemannte V 1 mit Atomenergie als Ladung, kurz eine bemannte steuerbare Atombombe, die mit Sicherheit von modernen schnellen Grossflugzeugen in der Nähe ihres Zieles abgesetzt wird, gewährleistet bei Lenkung von Menschenhand und bei Selbstaufopferung des Piloten eine sichere Vernichtung ihres Zieles. Die Lenkung einer solchen Bombe durch Fernsteuerung, gleich welcher Art, gewährt nicht die absolute Sicherheit, das Ziel richtig zu treffen. Denn die technische Beeinflussungsmöglichkeit der Fernsteuerung sowie des die Fernsteurung bedienenden Menschen durch den Feind liegt zur Zeit im Bereich des möglichen. Daraus ergeben sich Fehlerquellen, die die Erfolgsaussichten einer solchen Bombe sehr in Frage stellen. Dagegen bietet eine durch Menschenhand gesteuerte Bombe die nach menschlichem Ermessen grössten Erfolgsaussichten.

An improved manned V1 with atomic energy as a charge, in short a manned controllable atomic bomb, which can certainly be released by modern, fast, large airplanes close to its target, ensures a safe destruction of this target given that it is steered by the hands of a pilot ready to sacrifice himself. Guiding such a bomb by a remote control of any kind does not ensure the absolute certainty of hitting the target correctly. This happens because at this time it is technically possible for the enemy to interfere with the remote control and also influence the people controlling the remote guidance. This results in sources of error that seriously jeopardize the success of such a bomb. On the other hand, a human-controlled bomb offers the greatest possible prospects of success.

Edmund Tilley. October 1946. Report on the interrogation of Edmund Sorg. [TNA FO 1031/57]

“Specially adapted models of V-1 manned by pilots prepared to sacrifice their lives were to receive a powerful charge with which to destroy key targets, such as vital war plants and large battleships... It is more likely that the charge for the warhead which had been envisaged was not available in sufficient quantities. Significantly SORG mentioned an atomic charge for these suicide V-1s as the ideal explosive in a future ‘defensive’ war.”

[See document photos pp. 4898–4899.

For another document on the interrogation of Edmund Sorg by Edmund Tilley, see p. 4354.

It seems likely that there are many other detailed documents summarizing information that was learned from interrogating Sorg. Can those documents be located and declassified?

For photos of actual piloted and air-launched V-1s similar to what Sorg described, see p. 1841. For a news description that may be related, see p. 5012. For submarine-launched V-1s that may have been intended to carry weapons of mass destruction, see pp. 5618–5627. See also Henshall 2000, pp. 129–130, redrawn from original document 824B-Sk 895/a, 19 September 1944, in the U.S. Air and Space Museum archive. For photos of a similar air-to-ground nuclear missile system that was created (or recreated?) in the United States by Walter Dornberger beginning in 1946, see p. 1854.]

Sorg , Edmund 17.8.46.

Betrachtungen über die bemannte V 1 in Zusammenhang mit Atomenergie .

Bei der Durcharbeitung der Interrogation vom 16.8.46 habe ich folgende Gedankengänge über die Verwendung der bemannten V 1 in Zusammenhang mit Atomenergie erwogen :

Die Betrachtung der in viele Millionen Menschen gehenden Verluste und ungeheuren Materialzerstörungen, die ein moderner Angreifer im Laufe mehrerer Jahre verursacht, zwingt zu der Überlegung, welche Möglichkeiten gegeben sind , einen Angriffskrieg und damit diese Verluste und Schäden zu verhindern.

Jedes sich mit Angriffsabsichten tragende Land ist durch Vernichtung einer verhältnismässig kleinen Zahl von Punkten, die für den Angreifer lebenswichtig sind, schlagartig zu lähmen. Es sind dies, wie allgemein bekannt, z.B. Werke der Energiewirtschaft (Kohle, Elektrizität), der Öl Förderung, Aufbereitung und Lagerung, Kunstbauten des Verkehrs, Schlüsselindustrien der Rüstungswirtschaft, Schlachtschiffe u.s.w. Die Zahl dieser verwundbaren Stellen ist zwar bei den einzelnen Staaten verschieden, liegt aber zahlenmässig bei allen im Bereich der praktischen Einwirkungsmöglichkeit. Es liegt ebenfalls im Bereich der Möglichkeit, die kleine Zahl Menschen zu finden, die als internationale Polizeitruppe - als Flugzeugführer einer bemannten V 1 - jederzeit bereit sind, eine Bedrohung des Weltfriedens durch sofortige Vernichtung der oben erwähnten lebenswichtigen Punkte des angreifenden Staates zu verhindern.

Eine verbesserte bemannte V 1 mit Atomenergie als Ladung, kurz eine bemannte steuerbare Atombombe, die mit Sicherheit von modernen schnellen Grossflugzeugen in der Nähe ihres Zieles abgesetzt wird, gewährleistet bei Lenkung von Menschenhand und bei Selbstaufopferung des Piloten eine sichere Vernichtung ihres Zieles. Die Lenkung einer solchen Bombe durch Fernsteuerung ,gleich welcher Art ,gewährt nicht die absolute Sicherheit, das Ziel richtig zu treffen. Denn die technische Beeinflussungsmöglichkeit der Fernsteuerung sowie des die Fernsteuerung bedienenden Menschen durch den Feind liegt zur Zeit im Bereich des möglichen. Daraus ergeben sich Fehlerqellen ,die die Erfolgsaussichten einer solchen Bombe sehr in Frage stellen. Dagegen bietet eine durch Menschenhand gesteuerte Bombe die nach menschlichem Ermessen grössten Erfolgsaussichten.

So wäre eine entsprechend ausgewählte, geschulte und ausgerüstete internationale Polizeitruppe durch Einsatz der bemannten, steuerbaren Atombombe jederzeit in der Lage, grössere Angriffsabsichtenund Handlungen eines Landes sofort im Keim zu ersticken. Allein die Tatsache des Vorhandenseins einer solchen Polizeitruppe würde schon eine weitgehende Garantie gegen Angriffsabsichten sein.

Ein Einwand, dass der Angreifer mit dem gleichen oben angeführten Totaleinsatz von wenigen Menschen den Verteidiger lahmlegen könnte, trifft nicht zu. Denn jeder moderne Angreifer muss einen ungeheuren Rüstungsapparat unterhalten, dessen Nervenzentren infolge ihrer Vielzahl immer sichtbar und daher verwundbar sein werden. Dagegen kann der Verteidiger, der diese Riesenrüstung nicht benötigt und sich durch die oben erwähnte Polizeitruppe schützt, seine wenigen hierzu erforderlichen Nerven so schützen oder verteilen, dass sie nicht lahmgelegt werden können.

Aus diesen Gründen erscheint mir die bemannte Atombombe besonders geeignet, Angriffsabsichten hochgerüsteter Staaten zu verhindern und damit die Welt vor erneuten unabsehbaren Verlusten an Menschen und Material zu bewahren.

E. Sorg

5.

a partial list of the members of Hanna REITSCH's V-1 suicide squad and their present whereabouts and a few other items.

TOP SECRET

Frau SORG appeared at FIAT and was allowed to see her and on 3rd and 4th October, in the presence of the undersigned. Her statements, some of them previously made in her letters to her husband, revealed the imminence of the execution of a plot, possibly the evacuation of Luftwaffe personnel to PERU with the help of a Peruvian citizen of English extraction, who is now employed by UNRRA in MUNICH. Since immediate action seemed imperative a brief operational memorandum was written for C.I.C. on 6 Oct 46. Most of the information contained in the memorandum of 6 Oct 46 will be repeated and amplified in this report. The second report on SORG's knowledge of the latest Luftwaffe weapons, on his "vision" of a future defensive war by means of suicide V-1s with atomic charges, and on the hiding of the most secret documents of RECHLIN, will follow shortly after this report.

7. SORG claims to have told all his secrets to the American and British officers who interrogated him in late spring and early summer 1945 and to have handed over to them all the RECHLIN documents he had hidden/in Bavaria and Würtemburg for Colonel PETERSEN. In fact, he did reveal ~~many~~ some of his secrets and handed over a portion of the concealed documents. He has already admitted that he forgot to mention the latest fuse he tested, i.e. an acoustic or sonic fuse for aircraft to aircraft missiles. Apparently he had only given part of the story of Hanna REITSCH's "suicide squad" which was supervised and trained by SORG. Specially adapted models of V-1 manned by pilots prepared to sacrifice their lives were to receive a powerful charge with which to destroy key targets, such as vital war plants and large battleships. SORG stated that the training was abandoned, late in 1944, "because of German air inferiority". It is more likely that the charge for the warhead which had been envisaged was not available in sufficient quantities. Significantly SORG mentioned an atomic charge for these suicide V-1s as the ideal

TOP - 6 - SECRET

xplosive in a future "defensive" war. SORG has not been y truthful in his account of the finding of the 25/27 boxes of hidden documents. Some of these boxes were opened by French soldiers ignorant of their value, others were "lost". The only other man who knew the whole truth, a Major GROSHOLZ, Ia to Colonel PETERSEN, was shot by the French in May 1945 and his body was disintered by SORG in March 1946. It may safely be assumed that SORG has told some deliberate untruths about these documents and that he has not yet handed over to the allies all he had hidden in spring 1945.
